Presentation

Jeremy Bragg

Good morning, everyone. I'm Jeremy Bragg, Head of Investor Relations, and I'm joined today by our CEO, Tufan and our CFO, Helen. So welcome to our 2025 results.

Before we begin, I'm required to show you the safe harbor statement on Slide 2. So in today's presentation, we're going to cover our first half results in detail and our guidance for the full year. So after the presentation, we will take questions from the room and if there's time from our online audience. For those of you in the room, there are microphones in the seat in front of you, you need to press and hold to the button before you speak.

Before I hand over to Tufan, we'd like to show you a short video that highlights the strong progress we've made over the half. So thank you.

[Presentation]

M. Tufan Erginbilgic

CEO & Executive Director

Good morning. We continue to transform Rolls-Royce into a high-performing, competitive, resilient and growing business. We are creating a sustainably distinctive business in terms of safety, operational effectiveness, customer service, advantage technologies and products and a distinctive performance culture.

We continue to expand the earnings and cash potential of Rolls-Royce despite the challenges of supply chain and tariffs. Our first half results have been strong with significantly improved financial performance across the group. This has been driven by our transformation program and builds on what we have delivered over the past 2 years.

We made strong operational and strategic progress in the first half of 2025. This includes achieving key time on wing improvements, delivering strong aftermarket performance and contractual margin improvements in Civil Aerospace, capturing data center growth in Power Systems with improved profitability, strong order intake in Defence plus the selection of Rolls-Royce's SMR as the preferred provider of the U.K.'s small module reactors.

Our strong first half results gives us confidence to raise our guidance for 2025. It also builds further confidence in midterm targets for 2028 that we set out February. These mid-term targets are significantly underpinned by our strategic initiatives and the actions we have taken. As the first half shows, execution of our strategic initiatives continues to deliver strong results.

We are continuing to invest for growth across the group in a focused and disciplined way. Investments have increased every year since 2022 and will grow again this year. We are also growing shareholder returns. Today, we announced an interim dividend of 4.5p, our GBP 1 billion share buyback is progressing to plan with GBP 500 million of share buyback as of today.

We have achieved a lot over the past 2.5 years, and there is still more to do. We continue to see strong growth to the midterm and beyond. Despite an uncertain environment, our financial performance has improved significantly in the first half 2025, driven by our transformation program.

Operating profit of GBP 1.7 billion was 50% higher than last year, driven by the following items: in Civil Aerospace, we delivered strong aftermarket profit with higher volumes and margins across LTSA and time and materials. In large engines, our aftermarket revenue grew by 28% in the first half with even higher growth in aftermarket operating profit as a result of improved margins in both LTSA and time and materials.

Contractual margin improvements were higher than last year, driven by onerous contract renegotiations and the achievement of key time-on-wing milestones on the XWB-84. Spare engine profit was also higher reflecting improved margins and mix. In Defence, transport, OE and aftermarket, profit improved. And in Power Systems, we continue to capture growth in the data center market with improved margins. Plus, governmental performance was also strong.

Our performance continues to be impacted by industry-wide supply chain constraints, which understate the true impact of our transformation. The actions that we have taken have driven an improvement in the supply chain, particularly in the availability of finished parts with a 15% increase in parts delivered to us in the period. This has supported a higher number of shop visits and reduced turnaround times, particularly for the Trent XWB-84 and Trent 700, both have fallen significantly.

Despite an improvement in the availability of parts, we have continued to see product cost inflation as a result of supply chain challenges. We have been quick to react to the tariffs, where we have fully mitigated the drag impact across the group, as we transform Rolls-Royce into a more proactive, agile business.

All of this resulted in a group operating margin of 19.1%, 4.9 percentage points higher than last year. Civil Aerospace's operating margin rose by 7.1 percentage points to 24.9%. Defence's operating margin was 15.4%, similar to last year's. And in Power Systems, operating margin rose 5.6 percentage points to 15.3%.

Turning now to free cash flow for the group, which was GBP 1.6 billion, 37% higher than last year. Strong free cash flow was largely driven by strong operating profit and continued LTSA balance growth. The growth was supported by higher engine flying hours and an improved EFH rate, partly offset by higher number of shop visits.

The actions we are taking to improve are large engine LTSA contracts. The 6 levers of improvement that we have often talked about are driving higher LTSA margins and stronger cash flows. Return on capital rose by 3.1 percentage points to around 17%, driven primarily by operating profit. That shows distinctive value creation by Rolls-Royce and provides us with a competitive advantage. Our strong first half results were driven by the continued execution of strategic initiatives.

I will talk to 3 key initiatives that have driven significant profit and cash growth, which we first showed you in February. In widebody, our installed fleet has grown at 10% per year since 2022 versus 5% for the market, as we have captured more than 50% of the deliveries. We continue to expect installed fleet growth of 7% to 9% per year to the mid-term, driven by rising aircraft deliveries, as we continue to capture market share. This is underpinned by our large order backlog of more than 2,000 engines.

The first graph shows the multibillion cash benefits of renegotiating OE and aftermarket contracts in Civil Aerospace. We made great progress in the first half of 2025. The contracts that we renegotiated in the first half alone will benefit cash flows by GBP 1.4 billion over their contract life.

As shown on the graph, only 30% of these OE and aftermarket cash benefits will be realized by 2028, with the remainder being delivered progressively over time. We have now renegotiated all of our OE contracts, which means that our business aviation OE deliveries are now profitable. We remain on track for the Trent XWB installed engine deliveries to be breakeven or positive by the midterm.

We also made strong progress with onerous aftermarket contracts in the first half, which supported gross contractual margin improvements of GBP 402 million. We continue to find win-win solutions for our customers. We have now completed the renegotiation of all our significant onerous airline contracts and expect to largely conclude the remainder this year and 2026.

The second graph shows we are driving higher contract margins, and therefore, higher LTSA margins over time. To remind you, from February, our contract margin, the top line on the chart is the average LTSA margin across all signed contracts, even if the engines are not delivered yet. This is a leading indicator for the LTSA margin that will be booked in our income statement in the future. This is the second line in the chart.

In the first half of 2025, we have driven around 1 percentage point further improvement to both contract and LTSA margins compared to what we set out in February. Improved contract and LTSA margins are both driven by time on wing improvements on Trent XWB-84 and lower shop visit costs. In addition, higher contract margin also reflected benefits of new LTSA contracts, which are coming in with better terms.

Shop visit costs continued to improve during the first half. For the Trent XWB-84, shop visit costs remain on track to fall by 50% between 2020 -- 2019 and the midterm. We are also making good progress with time on wing. We hit the significant milestones on the Trent XWB-84 in the first half of 2025, which supported contractual margin improvements and will drive higher LTSA margins going forward.

The upgraded Trent 1000 HPT blade was certified in June, which will more than double the time on wing on these engines. Our Trent XWB-84EP engine deliveries also commence with Delta Airlines in the first half. These engines offer a more than 1% improvement in fuel burn and improved durability. In February, we set a target of improving the time on wing of our in-production engines by more than 80% by the end of 2027. As a result of the progress we made to date, more than half of the targeted improvement is not delivered or secured. Most of the cash benefits from our time on wing improvements will come after 2026 and will support cash flow growth to the midterm and beyond.

The third graph shows operating profit and margins in Power Generation, where we have restructured our business model to profitably capture strong data center growth. As a result, since 2022, Power Generation's operating margin has increased by 11x. Demand for our backup power generators for data centers remains very strong, and we now expect revenue growth of around 20% per year to the midterm in the Power Generation segment. This was previously, if you remember, 15% to 17%.

Power Generation has now become one of the most profitable segments within the Power Systems. This is making our financial delivery more evenly balanced through the year, which you can see in our first half results. All these initiatives are driving stronger performance to the midterm and beyond. We have made significant strategic progress across our 4 pillars. I already covered some of the key strategic initiatives. Let me talk about the rest very briefly.

First, portfolio choices and partnerships. In March, CEZ Group made a strategic investment into Rolls-Royce SMR, alongside a commitment to buy up to 6 SMRs. CEZ is an experienced operator of the existing nuclear fleet in the Czech Republic with a strong established supply chain. In May, we announced that Rolls-Royce and Turkish Technic will establish a new MRO center in Istanbul. This will be operated by the end of 2027 and will eventually support up to 200 shop visits per year.

In Power Systems as well as developing our next generation engine, we are also significantly upgrading our military engines with higher power density to capture growing demand. Our governmental business is also well positioned to capture strong market growth and increase European defense spending. As a result, we now expect higher governmental revenue growth of 12% to 14% per year to the midterm. Previously, again, this was 5% to 7%. In July, we completed the disposal of our naval propulsors business to Fairbanks Morse, and we expect to close the disposal of the naval handling business at a later date.

Second, strategic initiatives. Our Pearl business jet engines hit important milestones in the first half. The Gulfstream G800, powered by our Pearl 700 engine, was certified in April, ahead of the aircraft's entry into service later this year. In addition, our Pearl 10x engine for the forthcoming Dassault Falcon 10x aircraft has completed flight testing, and we are on track to complete all major engine certification test.

In Defence, we signed 2 key aftermarket services contracts worth over GBP 1.5 billion in total with the U.K. MoD and U.S. DoD. These contracts cover the continued maintenance of EJ200 engines for the Eurofighter Typhoon and AE 2100 engines for a variety of aircraft, notably the C130J Hercules.

Third, efficiency and simplification. We have a TCC/GM ratio of 0.35x. This is a best-in-class ratio, which represents a competitive advantage for Rolls-Royce amongst its peers. We have now delivered more than GBP 400 million of efficiency and simplification benefits since the start of 2022, and we remain on track to deliver more than GBP 500 million by the end of this year.

Since the start of 2022, we delivered over GBP 850 million of gross procurement savings and remain on track to deliver more than GBP 1 billion by the end of this year. Our efficiency and simplification targets are supported by zero-based budgeting and our GBS strategy, where efficiencies are scaling up. We have opened a new GBS center in Poland and are expanding our center in India.

Fourth, lower carbon and digitally enabled businesses. In June, Rolls-Royce SMR was selected as the preferred bidder to build 3 SMR units in the U.K. We expect to enter a 2-stage contract with GBEN in the fourth quarter of this year. Stage 1 will cover the site-specific design activity and the preparations for the site build, leading up to the final investment decision. Stage 2 will see us deliver 3 Rolls-Royce SMR units to go on grid by mid-2030s.

The U.K.'s decision also paves the way for further export orders with our next opportunity being in Sweden, where we expect a decision soon. As Rolls-Royce SMR activities ramp up in the U.K. and in the Czech Republic, these projects will start to generate revenues and profit from late 2025. Cash flows will be positive on a project basis throughout. We expect the Rolls-Royce SMR business will be profitable and free cash flow positive by 2030. We have unique capabilities in nuclear with a leading and highly differentiated position in a growing market. Therefore, we expect the value of this business to grow significantly from now.

In Power Systems, we won major new battery storage orders, including the Ignitis Group in Lithuania. These orders support strong revenue growth and our ambition to achieve the breakeven in the near term. We are increasingly adopting AI across the group. Rolls-Royce is testing its generative AI platform for a variety of use cases, including accelerating new product introductions and creating a more efficient MRO process. Work is underway in providing greater transparency across the supply chain through digital, data and AI. We are deploying AI capabilities in cybersecurity and improving the IT support services.

With that, let me pass it to Helen, who will tell you in more detail our first half results.

Helen McCabe
CFO & Director

Thank you, Tufan. Good morning, everyone. Before I get into the detail, let me start by saying how pleased I am with our progress. It's real evidence of our transformation. The results, they are strong, double-digit growth across revenue, profit and cash flow with balance sheet resilience continuing to be built. Every division is delivering, and we're rewarding our shareholders with growing distributions.

A reminder of the group highlights. Group revenues grew by 13% to GBP 9.1 billion with good end market growth, especially across Civil and Power Systems. Group operating profit grew by 50% to GBP 1.7 billion, driven by our strategic initiatives, including commercial optimization and cost efficiency benefits. Operating margin grew by 4.9 percentage points to 19.1%, and free cash flow, it grew by over GBP 400 million to GBP 1.6 billion. Cash delivery was driven by higher operating profit and continued LTSA balance growth.

Strong cash flow in the period meant that we closed the half year with a net cash position of over GBP 1 billion. That's around GBP 2 billion higher than a year ago. Return on capital, it rose to 16.9% for the rolling 12 months, representing significant value creation. And these results have enabled us to declare an interim dividend of 4.5p per share, following through on our capital frame commitments and rewarding our shareholders. So a strong set of results across all key financial metrics with every part of the organization delivering, results that demonstrate we are making continued strategic, operational and financial progress, a real team effort.

Now the detail by division, starting with Civil Aerospace. Civil delivered the largest year-on-year improvement in profit and margin with the impact of our strategic initiatives being very evident. Operating profit grew to GBP 1.2 billion an increase of 63% compared to last year. Operating margin grew to 24.9%, an increase of 7.1 percentage points compared to last year. Revenues grew to GBP 4.8 billion, an increase of 17%, driven by higher shop visits and commercial optimization. OE deliveries of 237 were broadly flat year-on-year. Of these, 122 were large engines, of which 23 were spares, as we continue to increase our

operational flexibility and support our customers. Business aviation deliveries of 115 were almost all Pearl engines.

Shop visits, they grew to 696, an increase of 12% year-on-year. Of these, 217 were large engine refurbs. That compares to 195 last year. The increase in shop visits was supported by stronger MRO performance as we expand capacity, strengthen processes and leverage AI tools across the network. It was also supported by improvements in parts availability across the supply chain, driven by air interventions, which I will come back to in a moment.

Now, operating profit in more detail. Three key factors drove that 63% increase. First, stronger large engine aftermarket profits. LTSA aftermarket profit grew as a result of a higher average LTSA margin and a higher number of shop visits alongside higher time material profits. Second, increased spare engine profits. Similar year-on-year volumes were delivered with improved margins and mix. And third, net contractual margin improvements. They were GBP 288 million. That compares to GBP 223 million in the first half of 2024. The GBP 228 million comprised a net benefit of GBP 181 million in onerous contracts and GBP 107 million from catch-ups.

You've heard how we have made significant progress renegotiating onerous aftermarket contracts, finding win-win solutions with our customers, allowing us to release onerous contract provisions in the period. We also achieved key time on wing milestones on the XWB-84, which resulted in a contract catch-up benefit. These 2 factors contributed to a gross benefit of GBP 402 million in the period. This was partially offset by an additional charge of GBP 114 million, which was taken across both onerous and catch-ups due to ongoing product cost inflation associated with supply chain challenges.

It's worth pausing for a few moments on Aerospace supply chain. When we spoke to you in February, we shared that we expected the supply chain to remain challenging during 2025 and '26. That is still our view. The industry continues to see product cost inflation, and we have our procurement savings program to help us mitigate the impact of it. We continue to manage the supply chain very tightly. Dedicated teams across the organization and teams we have embedded in our suppliers are driving meaningful improvement. Indeed, the number of critical suppliers on our watch list has fallen from around 15 to 10, and you've heard how MRO turnaround times are improving. So despite the continuing challenges, our actions are having an impact.

Now turning to cash. Civil delivered a trading cash flow of GBP 1.1 billion compared to GBP 1 billion in the prior period. Cash delivery was driven by operating profit and continued net LTSA balance growth, supported by large engine flying hours, which grew to 109% of 2019 levels, and a higher normalized engine flying hour rate. In summary, a very strong delivery from Civil on profit, margin and cash. As we look to the second half for Civil, we expect a lower operating profit and cash flow compared to the first half due to a lower contribution from contractual margin improvements, an increased number of OE deliveries and higher MRO investment-related costs. And in addition, for cash, the impact of higher shop visits, notably Trent 1000 refurbs.

Defence, where we continue to make good strategic progress. Key milestones included the first engine delivery for the MQ-25 development program, that's the U.S. Black Hawk helicopter replacement. Order intake for the period stood at GBP 4 billion with a book-to-bill ratio of 1.8x. And importantly, new orders came with improved profitability. Order backlog was GBP 18.8 billion, a record level, and equivalent to around 4 years of revenue. Order cover for the remainder of the year stands close to 100%.

Now turning to the financials. You may recall that the first half of 2024 included a one-off benefit in submarines, so masking the underlying progress we are making. Revenues, they stood at GBP 2.2 billion, broadly flat year-on-year. Excluding the one-off, revenue growth was 10%, driven by double-digit growth across transport OE and aftermarket.

Operating profit stood at GBP 342 million and operating margin at 15.4%, both broadly flat year-on-year. This reflected improved performance in transport across both OE and aftermarket, again, offset by the absence of the one-off benefits in submarines and continued supply chain constraints, notably in the Naval business.

Cash flow in Defence stood at GBP 327 million. Delivery was driven by operating profit alongside tight working capital management. In summary, a good delivery from our Defence team, which continues to position us well for future growth. Power Systems, a very strong performance in the period, as we continue to capture profitable growth in data centers and governmental.

Operating profit grew to GBP 313 million, an 89% increase year-on-year. And operating margin grew to 15.3%, a 5.6 percentage point increase year-on-year. Order intake was GBP 2.9 billion, with a book-to-bill ratio of 1.4x, a 32% increase year-on-year. Order cover for the remainder of the year is 100% with growing order coverage for both 2026 and '27. Demand remains particularly strong in Power Generation, which saw an order intake growth of 68%, primarily driven by data centers, where orders grew by 85% year-on-year. Revenues, they grew to GBP 2 billion, an increase of 20%. Power Gen and Governmental revenues grew by 26% and 19%, respectively. Data center revenue growth was 45%.

Operating profit growth of 89% was driven by 3 factors: first, a standout performance in power generation, notably data centers, where we are capturing profitable growth with a stronger mix in the high-power density sector, and all at higher margins, following the restructuring of this business.

Second, strong performance in governmental with higher volumes and commercial optimization benefits and where we are well positioned to capture growing European defense spending. And third, good momentum in Battery Energy Storage Systems with improving profitability and where we remain on track to break even in the near term.

Cash flow, it increased to GBP 425 million, driven by higher operating profit and tight working capital management as well as some timing benefits from early customer receipts. Simply put, a very strong performance from the whole of the Power Systems' team.

Looking to the second half, although we still expect Power Systems' profit and cash to be seasonably balanced to the second half that weighting wouldn't be as pronounced as in the past. This is due to the significant growth we have driven in power generation, which is now one of Power Systems most profitable businesses and one which has less seasonality. We also expect some reversal of the early customer receipts that came in the first half.

Before turning to group cash flow, the eagle eyes amongst you may have noticed that we are no longer reporting a New Markets division. As you know, last year, we wind down the Electrical Advanced Air Mobility business, and this year, with the CEZ Group now a strategic partner in Rolls-Royce SMR, in which we remain the majority shareholder, the equity accounted results of Rolls-Royce SMR now sit within all other businesses.

The funds flow, we delivered GBP 1.6 billion of free cash flow in the first half, more than GBP 400 million higher than last year. The principal driver for increased -- of this increased free cash flow was operating profit, which grew by almost GBP 600 million. Other factors included the Civil net LTSA balance. It was broadly similar to last year, standing at GBP 472 million. Growth was driven by higher engine flying hours alongside an improved engine flying hour rate, offset by a higher number of shop visits.

Net investments, they were similar to last year, with investment spend in the period standing at more than GBP 400 million. We continue to make purposeful strategic investments that drive growth to the midterm and beyond. This includes investments in time on wing and UltraFan in Civil. And in Power Systems, investments in additional capacity in the U.S., our next-generation engine for the growing data center market and in significant upgrades to our military engines.

Working capital, it was broadly neutral in the period. This compares to a build of more than GBP 200 million last year. We continue to drive sustainable improvements in working capital management, and we are making good progress. Compared to the same period last year, inventory days improved by 14 and days sales outstanding by 4, a strong performance given a tight supply chain and while we supported revenue growth.

Then provisions, they were an outflow of nearly GBP 300 million, around GBP 200 million higher than the same period last year. They included outflows, as we continue to successfully renegotiate and trade through our onerous contracts. Overhead costs, they were GBP 116 million, slightly higher than last year

and in line with expectations. Net interest, it was slightly positive compared to a small outflow last year. And finally, cash tax costs, they increased to GBP 259 million.

Tufan will talk to the full-year guidance, but let me give you some additional color on the cash flow. Large engine flying hours are expected to be within the guided range of 110% to 115% of 2019 levels. The net LTSA balance growth for the full year is expected to be at the low end of the GBP 0.8 billion to GBP 1.2 billion range, in line with what we previously shared. This means, we expect a lower growth in the second half of the year as shop visits, including Trent 1000 refurbs increase. Net investments, we expect them to be higher in the second half of the year. Overhead costs for the year will be GBP 148 million. Net interest payments will be broadly neutral for the year, and cash tax is expected to be around GBP 200 million higher year-on-year.

Capital frame and progress against our priorities. First, the balance sheet, which we continue to strengthen. We remain in a modest net cash position, GBP 1.1 billion at the half year, which provides us with flexibility and enhanced resilience, which are even more important in an uncertain macro environment. The credit rating agencies have continued to recognize our progress with further upgrades in the first half, and all still hold us on a positive outlook. Gross debt, as previously shared, we will reduce it further by repaying from available cash, the \$1 billion bond, which matures in October.

Then, distributions. In June, we paid our first dividend since 2019. Today, we're announcing an interim dividend of 4.5p per share in respect of the half year 2025, representing a distribution to shareholders of approximately GBP 380 million. As a reminder, we target an annual payout ratio of 30% to 40% of underlying profit after tax. And as of today, we are halfway through our GBP 1 billion share buyback. The remainder of which will be executed across the balance of the year.

Taken together, the full year buyback along with the 2024 full year and 2025 interim dividends represents a total cash distribution to shareholders of GBP 1.9 billion to be paid this year. Competitive and evidence of our commitment to growing shareholder returns. And all of this was delivered while we continued to strategically invest in the business to support growth to the midterm and beyond.

To close, a strong first half result across all divisions and against all key metrics. The strategy is delivering. We are performing as we transform. We know there is more to do, and we also know there is more to come. The teams have done a great job, a huge thanks to everyone.

And with that, let me pass you back to Tufan.

M. Tufan Erginbilgic
CEO & Executive Director

Thanks, Helen. Turning to our guidance now. Strong first half delivery gives us confidence to raise our 2025 guidance. We now expect underlying operating profit of GBP 3.1 billion to GBP 3.2 billion with a year-on-year improvement in all core divisions. Compared to an operating profit of GBP 1.7 billion in the first half, we expect slightly lower delivery in the second half of 2025, notably in Civil Aerospace. Here, we expect a lower contribution from contractual margin improvements, an increased number of OE deliveries and higher MRO expansion investment-related costs. We now expect free cash flow of GBP 3 billion to GBP 3.1 billion. Stronger free cash flow will be primarily driven by higher operating profit alongside continued LTSA balance growth.

We expect a slightly lower free cash flow in the second half compared to the first half. This reflects the lower operating profit in the second half of the year, more large engine refurbs with a significant step-up in Trent 1000 refurbs alongside higher net investment. Our free cash flow guidance includes a GBP 150 million to GBP 200 million impact from the supply chain, as previously guided. Our transformation plan is delivering strong results, as is evident this half. And we feel confident about the remainder of the year.

I will conclude today's presentation with key takeaways. We shared a lot with you. I actually thought I should give you the key takeaways. I'm sure you will take yours, but hopefully, this is helpful. We continue to expand the underlying earnings and cash potential of the Rolls-Royce in a challenging environment. Across the group, all divisions have delivered underlying performance improvement in the first half. Civil Aerospace's strong underlying operating profit and cash flow is driven by continued LTSA

margin improvements and continued market share growth. We have renegotiated all of our significant contracts and achieved major progress in our time on wing program. These initiatives will both contribute significantly to our profit and cash flow delivery to the midterm and beyond.

In Power Systems, we continue to improve our profitability, and now see higher growth potential in Power Generation, driven by data centers. We also see higher growth in governmental. In Defence, where we have delivered a year-on-year improvement in underlying performance with a record order book, our significant programs will scale up in the late 2020s. All these, which are driven by our strategic initiatives, continue to improve our operating margin and return on capital. As a result, we see good profit and cash flow growth in our existing businesses to the midterm and beyond, while we are taking concrete steps to generate further long-term profitable growth in new areas such as narrow body, SMRs and AMRs.

Rolls-Royce's SMR business will be profitable and free cash flow positive by 2030. Strong delivery in the first half of the year gives us confidence to raise our guidance for the full-year 2025 and also builds further confidence in our midterm targets for 2028. These midterm targets are a milestone, not a destination. I am confident and excited about our growth prospects beyond the midterm.

We are continuing to reward our shareholders with GBP 1.9 billion to be returned to shareholders through 2025, in line with our capital framework, as Helen talked about. This shows our commitment to shareholder distributions. There is a lot we achieved in the first half and still so much more we can deliver. I'm very proud of all that the Rolls-Royce team has done and look forward to all that we will continue to accomplish together.

Thank you for listening. Now, I'm going to open it for your questions.

Question and Answer

Nick Cunningham
Agency Partners LLP

It's Nick Cunningham from Agency Partners. Some of your customers, airlines and lessors have been vocal recently, complaining perhaps that Rolls isn't as nice as them now as it has been for most of the last 30 or 40 years. But you've renegotiated all those key onerous contracts. You just told us that. So does that mean that there's no real practical effect from their grumbling that, if you like, the deal is done? And then linked to that, the -- your narrow-body colleagues have been enjoying an exceptional windfall from the lack of supply of new engines and new aircraft, so it's keeping older ones in the air for longer with more scope on the overhauls and so on. Presumably, the same dynamics apply to the large engine market, and so are you seeing that effect in your T&M in particular? And has that helped you with your onerous contract renegotiations?

M. Tufan Erginbilgic
CEO & Executive Director

Okay. There is a lot there. I'm not sure it is 2 questions, but more than 2. But I think -- so let me start, first of all, I think, I don't know, some of our customers have been disappointed with Trent 1000 time on wing issues. And we have a big task force dealing with it. We actually have improved relations with customers. I can categorically tell you, there isn't any contract we renegotiated. Actually, relationship didn't improve relative to where it was, I can categorically tell you, because every time we were able to find win-win solutions.

So there is some noise because of Trent 1000 time on wing issues. Now with BoM B upgrading, obviously, certification, frankly, that will go away because by the end of this year, we will have an engine very, very competitive, let me tell you this. By the end of this year, actually Trent 1000, depending on how it is operated, obviously, different airlines will operate differently, but we expect 46 years' time on wing relative to where we have been, right? That was creating the sort of -- we are actually serving our customers better than before. And you can hear it from airframers easily if you are following that.

We are actually improving our customers service, and there is a big focus on it. This was the sort of issue. Now, we solved that issue. We have a very, very competitive engine. So I think that's the way to think about. In renegotiations, that was -- yes, if somebody is experiencing AOG, it's not a brilliant start to renegotiation, obviously. But we were able to do all the significant renegotiations, and we were all -- we have done it in a style that actually relationship improved.

Why is that? Because they now know when we commit something, we honor it. We are that company. We don't commit that easily. But when we commit, you hear some noise because we are not committing some things. I actually tell them when we commit, we will deliver. So until I am sure we will deliver, I'm not committing. So actually, that's not a bad noise. That's actually good noise because, frankly, this industry doesn't have a great track record on that one. So we don't want to contribute to that. We want to change that.

Your question around sort of whether we are actually -- yes, I think when you look at our best, obviously, Trent 700, right, if you create parallels with narrow body, yes, we are seeing, and it is -- if you remember, that's 1 of our 6 levers. We kept saying earning -- actually flying those things longer, we have a deliberate program on that, whether with the current customers, obviously, if they want to continue with that or with freight conversions or with sort of transfers to other commercial customers.

Yes, I think Trent 700, frankly, doing well, and we believe our projections suggest it will continue to do well. In fact, in February, if you remember, I said our Trent 700 LTSA balance growth didn't peak yet. I don't know any of you remember that, but that was there. So your question, is it helping our renegotiations? Not really, because, frankly, none of our renegotiations are around Trent 700. It is pretty profitable engine. You guys well know that.

So was that -- yes, Ben? And then, Ian. Yes, I'll come to you.

Benjamin Michael Heelan

BofA Securities, Research Division

Can I ask 3? First one, you've given us some outlines on capital allocation. Can you talk a little bit about that in 2026 and 2027? Are there parts of the portfolio, I'm thinking maybe Power Systems, that you want to add to given the balance sheet that you have now? Or can we assume that there could be more buybacks down the line? That's the first question.

Second question, you haven't talked today about UltraFan narrow body. Can you give us an update there? You made some noise at the air show about this, so just an update there would be great. And then in terms of the Civil business, you talked and guided historically for margins to be in the 18% to 20% range. Now, in H1, you've already achieved the 19% on an underlying basis, stripping out the catch-ups. Are we not going to grow margins from here? How can we think about that?

M. Tufan Erginbilgic

CEO & Executive Director

Thanks, Ben. Three good questions. I'm going to ask Helen to capture the capital allocation. Let me answer the others, second and third, and Helen will pick up the first one. So I think UltraFan narrow-body is -- we are actually making good progress in multiple dimensions. One is continue to work on the UltraFan demonstrator. We are actually on UltraFan, Ben, doing 2 things. We are doing further tests on wide-body UltraFan just to progress that, at the same time, working on the demonstrator for narrow-body, which may take 2 years to build a demonstrator. So that's the current plan. So that's one sort of technology angle, if you like, and product angle.

The other angle is our preference continues to be partnerships. Therefore, we are in active dialogue with almost all the parties, I should say. So that is also progressing well. So that's where we are. I'm actually very optimistic definitely for the next generation of narrow-body and our participation in that given all that.

So if I go to your Civil question, your math is absolutely spot on. So if you adjust for commercial improvements, it is 19%. So it is what I'm going to say. I mean, I said it, Helen said it, hopefully, it was clear. We are making underlying performance improvement, right, beyond sort of what we shared with you in February. Otherwise, how would we upgrade the guidance for this year if that's not true. So that's actually factually true. So we are -- we were expecting obviously improvement when we gave the midyear guidance and everything. And we are now ahead of that progress, which is great to see, frankly, in that.

But you need to obviously look at a couple of things sort of in that -- when you look at -- I always say sometimes our competitors, they issue 1 quarter I got 30% margin so that you cannot really look at, because our targets are sustainable targets as opposed to touch and go, if you like, right? So we just told you that effectively second half we have significant step-up on shop visits. That's not the issue for operating margin, but step-up comes with Trent 1000. And therefore, full year will equalize somewhere lower than 19% because those are the engines where we have the lowest shop visit profitability if you like. So they will a little bit dilute that picture.

But big point is underlying performance is improving, and that's very encouraging for me. And as a result, we are ahead of the plan. When you go to midterm targets, we are in an uncertain world, right, an increasingly uncertain world, sort of tariffs, supply chain challenges, impact of tariffs on world GDP, all that live conversation. So if we continue to manage those risks well, given our mindset, which I will come back to, yes, we are ahead of the sort of plan, but we need to manage those things. So those risks are real.

So I take you -- final comment I'm going to make, then I'll pass to Helen for capital framework. But -- so you guys get surprised sort of what's going on because our mindset change. Every time I talk about it, we are not after a bunch of budget numbers. We are after improving the business every day. And that means improving the underlying performance every day, every year. That excites me, frankly.

Now when you do that, you combine it with your strategic initiatives very granular and embedded in the organization, i.e., 42,000 people on them. Suddenly, that mindset, combined with that clarity, you go as fast as you can go because we are -- we increased the pace and intensity in the company. That's understood by everybody. So that is actually causing these things. But there are big risks that we need to be thoughtful. Therefore, I'm thinking, Ben, maybe it's too early to talk about midterm targets, but I'll leave you with a thought that we are making great underlying improvement.

Helen McCabe*CFO & Director*

Fantastic. Thanks, Ben. So I think 2 elements to your question. There was one around investments, and then, one is tied into capital frame. So in relation to investments, maybe just a couple of data points to help you there. So actually, Tufan referenced that since 2022, we've increased our investments in the business every year. And you will see that for 2025 as well.

When we took you through in February, our midterm targets, we shared then that we expected over the midterm net investments on average to be higher than they were at 2024. So again, you can see the confidence building that we're continuing to invest in this business, not just for the midterm, but beyond the GBP 1 billion on time on wing. A classic example of that, we don't see by any means the full benefit of that beyond the midterm.

You specifically mentioned in Power Gen -- in our Power Systems, Ben. Power Systems last year had a record level of capital spend in 2024. 2025, expect to see the same, very strong positions in data centers and governmental. So investment is going in to support that business. In fact, just in the last 3 or 4 weeks, we announced \$100 million investment in the U.S. across 2 of our sites there, specifically to support that build-out in production for data centers. So purposeful, strategic investments happening. And that is very important, purposeful and strategic investments happening.

In relation to capital frame and buyback, we've always been quite consistent around how we look to strike that balance between ensuring that we protect that balance sheet and then being very thoughtful about how we drive for additional investment, be that organic or inorganic or additional shareholder returns. And we've been clear that buybacks are in our tool kit.

And Tufan spoke about, we don't promise and not deliver. We were clear that we have a very clear capital frame, GBP 1.9 billion in cash distribution in our first year of cash distributions in more than 5 years, I think, is a demonstration that we follow through on our commitments, yes. And actually, that's in an environment where we're also repaying a \$1 billion bond. So that's how you should hold that going forward. Thank you, Ben.

M. Tufan Erginbilgic*CEO & Executive Director*

Thanks. Ian, I see you well. Thanks for sitting there.

Ian Christopher Douglas-Pennant*UBS Investment Bank, Research Division*

I think that the episode Tufan was referring to is when he didn't take my question. I think that was 2 years ago now. It's still holding you.

M. Tufan Erginbilgic*CEO & Executive Director*

I -- that was scars on me, if you...

Ian Christopher Douglas-Pennant*UBS Investment Bank, Research Division*

Yes. It's Ian Douglas-Pennant at UBS. First on 2028 guidance. I mean, it sounds churlish, but why not upgrade the 2028 guidance today? I mean, you -- as Ben points out, your Civil margins are already there

-- they are actually already there, and Defence and Power Systems as well. Clearly, your expectations for Power Systems growth have increased since you gave that guidance. I mean, why not upgrade the 2028 guidance at the same time?

M. Tufan Erginbilgic

CEO & Executive Director

Yes. I got you. You have more questions, so go ahead.

Ian Christopher Douglas-Pennant

UBS Investment Bank, Research Division

Just one more. And then the outperformance that you've seen this year, to what extent is that market? I mean, it seems like what you're seeing in Power Systems seems to -- sorry, forgive me if I'm wrong, but it sounds like the majority of that is just faster market growth than expected. Civil, clearly, the situation is better than a lot of you and your competitors expected at the beginning of the year. Or is there still -- you're just achieving more internally than you expected?

M. Tufan Erginbilgic

CEO & Executive Director

Okay. Very good. So let me go in that order. My answer to your question will sound very similar to my answer to Ben's question because they were similar questions. But yes, underlying performance improvement is happening, and it is driven by transformation. When we come to your second question, hopefully, I can bring it to life a little bit more, but -- and that's happening. Therefore, we upgraded our guidance. That should signal to you, if our previous guidance was in line with midterm, then we are ahead of it, by definition. That's for sure. So therefore, I'm actually happy with the progress we are making. But at the same time, there are risks out there.

And remember, midterm targets we set out only in February, if you remember, which was, I don't know, 5 months ago, you can count. So that is the -- I think it is too early, given -- frankly, if anything, world got more uncertain than certain. I think we are a lot more agile, a lot more responsive company; therefore, we are dealing with it. It may look easy to you guys. But actually, that needs to continue, okay? But world definitely, I'm not sure anybody in the room can tell what tariffs and what economic growth and what supply challenges will be hitting any business, frankly, going forward. So that's the world you are dealing with, and you need to take that into account.

We manage those risks because of the company we are becoming, a lot better, therefore, you are sitting and saying what's the problem? So -- but we need to continue to manage them. If we continue to manage them well, yes, but given the mindset -- I'm not going to repeat again what I said to Ben's question. Given that mindset, given that process in the company, if we can deliver midterm targets earlier, we will, because that's how we operate. But you need to actually hold it in that way.

Coming to your point, so there is a clear transformation impact, okay? I'll come to Power Gen, but let me start with Civil. I think -- look at today's results, one of the big drivers of those results, even if cash impact is not there profit-wise, was time on wing improvement. Remember, one of our strategic initiatives out of 17 is that, right? So that -- we allocated GBP 1 billion investment in 4 years. This is not like we are talking about UltraFan development. This is not like in 15 years GBP 1 billion. This is actually 4 years, right?

So you allocate that kind of resource, very rigorous execution, it is driving that. That's not market. That has nothing to do with the market. Again, that is improving LTSA margins, shop visit cost reduction. Think about improving shop visit cost at an inflationary supply chain challenge environment. It is counterintuitive. It is very much counterintuitive. Shop visits is one of our strategic initiatives. There is the driving of that, right? I'm talking about OE, XWB will be breakeven or positive in midterm, that is counterintuitive. So I can keep going how much time you got, but the sort of -- our market share capture is coming, right?

So Civil Aerospace, we gave you some LTSA margins. And in 5 months' time, I came and said, actually, whole pack profitability went up 1 percentage point in 5 months. Don't think 1%, like it is increasing the whole contract margins, whole LTSA margins of the company. So let's talk about Power Gen. How long have you been following Rolls-Royce? Probably longer than I've been here. Here's the breaking news for you. Data center volumes were always there. They didn't show up last 2 years, okay? Suddenly AI was not discovered last 2 years, trust me. We can all follow that. They were there, nobody talked about it, because what are you going to say? My biggest business is Power Gen, I have the biggest volumes, I'm not making money. Normally, results presentations don't go like that, right?

So -- but -- by fixing the business model, we enabled profitably capturing that growth. If we didn't, I said it last year this time, probably or whenever it was, 0 times 1 million, it is still 0, so -- but that is big underlying, yes, from none on top of that, so we fixed the business model, right? But if you look at my chart, after fixing, it is still going up. Why is it going up? There are 3 factors. We are pushing the mix to higher power density, Helen talked about that, in data centers.

It is good for customers. It is good for us, but don't make any mistake, it is our initiative. And then, pricing continues to -- plays a role. I think Helen talked about commercial optimization. Those 2 like-for-like improving, then you have the volume effect, obviously, further improving, because your fixed cost, we are managing, that's the last thing I'm going to say. You see all that, it is coming with improved profitability.

These results are saying to you the following: Civil and Power Systems, profitability unit base is improving. That's what it's selling, right? Hopefully, you could get that. So that sort of -- that is big distributor there is the cost initiatives we have, and they continue -- GBS initiatives, we didn't yet benefit. I mean, I talk about we are scaling up, but really early days. It can be very big. So that's my answer to your question.

And actually, last point, I was talking to Ben sort of before we showed up here. I said the difference between Rolls-Royce and many of our peers, they are talking about market growth, we are talking about transformation benefits plus market growth. If you actually think that way, you may understand our results better.

Jeremy has a question. Okay, Jeremy, I thought we'll work this together.

Jeremy Bragg

Very good.

M. Tufan Erginbilgic
CEO & Executive Director

Okay. I'm kidding. I think digital question.

Jeremy Bragg

Okay. Quite a few digital questions. So going to turn to those. So firstly, from David Perry. Congratulations on excellent results. Three questions. First one on SMR, which was, the prior CEO said that this could be a business that generates GBP 3 billion to GBP 4 billion of revenues by the mid-2030s. Is this still the case? And what sort of equity contribution? And by that, he means the equity accounted share of the results. Could we expect by that point? So that's question one.

Question 2 is on Power Systems, which is, again, on the theme of the midterm targets, which is given that data centers is the highest margin bid and the fastest growing, isn't it mechanical that you will achieve a higher margin than your midterm target range for Power Systems?

And then question 3 is also on Power Systems, which is, why was the cash generation so strong in the first half? Is that something we should expect to continue?

M. Tufan Erginbilgic
CEO & Executive Director

I think the third one, Helen talked about that, but I'm -- therefore, I'm going to pass to Helen again to capture it. I think on SMR, so I don't want to sort of comment on who said what, but here is how I see it, David, I think. We now have tangible 2 sort of initiatives. One is with GBEN for 3 units, but actually, hopefully, we are going to run them in a way that actually sort of we will change the nuclear track record on that. And that will actually mean that we can create a lot more than that as a Fleet Solution for U.K. beyond 3.

And then CEZ, same time frame, really, we are going to be up to 6 SMRs. So -- and both of them -- I said it in my speech, both of them have similar commissioning target dates, i.e., mid 2030s, okay, '34, '35. That's the target for both CEZ and -- frankly, that is I'm going to actually go beyond any revenue number.

Yes, given that every unit is sort of GBP 2.5 billion, GBP 3 billion, so you can start to think about revenue numbers in that context. But I'm going to go further to say, today, actually, we told you this business will be free cash flow positive business and positive profit business by 2030s, which is actually before the commissioning because revenues don't come when you sort of commission.

Equity accounting, we own more than 50%. And obviously, we continue to be a very big player on this one. So we should benefit from that. I said it in my speech, frankly. I expect, given we can be given where things are. I think if we are not market leaders in SMRs globally, I think we did something wrong, because we are the leading company right now. So that's the potential you may want to think about in this business. That's definitely the potential I think about.

On your Power Systems margin, yes, it is one of the most profitable. By the way, governmental is profitable because of the service angle of governmental, David. So you need to think that way. It is not only Power Generation, but it is one of the profitable businesses, definitely. And yes, though I actually expect -- I mean, it's Ben's question, Ian's question, you guys get sort of similar questions, it's sort of different angles, but similar questions. Yes, we just -- what did we tell you today on Power Systems? We said 2 things in my takeaways. We are improving the margins. I talk about, when I answered Ian's question, how we are doing that. And we now see higher growth. That's what we said to you today.

And we also upgraded the guidance. Yes, therefore, we see an upside. But talking about OP's margins for midterm with all the uncertainties in the world, I really find it, at this point, too early to talk about it. So again, I'm going to go back to my mindset question, David. Probably when you raised that question, you didn't know my answer. So I think if we can achieve it earlier, we will, obviously.

Do you want to pick up?

Helen McCabe
CFO & Director

Fantastic. So thanks, David. We miss you here today. So in relation to your question, so we have this period seen a more even cash distribution in Power Systems. In the past, the cash delivery was very second and H2 weighted. We're seeing that more even distribution. We still always expect it to be more weighted towards the second half, but it wouldn't be as pronounced. And in this period, that's because of 2 primary reasons.

Tufan spoken at length around how we're driving growth in Power Generation. That has got a much more consistent growth and delivery pattern during the year. So governmental, which used to be the one which actually brought in the seasonality, is much more muted, yes, because we're seeing that Power Generation business be a much more substantial part of the portfolio. Its delivery is more ratable. You heard how we've improved the margins in that business by 11x compared to 2022.

So more substantial and ratable delivery from Power Generation, particularly data centers. And then, in the first half of this year, we also did have some benefits from early receipts of customer advances. So we are seeing a little bit of a timing impact between H1 and H2. But I think going forward we should expect to see a slightly different balance in relation to profit and cash flow between H1 and H2 in Power Systems because we have that much more substantial Power Generation business in the portfolio now.

M. Tufan Erginbilgic

CEO & Executive Director

Jeremy, more questions from you?

Jeremy Bragg

Yes. These from Ross Law of Morgan Stanley. So first question is, congratulations on the achievements on the time on wing program, could you update us on how much of the GBP 1 billion has been spent? And how much is still to go?

And then the second question is, could you elaborate on the product cost inflation that you've seen as a result of the supply chain? Is it in a particular area? And what's causing it? And how should we hold that versus your comments about parts availability getting better?

M. Tufan Erginbilgic

CEO & Executive Director

Okay. Very good. So I think -- Ross, thanks for the questions. So time on wing sort of program, we are actually making great progress. Remember that GBP 1 billion was between '23, '27 period, and we are obviously -- I'm not going to talk about how much of it we spent, how much of it we didn't spend yet. But we are making good progress in that. So what I am going to tell you what is -- what we have done, what is left to do and that may give you a sense of how much we spent, how much we didn't spend, but that's the time period. So actually, that GBP 1 billion will stop after '27 with all the implication of that.

Time on wing, the big elements of that when we started, there are small elements, by the way, but I'm only focusing on the big ones. Definitely, Trent 1000, what we call 2 upgrades, BoM B and BoM C, and we obviously did BoM B, which is more than doubling time on wing. By the end of this year, we will do BoM C. It is already -- product is already on test. By the way, it is going well.

So once we do BoM C, so Trent 1000 time on wing program in a way is finished, and that will create by the end of this year, highly competitive engine. You need to think about time on wing sort of -- depending on how the operator sort of uses these engines and aircraft, 4 to 6 years type of time on wing, which is actually competitive, okay? And so that's going to be done by the end of this year.

XWB-84, we hit milestones, therefore, we actually secured that, and we are looking -- that's sort of not completely done, some to go, but we are making great progress there. The remaining big one that we continue to invest is this 97. In non-benign environments, we are going to double the time on wing. And in benign environments, we are going to increase time on wing by 50%. That is progressing, but that won't be completed before 2027. And so we will continue to invest in that. By the way, this engine is a very good engine in benign environments. In fact, orders -- actually airlines, especially hub airlines love it because of the distance and capacity and so on. But we -- that is how I would articulate our -- where we are on time on wing.

I think on product cost, effectively, it is in aerospace because that's where the supply chain -- in Power Systems, frankly, because supply chain is more stable, and there is a hint there for you and for us, frankly. When supply chain stabilizes, you can actually improve procurement initiatives a lot more, right? We are actually almost fully mitigating, almost, in Power Systems any product cost, i.e., inflationary effects. So therefore, this is exclusively aerospace.

Obviously, aerospace includes Defence as well because it is the same supply chain when I say aerospace. But how does it work with 15% parts improvement? It's actually different things. Our initiatives make sure that 15% is improving. But at the same time, given constrained environment, some suppliers are able to increase their prices. We are obviously -- that doesn't -- if you are thinking, is it hitting your underlying numbers, are they going to get worse? No, we are not that company anymore. We are obviously reflecting that in our prices. So that is how I would like you to think about.

Jeremy Bragg

Thanks. I suggest we take one more in the room if there is one, and then, we close.

M. Tufan Erginbilgic

CEO & Executive Director

Okay. In that case, I'm going to close. Thanks for coming here, and thanks for listening to us if you are on the digital. So I think we believe we are making great progress in the company. And we are -- actually what is interesting for me -- interesting in a positive sense, for me is actually, our execution is getting better. We are hitting operational milestones. We are making great strategic progress. That drives underlying performance because today's financials are today's financials. I worry about tomorrow's financials. And as long as you continue to improve the business, underlying performance, tomorrow's financials will be secured. And that's the journey we are in, and that's how we run the business, frankly. So thanks for listening. Have a great day.

Presentation

Jeremy Bragg

I'm Jeremy Bragg, Head of Investor Relations, and I'm joined today by our CEO, Tufan and our CFO, Helen.

So before we begin today's presentation, I'm required to show you the safe harbor statement on Slide 2. So the full materials can be downloaded from our website. And in today's presentation, we are going to cover financial and strategic progress over the past 2 years. The 2024 results in detail, our guidance for 2025 and our upgraded midterm targets. So after the presentation, there will be time for questions from the room and if there's time from our online audience. So for those of you in the room, there's microphones in the seat in front of you and you need to press and hold the button before you speak.

So before I hand over to Stefan, we'd like to show you a short video that highlights some of the progress that we've made this year.

[Presentation]

M. Tufan Erginbilgic

CEO & Executive Director

Good morning. We are transforming Rolls-Royce into a high-performing, competitive, resilient and growing business. We are expanding the earnings and cash potential alongside delivering significantly improved performance. This is about creating a sustainably distinctive business in terms of safety, operational effectiveness, customer service with advantaged technologies and products combined with a distinctive performance culture. These all mean we are taking Rolls-Royce to a place that it has never been before, which opens up further potential for future profitable growth. We have made progress, but we are not done yet. Today is important day for Rolls-Royce. 2024 represents another year of strong financial and strategic delivery, building on the progress made last year. We achieved this despite a supply chain environment that remains challenging.

Based on our 2025 guidance, we now expect to reach our CMD targets for profit and cash 2 years earlier than expected. We have materially increased the potential of the business and delivered at pace. We are upgrading our midterm guidance based on a 2028 time frame. We are confident that our actions, investments and how we run the company already significantly underpin future performance improvements. We now have a strong balance sheet with an investment-grade rating from all three agencies. In addition to reinstating the dividend, we are also announcing a GBP 1 billion share buyback, Rolls-Royce's first in a decade to be completed this year.

It is further evidence of our commitment to grow shareholder returns. Our strategic progress is a result of what we choose to do and how we are running the business. Together, they both enabled current and future delivery and develop a sustainable platform to continue to build on. We are operating as one Rolls-Royce, embedding a distinctive performance culture with a winning mindset where everybody knows their role and how they contribute to strategic delivery.

Our agenda for today, and Jeremy talked about it is as follows. First, I will briefly talk to the drivers of the step change in performance over the last two years, laying out some specific examples of our actions set us up how our actions set us up for continued future delivery. I will then share our guidance for 2025. Our upgraded midterm targets and the key drivers that underpin our midterm targets. Helen will then talk to our 2024 results. Our midterm cash outlook and how we are making Rolls-Royce more resilient and our capital framework. I will then finish by talking about the drivers of growth beyond the midterm.

Let us first look at our delivery over the past 2 years and the foundations that we have built. Our financial performance has improved significantly over the last 2 years. This has been achieved despite a supply chain, that remains challenging, which understates the true impact of our transformation. Group operating

profit has risen by almost 4x from GBP 650 million in 2022 to GBP 2.5 billion last year. Our operating margin has increased from 5.1% to 13.8% last year.

All three divisions contributed. Let me give you a brief summary of the key drivers of this performance improvement. In civil aerospace, operating profit has increased by more than 10x from around GBP 140 million in 2022 to GBP 1.5 billion last year, with a margin of 16.6%. This has been driven by four factors: first, stronger LTSA profitability with a higher profit per shop visit alongside increased shop visit volumes. Higher LTSA margins have been driven by commercial optimization, including renegotiating contracts, time-on-wing initiatives and lower shop visit costs. Second, time and material profit tripled, reflecting improved LLP margins with almost 60% of LTSA contracts now unbundled. Third, business aviation profit has more than doubled over the past 2 years with higher OE and aftermarket margins and profit. And fourth, widebody spare engine profit has improved significantly reflecting commercial optimization actions.

In defense, operating profit has increased by 50% over the past 2 years with a margin of 14.2%. The largest driver was improved aftermarket performance in combat and transport. Submarine profit has also grown significantly. Power Systems operating profit has doubled since 2022 with a significantly improved margin of 13.1%. The main driver of higher profit is power generation, where we fixed the business model to capture profitable growth. As a result of our actions, we now earn a double-digit operating margin in power generation, including data centers. Free cash flow has risen by almost 5x to GBP 2.4 billion in 2024 with improved cash generation across all divisions. This was largely driven by higher operating profit and supported by continued LTSA balance growth.

Over the past 2 years, we have captured more than 50% of total widebody deliveries. This means our market share of the widebody installed base has risen from 32% in 2022 to 36% last year. This helped to drive large engine flying hours to 103% of 2019's level. We have driven a higher normalized EFH rate. We are also investing more into the business, with net investments rising by around GBP 500 million since 2022, which will drive profitable growth to the midterm and beyond. In addition, we are seeing working capital benefits as we drive down inventory and receivable days.

Return on capital has risen from 4.9% in 2022 to 13.8% last year, representing significant value creation. To demonstrate how we improved some of the key drivers for profit and cash, I will now focus on three initiatives that have delivered significant performance improvements over the last 2 years. These initiatives will also drive stronger performance to the midterm and beyond. The first graph shows we have created a multibillion cash improvement from renegotiating OE and aftermarket contracts in civil aerospace. Over the last 3 years, we have renegotiated almost all our OE contracts. As a result, business aviation OE engines have turned profitable. By the end of 2024, we also successfully renegotiated a significant portion of our onerous aftermarket contracts and expect to largely conclude the remainder into 2025 and 2026.

Only around 30% of these OE and aftermarket cash benefits will be realized by 2028 with the remainder being delivered progressively over time, you can see it on the first graph. The second graph shows we are driving higher contract margins and therefore, higher LTSA margins over time. Our contract margin is the average LTSA margin across all signed contracts even if the engines are not delivered yet. This is a leading indicator for the LTSA margin that we will book in our income statement in the future. Our contract margin is improving by 17 percentage point between 2022 and 2028 due to new and renegotiated contracts that are coming in at higher margins and better terms as well as the operational improvements that we are making. This will drive around a 20 percentage point improvement in the LTSA margins in the income statement over the period.

We have already made strong progress in improving both contract and LTSA margins, as you can see from the chart. As our contract margin is a leading indicator for our LTSA margin in time, two lines will converge. Furthermore, our actions will drive further enhancements to both of these margins as we renegotiate more contracts, execute our plans and release contingencies and as we deliver new operational improvements. This will shift both of the lines up further.

Finally, in power generation, we have restructured our business model and are now delivering a double-digit operating margin. Power generation's margin has increased by more than 10x over the last 2 years, resulting in a competitive and significantly improved business model. This improvement was driven by

reducing overhead and product costs, driving better pricing and improved mix as we focused on selling higher-power engines and eliminating lower power ones.

At our CMD, we set out a target of delivering GBP 400 million to GBP 500 million of efficiency and simplification benefits across the group to make us more competitively advantaged, resilient and fit for the future. This target included annualized benefits of GBP 200 million by reducing layers, removing duplication and driving synergies across the group to enable simpler, more agile ways of working. We have already delivered efficiency and simplification benefits of more than GBP 350 million. And by the end of this year, we expect to deliver benefits of more than GBP 500 million 2 years earlier than planned.

At our CMD, we also set out plans to deliver around GBP 1 billion of gross procurement savings over the 5 years to 2027 to help offset the impact of inflation. We have already delivered more than half of this. By the end of this year, we expect to deliver more than GBP 1 billion of gross procurement savings despite a supply chain environment that remains challenging. Significantly improving our cost base means that our commercial improvements and therefore, gross margin increases flow directly to our bottom line. We are also implementing a new global business service strategy, which will improve performance further, better efficiency, effectiveness and experience with a new center opening in Poland and an expansion of our center in India. The benefits of this will progressively scale up.

We are also rolling out zero-based budgeting across the group following successful pilots in civil aerospace. These pilots demonstrated savings of 10% to 15% in third-party costs in identified areas. The benefits of all of these initiatives can be seen in our total cash to gross margin ratio. This has improved from 0.8% in 2022 to 0.47% last year. If you remember, this ratio in 2019 was actually 0.9%. This is a best-in-class ratio providing us with a sustainable competitive advantage. Hopefully, this gives you an insight into not only how we delivered profit and cash improvements so far, but also how these initiatives will drive improved financial outcomes into the future.

Our strategic plan is based around four pillars. We have made significant progress across each of these. I already covered some of our key strategic initiatives and efficiency and simplification. Let me talk about the rest briefly. First, portfolio choices and partnerships. As mentioned, we increased net investment by around GBP 500 million over the last 2 years, focusing on the most profitable projects across the group. In civil aerospace, we successfully tested UltraFan in 2023, and we are further improving the design progressing the development for both narrow and widebody aircraft. We have invested to grow capacity in Derby, Dahlewitz and Singapore which will allow us to increase deliveries of new engines. And by the end of this year, have the capacity to deliver a 50% increase in shop visits as compared to 2023 to support rising aftermarket volumes.

In Power Systems, we successfully tested our next-generation engine. This differentiated technology will improve our access to market segments and will enter service in 2028. We announced the disposals of noncore activities of our portfolio, including our direct air capture assets, naval propulsors & handling business in Defense and the lower power off-highway engine range in Power Systems. We also made the decision to shut down our electric advanced air mobility activities alongside our electrolyser and fuel cell activities.

Next, strategic initiatives. In Civil Aerospace, one of our most important strategic initiatives is time on wing. At the CMD, we set out our target of delivering a 40% increase in time on wing across our modern engines by the end of 2027. We now believe we can achieve double this time on the time on wing improvement within the same period, i.e., by the end of '27. We will have already delivered a significant improvement by the end of this year. Our increased time-on-wing target is driven by new initiatives. For example, on the Trent XWB-84, we use a combination of a compressor blade modification, through the engine in conjunction with improved analysis of millions of hours, operating data to systematically raise the cyclic limit of critical parts. As a result, we now expect shop visits to peak in 2026 before falling in the midterm to below our previous CMD target for 2027.

On Trent 1000, we are in the final stages of the certification of our new HPT blade that will more than double the time on wing of this engine. Flight testing was successfully completed. We have switched our OE production to the new blade already and are aiming for certification in 2Q. We expect to be able to introduce the new HPT blade to all engines across the fleet over the next 2 years, meaning that it will

deliver a near-term benefit. We are also on track to complete further improvements to Trent 1000 and Trent 7000 by the end of this year. That will add another 30% to time on wing.

On the XWB-97, we are doubling the life of the engine in non-benign environments and increasing it by 50% in benign environments. The first phase of improvements, new coatings for the turbine blade and seal segment, has been certified and is performing well. The next phase of improvements is underway and on track to be delivered by the end of 2027.

Finally, lower carbon and digitally enabled business. Rolls-Royce has unique nuclear capabilities, including SMRs, which I will talk to later. In Power Systems, we delivered 500 HVO power generators to the data center sector. Our battery storage system business, which will become profitable in the near term is growing quickly. We expect to deliver contracts with a total of 2,000 megawatts over the next 2 years.

We are capturing the benefits of becoming a more digitally enabled business. We are investing to upgrade our sales and operating planning system and upgrading our engineering mainframe. We are pioneering in new tools and techniques in civil aerospace, including the use of machine learning and advanced imaging technologies to inspect turbine blades. This results in a faster, more consistent process that extends the time on wing of critical engine components.

Turning now to our guidance for 2025. As you have heard, we delivered a lot over the past 3 years and laid strong foundations for the group. Our actions and initiatives set us up for another year of strong delivery this year. Our 2025 guidance will see us delivering our operating profit and free cash flow, CMD commitments 2 years earlier than planned. We expect underlying operating profit of GBP 2.7 billion to GBP 2.9 billion with a year-on-year improvement in operating profit in all core divisions. We expect free cash flow of GBP 2.7 billion to GBP 2.9 billion, primarily driven by higher operating profit alongside continued LTSA balance growth.

In 2025, we expect a GBP 150 million to GBP 200 million impact from the supply chain to free cash flow similar to that phase last year. Helen will take you through this in detail. We are also upgrading our midterm targets based on a 2028 time frame. These upgraded targets reflect the strong improvement in performance over the past 3 years and the potential that we see from the business. A significant portion of the performance improvements to the midterm are underpinned by the investments and the actions that we have already taken. I shared some of them with you earlier. These midterm targets are a milestone, not a destination. As you will hear later, I am confident and excited about our growth prospects beyond the midterm.

We target an operating profit of GBP 3.6 billion to GBP 3.9 billion in the midterm, an improvement of GBP 1.1 billion to GBP 1.4 billion compared to 2024 million. I will talk to you about the drivers of this improvement shortly. Our midterm operating margin target is 15% to 17%. This compares to an operating margin of 13.8% in 2024 as we transform Rolls-Royce into a truly competitive company. Our midterm target for free cash flow is GBP 4.2 billion to GBP 4.5 billion. This compares to GBP 2.4 billion delivered last year.

Stronger free cash flow is mainly driven by operating profit and continued LTSA balance growth. I would like to highlight one important point here. Our strategic initiatives and actions aimed at driving higher LTSA margins and LTSA balance growth. We intentionally do that. Let me explain, given our starting point of a young and growing fleet and the fact that we have a significant time on wing improvement opportunity, you should normally expect continued LTSA balance growth for the foreseeable future. Additionally, our commercial optimization and cost efficiency actions further drive LTSA balance growth. I would like to touch on some of the cash drivers and Helen will talk about cash in detail.

We are capturing more than 50% of new widebody deliveries, which means our installed fleet will grow at 7% to 9% compared to 3% to 5% for the market. These are per year targets, by the way. We are driving higher normalized EFH rate through commercial optimization with a growing cash benefit from contract renegotiations and as new contracts scale up. Our time on wing initiatives mean that shop visits will peak in 2026 before falling through 1,250 to 1,350 range in the midterm. Finally, we expect to deliver an 18% to 21% return on capital in the midterm, highlighting the economic value creation potential of the business. I believe this will be one of the leading returns in the industry.

I will now talk about the key drivers behind our midterm operating and margins. As I said, Helen will talk about the cash. These midterm targets are already significantly underpinned by the actions that we have taken. We expect a continued improvement in operating profit in all three core divisions. The largest improvement will come from civil aerospace where we target an 18% to 20% margin in the midterm.

We see the potential for this business to deliver a higher than 20% margin beyond the midterm. Higher operating profit in Civil will be driven by four factors: Firstly, a further improvement in aftermarket performance with an increase in LTSA margins driven by the six levers. As mentioned, the benefits to LTSA margins and cash flows from new contracts will scale up with a further benefit as we negotiate more new and renewing contracts. I discussed time on wing earlier, which will also be a key contributor to LTSA margin improvements. We now expect to increase the time on wing of our in-production engines by more than 80% by the end of 2027. This will drive a reduction in shop visits in the midterm.

We are also driving down shop visit costs by the midterm Trent XWB-84 shop visit costs will halve versus 2019 with more than a 35% reduction already achieved by the end of last year. And all of our in-production engines, we'll see a shop visit cost reduction during the time frame. Secondly, improved widebody OE profitability. By the midterm, Trent XWB installed engine deliveries will be breakeven or positive thanks to our commercial optimization and cost efficiency actions. We also expect higher profitability on spare engines also reflecting commercial optimization and mix effect. Thirdly, a further increase in business aviation performance with increased volumes as our Pearl engine deliveries ramp up alongside a continued business improvement with both OE and aftermarket growing profitably.

In Business Aviation, we expect to grow by double-digit percentages to the midterm and significantly higher than the market. And fourthly, these benefits will be partly offset by a reduced contribution from contractual margin improvements. As I mentioned, we expect to finish our renegotiations by '26.

In defense, we continue to target a 14% to 16% margin in the midterm. The performance improvement between now and the midterm will be mainly driven by self-help. Higher operating profit will be driven by improved OE and aftermarket performance notably in transport, supported by the commercial optimization actions we have taken over the past 2 years. This is partly offset by the divested earnings. In Power Systems, we now target a 14% to 16% margin in the midterm. Across power systems, more than half of our profit comes from services, notably governmental and marine, but also our gas engines and industrial. This makes our business more robust. We expect strong services growth going forward, which will also support margin improvements to the midterm.

In power generation, we expect revenue growth of 15% to 17% per year compared to around 10% for the market. This is driven by our differentiated products and systems offering and global account management and our disproportionate weighting to data centers. A good portion of data center growth to the midterm is already underpinned by firm orders. In governmental, we see market growth of 5% to 7% to the midterm. Our strong program positions means that we will grow faster than the market with attractive margins.

And in Marine, market growth of 5% to 7%, we expect to grow in line with the market, but a faster rate than we assumed at CMD. We anticipate significant growth in our lower carbon products, particularly battery storage systems where we expect very strong growth over the next for years.

Now I'm going to hand over to Helen.

Helen McCabe
CFO & Director

Thank you, Tufan. Good morning, everyone. I will now take you through our 2024 performance. And then for the midterm, our free cash flow growth and capital frame. So let's start with 2024. Strong results, double-digit growth across revenue, profit and cash flow with the balance sheet continuing to be strengthened? And what's important is that every division is delivering. Key financial highlights, revenues grew by 17% to GBP 17.8 billion, with good end growth across all divisions. Group operating profit grew by over 55% to GBP 2.5 billion, supported by delivery of our strategic initiatives.

Operating margin grew by over 3 percentage points to 13.8%. Free cash flow, it grew by GBP 1.1 billion to GBP 2.4 billion supported by higher operating profit, continued LTSA growth and a working capital release alongside higher net investments. Strong cash flow generation meant that we closed the year with a net cash position of GBP 0.5 billion the first time since 2018 that we have been in a net cash position. Return on capital that rose to 13.8%, driven by improved operating profit and margins. And yes, those strong results have enabled us to declare our first dividend in over 5 years and to announce a GBP 1 billion share buyback, our first in a decade.

Now to the detail by division. I'll start with civil aerospace. Civil delivered the largest year-on-year improvement in profit and cash, record outcomes. Operating profit grew to GBP 1.5 billion, an increase of 79%. Cash flow grew to GBP 2 billion, more than 3x higher than 2023. Operating margins grew to 16.6%, a 5 percentage point increase year-on-year, and revenues grew to GBP 9 billion, an increase of 24%, with strong growth across both OE and services. Indeed, service revenues grew 28%, driven by higher LTSA shop visits and the benefit from our commercial optimization actions. OE deliveries grew by 16% to 529. Of these, 278 were widebody engines, which included 221 installed engines, giving us a wide-body delivery share of more than 60% in 2024.

And spare engines were 57, four higher than the prior year, increasing our operational flexibility and our ability to serve our customers. Business Aviation deliveries grew to 251, 174 of which were Pearl engines, where we see strong and growing demand for this leading engine. And total shop visits grew by 7% to just over 1,300. Of these, 430 were large engine refurbs. That compares to 368 in 2023.

Now to operating profit in more detail. Four key factors drove that 79% increase. First, higher large engine aftermarket profits. This was primarily driven by our six levers to improve LTSA profits alongside higher shop visit volumes and increased time and material profit. Second, stronger business aviation profits across both OE and aftermarket. OE deliveries grew by 28% and were done at higher margins than the prior year. And aftermarket shop visits grew by 13%. Again, done at higher margins. Third, cost efficiencies, our actions supported lower year-on-year and direct costs, this despite continued inflationary pressure. And fourth, contractual margin improvements. Net contractual margin improvements were a benefit of GBP 235 million. This compares to a charge of GBP 54 million in 2023. The GBP 235 million comprised a benefit of GBP 290 million from catch-ups and a GBP 55 million charge against onerous contracts.

We continue to make good progress across both large engine and business aviation contracts. In large engines, we continue to find win-win solutions with customers. As a result, we released further onerous provisions. We also saw benefits from catch-ups across both large engines and business aviation, driven by our actions on life cycle costs and commercial improvements. In total, all of this contributed to a gross benefit at GBP 617 million in the year. However, this benefit was partially offset by additional charges of GBP 382 million taken across both onerous and catch-ups, largely as a result of prolonged supply chain challenges. We continue to manage the supply chain very tightly.

Let me give you just a few examples of what we are doing. Procurement and supplier management teams have been integrated. Teams have been upskilled, have better tools and have better processes. In aerospace, we have secured additional raw material buffer stocks, which we are sharing with suppliers to help them tackle shortages. We are embedding around 250 people across key suppliers to provide additional skills, capability and to drive stronger integrated planning. Agile teams have stood up. Our Trent 1000 task force in place. These bring together people from operations, supply chain, engineering, technology, safety and planning. These changes are driving positive impacts. For example, we increased Trent 1000 supply chain output by around 20% in 2024. We expect the supply chain to remain challenged for the next 12 to 18 months, but it is being managed very tightly.

Let me now turn to cash. Civil delivery [Audio Gap] as we continue to strategically invest in areas such as time on wing, UltraFan, MRO and OE capacity. In summary, a very strong performance from the Civil team, delivering higher profit margins and cash and all while continuing to invest in the future.

Defense, also a strong performance, reflecting the benefits of strategic initiatives, particularly our commercial optimization and cost efficiency actions. Order intake, order book, revenue, profit margins

and cash were all [Audio Gap] percentage point increase year-on-year, a strong improvement when you consider the higher mix from the lower margins in submarines.

Order intake was GBP 13.3 billion with a bit to bill ratio of 2.9x. This was supported by a first-of-its-kind multiyear submarine contract worth GBP 9 billion with the Ministry of Defense. Order backlog at the end of the year was GBP 17.4 billion with an order cover of 90% for 2025. Revenues, they grew to GBP 4.5 billion, an increase of 13%. This was led by submarines, which reported growth of over 50%, while combat and transport were broadly flat.

As I mentioned at half year results, defense revenue growth was boosted by a one-off item associated with the submarine contract. Even excluding this, revenue growth was still 7% for the division. Year-on-year improvement in operating profit was driven by three key factors. First, strong aftermarket profit led by transport, reflecting a more favorable mix, including more spare parts sales and improved pricing. Second, strong submarine growth, reflecting the ramp-up of programs such as AUKUS. Third, cost efficiencies, including an increase in customer-funded R&D as we ramp up on projects such as FLRAA, GCAP, B-52 and AUKUS. And these benefits were partially offset by the impact from lower OE volumes due to supply chain constraints.

Defense's cash flow increased to GBP 591 million. Cash delivery was driven by operating profit and a disciplined approach to working capital. So a strong year, higher profits, margins and cash and [Audio Gap] and critical contract wins that underpin strong profit growth in Power Gen, where our restructuring of the business has led to double-digit operating margins. Operating profit grew to GBP 560 million, a 40% increase year-on-year. Operating margins grew to 13.1%, a 2.7 percentage point increase. Order intake grew to GBP 5.1 billion, a 19% increase with a book-to-bill ratio of 1.2x. OE order coverage for 2025 stands at 82%. Demand remains particularly strong in Power Gen where we have strong exposure to the fast-growing data center market, leading to a 42% increase in orders. In governmental, our order intake was also up by a third year-on-year.

Revenues grew to GBP 4.3 billion, an increase of 11%. Power Gen and governmental delivered increases of 25% and 17%, respectively. Data center revenue growth was 46%. You will see on this slide that industrial revenues were 20% lower year-on-year. This was largely due to the disposal of the low power range off highway business.

Operating profit growth was driven by three factors: commercial optimization. We continue to see the benefits from our pricing actions. This was particularly evident in power generation, which also benefited from an improved mix as we focused on larger, higher-margin products. Battery energy storage systems, where we continue to see strong opportunity and where we're on track towards profitability in the near term and cost efficiencies, what our actions helped mitigate the impact of inflation.

Trading cash flow it stood at GBP 452 million. That compares to GBP 461 million in 2023. This slight decrease reflected strong operating profit growth, record levels of investment. For example, in our next-generation engine, which will offer best-in-class fuel efficiency and power density and higher working capital as we support continued business growth to wrap a strong outcome for power systems across all key metrics.

Now let's move to the cash flow. We delivered GBP 2.4 billion of free cash flow, more than GBP 1.1 billion higher than in 2023. The main driver of the year-on-year increase was higher operating profit, which grew by approximately GBP 900 million. Other factors included investments. We continue to invest for future growth across the group with a clear focus on investments that are strategically aligned, attractive projects that generate profitable growth to the midterm and beyond. These include our GBP 1 billion multiyear time on wing program, additional capacity in Derby, Dahlewitz, and Singapore to support higher OE and aftermarket volumes, continued investments in Power Systems and Defense, investments in our engineering mainframe and in our sales and operation planning processes.

As a result, net investments were GBP 280 million of an outflow that is GBP 360 million higher than in 2023. The net LTSA balance, that was just below the lower end of the guided range, standing at approximately GBP 700 million at year-end. Around GBP 400 million lower than in 2023. The net LTSA balance was driven by higher engine flying hours and an improved normalized engine flying hour rates.

This was partially offset by a higher number of shop visits, including a record number of Trent 1000 refurbishments and the impact of managing through supply chain headwinds.

Then working capital, as you know, this is one of our key priorities at CMD, and we continue to make good progress. We released around GBP 280 million of working capital in the period. That compares to a build of GBP 360 million in 2023. A strong performance given industry-wide supply chain challenges and while we supported revenue growth. We are driving a much stronger working capital culture and discipline across the group. In the 2 years since we stood up our working capital program, inventory days have improved by more than 45 days, days sales outstanding by 14 and overdue debt has fallen by more than 40%.

Next, provisions. They were an outflow of GBP 170 million, this included outflows as we traded through our onerous contract provisions. There were about GBP 100 million lower than in 2023. Then overhedge costs, as guided they were around GBP 150 million, more than GBP 200 million lower than in 2023. Net interest costs they were broadly neutral, an improvement of GBP 145 million year-on-year, driven by improved cash delivery. And finally, cash tax costs. They stood at GBP 380 million, GBP 200 million higher than in 2023.

Tufan shared our free cash flow outlook for 2025. Let me give you some additional data to help with your models. We expect the net LTSA balance growth to be at the lower end of the guided range of GBP 0.8 billion to GBP 1.2 billion. This reflects continued growth in large engine flying hours to 110% to 115% of 2019 levels. And a higher normalized engine flying hour rate as well as the impact from higher shop visits, which grew to between 1,400 to 1,500 and the continued impact from the supply chain environment.

We expect net interest costs to remain broadly neutral. And then the cash tax cost of unwinding the overhedge position to be similar at GBP 148 million. And cash tax costs to be around GBP 200 million higher. Resilience, we have been consistently clear that a key priority is to make our business more resilient. Our results today demonstrate that we are delivering. Operating leverage continues to fall. We continue to strengthen the balance sheet, returns continue to improve.

Tufan shared how our total cash cost to gross margin ratio is now a best-in-class, and there is more we want to do. The balance sheet has been strengthened. Look at the chart in the middle. We reduced net debt by GBP 2.4 billion in the year to end 2024 with a net cash position of GBP 0.5 billion. In May, we reduced gross leverage by repaying a EUR 550 million bond, and we canceled the last remaining undrawn UKEF supported loan. Our liquidity position also remains strong, standing at GBP 8.1 billion at year-end. And as you've heard, all three credit rating agencies now rate us at investment grade and all three hold us on a positive outlook.

The chart on the right brings home our improved resilience. We're in 2019 for the first bar. It represents the percentage decline in large engine flying hour receipts, but would have taken the group to a cash flow breakeven position. Now look at the right-hand bar, which shows the equivalent percentage in 2024. Across the group, we could have weathered a much steeper decline in engine flying hour receipts, almost twice the level of 2019, twice the level. And we would still have achieved cash breakeven. We are building foundations that are much, much stronger. We are a much more resilient business.

Now moving to the midterm free cash flow, which as a reminder, we hold at a 2028 time frame. We are driving for sustainable, higher quality cash flow growth as we continue to improve the business model and benefit from the actions already put in play. We are targeting between GBP 4.2 billion and GBP 4.5 billion of free cash flow, a growth of around GBP 2 billion compared to 2024. The main elements of this growth are operating profit, growth of between GBP 1.1 billion and GBP 1.4 billion over the period is key. We achieved that by continuing to strategically and sustainably expand the earnings potential of the business with every division delivering.

LTSA, by the midterm, we expect the net Civil LTSA balance to grow towards the top end of the GBP 0.8 billion to GBP 1.2 billion range. We will drive LTSA growth through five important factors: one, continued engine growth in engine flying hours driven primarily by our growing installed fleet as we continue to grow faster than the market. We expect large engine flying hours to grow to between 130% to 140% of 2019 levels by the midterm.

And Business Aviation where we hold a material and growing market share and where the time between shop visits is longer, driving LTSA balance growth. Two, a higher average normalized engine flying hour rate. You have heard how a significant amount of work has been done to improve our LTSA contracts and how most of the cash benefit is still to come. Three, time on wing, which helps extend the time between shop visits, so also supporting LTSA balance growth. We've shared how the opportunity is significant and how we're going even further than initially planned. And again, most of the benefit is still to come.

As a result, we expect shop visits to peak in 2026 and then fall to around 1,250 to 1,350 by the midterm. Four, we expect in advance of the midterm, the cash drag from the supply chain to be gone. And five, currency.

The consumption of our legacy hedge book means our midterm guidance assumes a blended ForEx rate of \$1.31 to the pound compared to \$1.48 in 2024. This will drive a higher sterling equivalent for the dollar-based inflows.

Next, investments. Our approach will continue to be disciplined with spend, always prioritizing safety and strategic growth. Looking across the period, we expect CapEx and R&D to average above depreciation and amortization.

Working capital. As group revenues continue to grow, this will naturally result in an increase in working capital. Our working capital program will help mitigate this impact. As shared at CMD, we had a gross working capital reduction target of around GBP 2 billion by 2027. We have plans to go further. Taking all of this together, hold that across the period, we expect to release working capital.

Then the cash cost of closing out overhedge positions, which were a drag of GBP 146 million in 2024 will be going by 2027. And as our profits grow, cash tax payments will naturally increase. Whilst we expect cash to grow in all years between now and the midterm, it is important to note, it will not necessarily always be linear due, for example, to the timing and mix of shop visits.

Capital frame. Our frame will continue to focus on striking a balance between 3 clear priorities: a strong balance sheet, a commitment to regular and growing dividends and a disciplined approach to further investments and to additional shareholder distributions.

First, the balance sheet, which we have worked hard to rebuild. We are now in a modest net cash position, which is not uncommon in our industry and a sensible place for us to operate from, especially in the near term. Gross debt, we will reduce it further, repaying from available cash the \$1 billion bond, which matures in 2025. These measures along with strong operational execution and earnings and cash flow growth should help us achieve a strong investment-grade rating. We have made good progress building balance sheet resilience. And as we continue through transformation, we will remain prudent in our approach to leverage and we will maintain robust liquidity levels.

Then distributions, having strengthened the balance sheet, we are now able to reward our shareholders with a competitive level of returns. As shared at our 2024 half year results, we are reinstating regular shareholder dividends. And we are pleased to announce that the Board is recommending a cash dividend of 6p per share in respect to the full year 2024, representing a payout ratio of 30% of underlying profit after tax, the first dividend paid by Rolls-Royce in over 5 years, and the distribution to shareholders of approximately GBP 500 million.

Going forward, we will pay an interim and a final cash dividend each year. And full year dividends will be based on a payout ratio of between 30% to 40% of underlying profit after tax. We assume an effective tax rate in the mid-20% range. Over the midterm, we expect to be broadly in the middle of that 30% to 40% payout ratio, a competitive payout ratio for our industry and as our earnings grow, so, too, will our distributions.

Another important milestone in our transformation. We are announcing a share buyback. It will total GBP 1 billion, will start immediately and will complete over the remainder of 2025. Taken together with the dividend, this represents a total distribution to shareholders of GBP 1.5 billion, competitive and evidence of our commitment to growing shareholder returns.

Going forward, we will continue to strike a balance of holding a strong and flexible balance sheet as we make active and disciplined capital allocation decisions to drive shareholder value, be they further investments, organic or inorganic or additional shareholder distributions, all of which will be assessed by strategic fit and how they contribute to growing long-term value.

To close, when we spoke at Capital Markets Day in 2023, I said transformation was not easy, but that it could be done. Our results today clearly demonstrate not only that it can be done, but that we are doing it. Everyone in Rolls-Royce has worked immensely hard. It's most definitely been busy. We are immensely proud of everything that everyone has done. And we are clear there is more to do, and there is more to come.

With that, let me pass you back to Tufan.

M. Tufan Erginbilgic

CEO & Executive Director

Okay. There is definitely more to do and more to come. And I'm going to go to that. But before I go to that, let me recap. Thanks, Helen.

We covered a lot of ground. So let me recap on the key messages. Our transformation program has already delivered a step change in financial performance across the group. We have given you insights into what we are doing and how we are achieving this. The strategic actions we have taken and the investments we have made significantly underpin our '25 guidance and upgraded midterm targets. In fact, the full benefits of our actions will not be realized in full until beyond the midterm.

Let me now talk to you about why we are excited about the outlook beyond the midterm. In Civil Aerospace, we are uniquely positioned to capitalize on our advantaged positions in widebody and business aviation. As discussed earlier, the benefits of our OE and aftermarket contract renegotiations and commercial optimization actions on new and renewing contracts are progressively scaling up with the full benefits to come beyond midterm. As contracts with higher margin scale-up, we expect to deliver further progress in improving LTSA margin and cash generation.

The same is true for time on wing. We are spending GBP 1 billion on improving the time on wing of our modern engines by the end of 2027. Not only will this investment be concluded by that point, but the cash benefits of our time on wing improvements will ramp up beyond the midterm.

UltraFan positions us strongly for the next generation of aircraft, either wide or narrowbody. UltraFan is 10% more efficient than the Trent XWB-84, the most efficient engine in the market. It has a geared architecture and is 100% SAF, sustainable aviation fuels compatible.

In business aviation, we are strongly positioned on the latest large cabin business jets, including the G700, G800 and the Dassault Falcon 10X. All of these improvements in Civil Aerospace are complemented by widebody and business aviation growing faster than the market.

In Defence, the growth will be driven by a ramp-up of several major programs. On the B-52, we expect to deliver around 600 engines with production starting in the late 2020s. On FLRAA, all year revenues will also start to ramp up in the late 2020s. As a replacement for the Black Hawk helicopter, this looks set to be a very large program with potential for significant export sales in addition to the sales to U.S. Army.

Production for GCAP a next-generation combat aircraft, will be ramping up in the mid 2035 -- mid '30s actually. And in submarines, revenues from AUKUS will ramp up by around 50% from today to the late 2020s. This is a CapEx light business model with a very high return on capital.

Rolls-Royce looks forward to powering the U.S. Navy's MQ-25, the first autonomous refueler in aviation history. This aircraft will use the AE 3007N engine and expands Rolls-Royce leadership in unmanned propulsion.

In addition, we have -- we anticipate sustained demand for our mature and profitable products in both combat and transport. For example, the EJ200 engine for Eurofighter.

Our strong product offering means that we are well placed to win future contracts. Great examples of this are the SAOC and TACAMO contracts that we announced last year.

In Power Systems, we have differentiated products in power generation, governmental, marine and industrial end markets. They are all expected to grow. Our position in Power Generation remains highly attractive with significant long-term growth potential in data centers. Additional profitable growth will be underpinned by our next-generation engine in Power Systems, the first new engine in over 2 decades, which will offer significantly improved power density and efficiency. This differentiated product will create commercial opportunities and new market segment access.

We also see exciting opportunities in our low carbon -- lower carbon products, notably profitable growth from battery storage system business and for lower carbon fuel products, for example, hydrogen for our stationary business, methanol for marine and the increased use of HVO for data centers, mining and rail.

Our unique nuclear capability also means that we are well placed to capture growing demand for SMRs. We see a significant market opportunity for micro reactors in defense, space and commercial applications. Finally, we see a significant value creation opportunity in SMRs, which I will talk to now.

We are uniquely placed to win in this large and growing market and create significant value. Let me explain why. Rolls-Royce SMR is a business with a unique and differentiated product offering and an attractive cash-generative business model. The addressable market for SMRs is large and growing quickly.

The International Energy Agency, IEA, currently forecast that global electricity generation will double by 2050. Nuclear has a growing role to play from an energy supply security and net zero perspective as other continuous generative assets are phased out. Based on IEA's estimates, we see a credible SMR market of almost 200 gigawatts by 2050, equivalent to around 400 of our 470 megawatts SMRs.

We are well positioned to win in this market. Rolls-Royce has over 60 years' experience in powering the U.K. Royal Navy's fleet of nuclear submarines. Our SMRs are based on proven technologies. Our SMRs are fully modularized, reducing deployment time and offering up new locations without customized infrastructure needs, which will reduce costs and speed up our time to market. Around 80% of our SMR will be built in factories as opposed to on-site, materially reducing the risks associated with traditional nuclear projects. The larger power output will result in green electricity at a highly competitive cost without the intermediancy issues associated with solar and wind. Therefore, they don't require storage or backup systems. Finally, we are around 18 months ahead of our competitors in the GDA regulatory process in the U.K.

Rolls-Royce SMR is already winning and making significant progress. Last year, we signed this new strategic partnership with CEZ to deploy up to 6 SMRs in the Czech Republic. We were also down selected in both the U.K. and Sweden's competition. Additionally, we have significant interest from many other countries.

Our cash-generative business model is very attractive with positive OE margins from the very first unit rising over time, driven by economies of scale and the learning curve effect. Our SMR contracts will also be immediately cash flow generative because of customer advance payments as shown on the chart on the right. More than 80% of the components that make up our SMRs will be delivered by third-party suppliers. This will materially reduce our capital intensity and mitigate risks. As a result, we expect to generate a strong double-digit return on capital from SMRs.

Risks, also be tightly controlled using tried and tested technology towards R&D, reduces risk and increases speed to market. Our financial risks are shared by our strategic partners and suppliers, each of whom bring key strengths and capabilities to the business. For example, CEZ, who has experience as a nuclear operator and brings deep supply chain capability. And our initial contracts will have margin protection built into them using, for example, cost-plus contracts.

So this is a differentiated business and one that we believe has a significantly higher value than it is listed or unlisted peers. The value of the business will grow materially from now as we successfully execute and deliver growing revenues, profit and cash flows.

To summarize, we are delivering on our proposition to transform Rolls-Royce into a high-performing, competitive, resilient and growing business. We have achieved a lot over the past 2 years with significantly improved financial performance across the group driven by our strategic initiatives despite the impact of a challenging supply chain environment.

We are delivering this at pace. Our 2025 guidance will see us delivering our CMD targets 2 years earlier than planned. Today, we also issued new upgraded midterm guidance, benefiting from our expanded earnings and cash potential. Our strong delivery over the past 2 years gives us confidence that we can, not only achieve our midterm targets, but also significantly beyond the midterm -- significantly grow beyond the midterm. This growth is underpinned by our strategic initiatives and the investments that we have been making over the past 2 years and their continued implementation going forward.

A stronger balance sheet also gives us confidence to reinstate dividends and announce a GBP 1 billion share buyback for 2025. These also all show our commitment to grow shareholder returns.

We have made great progress, and we see a lot more potential. We are creating a sustainably distinctive business in terms of safety, operational excellence, customer service, advantage products and technologies with a high-performance culture.

I am very proud of the Rolls-Royce team and what we've delivered so far. They know their role in delivering our strategic progress and are energized to make a difference. Thank you for listening. Now we are going to open it up for your questions.

Question and Answer

Jeremy Bragg

Thanks very much everybody. We'll take questions in the room, and then if there's time, a few on the webcast. So you are quick, Charles. Do you want to start?

Charles J Armitage

Citigroup Inc., Research Division

Charles Armitage. One clarification and a couple of questions. The first, a clarification. I think you said amongst your key drivers of the improvement, pretty much in the first 3 minutes of your comments, there was something about T&M and moving LTSAs to T&M. Is that -- what does that mean?

The other two questions. One is the Trent 1000 time on wing improvements. Does that mean you can start regaining share? Or is it a case of most of the widebody choices have already been made and you'll probably be taking along in the 20%, 30% range?

And the thirty-one is the GBP 450 million improvements from procurements from '24 to '25 million, GBP 150 million in indirect, that GBP 600 million possibly offset by some of the catch-ups maybe, also with the contract provisions, onerous contract provisions. It sounds like your '24 -- your '25 EBIT looks a bit low.

M. Tufan Erginbilgic

CEO & Executive Director

Sorry. Are you talking about cost improvements?

Charles J Armitage

Citigroup Inc., Research Division

Your setting fact on the cost.

M. Tufan Erginbilgic

CEO & Executive Director

Yes, I'll come to that. Okay. Let's go in the order. I think clarification. What I said is, I think in CMD, we talked about that. We have been unbundling LLPs because it gives you more flexibility with commercial optimization and so on. So I said in my speech that 60% of our contracts are now unbundled. That's what I said, okay?

Trent 1000, yes, that's what that means. Frankly, we are -- I said it in my speech, we are making good progress. By the end of this year, this is going to be totally competitive engine in terms of time on wing. And the main issue with Trent 1000, I know this precedes my time definitely, there are lots of noises about this. Reliability of this engine is as good as the next. Our main issue has been time on wing. And we are effectively fixing it for good and we know it works. I mean flight test was successful, but it wasn't a surprise because Trent 7000, we actually did it. Now Trent 7000 is performing, last 2 years, better than we expected. As you know, they are brother sort of engines.

So we are seeing doubling the time, but actually Trent 7000 so far, even in an environment like Kuwait, performing brilliantly. So -- and this [Bumbly,] we call it [Bumbly,] first improvement will bring in 2Q once the certification happens. Actually, that will double the time on wing. Then the next improvement by the end of the year will come with 30%. The good news is this required flight test and therefore, Boeing -- working with Boeing and FAA certification, et cetera. The other one is only engine-level certification, we can quickly implement it. Yes, we are looking to increase the share on 787. Why not? Because this is going to be a highly competitive product. That's why we focused on that.

Your sort of calculation, I will challenge that a little bit because you cannot add them up that way because there are -- we are, for example, procurement. We are seeing those things will offset, partially offset some of the supply chain increases, number one. Number two, while we are decreasing indirect cost, as

you highlighted, we are growing, we are increasing other costs, okay? So therefore, you need -- these benefits help gross margin flows through, but you generate them up the way you just did. So it is not a catch-up or onerous contract issue because as we talked about in our conversation, we still expect good sort of onerous and catch-up in '25 and '26. We are making great progress after '26, they go -- especially onerous, go down.

Catch-up will definitely not disappear because as we continue -- the way you should hold catch-ups is underlying business improvement. Actually, onerous contracts is also underlying business improvement by definition. But therefore, we continue to improve the business. Catch-ups will continue to be there.

You raised actually first your hand, but Jeremy went there. So I let that happen. So I don't want to be unfair.

Chloe Lemarie

Jefferies LLC, Research Division

Chloe Lemarie from Jefferies. I actually have two questions. The first one is on the contract margin improvement from 2022 to 2028. Could you maybe break down the 17 points between what you got on pricing versus cost versus time on wing improvement? And is it fair to assume that the improvement beyond 2028 would be mainly the remainder of the time on wing benefits that you're targeted by 2028?

And the second question is actually, if we can -- on the narrowbodies. So can you detail the key technologies that you bring to a potential partner because we're seeing the 2 incumbents going very different routes technology-wise. So how do you think you would fit into that landscape, please?

M. Tufan Erginbilgic

CEO & Executive Director

Okay. Two good questions. I think contract, let's talk about. I'm not going to break it down for you. That's why we talk about 6 levers, but they all play the role. So if you ask me, what are the big ones, you, specifically, you're talking about contract margin. So contract margin, it is very true that new contracts are coming with a much better margin profile than our historical contracts, okay?

Contract margin, even if, as I said in my speech, even if the engine is not delivered yet, once you sign the contract, it becomes contract margin, if you like. Therefore, even some undelivered engines in that with higher margins. Definitely, the further you go, that mix will change in favor of us because all contracts will expire, new contracts with higher margins, that will continue definitely. That plays a big role. Renegotiate contracts play a big role. I showed you the cash profile. We are talking about multibillion sort of numbers there.

Those two and then time on wing, probably three big things like shop visit cost in this period, XW went down, but actually, in the next period, shop visit reductions will add more than it did in this period, okay? That's how you may -- why, you will say. Supply chain didn't allow us to do some of the things there, okay? Product costs, the same. Next period will be better than this period.

So your point around going forward, I would disagree with your characterization. So let me tell you how it is going to play out. So that's why I said my expectation, those 2 curves will shift up. Why? So first of all, if you actually -- we said we are going to renegotiate more contracts in '25% '26, that's not in the numbers because this is only what we achieved throughout there than what we may achieve, if you like. So those things, we are making good progress. That will actually increase that. Operational improvements will definitely improve that.

But also, even if you deliver your plan. So the way you think about our contracts. Inherently, you say, I'm going to achieve time on wing X, like I will double time on wing on Trent 1000. You put a contingency against that because it's not 100% certainty that you will. If you effectively execute that, which we have been doing so far, you actually release the contingency. So even executing your plan on time in budget will improve those things. Therefore, 3 things will improve, further renegotiations, executing your plans the way you want to execute and then finding new operational improvements. And time on wing going from 40% to 80% is enormous. This is not sort of peanut. So that's it.

If I go to your narrowbody, so I will say this. We are very well positioned on narrowbody. Therefore, everybody is talking to us and we are talking to everybody. So I said it in CMD, our preference is partnership. We don't need partnership for capability, but our preference is that. So we will see where that goes. It's early days, but we have -- with UltraFan, great technologies, that's why everybody is talking to us, and great engineering capability in general are there, and UltraFan is more efficient engine, as I said, than any other engine available in the market at this point in time. And the IPs we have on that on a geared structure is very favorable. Let me put it that way.

So I think we will see how that story unfolds. But we believe we can actually do things in that space.

David, you were third.

David Howard Perry

JPMorgan Chase & Co, Research Division

Yes. I've got one very short question, one slightly longer. The short one is, would it be silly just to assume ongoing share buybacks every year given the amount of cash you're going to generate?

The longer question, if you bear with me, is you've told us that the Civil Aero margin in '28 will be 18 to 20. You've also told us that the bulk of the widebody OE, your biggest engine, is going to be breakeven, which is a lot better than I assume. Very crudely, the implication of that is LTSA margins are probably still only 30% in 2028, which is a lot lower than the aftermarket margins of your peers. So would you agree with my crude math? Apologies if I'm wrong. If you do agree, why are the LTSA margins so low and where could they go to?

M. Tufan Erginbilgic

CEO & Executive Director

Okay. I'm going to ask Helen answer buyback program. Let me answer your sort of operating margin question. So I think, first of all, I didn't say all engines because we still have, at that point, we want to sell Trent 1000 and A380 -- sorry, A330neo obviously. I was only referring to XWB, which is factually correct.

Second, I think when you think about sort of your calculation, David, especially from today to that point. Today, we were very successful with negotiations. Therefore, we were able to book, yes, some of it, as Helen talked about, because of product cost and supply chain challenges partially offset but we were able to deliver big commercial improvements. That will not be available by midterm because we will have done that already. So onerous contracts and so on, we will have delivered by that time, frankly. So I think that is going to be for 20 time frame, that will be a negative definitely in the equation.

Do you want to answer buyback?

Helen McCabe

CFO & Director

Thanks. Thanks, David. So David, hold it, we had a clear capital frame. And as we've said, going forward, we will be consistent as how we strike that balance between our priorities. We've been consistently clear we will protect the balance sheet with a net cash position and modest net cash position. We're comfortable operating from there, particularly in the near term, not an unusual place, as I said, for the industry. Then we'll ensure that shareholder dividends are regular. They will continue to grow in line with our earnings growth. And then we will continue to assess the options beyond that, be it additional investments, organic, inorganic or additional distributions and buybacks are in that tool kit. But we will be very disciplined as to how we assess that. We will look at the strategic fit. We will look at what we do for shareholder value and return and we'll look at the appropriateness of the timing of that. So that's how you should hold that going forward.

M. Tufan Erginbilgic

CEO & Executive Director

Go ahead.

Unknown Analyst

Two for me. So firstly, Tufan, time on wing, going from 40% to 80% is obviously a very, very significant improvement. You've been talking about 40%. Come on, how are you getting there? What is really incremental that is driving that material improvement because it is significant?

And then on your 2028 guide, your cash is still significantly ahead of your profit. So when we think about your guidance beyond the midterm, you've given us some color. Is that cash going to roll and meet the profitability? Or is the profitability going to come up as the cash flow will continue to grind higher? Because at some point, there's going to have to be a realignment there. So those were the two.

M. Tufan Erginbilgic

CEO & Executive Director

That's great. So normally, I pass to Helen. I'm going to make, on the second one, one big point because I think you may want to think about this slightly differently. I'm going to make an offer to you. Then Helen will obviously build on it.

Helen McCabe

CFO & Director

I don't know what's coming.

M. Tufan Erginbilgic

CEO & Executive Director

So full of surprises, life, I guess. But time on wing, there is the direct answer, which I will come to. Then there is this sort of how does that happen, right? Here is how that happens. So effectively, that's an insight into how we run the business. I keep saying we are running the business differently. I'm not sure it resonates yet. But this is part of that.

So Rolls-Royce has been talking about time on wing, I don't know how long, definitely precedes my time. But when you actually put, okay, we are not going to talk about it. We have made strategic choices. Now, a very granular strategy, that cascades into 17 strategic programs, whole company. If you are working for Rolls-Royce, you are working one of those programs. So you know your role, right? By resourcing, time on wing is one of them. You wouldn't be surprised. By resourcing with the right talent, right money, suddenly you accelerate and more stuff comes out. So I can repeat this. So this is an insight to you, how we run the company.

There's a direct answer to you. This is mainly -- I actually referred to that in my speech. This is mainly -- other programs out there, we have been talking about. But mainly, it's XWB-84. XWB-84, effectively, what we did there is it's a conjunction -- combination of two things. We actually do a modification on compressor blade. We are hardening the root of the blade effectively. That's what we are doing there.

In addition to that, this is millions of hours of operating data with higher fidelity understanding of speed pressure and temperature within an engine with a highly instrumented sort of testing. So normally, we do our LLPs, when I say critical parts, some of critical LLPs there, okay? We do it different than our competition. Our competition goes with long times, a lot longer than we put on LLPs. We go, here is the limit, and only when we understand operational with high fidelity, we sort of raised the limit, right?

So now on XWB, we had a great time on wing, mostly driven by HPT blade right? Our time on wing limitations mostly come from HPT blade, so think that way. But the issue was, so HPT blade goes from here to here, more than 4,000 cycle, actually, which is for the new engines, enormous. We had LLPs cannot grow that long. So when you actually take those LLPs up because of the process I talked about, suddenly, you have enormous and actually refurb reduction in this time frame. We talk about after '26. That's a combination of two things. Effectively refurb reduction in 84 because of this because it is refurb because we are changing many parts. It is refurb. Combination of that and Trent 1000 blade change, not required with nonrefurbs. So you see both of them go down, and that actually drives total shop visit costs done.

I hope -- long answer, but I wanted to sort of give you -- this is not some [indiscernible] sort of thing. But we may find more opportunities. I just -- therefore, I went through that.

But on the cash, obviously, Helen will answer it. But I would like to you, guys -- here is the offer, to think about LTSA balance growth slightly differently, okay, for us. We have a young growing fleet. And we have big time on wing improvement opportunity. If our starting point was, everything is brilliant, time on wing, this 80% is not there, then I think you may be right. When does it actually end. But our starting point is -- I'm telling you almost doubling time on wing, and you are in this industry, right, you will know what that means for the whole modern engines, right? That, plus all our programs do two things: increase the [indiscernible] effectively balance, LTSA balance and increase our take on it, our margin. That is what it is designed for effectively. Cost efficiencies, our 6 levers, plus everything else we do, renegotiating all that.

So effectively, when you guys continue to think, I think this LTSA balance growth sort of temporary, think again because of our starting position and because of what we do for -- I'll tell you this, our Trent 700 LTSA balance didn't peak yet after 30 years. And you will say, "Why, Tufan?" I will say, you keep improving it, right?

So now, Helen will answer.

Helen McCabe
CFO & Director

I got what left to say?

M. Tufan Erginbilgic
CEO & Executive Director

But I want you to think very differently about LTSA balance. That's why I said it because some people think, it's not cash. It is. Why am I driving it if it is not? And the important thing is that I'm driving it, I'm increasing my portion significantly, 20 percentage points. We are not done.

Helen McCabe
CFO & Director

I think I'm just going to summarize. So I mean if you think about cash in 2028, so around GBP 2 billion higher than in 2024, think of 5 things behind that. Operating profit growth, obviously, of over GBP 1 billion. LTSA gets to the top end of that range because of their actions. Supply chain, that drag has gone away. Onerous, we heard in 2026, how we've been through most of the onerous contracts. So as you know, when we do that, you get the profit benefit, the cash takes a longer time to come through. And then tax, obviously, we expect to grow.

That LTSA growth, as you've heard, because of our position in that young growing widebody fleet, what we're doing around LTSA margins, what we're doing on time on wing, up to 2020, there is some ForEx benefit. All of that helps support. And I think your example of the Trent 700 is a fantastic way to bring that to life, an engine that's been in service for 30 years.

M. Tufan Erginbilgic
CEO & Executive Director

1994.

Helen McCabe
CFO & Director

Yes, and we haven't seen that LTSA balance peak yet. So I think that's just an easy example to bring that to life. But that's how you should hold it going forward. Yes.

M. Tufan Erginbilgic
CEO & Executive Director

Yes. Then I'll go there.

Unknown Analyst

13 years of [indiscernible], so still I haven't got used to these market events. Trent 1000 certification is now expected in Q2 versus Q1 before. Could you help us understand what the slip there is?

M. Tufan Erginbilgic

CEO & Executive Director

I mean it's very simple. Boeing start 2 months, that delayed around 2 months.

Unknown Analyst

Okay. I'll follow up on that.

M. Tufan Erginbilgic

CEO & Executive Director

No. I mean it is because it is a successful test. And there isn't anything else yet. So we said it first half, 1Q, then frankly, Boeing's strike sort of happened. And we couldn't continue with the flight test. So we start -- if you remember, I think I said it early August when we were making presentation, we started flight test yesterday or something I said, which was true. But then we had to stop when the strike happened.

Unknown Analyst

Just a follow-up on David's question earlier. Do you have a target capital structure in mind, a certain gearing ratio that you're in before? You mentioned something at H1 last year and then we haven't heard that again.

And then last question. There was one slide, Tufan, late in your presentation where you -- if I read that chart as correct, you suggest that SMR will be as big or larger than Defence in 2040, can I just sense check that as a statement?

M. Tufan Erginbilgic

CEO & Executive Director

Okay. So I'll answer that and your capital frame question, Helen will answer. But so it can be, right? I mean, it can be. If you actually think about it, the reality is, I always start with big picture. Does that actually make sense, right? Whether you are a supply security person or net zero person, SMRs will have to play a big role, definitely in Europe if not the world, but definitely in Europe. Therefore, quite a few Central European countries went there already, as you know. And some of the Scandinavian countries as well.

So I think that big picture is true. I mean I come from energy industry. I can tell you this -- you don't want to go to net zero with solar and wind because it will be -- with the energy storage technology in the world available, that will be a disaster solution for any country goes there with solar and wind if -- with the current technology, unless you put a gas-powered backup system, which will be a lot more expensive than SMR, right? So when I say, SMR, big picture, it makes sense. It is a competitive electricity.

If you take into account, you are going to do like gas with CCUS, then SMR will be cheaper. Electricity cost, I'm talking about. All solar and wind with a backup system, again, SMR will be cheaper. So therefore, big picture, it makes sense. Competitively, it makes sense. Therefore, it can grow quickly, absolutely.

So I'm not going to speculate sort of -- because those numbers -- the point of that chart, there is lots of underpinning. They are not as robust numbers as our midterm targets, by the way. So there is a qualification there in that sense.

But over to you.

Helen McCabe

CFO & Director

Fantastic. So thanks for the question, [Ian,] and you do have a good memory, as I've come to expect from you. So net cash. As I said, we're comfortable working from that net cash position, particularly in the near term. We're back to investment-grade rating. We would like to actually get to a strong investment-grade rating. So if you think about what that equates to, it would be commensurate with the leverage of up to 1% and 1.5%. So we could go up to that point. But we would obviously be very deliberate if we did that. It would need to be for the right opportunity, which we would assess against our very strict criteria around strategic fit and how that drives shareholder value. And I think just worth saying, in case it was in the back of your mind, we don't have any intent of leveraging up for buybacks.

M. Tufan Erginbilgic
CEO & Executive Director

Thanks, Helen. Yes?

Nick Cunningham
Agency Partners LLP

Nick Cunningham from Agency Partners. A little bit of a detailed one and then perhaps a very general one. The supply chain charges that you took, I think, GBP 382 million in Civil. I just wonder what exactly those are. Are they your best guess of the impact on the cost to complete on the existing contract portfolio? And therefore, do they not recur? Or are they sort of in-year cost? So that's the first question.

And the second much more general one. The cash flow, both in the year you just reported and looking forward, it's very pleasing, particularly because I didn't actually believe my own forecast, but they are roughly there. That does have the effect of making cash pile up very rapidly and in very substantial quantities. So that really obviously opens up those strategic opportunities. In the broader sense, because obviously you don't want to open too much, but in the broader sense, where do those opportunities lie in sort of general within your existing segments or in nuclear or whatever? Anything you can say would be interesting.

M. Tufan Erginbilgic
CEO & Executive Director

So Helen, do you want to pick up both of them? And I may add sort of where I see in the big picture opportunities bit.

Helen McCabe
CFO & Director

Fantastic. So thanks, Nick. So as you see, charging the supply chain of just under [GBP 400 million,] that reflects our best estimate based on supply chain situation at the minute. The way that long-term contract accounting works, if you've got onerous contracts, then that impact that you see, you've actually take all and year. So that's how you should think about that. In relation to what's driving that, I mean, it's very consistent with what we spoke about in the past, particularly parts supply availability, casting, forging. As we said, we expect the supply chain to remain a challenge for the next 12 to 18 months. But that's how you should hold it. That's our best view at the minute.

In relation to cash flow, and you said that pileup. I think it gets back to some of the questions earlier. We've got a clear capital frame as to how we all think about decisions, about what we do with the cash balances and how we strike that balance between the strong balance sheet. You've heard how we want to get to strong investment-grade rating. We've got a clear dividend policy. We started at 30%. We expect to be in the middle of that range going forward. Not only is that an increase, but as our earnings grow, if you're doing a payout ratio, the dividend will also grow as a result of that. And then we've got clear guide rails as to how we will assess opportunities, organic, inorganic, which I think Tufan wants to speak about, or additional distributions, which could include share buybacks, but it's a good place to be operating from, yes.

M. Tufan Erginbilgic
CEO & Executive Director

I think, I mean Helen said it. A couple of things. First of all, that forecast, it's great to hear. We are forecasting the same way. But I think that forecast already includes what we want to invest in anyway, okay? So therefore up. Therefore, I'm going to take your question like where are the big opportunities rather than where do you want to invest because we are already investing. We increased the net investment, therefore.

Frankly, we are in a privileged situation. I think a part of it, where we operate, a part of it, the opportunities we created for ourselves, frankly. And there is a growth potential, obviously, in Civil Aerospace, where we are highly differentiated and that can be narrowbody, widebody. But UltraFan Ultrafan investments, for example, in our forecast, obviously, right, you should think that way. So time on wing, 1 billion will expire by that time as we talked about.

SMR, at this point, SMR will not actually require big investment. It will grow. Only thing what Helen said is -- and Power Systems, one point I'm going to make just to point out. Power System, capital and research and development right now, highest in their history, 100 plus years. That should tell you how we're thinking about it. There is a growth potential that's immense, but that's immense with proper returns, right? So there is lots of rigor, there is lots of challenge, but there is never hold back. That's why I'm not talking about in '28. Today, their CapEx and R&D is the highest on record for Power Systems because -- why? Because there is so much data center-driven growth opportunity that -- and some governmental, frankly, that we want to actually benefit from.

So we have -- only thing I'm going to talk about because we are already investing, only thing I can talk to you about, where the sort of -- it can come from any of our businesses because if we had low return business, low-margin business, frankly, we are already getting out of them. So therefore, that opportunity, organic or inorganic may come from many places, and we will evaluate the way Helen talked about.

Jeremy, do we have digital question or do you have a question?

Jeremy Bragg

Not my question. So there's a couple of questions here. Maybe we could finish on these. And one is, what do you consider the impact of potential tariffs to be in the U.S.?

And the second one, which I think you'll like, Tufan, is, when do you expect a decision on SMRs from the U.K. government?

M. Tufan Erginbilgic

CEO & Executive Director

I always like that. So I think tariffs first. We have done lots of work as you can expect. Frankly, I will say this. All the tariffs already announced, there is limited impact for us. And what else may come, obviously, I'm not going to speculate here. But I'm going to say the following. Our mindset and the processes we are putting in place, some of it being very proactive to mitigate the impacts. And because we want to run a company, that's part of -- I talked to you about distinctive performance culture. This is actually one of the principles there. How do you create response capability, mindset and capability because mindset is important. So that's my tariff answer.

I think that's GBN question. I mean it has been delayed, obviously. But we expect in 2Q, probably towards the end of 2Q GBN to come and select technologies and so on.

But here is the good news. So again, this should give you an insight to how we run the business. We actually -- we didn't want to sort of bet on one thing for the whole business. Therefore, we went out there, work with other countries and develop options so that we can actually unlock SMR potential. And CEZ deal is a highly strategic deal effectively does that. So therefore, we are not sitting here and saying, "wow, we got 800 people, we don't know what to do with it." No. There are actually, as we speak, working with CEZ on the first site already because CEZ already identified the first site. In fact, CEZ's CEO is actually coming here early March to meet me, et cetera.

So my big point is, yes, that process is very important for us. I argue, very important for U.K. because I said it publicly and privately, these new technologies come in. Offshore wind, I was in energy industry when that came. Frankly, U.K. didn't move fast enough and lost to first-mover advantage, and therefore, lost opportunity to develop wind supply chain in the U.K. It was developed elsewhere, and it will never come back. Right now, we have a leading SMR in the U.K. This is a perfect opportunity to create U.K. supply chain in the U.K. with the first mover advantage because, frankly, our mid-tier capability is unique in the world. I may have said it before. I don't know how it resonates with you.

There is -- let me spell it. There is no other private company in the world with our nuclear capabilities. I actually tell the nuclear team, if we are not market leader in SMRs and micro reactors, we made a mistake in going after that because we should be natural leaders in that space given our unique capability. So that's my GBN answer, always long answer for GBN.

Any other questions?

I think we are going to close. Thanks for coming. Thanks for great questions as usual. We are making progress. Hopefully, you agree with that. We actually expanded the earnings and cash potential of the business. But more importantly, our future mid-term targets already underpinned to a great extent by the actions we have taken. For example, 80% time on wing, we know that, otherwise, we wouldn't share with you other 40%, right? So there is no technology risk there, for example. So that's what I mean. So I think that's what we are on to. And we talked about beyond midterm because we are excited by it. Thanks again. Have a great day.

Presentation

Jeremy Bragg

Good morning, everyone, and welcome to our half year 2024 results presentation. My name is Jeremy Bragg, I'm Head of Investor Relations, and I'm joined here today by our CEO, Tufan Erginbilgic; and our CFO, Helen McCabe.

So before we start today's presentation, I'm required to show you our safe harbor statement on Slide 2. As always, the full set of results materials can be downloaded from the Investor Relations section of our website.

We're going to start today with an update on our financial performance and strategic progress from Tufan before Helen goes into more details on our 2024 half year results. Tufan will then close the presentation with our guidance and investment proposition. After the presentation, there will be time for questions from the room and from our audience online. [Operator Instructions].

So with that, I'll hand over to Tufan. Thank you.

M. Tufan Erginbilgic

CEO & Executive Director

Thanks, Jeremy. Good morning, everyone. Our transformation aims to build a sustainably distinctive Rolls-Royce that is high-performing, competitive, resilient and growing with improving profitability and cash flow generation and a strong balance sheet and growing shareholder returns.

Operational excellence and the safety of our people and our products is our very first priority. We put safety and quality at the heart of everything we do. It is a responsibility every employee in the company carries. Our strategic initiatives aim to improve operational effectiveness and deliver best-in-class customer service.

We are significantly expanding the earnings and cash potential of the group despite challenges associated with the supply chain. We have made a strong start to the year, delivering a significant year-on-year improvement in operating profit and free cash flow across all 3 core divisions.

The strong start was driven by our strategic initiatives, notably commercial optimization and cost efficiencies. This continued strong progress gives us confidence to raise our guidance for 2024, both for operating profit and free cash flow, which I will come back to later.

We are unlocking the potential of the business and are on track to deliver our midterm targets. We are focusing on strategic progress of the business with a relentless efforts to make it better every day. Consistent with my previous transformations, we are seeing a front-end loaded strategic delivery.

As we have stated before, if we can achieve our midterm targets before 2027, then we will. We have also made good progress strengthening our balance sheet and building cash flow resilience. This progress allows us to announce today that we will reinstate shareholder distributions for full year 2024 results. This will be based on a 30% payout ratio of underlying profit after tax for the full year 2024. Helen will talk to you about this in more detail.

Let's look at our financial performance in the period. Operating profit of GBP 1.1 billion was 74% higher than last year. Our operating margin of 14% was 4.4 percentage point higher than last year. All 3 core businesses contributed to this higher operating profit. I would like to highlight some of the key drivers.

First, in Civil Aerospace, aftermarket profit was driven by higher LTSA margins and increased number of large engine shop visits. Our LTSA margins increased for all engine types, except the Trent 1000, which we expect to improve in the second half.

Business Aviation also delivered a strong performance improvement, which builds on the doubling of profit we delivered last year.

Second. Contractual margin improvements reflect improved commercial terms and lower costs across our large engine and business aviation contracts. These are underlying business improvements that result in higher immediate or future cash flows.

Third. Strong profit growth in defense, driven by improved aftermarket performance in transport and combat and growth in submarine.

And fourth. Profitable growth in Power Systems, driven by our data center growth. The actions we have taken to significantly improve the business model in power generation driving commercial optimization and cost efficiencies mean that we have been able to increasingly benefit from the attractive market growth in data centers.

In addition, across all businesses, our efficiency and simplification actions have helped mitigate the impact of inflation in the period. Free cash flow was GBP 1.2 billion versus GBP 0.4 billion in first half 2023. This was driven by higher operating profit and continued LTSA balance growth as we continue to grow our EFH rate through our commercial optimization efforts.

Lastly, return on capital improved materially to 13.8% and represents significant value creation. Our strong financial delivery in the first half further increases our confidence in full year delivery. And this strong delivery was achieved despite prolonged supply chain headwinds, in particular, a lack of availability of parts, which is causing delays to OE deliveries and shop visits.

The supply chain is an industry-wide issue, but we are proactively and relentlessly managing these challenges to mitigate their impact. We have established a new procurement and supply chain organization with an increased focus on achieving world-class capability. This includes the appointment of a Group Chief Procurement Officer with extensive industry experience.

We continue to work very closely with our suppliers to make sure we've got products in the right place at the right time. And where we need it, we have embedded our teams to support specific suppliers.

Our focus is on 15 suppliers whose delivery performance requires focused interventions. Additionally, we have a group of 26 suppliers in our high-performing supplier group as we look to focus our activities with high-performing suppliers where necessary.

We also created a dedicated multidisciplinary agile team focused solely on resolving part supply issues. We continue to make substantial progress against each of the 4 pillars of our strategy: portfolio choices, strategic initiatives, efficiency and simplification, lower carbon and digitalization.

First, portfolio choices and partnerships. In Business Aviation, deliveries are ramping up of the Pearl 700 engine for the Gulfstream G700 business jet, which entered service in April. We delivered 83 Pearl engines in the first half of 2024. Our commercial optimization actions means that Business aviation engine deliveries are now mostly profitable. We also invested to grow our capacity in Darby and Dahlewitz, which will allow us to deliver around 40% additional new engines per year from 2025 compared to 2023 and support rising aftermarket volumes.

Moving to the second pillar. Let me talk about a few other things here on the first pillar, by the way. So in line with our strategy, we also completed, in the first pillar on the divestments, sale of Direct Air Capture business. And yesterday, we completed the sale of off-highway engines business in the lower power range in Power Systems.

Now talking about Second pillar, Advantaged Businesses and strategic initiatives. In Civil Aerospace, the Trent XWB-97 was our best-selling engine with 108 new orders placed in the first half of the year. Our time-on-wing initiatives are progressing well. Here, we are investing GBP 1 billion to improve the time-on-wing of our modern engines by 40%. This includes doubling the time-on-wing of the XWB-97 in nonbenign environments.

Flight testing of Trent 1000 HPT blade is progressing well. Actually, just yesterday, we did the first flight test very successfully. I can now declare that I got the news from West Coast. So it was very successful, 1 hour, 15 minutes flight test, and that will continue 8 weeks right now. So -- but it is progressing well.

We expect the improved HPT blade for the certified by the FAA later this year. This part will more than double the time-on-wing of the Trent 1000 engine and is already in service in 50% of the Trent 7000 fleet.

We have progressed the design of further improvements for Trent 1000 and 7000 engines. This will deliver an incremental 25%, 30% improvement in time-on-wing by the end of 2025. Manufacture of these engine components is already well underway for engine testing.

We have also tested improvements for the Trent XWB-84 that will further improve the fuel burn efficiency of the best-in-class engine. Certification for these improvements will be achieved later this year and for entering into service in 2025.

In our large engine LTSA business, we delivered contractual margin improvements of GBP 431 million. This reflects continued progress, renegotiating onerous contracts in widebody as well as catch-ups in both widebody and business aviation, driven by price escalation and cost reductions on key platforms.

In defense, we are proud to be partnered with prime contractors, Sierra Nevada Corporation to provide engines for the U.S. Air Force Survivable Airborne Operations Center Program. This is another great win in defense, and we expect the order to have a near-term benefit to earnings. And in submarines, we started to work on August.

In power generation, we have improved the business model, which means that we are capturing profitable growth from our strong position in the fast-growing market for data centers.

Next, efficiency and simplification. Our new organizational design came into effect as of 1 June '24. This is about being a simpler, more agile and less top-heavy organization. An organization with clear accountabilities to make decisions at pace, where we can also leverage synergies across the group.

We are redesigning our tools and processes and changing our ways of working and behaviors to enable our organization to be simpler, more efficient and more effective. In total, we expect our efficiency and simplification program to deliver more than GBP 250 million of cumulative benefits by the end of this year, on track to deliver our targeted total annualized savings of GBP 400 million to GBP 500 million by the midterm. Within that, organizational design remains on track to deliver benefits of GBP 200 million by the end of 2025.

Next, procurement. By the end of this year, we expect to deliver around GBP 500 million of cumulative third-party cost savings. We remain on track to deliver our target of GBP 1 billion of gross third-party cost savings by the midterm, which will partly mitigate supply chain inflation.

Supporting this is a zero-based budgeting. Pilots in civil aerospace have been successfully completed and confirmed our expectation of 10% to 15% savings in third party cost through this approach. We are now in the process of rolling out zero-based budgeting across the group. This is something that Helen and I have used extensively in the past, and we have found it to be very, very effective.

Finally, Lower Carbon and Digitally Enabled. We have secured partial funding from the German government as part of a consortium to develop the necessary technologies for a highly efficient hydrogen reciprocal engine to drive combined heat and power systems.

In SMRs, Rolls-Royce is 1 of the 2 companies that have been shortlisted by Vattenfall, the Swedish power company, competing to potentially deploy a fleet of small marginal reactors in Sweden. The program is part of Vattenfall's plans to meet the rising demand for electricity, adding nuclear capacity and helping Sweden achieve its goal of creating a fossil-free economy by 2045.

In Power Systems, we won some major battery storage systems contracts. These include a contract to help ensure the stability of the power grid in Latvia through the installation of one of the largest battery storage systems in the EU.

It will have an output of 80 megawatts and a storage capacity of 160 megawatts hours.

Turning to Digital. We are now using machine learning and advanced imaging technologies to inspect turbine blades. By using this technology, in conjunction with our understanding of how each blade has

been operated in service. We have been able to remove uncertainty around our planning assumptions for blade replacements for individual engines.

This results in a faster, more consistent blade inspection process that is reducing costs and extending the time-on-wing of critical engine components. It also provides vital in-service condition information that feeds back to our design and manufacturing engineering teams, underpinning current and future product enhancements.

What I shared are just some of the highlights of what we delivered in the first half of the year. They help demonstrate that our transformation is being delivered by multiple initiatives and actions coming together successfully in order to build a sustainably distinctive business.

I will now pass to Helen to take you through the results in more detail and how we are building resilience and our shareholder distribution policy.

Helen McCabe
CFO & Director

Thank you, Tufan. Good morning, everyone. Now let's look at half year performance in more detail. First, I will take you through the key financials for the group and by division, and then how we are continuing to improve the resilience of Rolls-Royce and maintain a strong balance sheet; and finally, our new shareholder distribution policy.

So let's start with the results. They are strong, double-digit growth across revenue, profit and cash flow. The balance sheet is also being strengthened. The results show that we are running the business very differently with a focus on high-quality and sustainable earnings and cash flow growth.

Group revenues grew by 19% to GBP 8.2 billion, with good end market growth across all divisions. Group operating profit grew by 74% to GBP 1.1 billion. Operating margin increased by 4.4 percentage points to 14%, again, with strong growth across all divisions.

Free cash flow increased to GBP 1.2 billion, more than triple that over the same period in 2023. Cash flow generation in the period meant we reduced net debt to GBP 822 million compared to GBP 2 billion at the end of 2023. To put that in perspective, that is our lowest net debt position in more than 5 years.

Lastly, return on capital rose to 13.8% for the rolling 12 months, which represents significant value creation. This was driven by higher operating profit and margin, focused capital allocation and disciplined working capital management. A very strong set of results with every part of the organization leaning in to deliver.

Now the detailed by division, starting with Civil Aerospace. Civil Aerospace delivered the largest year-on-year improvement. The highlights include: operating profit grew to GBP 740 million, an increase of 85% compared to last year. Operating margins grew to 18%, a 5.6% increase compared to last year.

Revenues grew to GBP 4.1 billion, an increase of 27%, driven by higher shop visits, OE deliveries and commercial optimization. OE deliveries grew by 26% to 236. This was achieved despite the supply chain environment. Of the 236, 120 were large engines, of which 21 were spares.

Business Aviation deliveries were 116, of which, as Tufan mentioned, 83 were Pearl deliveries. And total shop visits grew by 6% to 624. Of these, 195 were large engine major shop visits. This compares to 144 last year.

Now operating profit in more detail. Four key factors drove the 85% increase. First, higher large engine aftermarket profits. The LTSA aftermarket profit grew as a result of higher average LTSA across almost all engines, combined with an increased number of shop visits. In addition, time and materials profit increased, driven by our commercial actions.

Second, stronger business aviation profitability. This was in both OE and aftermarket. In OE, deliveries grew by 59% to 160, and they were mostly delivered at positive margins. In aftermarket business aviation and regional shop visits grew by 7% to 211, which were also done at higher margins.

Third, cost efficiencies. Our actions supported lower year-on-year indirect costs despite continued inflationary pressure.

And fourth, contractual margin improvements. Net contractual margin improvements were GBP 223 million. This compares to GBP 105 million in H1 '23. The GBP 223 million comprises a benefit of GBP 216 million from catch-ups and a GBP 7 million improvement in onerous contracts.

But let me unpack that for you. In large engines, we continue to renegotiate and find win-win solutions with our customers. And in both large engines and business aviation, we saw a benefit from catch-ups, driven by, for example, our focus on life cycle cost reductions and price escalation.

In total, all of this contributed to a gross benefit of GBP 431 million. However, there were some offsets, an additional charge of GBP 208 million was taken across both onerous and catch-ups, largely due to prolonged supply chain challenges.

You've already heard from Tufan how the supply chain remains a challenge. We are very proactively managing this across every level of the organization. We are laser-focused on it.

Now turning to cash. Civil Aerospace delivered a trading cash flow of over GBP 1 billion compared to GBP 400 million in the prior period. Cash delivery was driven by higher operating profit and continued net LTSA balance growth.

This was supported by a 22% increase in large engine flying hours, bringing them to 101% of 2019 levels and a higher normalized engine flying hour rate. Expectations for the second half of the year. We expect a lower operating margin in Civil due to a higher number of OE deliveries and aftermarket shop visit mix, notably an increased number of Trent 1000 major refurbs.

Defense, another strong performance, reflecting the benefits of our strategic initiatives, particularly our commercial optimization and cost efficiency actions. Operating profit grew to GBP 345 million, an increase of 34% year-on-year.

Operating margin grew to 15.5%, a 1.9 percentage point increase. Order intake for the period was GBP 1.7 billion, with a book-to-bill ratio of 0.8x and an order backlog of GBP 8.5 billion.

Order cover for the remainder of the year stands at nearly 100%. Revenue grew by 18% to GBP 2.2 billion. This was led by submarines and combat, which both reported double-digit growth. Most revenue growth come from services, which grew 27% year-on-year. It's worth noting that defense revenue growth included a benefit due to a change in a submarine contract.

Excluding this, revenue growth was a very healthy 8% for the division. The year-on-year improvement in operating profit was driven by 3 key factors: first, strong aftermarket profit in both combat and transport, including a more favorable mix and improved pricing.

Second, submarines growth, which was very strong, reflecting the ramp-up of programs, including focus. And third, cost efficiencies, including an increase in customer-funded R&D as work ramps up on key programs that will drive decades of growth, notably AUKUS, B-52, FLRAA and GCAP.

Defense's cash flow increased to GBP 234 million. Cash delivery was driven by operating profit and an improved working capital performance. In the second half, we expect a lower operating margin, reflecting the impact of aftermarket mix and increased OE deliveries.

Power Systems also delivered a strong result. The significant year-on-year improvement was driven by our actions on pricing and costs. Operating profit grew to GBP 189 million, a 56% increase. Operating margin increased to 10.3%, an increase of 3.3 percentage points.

Order intake was GBP 2.4 billion, with a book-to-bill ratio of 1.3x. Order cover for the remainder of 2024 is greater than 100% and 44% for 2025. Demand remains strong, particularly in power generation, where we saw increased demand from data centers for backup power units and in governmental where we saw growth in land defense.

Revenues grew by 6% to GBP 1.8 billion. OE revenues grew by 10%, with service revenues broadly flat. Power generation and governmental reported the highest growth, 15% and 12%, respectively. Power generation remains an exciting opportunity, now representing more than 40% of Power Systems total revenue.

Operating profit growth was primarily driven by 2 factors: Commercial optimization, we saw the benefits from the actions we have taken on pricing in all subsegments with power generation being the standout. And cost efficiency actions. The team continued the good work in this area with their focused actions helping to mitigate the impact of inflation.

Cash flow increased to GBP 121 million. It was driven by higher operating profit and working capital continuing to be tightly managed. And as we typically see with Power Systems, which is more seasonal, we expect a stronger profit and margins in the second half of the year. So a very strong performance across all 3 core divisions, we are delivering as one Rolls Royce.

Now let's move to the funds flow. We delivered almost GBP 1.2 billion of free cash flow in the first half, GBP 800 million higher than in the same period last year, a record delivery for our first half year. The principal drivers of free cash flow growth was increased operating profit, which grew by GBP 476 million.

Other factors included: net investments of GBP 41 million, notable investments in Civil Aerospace in the first half included time-on-wing improvements, particularly on the Trent XWB-97 and further investments in our Pearl engines. In defense, we invested in test facilities in Indianapolis. And in Power Systems, we further invested in our new engine to replace the 4000 engine.

Civil net LTSA balance. This was broadly similar to last year at GBP 544 million. Engine flying hour growth and a higher normalized engine flying hour rate were partially offset by an increase in the number of shop visits.

And then working capital. As you know, this is a key focus area, and we continue to make good progress. Our working capital outflow was lower than in the same period in 2023, even as we supported business growth and dealt with the supply chain. Inventory and debtor days both improved year-on-year.

Then over hedge costs, as expected, were materially lower year-on-year. Net interest costs fell significantly by GBP 66 million, reflecting our improved cash position.

And finally, cash tax costs rose to GBP 113 million due to timing differences compared to payments made last year. Turning to the full year. We continue to expect the net LTSA balance growth to be towards the lower end of the range of GBP 0.8 billion to GBP 1.2 billion, as shop visits ramp up in the second half of the year, notably, as I mentioned, on Trent 1000 refurb.

We expect continued progress on working capital with the release of working capital in the second half and over hedge costs to remain at GBP 146 million, as previously guided. We now expect net interest to be around GBP 100 million lower year-on-year and cash tax to be GBP 150 million higher year-on-year.

Fourth, reflecting the impact of our stronger profit and cash delivery. These details are set out in our supplementary slides. One of my key priorities I set out at Capital Markets Day was the need to improve resilience and strengthen the balance sheet.

You can see from the results today that we are becoming a more resilient business with reduced operating leverage, a stronger balance sheet and improved returns. Look at our total cash cost to gross margin ratio, or TCC to GM, which is shown on the left. It shows an improvement 0.49x, already at the upper end of our midterm target range of 0.4 to 0.5.

This has been driven by 2 key focus areas: cost efficiency and commercial optimization. Our TCC to GM ratio is now almost half of what it was in 2019. It is approaching best-in-class.

We are also building resilience by strengthening the balance sheet. We reduced gross debt, excluding leases, to GBP 3.6 billion by repaying a 550 million Eurobond in May, and we canceled the last remaining U.K. EF supported undrawn loan facility.

Net debt fell to GBP 0.8 billion from GBP 2 billion at the end of '23. Our net debt-to-EBITDA ratio now stands at 0.3x, which compares to 0.8x at the end of 2023. Our liquidity position remains strong at GBP 6.8 billion. Our work has been recognized by the credit rating agencies. 2 of 3, Fitch and S&P Global, now rate us as investment grade and all 3 have us on a positive outlook.

We are building stronger foundations. We are creating a more resilient business. We remain committed to maintaining a strong balance sheet. Tufan and I have been consistently clear on this. As we set out at the CMD, our capital frame is focused on 3 clear priorities: a strong balance sheet, a commitment to regular and growing shareholder distributions and a disciplined approach to further investments, which could include additional distributions.

We have made strong progress and are now confident that the strength of the balance sheet is being sustainably improved. We intend to achieve and maintain a strong investment-grade rating and robust liquidity levels.

Today, we are pleased to announce that we will be reinstating regular and sustainable shareholder distributions, starting in respect of the full year 2024 results. A regular shareholder distribution will be based on an earnings payout ratio with a policy to distribute 30% to 40% of underlying profit after tax.

We will start at 30% in respect of the full year 2024. We have assumed an effective tax rate in the mid-20s. And over the midterm, we expect to be broadly in the middle of the 30% to 40% payout range. This is a competitive payout ratio for our industry.

And as our earnings grow, so too will our distributions. We have consistently said safety expenditure will always be our top priority. And as we continue to invest in the business to deliver earnings and cash flow growth to the midterm and beyond, we will be disciplined. All investments are assessed against the lenses of strategic fit and shareholder value.

This includes any incremental investments, which could be organic or inorganic. We have strict investment hurdle rates in the mid- to high teens for our 3 established divisions and a group-wide investment committee. It's a rigorous process.

Alongside incremental investments, we will also consider the relative merits of further distributions to shareholders, which could include share buybacks.

To close, we have delivered strong first half results against all key metrics. We are continuing to build resilience. We are becoming a stronger Rolls-Royce. We are ambitious. There is still more we want and need to do. We will remain focused and deliberate. And we are excited about the potential that lies ahead.

With that, let me pass you back to Tufan, who will talk you through our updated guidance.

M. Tufan Erginbilgic

CEO & Executive Director

Okay. Thanks, Helen. Hopefully, now you're convinced it's a strong set of results. As we can see from our results, we are expanding the profit and cash potential of the business and significantly improving the quality of earnings, despite significant challenges from the supply chain.

We are managing the business very differently, focusing on sustainable and quality profit and cash flow growth. All 4 pillars of our strategy are critical to our success. We are executing on a granular plan with clear strategic purpose and rigorous performance management.

Now turning to our guidance for 2024. Following a strong first half delivery, we are raising our guidance for the full year. We now expect operating profit of GBP 2.1 billion, GBP 2.3 billion. This compares to our previous operating profit guidance of GBP 1.7 billion to GBP 2 billion.

For free cash flow, we now expect GBP 2.1 billion to GBP 2.2 billion. This is higher than our previous free cash flow guidance of GBP 1.7 billion to GBP 1.9 billion, despite the GBP 150 million to GBP 200 million charge associated with the supply chain.

We are actively working to mitigate these headwinds, but we anticipate the supply chain to remain challenging for another 18 to 24 months. As the supply chain stabilizes, the benefits of our transformation program will be even more visible.

In Civil Aerospace, we maintain our guidance on EFH growth, OE deliveries and shop visits. By the end of 2024, based on our updated guidance, we will have delivered more than 75% of our midterm profit improvement and more than 65% of our targeted free cash flow improvement.

We have seen fast progress in the first years of our transformation due to our actions. This front-end loaded financial delivery is consistent with my prior turnarounds and should provide further confidence in our midterm targets. We are on track to deliver these in 2027, and if we can achieve them earlier, we will.

Let me summarize. We made great progress on our ambitious transformation plan and delivering the Rolls-Royce proposition. We are becoming a high-performing, competitive and resilient business with growing sustainable cash flows, shareholder returns and strong balance sheet.

Among all this, safety and quality are our top priorities and at the core of our business. Our transformation is progressing at pace and with intensity. Our strong first half results give us confidence to raise our full year guidance for both operating profit and free cash flow.

We are well on track to deliver the improvements in profit and cash flow set out in our midterm targets. We have always stated that our midterm targets are a milestone. The investments we are making today along with our strategic actions will also result in attractive profit and cash flow growth beyond the midterm.

I am truly excited by Rolls-Royce's long-term outlook. All these mean we are in a position to reinstate shareholder distributions for full year 2024 results, an important moment in the Rolls-Royce transformation and [Indiscernible] our Rolls-Royce's proposition.

We have achieved a lot, but there is more to do. We have a granular strategy, which aligns the whole organization. Strategic initiatives are owned and actioned with clear accountabilities. Everybody knows their role, what they must deliver and their part in our transformation. I am incredibly proud of how our employees are working relentlessly to reach our ambition to create a sustainably distinctive business. I would like to thank them for their hard work and the impact they make. It is their energy and commitment that is making the difference.

Before I open to questions, I would like to take a moment to thank Isabel for her dedication and contribution to Rolls-Royce over the last 5 years as the Head of Investor Relations. This is her last set of results, and we wish her luck for the future.

I was going to also announce Jeremy, but he announced himself. So I should just sort of -- that says something, he's always one step ahead of me. So Jeremy, Jeremy is obviously taking over as the Head of Investor Relations, and we have full confidence, obviously, in him, and I wish him all the success in his new role.

With that, we are going to open it to questions.

Question and Answer

David Howard Perry

JPMorgan Chase & Co, Research Division

Okay. Yes, David Perry from JPMorgan. Can I also just wish Isabel all the best? She went through some tough times, and seeing the good times now. So first question, a very high level. On the medium-term guidance you conveyed in your presentation, you are really on track, probably ahead of plan.

So just wondering what is it that's stopping you formally raising the targets or officially pulling forward what you define as the midterm? Then just being a little bit more detailed. I thought I'd ask one on Power Systems.

I just thought the growth there might have been a little bit stronger. So could you just unpick a little bit some of the things. So exactly how much is pure, pure data centers and maybe talk to the bits that were down?

And then last one for Helen, if I may. On working cap, just so minus GBP 228 million in H1. Can you just say what you think that number will be for the full year, neutral or positive?

M. Tufan Erginbilgic

CEO & Executive Director

Good questions. I'll take first and Helen will take the working capital question. So I think, David, you are absolutely right, we are definitely making good progress. And actually expanding the earnings and cash potential of this business in an accelerated way. And what is really behind that?

You need to understand how we run the business and what's the mindset behind that. We are not chasing a bunch of numbers, but actually making the sort of strategic progress is our focus. What does that mean? It is -- it means actually making the business better every day and that is what we are incentivizing with the teams as well.

And that strategic progress -- and if you actually think about combined that mindset with clear programs, very clear programs and you run them at pace and with intensity, suddenly accelerate delivery comps. And that's what you are looking at.

Because of that reason, though, it won't be linear. I mean I said it earlier as well. Actually, I've seen this movie before. Almost -- I was actually one dark night, I was sort of stepping back and thinking, what's going on here? It was going on exactly almost identical picture in terms of how front-end delivery was happening.

Therefore, it won't be linear. I know that. And -- but front-end delivery obviously derisk, I would argue, our midterm target delivery. And that's a good thing definitely. And I said it in my speech that, frankly, we will keep going with strategic progress. If we can achieve the targets before '27, we will.

Last point I'm going to make is, we always said '27 targets are a milestone. Although if I remind you how we set those targets, we actually said we are going to create high-performing competitive resilient growing business, effectively with external benchmarking, we converted them to financial targets, right? That's how we did it. So when we get there, it is going to be very competitive and resilient business, and Helen was talking about resilience earlier.

So I think -- but there are milestones. Given the things we are doing, I can actually go division by division, make it, I won't unless there is a question. But I can illustrate to you why what we are doing right now is creating more profitable growth even beyond midterm.

So your second question on Power Systems, great observation. I agree with you, 6% is not -- but as you know, David, the Power Systems have multiple subsegments in it. And the answer is -- so I'm going to

unpick it for you, hopefully. So within that, already Helen said around 40% of our revenue comes from Power Gen.

Power Gen growth was actually 15% within that, okay? Given the order intake I see right now, order intakes year-on-year in Power Gen from data centers, growing more than 40%, I actually believe that may accelerate that growth. But in first half results, it is 15%.

If you actually only look at data center portion of Power's generation, it is actually 17%. Governmental growth is also good, around 12%, but there are marine. We did -- we had a good growth last year, benchmark against that was tough.

Marine is a little bit flat year-on-year. And Industrial, mainly the business we just completed to sell. Now you know why we are selling it, but it actually shrank. So it went backwards, so -- in the first half. So -- because frankly, the reason we sold it, it was at differentiated enough business for us. Hopefully, that answers first 2 questions. Over to you.

Helen McCabe

CFO & Director

Thanks, Tufan. Thanks, David. So as you see, working capital, we did see a build in the first half of the year. It's worth noting that in that build as we look to make sure that we had particularly inventory in the right place at the right time for a product, we actually still made progress on our working capital initiatives.

That was one of the priorities that we set out at Capital Markets Day. If you look year-on-year inventory days H1 '24 to H1 '23 actually improved by 12 days. Actually, debtor days also improved. In the second half of the year, now that we've got inventory in the right place for our right products, we expect a release of working capital, and we'll continue to see improvements across inventory and debtors.

Just a little bit of context for you. Tufan and I were looking the other day. If we go back to the end of 2022 to where we are now, just to give you a little bit of a feel for what we're doing around building resilience: we've improved inventory days by more than 20 and we improved debtor days by more than 10. Yet that's all sustainable reductions while ensuring that we've got the right capacity and capability to support us in this current environment where the supply chain remains challenged.

So hopefully, that helps, David. Yes, that really expected in the second half across debtors and inventory.

M. Tufan Erginbilgic

CEO & Executive Director

Thanks, Helen. That was one question, then I'll come to...

Nick Cunningham

Agency Partners LLP

Nick Cunningham, Agency Partners. Just picking up on that working capital question and over a sort of longer term. Rolls-Royce has built a lot of working capital over recent years because they had to for the crisis and more recently because of supply chain. But in the CMD, you seem to be emphasizing more cash profits and LTSA net balance build as the cash generator rather than working capital.

But whereas, it seems sort of obvious externally that working capital should be a really big source of cash looking slightly further out. So do we need to get past the crisis in supply chain to be able to release some of that? Can those day numbers sort of get back to where they were pre-COVID, if you like?

And then a second question, which is -- having followed Rolls-Royce for so long, it seems to be an odd one to be asking now. But capital structure, the resumption of the dividend and the sheer quantity of cash that you're generating makes one want to ask about what is the appropriate capital structure for Rolls looking forward?

I mean historically, you might have said, well, you should really be a net cash business in the balance sheet. A bit like Airbus' as well on the basis that it's a very volatile and typical industry. Is that the case? And sort of what sort of balance is an appropriate balance?

And then finally, and apologies for a really nerdy one. But Rolls-Royce has a lot of historical U.K. tax losses. In fact, it wrote-off a chunk of them because it thought it would never recover them. I don't think that's true any longer. So how much tax shelter do you have? And should that keep your average tax rate down below a sort of industry norm? And can you even write some of them back? That's it.

M. Tufan Erginbilgic
CEO & Executive Director

Helen, those are for you. I may add a few points on the second point, but...

Helen McCabe
CFO & Director

Fantastic. Okay. So thank you, Nick. So I've written them down. So tell me if I miss anything. So I think to your first question, working capital. So if I take you back to Capital Markets Day and just remind you of a couple of things that we said there.

So we said at Capital Markets Day that we were looking to -- on a gross basis, we had a program of work to underpin GBP 2 billion of working capital release. Now that was in addition to how we supported the business and grow. So obviously, you need working capital to build for that and to deal with some legacy concession payments. So that GBP 2 billion was in part offset to support growth and address those legacy concession payments.

If I stand back from that and see, well, how we are actually progressing on that GBP 2 billion? We have delivered GBP 0.4 billion off that. And you can clearly see that come through in those metrics that I was sharing with David. Inventory days already have improved by 20% that is not inconsequential while we support the supply chain.

Debtor days have improved by 10. There is more that we want to do, and we will do, but we are making good progress on that. But that's how you hold that working capital question. So hopefully that helps.

In relation to your balance sheet question, I think we have been consistently clear that particularly where Rolls-Royce has come from a historic perspective that our first priority always after safety is making sure that we have a strong balance sheet, a resilient balance sheet, and we maintain that.

And you saw from the slide that I had up that we say we want to have a strong investment grade profile, yes? Now investment-grade profile for some that differs. Some may be say BBB+, so what does that equate to from a net debt-to-EBITDA perspective, 1 to 1.5.

I think to your specific question, where we are at Rolls-Royce at the minute? I would definitely be comfortable running with the level lower than that and 18 months in to a material transformation program, more prudent and to run with the net cash position.

So that's how we'll hold it in the near term and the medium term. And as I said, as I was going through the results, we will always be incredibly clear and disciplined about how we choose where to invest and why, but we will always make sure that the balance sheet is appropriately protected as well. So that's how you should just hold our intent around the balance sheet in the near to the medium term. And you did -- apologies.

M. Tufan Erginbilgic
CEO & Executive Director

On resilience, I'll come from a slightly different perspective. I think balance sheet answer hopefully you got. But I would like you may want to think about Rolls-Royce slightly different than you thought about Rolls-Royce before. So I think the resilience -- resilience has the aspects that Helen talk about.

One aspect of it from a cash generation perspective, if you actually think about, all Rolls-Royce had one division effectively, and it got TCC GM almost 1. So that means every time somebody coughs, sort of you are falling down. So that's one thing.

Second, cash generation was an issue in that division or in general. And therefore, even you didn't need COVID, you need a proper recession, frankly, to be in negative territory. If I take you to even the current Rolls-Royce, not even where we are going to go.

But you effectively have 2 divisions, Defense and Power Systems, I would say, with ratable earnings and cash almost isolate -- I mean, at least to a greater extent, isolated from cyclicalities because one defense, obviously, related to other things. The other one, we just talked about data centers, sort of digital transformation rather than every quarter, there is a recession or something.

In the past, they were there. But in one, you were making 0 money, 0 cash generation -- negative cash generation. So if I were you, I didn't worry about them. But right now even, we are delivering between those 2 more than GBP 1 billion cash. So that cash is not cyclical. That's why -- and then you go to civil, you got this sort of in the first opportunity stumbling, sort of division replaced by a big cash surplus, which creates the cushion.

I mean, looking -- flying hours, we are saying 101%, right? And we upgraded the guidance, and Civil has a lot to do with it. So that should -- that cushion makes it a lot less volatile and TCC GM went from one to almost half, sort of if you think about it, so when you think about volatility, cyclicity, you may want to think about Rolls-Royce differently versus some other peers in the industry.

Helen McCabe
CFO & Director

Thank you, Tufan. So in relation to your final question, so deferred tax. So obviously, as we continue to expand earnings potential, then we do look at the deferred tax balance, both recognized and unrecognized very closely. And if you look at some of the notes to the accounts, you may not have time to do that, Nick, there is a comment in there that in the half year, we have recognized any element of deferred tax and that is something that we'll continue to monitor very closely, and we take a very close view on that. I wouldn't say it was -- it remains prudent, but appropriate. Yes. Thank you.

M. Tufan Erginbilgic
CEO & Executive Director

Thanks, Helen. Ian, do you still have the question?

Ian Douglas-Pennant
UBS Investment Bank, Research Division

Yes. So my question has changed slightly given your last answer. So I have in my head, and apologizes, I don't have my notes with me, so I can't check it, but you used to be talking about a small net debt position being the target capital structure, and that seems to have changed this morning. So given Tufan's comments about this being a different company, I guess, why?

And then second related question, even if you are aiming for a small net debt structure and even if you do start to pay a dividend, as you're targeting, you're still going to be generating more cash than you're using unless you start doing large-scale M&A. Does that mean a buyback is a conceivable outcome or how would you resolve that difference? I'll leave it there.

Helen McCabe
CFO & Director

Yes. So just to clarify, so I mean, at the minute, from net debt to EBITDA, we're at 0.3. Just to be clear, I said in the short term, if you're in a positive position, I'm fine with that 18 months into a material transformation program. I think we've been consistently clear as to how we hold our capital frame, yes, and how we've set that out.

We've always said safety, then we said the balance sheet. We're making good progress on that, you can see from the metrics that we shared with you today. Then we said resumption of shareholder distributions. Today, a nice milestone, I think, in the Rolls-Royce journey announcing after more than 5 years that we will be resuming the distributions.

And then after that, those strategic priorities in those 4 pillars are the frames that Tufan took through. We have a very clear strategic frame, and we will use that to help guide what we do with our capital. So we will always be driven by strategic clarity based on our very detailed and clear strategy. We will then be driven shareholder value, what is the right thing to do there and how we balance the 2 of them.

And we have options and we will look at how we balance those different options between further investments, organic, inorganic or further distributions, which may include share buybacks, but it will always be driven by that clear capital frame and those clear strategic lenses we've been consistently sharing with you.

M. Tufan Erginbilgic

CEO & Executive Director

Thanks, Helen.

Charlotte Anne Keyworth

Barclays Bank PLC, Research Division

I'm Charlotte Keyworth from Barclays. I was going to ask about share buybacks, but I think we've probably exhausted that one there.

M. Tufan Erginbilgic

CEO & Executive Director

Yes, yes. Good conclusion.

Charlotte Anne Keyworth

Barclays Bank PLC, Research Division

Yes. So my first question then was around the Civil margin in H2. So you took a GBP 410 million onerous contract provision last year. And I was surprised to see how little you'd release in the first half. So my question is, if with the shop visits being higher, does that include any assumption of further release from what you're seeing in the second half contributing to the margin? That's the first question.

And then the second one, actually, I was watching your often cheerful LinkedIn post, Tufan, you mentioned SMR. And I saw you were calling on the U.K. government to offer a contract by the end of the year. And I appreciate you've obviously got to the shortlisted position with Sweden. But should we infer anything on that time line in terms of strategic decisions because clearly it's burning cash at the moment.

M. Tufan Erginbilgic

CEO & Executive Director

Okay. I think first question, Helen may want to add sort of some color from accounting perspective as well. But I think second half margins actually not very complex in terms of this year, why we are saying it is going to be lower because OE delivery -- I mean, because of supply chain issues, frankly, more of our shop visits and more of our OE deliveries sitting now in second half, okay? So obviously, OE deliveries have a different margin profile on it. That's one thing.

Second, on the shop visits, the biggest step up -- if you remember, February this year, we talk about when we set the guidance, we said Trent 1000 shop visits will double this year. And you actually see that effect, but more of it, a lot of it will happen second half rather than first half.

And Trent 1000, and there is the cash implication of it as well. Trent 1000 is our highest cost shop visits because of some sort of historic issues, frankly, but we are going to improve. But our run rate on shop visit cost and because of our shop visit program on Trent 1000 will improve significantly by the end of this year.

But calendar year impact will not be there. So therefore, you are effectively looking at high shop visit cost circling cash, cash implication and lower margin -- LTSA margin that combination lower LTSA margin shop visits and OE deliveries is pulling the sort of operating margin down, okay?

Helen McCabe

CFO & Director

I think you've covered it. I mean, Charlotte, as you said, at the end of last year, we took that in provision for the supply chain. You know onerous contracts that because they're owners you have to take the full impact of that in the year that you do. So it's not built into the future margins. And this year, when we talk about the 208, the onerous part of [Indiscernible] take it in the period. So it's not built into the future piece. So I think you've covered the rest of it, Tufan that was the accounting part. Thank you.

M. Tufan Erginbilgic

CEO & Executive Director

I mean, good news is, I just announced 1 week flight test, that's significant because that certification will allow Trent 1000 shop visits to actually flatten going forward rather than keep going up, right? So that is -- we have been actually working with Boeing very closely because that's an important moment frankly. And I was delighted that first successful flight happened yesterday, literally.

And it is going to be 8 weeks flight test, standard the documentation, then hopefully, we get the certification, then that's the process. So going to SMR. First of all, thanks for at least somebody is following my LinkedIn post. So one data point, that's good.

So I think -- I mean, there are a couple of things there, really. First of all, we are really -- that milestone means, i.e., final phase of GDA process, regulatory process, means, a, recognition by the regulator, our technology; b, actually, that means we are almost 2 years ahead of everybody else, right? Literally, 2 years ahead of everybody else.

So what needs to happen right now is really a decision -- technology selection decision is due with GBM November-December that needs to happen without any delay. I mean it is already 6 months delayed. I'm not going to bore you sort of with my first-mover advantage point.

But my point is, U.K. missed offshore wind supply chain development in the U.K. If we are not careful, U.K. will miss SMR supply chain development in the U.K. because first mover will shape that supply chain, and that's true. And then exports will come. So big economic growth aspect.

But I think earlier the better that technology selection, but no later than end of November. And equally importantly, by the end of 1Q next year, there needs to be really clear, committed projects so that we can go into execution phase.

To your point, many countries actually watching GBM process, and we are working with them, they actually like our technology, like Sweden, Czech Republic, they actually sent very capable teams to do due diligence on our technology and they were delighted to see what we got.

So they are sort of eager to employ our technology. But they are looking at GBM process, but what if U.K. doesn't endorse this, then I am a little bit sort of exposed. I don't believe there is that risk, absolutely, because we are 2 years ahead of everybody with a proven technology with lots of capability. I don't think there is that risk. But dating there is that risk, therefore GBM process is very important, right?

I'll go there, then I'll go to Jeremy, it seems like...

Unknown Analyst

[Indiscernible] from Goldman Sachs. And I'm extending my thanks to Isabel for all the help in the ramp up and support. So 2 questions. The first one is on the supply chain. And I'm wondering if you could help us understand the commentary from Airbus in June regarding the Trent 7000? Is there any issue that you're facing on this engine with your supply chain? So that's the first one.

The second question is to understand whether the GBP 150 million to GBP 200 million of cash impact that you mentioned due to the supply chain was already assumed in the guidance at the time of formulating it in March. I'm asking because by looking at the upgrade of the full year guide, it seems that there's been an element turning more positive in your assumptions of cash flow since then. So I was wondering what that is?

M. Tufan Erginbilgic

CEO & Executive Director

Thanks. Thanks for the questions. I think -- very short answer. Frankly, we didn't cause any issues. We were 1 engine behind first half, okay, 1 engine, 7000. So literally 1 engine, I can say it. So therefore, there is no -- I mean there is no issue we cause to any air framers, frankly. And that's our plan for second half.

It is easy to say, but not easy to achieve. But team did a great job. We got there because, as you know, not many companies can say that in our industry because supply chain is really challenging. Now that I spend probably more than I would like to spend on it, I know how challenging, but we are managing it proactively.

To your question, in our guidance in February, we knew a little, but not to the extent that we would actually say GBP 150 million to GBP 200 million. So we now know more and that's the cash impact. By the way, more of it, more cash impact will be in second half. When you guys think about your cash formula for second half, you need to think that way, okay?

That's first half, very small portion of it because there is a lag in some of these hits and the second half will be equally challenging, we believe. So there was little frankly, in our guidance. Therefore, we didn't talk about it because we don't want to talk about small numbers.

Having said that, I think in my script, I talk about the things we are doing to mitigate that impact. So we are going to obviously do as much as possible to mitigate that impact. But also, we are highlighting that supply chain will continue to be challenging, at least 18 to 24 months. But we will manage it and mitigate as much as we can and that's why I talk -- I'm not going to repeat everything I said in the script, but those actions are there.

And frankly, I meet with agile team weekly basis, weekly basis. So that should tell you the intensity and pace on it, right? Jeremy?

Jeremy Bragg

Thank you. So we've got some questions online, which I'll go through -- I'll deal with them one by one. So firstly, from Ben Heelan. Please, could you give an update on how the pricing negotiations are going with onerous contracts? And is there more to come in the second half and in future years?

M. Tufan Erginbilgic

CEO & Executive Director

That's it? Okay. Let's go with that. Thanks, Jeremy. So I think -- thanks, Ben. Price -- here is how you would like to think about our renegotiations. By the way, when I go to renegotiations, I want to remind you that our LTSA margin expansion, there are 6 levers, 3 of them efficiency, 3 of them top line. Always keep that in mind because otherwise, you won't understand what is going on with LTSA margin, right?

For example, our shop visit cost went down this year as we planned, right? So that's contributing to LTSA margin improvement. It's not only pricing. But because Ben is asking a specific question on onerous contract negotiations. Frankly, we started last year, as you know, OE contract negotiations as well as some airline contract negotiations, we made great progress. And last year and first half, we actually book some of it.

And short answer to Ben, yes, there is more to do. It is not like new conversations, but progressing conversations are there. Until they are landed, obviously, we cannot book them. So there is some to go still in terms of negotiations. And if you ask me how it is going, actually, overall, we did -- I would argue that we did a great job, and team has done a great job in terms of what we achieved, but also in terms of

how we find win-win solutions, therefore, what we achieved strengthened our partnership with airlines or OEs rather than creating tension.

So it is not only good performance improvement, but actually, it became good partnership improvement on the back of it. So -- but there is more to come.

Jeremy Bragg

So next one, I'm going to consolidate a couple and that sort of round off the supply chain, I think, which is, firstly, you've taken GBP 400 million of charges last year and GBP 200 million now, what exactly do they -- are they, so is it higher parts costs or new agreements? And is there a risk that you might take future charges? So that's the first question.

Second question is, the 18- to 24-month time frame hasn't changed, so are you seeing a prolonged impact? And the third question is on the GBP 150 million to GBP 200 million cash which is, again, exactly what is it? Are you having to provide financial support to suppliers? Is it higher costs, et cetera?

M. Tufan Erginbilgic

CEO & Executive Director

Well, there are lots of questions there pointing out to the same thing. Yes, we took last year's and this year's, you are absolutely right. Both of them were supply chain related, some product cost increase and parts availability is creating some customer disruptions. It also includes that.

But almost answer to the first question is in the second question. Yes, because of prolonged supply chain, yes, we said 18 to 24 months, I don't -- we keep managing these things very closely, but I don't have a crystal ball to say this is it. So about 18 to 24 months, yes, it prolonged.

And as a result, we got more charge. Is there a risk to be more? Hopefully not. In fact, our mitigating actions may improve that. So the way I hold onerous and catch-up hit, when it comes to this, frankly, commercial agreements are commercial agreements, they are there to stay.

But if we can actually improve these things, hopefully, we can actually claim some back. But definitely try not to have additional hit. So that's our intent. In a way, GBP 150 million to GBP 200 million is the cash conversion, if I may say, because as you know, our accounting when it comes to onerous and catch-ups, we get immediate impact.

Cash is a different issue. So GBP 150 million, GBP 200 million is effectively this year's number because of supply chain-related costs, including customer disruption costs and again, we will -- and if we are saying 18, 24 months, we see a challenging environment. But again, we will try to mitigate as much as possible. But that's where we are at this point.

Jeremy Bragg

So next one, switching it up is on Trent 1000, which is what's your confidence of regaining market share on Trent 1000 given the time-on-wing improvements you've got scheduled with particular reference to the British Airways decision to switch to the GE engine?

M. Tufan Erginbilgic

CEO & Executive Director

So I think -- I look at -- as you may expect, I told about this long and hard. So sometimes people think because of our pricing actions, we are losing contracts, et cetera. That's not true, actually. So first of all, we are only thing -- we are remunerating our pricing actions is the investments we make and the risks we take.

In the past, Rolls-Royce didn't actually price that fairly and we are right now. So our issue with Trent 1000 is not reliability. It is -- reliability of this engine is as good as the competitor engine, but time-on-wing has been the issue, therefore, to gain market share in this, we are -- it is -- we created this structured program well resourced. We are investing GBP 1 billion in it. It's not all Trent 1000 by the way, all engines, but Trent 1000 and 97 are the key ones in it.

And the flight test is a very, very significant moment because getting to that point. But that, that is certified. We will double the time when we think about it. Then we have next year, we have another 25%, 30%. Here is the good news about that, that requires only engine-level certification rather than aircraft-level certification which is a lot faster.

You don't have to do flight tests with Boeing and all that stuff. Once those 2 happen, you have a very, very competitive time-on-wing, equal to our competitors on Trent 1000. And with that, if you actually look at right now, all the orders coming into the industry, they will be only delivered '27, '28, '29, if you are lucky.

So we are already -- sort of we will be ready when the new deliveries come and you will say then why aren't they ordering because they need to see -- we need to deliver, they need to feel confident about that. That's what we are in.

But actually, it works. We know that because we retrofitted 50% of the fleet in Trent 7000, even in Trent 7000 with these new blades, even in sort of nonbenign environment, like Kuwait has it, actually so far, it is running really, really well. So -- and it is already a couple of years, right?

So I think -- do we believe we can regain market share? Absolutely. Otherwise, we wouldn't have invested in time on wing. That is the only thing holding us back.

Jeremy Bragg

So next question is about the broader environment for airlines and a softening of airline ticket pricing and profit warning. So a question from Phil Buller at Berenberg, which is basically our ability or confidence in delivering our midterm targets in an environment where potentially demand and pricing is softening for airlines.

M. Tufan Erginbilgic

CEO & Executive Director

Frankly, first of all, we don't see it yet, but I'll come back to that flying hours in a minute. But we don't see that. But I would like you guys to make a distinction between competitive intensity in airline business versus the demand, right? Because they are talking about yield, which has a lot to do with competitive intensity.

So I think we don't see that issue. I mean we talk about supply chain. This, so far, frankly, demand is not an issue. If you look at our order book or Airbus, Boeing order books, you will conclude that's not -- demand is not the issue, but actually supply chain is the issue to deliver that.

Second thing is passenger growth is already happening, 6% growth this year. Some people expect double-digit growth this year by the time year is over. So passenger growth is happening.

And another point I'm going to say, there may be sort of -- I'm not going to sit here and project cyclicity of this industry. But fundamentals, this is going to be a growing industry. Passenger numbers are expected to double, especially driven by India and China. I may point out our strategy was very deliberate to play big in India and China.

If you notice, we have a great position soon with one more announcement, which will tell you how we are reinforcing that position. So -- but that -- we have a great position to capture that growth, which will be driven by India and China. But -- and if you look at Boeing and Airbus, they are saying aircraft -- number of aircraft in the next 20 years will double, which is in line with the passenger numbers doubling.

Last point I'm going to say, look at our results and then Helen's resilience presentation. Our results, EFH, we said 101 sort of 100% almost, and we are upgrading our guidance. Frankly, if I was in your seat, probably you would be thinking, hey, your EFH is a little bit light.

By the way, supply chain is something to do with it as well to some extent. But what does it tell you? We are actually expanding underlying performance in this business and with that, making it more resilient because environment will be what it will be.

But earlier comments from Helen and me, which should tell you, we are ready to deal with any environment, although I don't see that environment -- I don't actually read that cross from competitive intensity airlines to this. By the way, even in airlines, obviously, I talk to CEOs, different airlines see the picture slightly differently.

Jeremy Bragg

So we'll make this the last one, I think, guys, which is focusing on narrowbody this time. So this is per the comments [Indiscernible] you're moving ahead with the demonstrator engine for the narrowbody market. Is this a change in strategy? And what made you the decision to go it alone versus your prior comments about doing it as a partnership?

M. Tufan Erginbilgic

CEO & Executive Director

There's no change of strategy. We are pretty consistent company. We deliver what we say. So in CMD, if you remember, that's the first time we officially told you that where we are going to participate, where we are not going to participate. Part of that, we said narrowbody is something attractive for us, and we will participate preferably with partnerships. Nothing has changed in that.

And what gives us the confidence to participate in that is our engineering capability, obviously, but also UltraFan, next-generation engine will have to be more efficient. And most efficient engine today in the industry is 84. UltraFan is 10% more efficient than that. And actually, at plane level, we believe you can get to 15% efficiency doing some other things on the plane combination.

And IPs we have on UltraFan, a coverage of them and the duration of them positions us well. Why are we going with the demonstrator? Because, frankly, that doesn't mean we don't want to partner, but that means we would like -- we don't want to wait and position ourselves well out there.

So our preference didn't change, our strategy didn't change, but we actually see opportunities to progress this. And while we are progressing UltraFan with small engine as well, some additional funding comes with it because it is a different space. So there are some advantages of that as well.

Jeremy Bragg

Great. Thank you. We'll leave it there. Thanks very much, Tufan and Helen.

M. Tufan Erginbilgic

CEO & Executive Director

Thanks, Jeremy. I think while we are closing, first of all, thanks, Helen. And I think thanks for coming here, and thanks for all the questions. Thanks for your engagement in general with Rolls-Royce. We believe we are really making good progress. And today, hopefully, you get some data point in that progression, and I'm actually excited about what we will deliver not only in midterm, but also the future beyond that. And we are making good progress. Most importantly, our organization is responding to this brilliantly and that makes a difference. Thank you for coming. Have a great day.

Isabel Green

Head of Investor Relations

Hello, and welcome, everyone, to our 2023 full year results presentation. I'm Isabel Green, Head of Investor Relations. And I'm joined here today by our CEO, Tufan Erginbilgic; and our CFO, Helen McCabe.

Before we begin, I'm required to show you our safe harbor statement on Slide 2. As always, the full set of results materials can be downloaded from the Investor Relations section of our website. We're going to start today with an update on our performance and strategy from Tufan, and then Helen will present our 2023 results. Tufan will come back at the end to present our 2024 outlook and wrap up.

We'll take just over half an hour to present the slides, after which there will be time for questions in the room and from the audience online. In the room, please do use your press to talk microphones so that everyone online can hear your questions.

So with that, thank you very much. I'll hand over to Tufan.

M. Tufan Erginbilgic

CEO & Executive Director

Thanks, Isabel. Good morning, everyone. Thanks for coming. '23 was a big year for Rolls-Royce. We put in place a transformation program and strategic framework that is unlocking our potential to be a high-performing competitive, resilient and growing business. We worked at pace, achieved record results. Our strategic focus and disciplined execution helped to grow our operating profit to GBP 1.6 billion, and we converted this into GBP 1.3 billion of free cash flows.

This significant step-up in performance was driven by our actions with record results across the group, driven by commercial optimization, cost efficiencies and our strategic initiatives. We are creating momentum and a track record of significant delivery. This time last year, we set guidance ahead of expectations as our actions supported 25% uplift to the plans we started with.

Then at the half year, we upgraded guidance by around 40% as we delivered better-than-expected first half performance. And now today, we delivered record results. Double what was in Rolls-Royce plans less than 18 months ago. In Civil Aerospace, we delivered a fourfold margin increase. In Power Systems, we talk about the potential of the division if managed well, and now we have the best profit in 114-year history. And in Defense, our margin of 13.8% is almost at our midterm range of 14% to 16%.

This performance is underpinned by our new ways of working. A winning mindset is key to our success. We have an energized and aligned workforce led by a new executive team. We are managing the group very differently. We improved our capability in commercial optimization and changed the way we manage our costs and capital allocation for the most effective outcomes.

To support all these, we significantly improved management information and performance management. We have a lot more to do here, though. In November, at our CMD, we shared our new strategy with clear strategy. Detailed strategic initiatives are owned by the divisions with clear accountability and performance management to ensure we deliver. We are building on strong foundations, our achievements in 2023 give confidence in our outlook for this year, where we expect continuous improvement in both profit and cash. This is despite ongoing macroeconomic and supply chain challenges, which we will continue to mitigate with our actions.

Our strong progress so far and the plans we have in place give us confidence in our midterm targets. By the end of 2024, we expect to deliver more than as we are targeting for the midterm. We plan to achieve our targets by 2027 time frame. But if we can get there sooner, we will.

Let's look at 2023 in more detail. Operating profit of GBP 1.6 billion was more than GBP 900 million higher than in 2022. Our midterm target of GBP 2.5 billion to GBP 2.8 billion implies around GBP 2 billion of profit growth between 2022 and 2027. In '23 alone, we delivered almost half of that.

Our group operating margin of 10.3% in '23 more than doubled year-on-year as we focused on commercial optimization and cost efficiencies across the group. Again, this represents our midterm target of 13% to 15% as we close the gap to our competition.

Free cash flow also more than doubled from GBP 0.5 billion to GBP 1.3 billion, a record for Rolls-Royce. This was achieved despite continued supply chain challenges. Our higher operating profit and a net GBP 1.1 billion movement in the LTSA balance drove this improvement. Free cash flow was GBP 400 million higher than in 2019 despite engine flying hours of only 88% compared to 2019.

This again demonstrated how much -- same cash performance of the group. Finally, we delivered a return on capital of 11.3%, the first time that the group has achieved a double-digit return on capital for many years. These results reflect the hard work and focused actions of all our teams. However, we still have a lot more to do.

Last year, all of our established divisions contributed to the significant improvement in operating profit and margins with commercial optimization and cost efficiencies common in all of them. The largest improvement year-on-year came from GBP [Technical Difficulty] million improvement in operating profit and a 9 percentage points increase in margins to 11%. Putting this in context, in 2022, at the Civilian Investor Day, Rolls-Royce guided high single margins by 2024 or 2025, based on a return to 100% of 2019 engine flying hours.

This shows how much we change. We are delivering significantly beyond this already as we benefit from our transformation actions. In Defense, operating profit grew by 30%, with a margin of 13.8%, [Audio Gap] The team has done a great job here. The improvement in margins was mainly due to our strategic actions as opposed to volume growth.

Finally, Power Systems. For the full year, Power Systems margins improved by 2 percentage points to 10.4 percentage points [Audio Gap] rising and cost efficiencies. The second half of the year was very different to the first. Just as we said, it would be in February. In early 2023, we took actions to raise prices and deliver cost efficiencies to improve profits and cash to a record level.

We have a clear strategy based on 4 pillars: Portfolio choice, strategic initiatives, efficiency and simplification and low carbon and digitalization. Let me talk about the progress in our strategic delivery starting with these first 2 pillars on this slide. Firstly, portfolio choices. At the CMD, we said we would be investing differently. Focusing on those opportunities where we have a chance to differentiate and where we can lead.

In Civil Aerospace, the UltraFan program successfully tested at full power in 2023 in trials that also showed the power gearbox handled accelerations and decelerations 20x faster than we had previously achieved. Last year, we continued to invest in our Pearl 700 engine was certified by FAA for gas streams, G700 and G800 aircraft.

In Defense, we [indiscernible] of the AUKUS submarine program and received formal confirmation of the FLRAA program in the U.S. Work has commenced on both programs as we image for our future on these key platforms. In Power Systems, work has begun on a new engine that will join our portfolio alongside our current Series 4000. This will be the first major new engine program for Power Systems in more than 2 decades.

In SMR, we entered the second phase of the GDA regulatory process and were shortlisted in the U.K. government's technology selection process. We took the decision to exit our electrical business or alternatively for the right value reduce our position to minority with an intention to exit fully in the midterm.

We are progressing well on this. We also announced the disposal of our off-highway low-power range diesel engine business, which is expected to complete this year. Moving on to the second pillar, strategic

initiatives. In Civil Aerospace, we are investing GBP 1 billion in time on wing improvements. This is a multiyear investment. We are working on the final stages with Boeing and the FAA on certifying the new [Audio Gap] double the engines time on wing. We expect it to be approved this year taking us to a competitive level of durability by next year, while the reliability remains very strong.

This is the same improvement that's very strong. This is the same improvement that we have certified on the Trent 7000 blade, which we have already retrofitted to over 20% of the fleet. And we aim to double the time on wing of the Trent amongst over the next 2 to 3 years with our investment in HBT blade coatings that are more resilient in areas with plus of sand and dust.

In benign environments, where performance is already good. We see potential for a 50% increase in time on wing. We are also driving down shop visits costs. For example, we achieved 10% reduction in this assembly and repair ours on the Trent XWB-84 in 2023, and we have a clear plan for continuous improvement.

As part of our program, last year and major airline contract renegotiations were either concluded or progressed. I was personally involved in agreeing win-win solutions in these negotiations, and we have more to do on this in 2024. In Power Systems, we installed and commissioned a major battery storage system to support renewable power into the public grid in the Netherlands.

This 30-megawatt project with 60-megawatt battery storage capacity is one of the largest battery storage system anywhere in Europe. Now moving to our other 2 strategic pillars. We are becoming a more efficient business and simplified organization. Our efficiency and simplification initiatives aim to deliver sustainable annualized savings of GBP 400 million to GBP 500 million. Around GBP 150 million of this has already been achieved in our 2023 results. And we expect a further GBP 200 million from our organizational design changes, which will remove 2,000 to 2,500 [indiscernible] by the end of 2025.

Earlier this month, we began the consultation on our new proposed organization design, which will remove 2 layers and improve spans of control making it more strategically aligned and efficient. We have a number of third-party cost initiatives that aim to deliver GBP 1 billion cumulative savings by the midterm. Last year, we achieved GBP 130 million of this.

We are centralizing the procurement function at the group level. This will generate further savings as we reduce duplication and unlock synergies. We are also introducing zero-based budgeting. This will aim to save an additional targeted 10% to 15% in cost by applying a proven approach.

The final strategic pillar is low carbon and digitally-enabled business. We remain committed to becoming a net zero company by 2050 and supporting our customers to do the same. In 2023, we met our targets to test our in production civil engines with 100% SAF, sustainable aviation fuel with 100% SAF transatlantic commercial flight 787 with our Trent 1000 engines.

In Power Systems, we proved that our Series 2000 and 4000 reciprocating engines can also operate sustainably with testing and certification last year using sustainable fuels. It is not just a say of that getting good results. We have successful hydrogen testing programs in Civil Aerospace and Power Systems and digital tools. For example, we implemented a new digitally mapped demand forecasting tool for supply chain management in Defense, resulting in GBP 75 million estimated cost savings in the next 3 years.

This value should increase as the remaining engine programs are onboarded are critical to our success. There is no silver bullet. This is about executing granular plans with clear strategic purpose and performance management. This is how we are delivering. This is why we outperformed in 2023. We look forward to 2024 and the medium term with confidence that we will fully unlock our potential.

I will now hand over to Helen to cover 2023 results in more detail.

Helen McCabe
CFO & Director

Good morning, everyone. Record 2023 results. They demonstrate that we are managing the business very differently. That we have a clear focus on delivering high-quality and sustainable earnings and cash flow and that our strategic initiatives and transformation program are delivering at pace.

The key financial highlights. Group revenue grew by 21% with strong growth across all divisions. Our advantaged businesses are uniquely positioned in end markets. [Audio Gap] GBP 1.6 billion, operating margin more than doubled to 10.3% due primarily to commercial optimization and cost efficiency actions across the whole of the group. The largest year-on-year performance was in Civil Aerospace, but margins in Defense and Power Systems also substantially increased.

Free cash flow was GBP 1.3 billion, more than double that of 2022, an all-time record for Rolls-Royce. Strong cash flow generation meant that we reduced net debt to GBP 2 billion, a reduction of more than 40% year-on-year, and our return on capital rose from just under 5% in 2022 to over 11% in 2023, driven primarily by improved operating margins, but also by our disciplined capital allocation and working capital management.

So let's move to performance by division. Civil Aerospace. I'll start with a summary of the highlights, then go into more detail on financials, the impacted industry-wide headwind. Civil Aerospace delivered the largest year-on-year improvement in profit and operating margins. We delivered operating profit almost 6x higher than that of the prior year. It increased to GBP 850 million from GBP 143 million in 2022. We achieved double-digit operating margins of 11.6%. That compares to 2.5% in 2022.

We grew revenues by 29% to GBP 7.3 billion. That was driven by large engines and business aviation deliveries as well as higher shop visits and commercial optimization. OE engine deliveries. They grew by 29% [Audio Gap] despite supply chain challenges. Of these, 262 were widebody engines, which included 53 spares. That supported increasing number of shop visits, that did as our fleet grows and total shop visits grew by 18% to 1,227. Of these, 368 were large engine refirms compared to 248 in 2022.

Operating profit in more detail. There were 3 key factors behind that sixfold increase. First, widebody. We delivered higher aftermarket profitability with an increased volume of LTSA shop visits and a higher profitability per shop visit driven by our commercial optimization actions. In terms of shop visits, there was an increase in Trent 1000, Trent XWB and Trent 700 refurbishments in the second half of the year.

We also benefited from a materially higher contribution from time and materials where we increased the pricing of life limited parts by an average 12% in the year. Second, Business Aviation. We more than doubled profitability, again, driven primarily by aftermarket with increased shop visits and improved commercial optimization as a result of the team's actions.

Business Aviation deliveries increased by 19% to 196, driven by growing demand for apparel engines; and third, cost efficiencies. Our actions supported lower indirect costs with a reduction year-on-year despite broader inflationary pressures. But we also faced some headwinds, industry headwinds. Industry supply chain challenges drove higher costs. This impacted catch-ups of higher costs and the net movement of onerous contract provisions. Catch-ups were a charge of GBP 29 million, GBP 119 million benefit in 2022. But if you recall, 2022 benefited from a material positive adjustment associated with inflation that triggered price escalation causes which, as we expected, did not repeat in 2023.

We also took onerous contract provisions totaling GBP 410 million again, primarily as the result of industry supply chain challenges as we recognize the impact of higher future product cost. This impact was broadly offset by the strong progress we made on contract negotiations. Our actions to progress or close all key contract negotiations in conjunction with time and wing improvements drove a significant release of provisions in the year, GBP 385 million cash. Civil Aerospace delivered trading cash flows of GBP 626 million. A GBP 400 million [Technical Difficulty] mainly due to higher operating profit and a continued LTSA balance growth as engine flying hours increased to GBP 16.5 million with large engine flying hours standing at 88% of 2019 levels. And working capital outflows were lower than the prior year while net investments were higher as we invested in our strategic projects.

In summary, a very strong performance from Civil. Defense. The results reflect a material improvement in operating profit and margins as we delivered on our commercial organization and cost actions [Technical

Difficulty] GBP 562 million, a 30% increase. Operating margins for the full year were 30.8%, around a 2 percentage point increase on the previous year and very close to our midterm targets, as you've heard from Tufan.

We saw strong demand across all of Defense's key end markets with strong order inflows with a book-to-bill ratio of 1.3x, which drove a record order book of GBP 9.2 billion. Revenue growth was double digit, 12%. This was driven by volume and pricing. There was growth in all key end markets, notably submarines and combat, which grew by 20% and 18%, respectively.

The year-on-year improvement in operating profit was driven by 3 key factors: commercial optimization. The team did an excellent job renegotiating contracts, ensuring our value-based pricing guide rails were followed as contracts came up for renewal. Cost efficiency actions. We managed costs and revenue grew and indeed, we just indirect costs, reflecting the impact of our strategic choices and increased customer funding with an R&D fund.

Defense's cash flow increased to GBP 511 million. This was largely driven by higher operating profit, but also reflected strong working capital performance with inventory reducing in the year and continued strong customer inflows from deposits.

Next, Power Systems. As you've heard, Power Systems delivered record results in 2023. Operating profit increased by 44% to GBP 413 million with an operating margin of 10.4%, a 2 percentage point increase compared to 2022. Order intake was 4.3 [Audio Gap] for 2024. Demand was strong in our advantaged businesses of power generation, marine and governmental. Revenues grew to GBP 4 billion, a 16% increase with a 34% growth in power generation, in particular, data centers where we have a leading position. Growth in Marine was also strong, as you can see from the slide. Increased operating profit was primarily driven by commercial optimization, our actions to address all subsegments, cost efficiency our actions, which resulted in lower indirect costs, again, despite volume growth and inflationary pressure and power gen.

In the year, profitability tripled as we addressed the business model, focusing on both pricing and cost improvements. Cash flow. It broadly tripled year-on-year to GBP 461 million with an exceptionally high cash conversion ratio of 112% versus 56% in the previous year. Our working capital initiatives were particularly impactful with a substantial inventory release in the second half of the year as well as high levels of advanced deposits, some of which we received earlier than expected.

Power Systems, like Civil and Defense brought home a very strong 2023 performance. Now we delivered GBP 1.3 billion of free cash flow, approximately GBP 800 million higher than 2022. The main driver of the year-on-year increase was higher operating profit, which grew by over GBP 900 million.

Turning to the other factors, investments. We continue to invest in growth opportunities for the business with a clear focus on investments that are strategically aligned. Attractive projects that generate profitable growth to the midterm and beyond, such as time on wing, investments were around GBP 200 million higher year-on-year. LTSA. As expected, the net LTSA balance grew. It was around GBP 300 million higher than the prior year, reflecting engine flying hour growth and higher normalized engine flying hour rate.

It also included some one-off benefits such as the recovery of the GBP 100 million of debt that we had previously written off. Then working capital. As I said at the CMD, this is a priority, and we made good progress. Our working capital outflow was lower than in 2022. We released working capital in the second half of the year with all 3 divisions releasing inventory in the second half. Inventory days reduced.

And as we focused on overdue and unbilled debt, debtor days also reduced. I'd like to just pause and thank the finance teams and all of the divisions for the work on this in a very difficult macro environment. Everyone did a great job. We are making sustainable progress in working capital and the program we have in place, and I expect that to continue into 2024 and beyond.

Next, provisions. They moved by just over GBP 200 million. This includes the payment for the Collins legal judgment and outflows as we traded through our onerous contract provisions, then overdue hedging costs, sorry then overhedge costs. GBP 100 million, GBP 60 million higher than in 2022. Net interest costs. These

reduced by over GBP 140 million, driven by improved cash delivery and the benefit of higher interest rates.

And finally, cash tax costs of GBP 172 million. They were similar to prior year as we had guided. We delivered a record cash delivery for Rolls-Royce in 2023. Cash remains an absolute priority for the whole team. Tufan will talk to the outlook for 2024, but let me give you some data points to help with your cash models.

We expect the LTSA balance growth net of RRSP prepayments to be at the low end of the guided rate of RRSPA to GBP 1.2 billion. This reflects growth in short visits and mix impact and a non-repeat of the one-off impacts, such as the GBP 100 million of debt recovered in 2023. And as we repay debt and continue to strengthen the balance sheet, we expect our net interest costs to reduce modestly in 2024. We expect cash tax costs to be roughly GBP 100 million higher as profit grew and the cash cost of unwinding the overhedge position to reduce to GBP 146 million, as we have previously signaled.

Now moving to how we are building resilience. A key priority I set out at CMD was how we are building a more resilient business with an improved balance sheet, a better operating leverage and higher returns. You've heard examples of how we are driving efficiencies across the group. For example, the GBP 150 million of cost efficiencies and the GBP 130 million of reduction in third-party costs.

Actions such as these have supported our TCC to GM ratio improving to 0.5x, significantly [Technical Difficulty] 2022 and indeed in 2019 pre-COVID. We are making strong progress towards our midterm target of 0.4x to 0.5x as well as making our profit delivery more resilient and expanding the earnings potential of the business, we have also strengthened the balance sheet to GBP 2 billion and our net debt-to-EBITDA ratio at the end of the year was below 1x.

Our gross debt of GBP 4 billion was broadly unchanged, and it remains our intent to repay the forthcoming EUR 550 million bond from underlying cash as it falls due midyear. Liquidity remained strong, standing at GBP 7.2 billion at the end of the year and that is after we retired 2 undrawn facilities of GBP 1 billion each in the year. Our efforts to improve resilience, rebuild the balance sheet and put in place has been recognized with upgrades from all 3 credit rating agencies in 2023.

As I previously shared, once we are confident the balance sheet has sufficient, sustainable resilience and that we are comfortably at investment-grade profile, we intend to resume shareholder distributions. To conclude, we have delivered strong financial progress in 2023, with strong results across all divisions. This performance has been underpinned by our clear strategy and delivery of our strategic initiatives.

We are running the business very differently. We are building a track record and delivering on our commitments. And with that, let me hand you back to Tufan.

M. Tufan Erginbilgic
CEO & Executive Director

Thanks, Helen. Last year, we delivered strong results despite an uncertain geopolitical environment, high inflation and interest rates, recession risk and significant supply chain difficulties. We expect the supply chain to remain challenging for another 18 to 24 months. Supply chain issues have resulted in higher product costs in 2023. In fact, Helen mentioned that. Across the industry in Aerospace, there are bottlenecks caused by both labor and parts shortages.

Higher interest rates and reduced availability of credit have also impacted some of our suppliers. This is something that we will continue to monitor closely, [Technical Difficulty] introducing digital and AI tools to better manage the supply chain. In 2024, we will actively manage these challenges and continue to transform Rolls-Royce to be a more resilient business by continuing to improve our total gross margin ratio and strengthening our balance sheet, as Helen mentioned.

In addition to our actions, some trends affecting our business partly insulators. In Civil Aerospace, we have a growing market share in widebody. We expect to benefit from a continued recovery in global travel and in particular, international travel in Asia. In Defense, we see more long-term support for Defense and governmental spending resulting from geopolitical tensions. Recent order wins such as FLRAA, AUKUS and

B52 will drive growth for decades to come. In Power Systems, we expect to see growth in governmental driven by secular data center growth.

Turning now to our guidance for this year. We expect progress towards our midterm targets. We expect to deliver operating profit of GBP 1.7 billion to 2 billion, with margin improvements in all divisions and free cash flow of GBP 1.7 billion to GBP 1.9 billion, driven primarily by higher operating profit. This guidance assumes large engine flying hours at 100% to 110% of 2019 levels, reflecting yet to deliver 500 to 550 OE engines, of which around half will be widebody engines.

Spare engine deliveries are expected to be broadly similar to 2023 number. And we expect 1,300 to 1,400 total shop visits, including 450 to 500 large engine refurbishes. Based on what we achieved already in 2023 and our guidance for 2024. By the end of this year, we will be over halfway towards achieving our midterm targets for operating profit and cash flows [Audio Gap] delivery and impact of our transformation and strategy.

Effectively, we are front-end loading performance improvement delivery for our midterm targets. We have a bold, but achievable plan to transform Rolls-Royce into high-performing competitor and resilient business with growing sustainable cash flows, a strong balance sheet and growing strategy to achieve this, which is owned across the organization.

Our transformation is based on building a sustainably distinctive business. It has 4 key elements. First, operational excellence. The safety of our people and our products is the [Audio Gap]. We put safety and quality control at the heart of everything we do, and it is a responsibility every employee in the company carries.

Our strategic initiatives aim to improve operational effectiveness to deliver best-in-class customer service despite the supply chain challenges. Second, our advantage products and technologies are highly competitive. We already have some of the best products and technology in the industry.

We are investing further to improve our products significantly. Our highly advantaged product portfolio will sustainably drive stronger long-term financial performance. Third, we are becoming more focused, enabling increased investment in the most important programs, while deselecting those that are not aligned to our strategy or they don't meet our investment criteria [Audio Gap] or strategic plan or exit.

This focuses and aligns our organization on the most value-creating activities. Fourth, our new mindset and the distinctive performance culture we are building are fundamental to delivering our plans. We have an aligned one Rolls-Royce that can fully realize its [indiscernible]. We have ambitious, but achievable midterm targets.

There is much more for us to do, but we are building a track record of delivery, as you have seen in our results today. And we are confident that we will generate value for all our stakeholders and deliver our Rolls-Royce proposition. Now I'm going to open the floor for questions. You were quick. I'll start here. Then I'll go there.

Question and Answer

David Howard Perry

JPMorgan Chase & Co, Research Division

It's David Perry JPMorgan. Congratulations on your success [Audio Gap] huge jump in Civil Aero a little bit, and it's even better if you look at it without the contract catch-up of last year, it's over GBP 1 billion. And Helen, you talked a bit to the reasons, but could you sort of just put some weighting on those reasons, cost versus aftermarket versus business jet, et cetera?

Secondly, Tufan. I know you don't want to comment any more on engine flight hour pricing per hour. But just maybe you're willing to tell us what the percentage change in the average price was in the year-over-year, maybe for the second half and maybe what [Audio Gap] 2024.

M. Tufan Erginbilgic

CEO & Executive Director

Thanks, David. Civil, I agree with you. It was a good year for Civil Aerospace business definitely. I think -- and Rob is here, I'm sure at the break, if you want more details, I'm sure he is going to be willing to share that with you. But I think the big factors. I'm not going to repeat because your question was more sort of where the emphasis is.

I think here is how you may want to think about this. Aftermarket obviously has driven it both LTSA and T&M, time and material LLPs. And in both of them, commercial optimization play their role. And then business aviation growth was significant profitable growth. Costs are interesting because if you're actually thinking about net cost efficiency but cost thing is, you more than offset inflation there because there is inflation in direct cost, more than offset the inflation, i.e., net of inflation, you are when you have cost savings, that means all your pricing actions flowing through the bottom line.

That's a big leverage impact, right, in any business, not to mention this business. So that is what was going on here. I think in terms of numbers, LTSA and time and material were the biggest contributors, cost contribution was less. But if you think what it would have been because normally inflation would have increased our cost. That didn't happen, and you had net benefit that was important contribution. So you predicted rightly, I'm not going to talk about sort of -- because -- not because we are hiding it, David. But actually, the way we are running this business is very different.

And we need to sort of a common understanding on that. So we are actually looking every opportunity either for cost reductions or pricing. So therefore, there are some systematic sort of approach, some very disciplined execution. But within that, there is lots of dynamic thinking going on.

And as a result of that, some of this -- so if I give you a rule of thumb, it is not going to work necessarily. But I said it in CMD, and I will continue to say it because effectively, this year's EFH rate was actually almost identical to our forecast in CMD and our projection for 2024 is similar to our CMD numbers and it's similar to -- and that's what you should expect going forward because of our pricing actions. Thanks, David. I'm going to go there and come back here.

Ross Law

Morgan Stanley, Research Division

Ross from Morgan Stanley. So first one on the engine flyer assumptions for this year, 100%, 110% of 2019 what's assumed in that in terms of installed fleet size? Is that going to continue to grow? Secondly, on and material pricing, Helen, you mentioned you achieved 12% in '23. Interested in your thoughts for '24 there. And then lastly, just on the provision in Civil of GBP 410 million. You said that's obviously supply chain led, maybe a bit more detail about what types of supplier or what types of product drove this?

M. Tufan Erginbilgic

CEO & Executive Director

Okay. I'm going to ask Helen to pick up the product cost. I think on EFH effectively 100%, 110%. Yes. Short answer to your question. Yes, our installed engine base growing, and you should expect that to grow because our market share is growing. So -- and 100%, 110% is no longer you shouldn't think and it is even more true going forward. You shouldn't think market recovering from COVID. If I give you a percentage, half of it market recovery, half of it actually installed engine growth. Looking forward, you want to have much recovery rather, you will see more normal market growth, but over and above that our growth. So we actually said in CMD widebody market growth we expect between 5% to 7%, but we said our growth will be more 7% to 9%. So same dynamics, I think, playing out here definitely.

On T&M, yes, we made similar price increase this year as well. That will be my short answer.

Operator

Fantastic. So Ross, thank you for the question. So supply chain. So the GBP 410 is I think several between all of the divisions is the one that's been most impacted by supply chain challenges. If you look at the macroeconomic environment, high inflation, high interest rates, lack of credit in some of the markets. But lack of credit and some of the supplier base is under pressure. What does that do? That causes impacts to operations, product costs, parts availability that everyone has seen coming through.

The team under Rob's leadership has done an excellent job leaning into that, very proactive, you heard how across the group and the majority of it sitting in Civil. We've actually taken actions, which has given us GBP 130 million benefit. The very practical things underpin that, where Rob and the team actually sent in a task force to provide support. One of them we sent in for our people to provide additional support. We're looking at what's our make-buy strategy, what's our component strategy? Where should we be moving to dual sourcing?

So yes, macro environment, should we be moving to dual sourcing? So yes, macro environment is challenging. We expect 18 to 24 months that we are very proactively leaning in to address and to mitigate that as much as possible.

Nick Cunningham

Agency Partners LLP

Nick Cunningham, Agency Partners. I just wanted to apologize in advance for a very simplistic typical analyst question, but some -- if I add up the cost savings that you talked about that are still to go, they're more than the delta in profits to 2027 that you're aiming for.

And of course, you'll have volume growth and so on in that period as well. So presumably, there are some offsets. I'm guessing inflation is one of them. But are there others like some sort of give backs in terms of investment in R&D, for example, that we should be thinking about in terms of how you get to that sort of net.

M. Tufan Erginbilgic

CEO & Executive Director

To math right, because I don't get there with that math. But I think we effectively said GBP 400 million to GBP 500 million indirect costs, right, net savings. So GBP 150 million, we delivered obviously. So the rest, that means around GBP 250 million, we will deliver. So that will contribute to our midterm targets.

But it doesn't achieve itself midterm targets. I'm sure you appreciate that. So there are -- there is lots of commercial optimization going on. And you heard the product cost increase frankly. In CMD, we knew product cost increase. Rob talked about. I talked about one of the 6 levers, we have product cost reduction project. We were actually using the baseline we knew then because it was November, we knew then bit higher. So from that baseline, we are effectively reducing the product cost. So that is how you should actually think about the components here.

Helen McCabe

CFO & Director

Can I add? And I was going to say, I think, of course, we've allowed for inflation in our models, Nick, absolutely. And growth costs which we look at very closely to make sure that we've got the right support to support our strategic initiatives going forward.

M. Tufan Erginbilgic
CEO & Executive Director

Thanks for sitting there. That's our inside joke last time I couldn't see him. He was hiding somewhere else.

Ian Douglas-Pennant
UBS Investment Bank, Research Division

It's Ian Douglas from UBS. First on supply cost inflation that you're seeing. Helen, how do you think about this in terms of working capital reduction, especially around inventory? Do you need more safety stocks than perhaps you thought you did pretty. And secondly, when do you think you would feel that you are sustainably investment-grade credit profile, and therefore, you could start returning capital to shareholders?

Helen McCabe
CFO & Director

Fantastic. So supply chain and inventory. As I said, 2023 was a difficult environment for everyone. Since we launched our program every division in the second half of 2023 released inventory. And I think that, combined with a reduction in inventory days, while we're growing the business, reduction in inviable improvement, do we need to build inventory? One of the things that we're doing, we're doing multiple things, as we're being very deliberate around where we're holding inventory and what we need to hold it for.

If you look, and it's across Civil, Defense and Power Systems, we have got work plans in place to be much tighter in our sales and operating plan, and we've identified pockets even in a difficult environment in 2023 where we can release inventory because we had elements of inefficiency across the chain. Power systems agreeing how they manage their inventory flow so that, that didn't set as work in progress for excessive amount of time.

So do I expect to build inventory? In absolute terms, no, because we'll be very deliberate as to how we manage the end-to-end chain, I expect continued progress on our working capital program going forward. In relation to investment-grade profile, as we've shared before, our priority is to strengthen the balance sheet and get it to where it needs to be to support us in delivery of our midterm targets.

After a number of difficult years for Rolls-Royce, we are absolutely determined that we will do that and deliver on our promises for all of our stakeholders. We are making progress. So once that balance sheet is sufficiently strengthened, and once we are comfortably and sustainably investment-grade profile, we are committed to resuming shareholder distributions. And at that point, we'll come back and update you further.

Victor Allard
Goldman Sachs Group, Inc., Research Division

Victor Allard from Goldman Sachs. I wanted to follow up on T&M, we've seen a very strong increase in 2023. We talked about pricing in terms of unbundling some content that you've talked about in the past and at the CMD. Could you please share some color in terms of do you see volume growing this year? Should we think about it as growing in line with large refer but probably even outpacing that figure?

M. Tufan Erginbilgic
CEO & Executive Director

Thank you. I think yes, we are unbundling in the new deals, definitely. And I think I mentioned last time that our current portfolio, if you look at it, 50% unbundled, 50% bundled. So roughly, roughly talking. So -- but going forward, differently, we want to make whole system more flexible. So that's the drive. So if

you actually think about this is not only for T&M, but for everything we do because we are taking actions, proactive actions and the more -- in a flexible system, that's what they will do.

So our mindset is definitely there. So yes, normally, you should expect that to go up with the shop visits, but there is a caution there that it depends on the mix because some shop visits, obviously, that is well [Audio Gap] approach to that because that's not how this is going to work.

Unknown Analyst

I'm Stephan from Bank of America. Just asking from the credit side about investment-grade profile and obviously, net debt is a big part of that, but also just wondering what ideally be? And then -- and next question is just a lot of industrial businesses. There's been a lot more focus on factoring and reverse factoring programs and any indication of where you're taking that going forward?

M. Tufan Erginbilgic

CEO & Executive Director

I will answer the second question straight. We want cash flow growth of the company rather than doing the [Audio Gap] if you like. with that some kind of engineering.

Helen McCabe

CFO & Director

So how you should hold gross debt, net debt so we've got a strong liquidity position. You heard me say GBP 7.2 billion. We will always ensure that we have sufficient levels of cash and access to undrawn facilities to ensure that we have the operational and financial flexibility we need to deliver that we have. We look at that very flexibility, we need to deliver on our strategy. We look at that very, very closely.

And as I also shared, we have a clear plan detail in '24 and '25. Our intent is for the bonds that fall due in '24 and '25 to repay those from cash. But it's something that we look at very closely. It is tied to that balance sheet resilience.

M. Tufan Erginbilgic

CEO & Executive Director

So Isabel, you are well, let's go there.

Isabel Green

Head of Investor Relations

Just checking one microphones on do I need to. Yes it is grand. I would need to use the seat microphone as well. I've got 3 different areas of questions online. The first one in terms of Phil Buller, Berenberg, who sadly can't be in the room today. He asked labor shortages were cited as part of the reasons of the provision. So are we taking -- we're taking employees out of our own organization and has given what we see?

M. Tufan Erginbilgic

CEO & Executive Director

Okay. Let me -- yes, thanks for the question. Let's be very clear what we are doing. By the way, I wasn't referring to our labor shortages. I was referring to industry labor shortages. In our case, we didn't have that issue. Normally, smaller suppliers really have that issue for everybody's benefit, but it really have that issue. May mean that you are not actually producing the engine. So it just our plans. We are very clear. We have been actually increasing direct labor, but we look at productivity improvements. So we actually improved the productivity last year.

And while you are increasing direct labor, you are increasing production, direct labor supports that we drive productivity improvements. Our 2,000, 2,500 is mostly what we call sort of indirect. Therefore it is not volume related and consultation right now. And as I mentioned in my script, by the end of next year, we should have broadly finished that program in terms of exits and so on.

Isabel Green*Head of Investor Relations*

If I could follow up. I've got 3 analysts with 3 questions on the same theme. So I'll read all of them out and cover them in the answers. So Emerick Folan from Kepler Chevreux asks, what is the current time on wing for Trent 1000 and Trent XWB? And how does that compare with the Trent 700? Clari Lemarie asks, could we talk about the Trent 1000 fix as of today is the HPT blade on the take across both the Trent 7000 and the Trent 1000 fleets -- and again, Ben Helene of Bank of America also asks, could we discuss time on wing, Trump 1000 and where we are on certification of the final fix? So thank you all 3 of them. Thank you for your answer.

M. Tufan Erginbilgic*CEO & Executive Director*

I then frankly, let me take it up in that order. But -- so engine technology change in Civil Aerospace because Civil Aerospace went to fuel efficiency. And with that, frankly, because there is one question here, can you compare it with Trent 700. That's why I'm saying it. And this applies to all. It's not Rolls-Royce specific issue. You are -- this industry, as you know, I'm not insider, but I came from outside.

My reflection of it somehow industry move their expecting different results. Frankly automotive industry went through this journey before aviation industry because of the emission standards in automotive industry. When you want more efficiency, it comes with higher temperature and so on, and therefore, cycle time is lower. So no, I think no engine we will produce Trent 700 cycle time. But what we are doing with our engines, taking them to a very competitive level, okay, in any environment. That's what we are doing.

XWB824 is the best engine right now, durability, reliability and fuel efficiency in widebody market without any doubt, and you can ask any customer. Therefore, we are actually saying now all of other engines we have, we want to take it -- I talk about GBP 1 billion investment in time on wing. We -- it is a very structured program. Not to mention, Rob. I actually [Audio Gap] already doubled the time on it. Last year, by the end of last year, it was going to be certified. Unfortunately, it didn't and it got delayed. And this year, we now -- we are working with both Boeing and FAA. Frankly, I was there, I met meetings a month ago with both Dave Cardon and the new head of FAA work with and accelerate and certified this year.

Then shop visits, how long it is going to take this year -- in '22, if you remember, we already retrofitted 20% of it because you wait for the shop visits for the engines to come to shop visits to retrofit. But importantly, we are making another 30% improvement on Trent 1000. Therefore, I said in my script that by the end of next year, it will be absolutely fully competitive engine on durability, as good as the competition and reliability is already very good.

By the way, reliability of all our engines are very, very good. On 97, I think in none -- sort of in benign environments, it's actually a good engine. We like -- I'll give you some numbers and it sells really well. Last year's orders, 135 aircrafts. We only expect that to grow on 97. So it is a good performing engine in what is called as non-dusty, non-[indiscernible] environments, i.e., sort of something like Middle East and so on. But our time on wing program, which will take like Trent 1000 I said by the end of next year, we will be there. I think this will take a couple of years, 2, 3 years for us to take it to the market.

What it is going to do, it's going to double the time on wing to enable that. I actually met with Tim Clark last week. He's very happy where this is going to go. He cannot wait for that to come to the market. I can assure you. So you can ask him yourself, because I was there Friday meeting him. So pretty up to date I would say. But -- so I think frankly, that will double time on wing in nonbenign environments. And already good performance in benign environments. We will increase it 50%.

So once we do all that, thinking about the impact, it is going to have all our shop visits and or lack of them, I should say, so -- and the EFH rate and so on. So that's why I sometimes say all the things we are doing obviously helping midterm delivery, but it is going to create even much bigger value in the future, take this 97.

It will be actually the highest trust best aircraft probably 4 years, 3 years from now. So is that going to help our midterm results? Maybe a little bit. Is it going to help -- is it going to create enormous value

beyond that because you don't anymore invest GBP 1 billion, but you got all the benefits of it? Yes, and Trent 1000 the same.

So I think that's a long answer, but it is an important program for us. It is one of the 6 levers that Rob drives very hard.

Isabel Green

Head of Investor Relations

Thank you, Tufan. Before I go on to -- I've got time for one last question, which I'll read out from online, but just to say thank you for everyone online for the number of questions we've received. There are a lot of them. Clearly not time to do all today, but my team and I will get back to you individually. So thank you. And apologies if you didn't make the cut. The final one that I'll read out today is from Bob started from Vertical Research, who has said Airbus noted last week that the pricing on current widebody competition is challenging. How does this reconcile with Rolls-Royce's ambition of getting much better pricing on new Trent engines?

M. Tufan Erginbilgic

CEO & Executive Director

So I think we are very aligned with Airbus. First of all, I should say. And I had Saturday dinner with [indiscernible] as well, by the way. So we have very good alignment between the 2 companies. Definitely, that's how you should think about it. And our pricing, one correction on that question, it's not an ambition. We are actually -- we have been implementing it. So it is an implementation for good 12 months. There is no new ambition, we will continuously implement that pricing framework that Airbus is well aware and well aligned.

And obviously, we have similar situation with Boeing. So it's not an ambition. It is well in execution with very good results because last year, in the last 15 years, we record orders for Rolls-Royce. We got 700 engines. Our order book is longer than it has ever been. I think it is in your supplement that 1,600, I'm rounding the numbers a little bit. 1,600 engines in order. So you can do the math, how many years engine order that is. So I think our pricing position is all about remunerating the value we create and creating win-win solutions as a result of that. Isabel, any more questions?

Isabel Green

Head of Investor Relations

That's all we have time for online today. So back to you to wrap up, Tufan.

M. Tufan Erginbilgic

CEO & Executive Director

Any pressing question in the room, I always ask sort of okay, very good. Thanks for coming, and thanks for all the questions digitally as well. Thanks for all the questions. And frankly, we think we are making great progress with our program. You can see it is not one division. It is all the divisions delivering. And you can see the same themes coming through. Why is that? Because it is one Rolls-Royce, actually implementing similar actions where the market opportunity is. And therefore, you hear commercial optimization, efficiency, working capital improvements and so on across the board. And we are on that agenda.

One thing I'm going to say, thinking about cumulative delivery. And I've been in this journey before. Don't look at every discrete year. We have midterm targets. The way we are really running this business is no longer teams are targeting a number they want -- we want to make strategic projects at pace.

Some years, that will mean you over deliver. Some other years may offset that a little bit. Most important thing on a cumulative basis, are we actually on track. And I would say if you look at our profit and cash numbers, I would say we almost -- when we deliver 2024 midpoint, if I take, it is going to be almost 60% delivery on the performance improvement both on profit and cash in 2 years.

So this is the opposite of hockey stick. I hope you appreciate that and demonstrates our progress. With that, thank you very much. Have a great day.

Presentation

Isabel Green*Head of Investor Relations*

Hello, and welcome, everyone, to our 2023 Capital Markets Day. I'm Isabel Green, Head of Investor Relations, and I am delighted to welcome all of you to our event today. Before we begin, I have a few notices to share. Firstly, Q&A. There's a lot of you here, so no more than 2 questions each. And please use your press to talk microphones, which are in your seats so that everyone online can hear you. For those of you online, you can submit your questions on the Q&A box. My team and I are also available after the event if you want to e-mail us.

Secondly, there are no practice fire alarms scheduled here today. So if you hear an alarm, leave the room by your nearest available emergency exit. And finally, please take note of our safe harbor statement.

The forward-looking statements we make today are subject to the usual risks and uncertainties. Further details can be found in the Risk section of our latest annual report. Thank you. We will now begin.

[Presentation]

Tufan Erginbilgic*CEO & Executive Director*

Okay. Welcome, everybody. Good afternoon. And if you are joining from the U.S., good morning as well. Thank you for taking the time to join us today to those in the room and to those online. I hope you enjoyed the video. Every time I watch it, I am impressed and energized. Rolls-Royce is a great company with a rich heritage, a company with so much to be proud of and so much potential. And it is that potential and how we will deliver it, we will share with you today.

We have been making progress in creating a high-performing, competitive, resilient, growing company. We delivered strong first half results helped by transformation and performance management. We are accelerating financial delivery and raised our full year guidance earlier this year. This progress gives us confidence in the delivery of our strategic plan and the midterm targets.

First, I would like to introduce my leadership team. They represent an outstanding mix of deep technical and commercial expertise and bring a fresh perspective. Presenting today, Helen McCabe, our CFO; Adam Riddle, Defense; and 2 brothers there, Rob Watson, Civil Aerospace; and Jörg Stratmann, Power Systems.

And here, but not presenting, we have Chris Cholerton, on the front row; and Nikki Grady-Smith, blue dress lady; and Simon Burr, just next to her, our technology crew, Sarah Armstrong, our HR Director; and Mark Gregory, our General Counsel. You will have the opportunity to meet them during the day.

As video suggested, Rolls-Royce is at a pivotal point in its history. This year, we developed a clear strategy that will see this great company perform to its full potential. We have made material progress, but there is more we want to do. That is what we are addressing today.

Today, the team and I will take you through how we plan to do that. I will start with this strategic update and share our midterm targets, then I will set out our clear and granular strategy. Following that, Helen will take us through the financials, including our capital framework. We will then take the questions from the room followed by an extended break, during which those in London can experience our on-site exhibition and those online can explore case studies and exhibits virtually.

When we return, you will hear from the 3 divisional presidents about our detailed strategic initiatives, which will -- which underpin our targets. We will conclude with a final Q&A and key takeaways.

I want you to leave today with a powerful sense that this strategy is clear and that it is different. It will take Rolls-Royce to a top-tier competitive performance.

It will be rigorously delivered, and it is owned by the whole organization. Everyone is aligned and focused on its delivery. I am proud of what our teams have achieved so far. This is our proposition which we shared with you before. Firstly, build a high-performing competitive and resilient business with profitable growth; second, grow sustainable free cash flow, generate cash from operations and be disciplined with capital investment; third, build a strong balance sheet and grow shareholder returns.

By doing this, we will become a stronger partner to our customers as they meet the challenges and opportunities that define the future. We will unlock the full potential as we translate engineering excellence into strong financial performance. We will have the financial strength to invest in growth and grow shareholder returns. And we will create more opportunities for our people. So everyone can be a part of an energizing, rewarding and world-leading team.

Turning to our differentiated position. We have a strong portfolio of products and technologies in attractive markets. From these positions of strength, we are transforming to become a stronger business with a high-performance culture.

In Civil Aerospace, we are positioned to grow in the wide-body and business aviation markets, which are market-leading, efficient and high-performing Trent and Pearl engine families. These products power the latest and most advanced aircraft types, such as the Airbus A350 and gas streams, G700 and 800.

In Defense, we are a trusted long-term partner to the U.S. Department of Defense and U.K. Ministry of Defense. We have an exceptional order pipeline in transport, combat and submarine, helping to secure our long-term growth profile.

In Power Systems, we have a greater mix of revenue in high power segments where the margins are stronger. This gives us a structural advantage compared to our peers. And in Nuclear, our capability is unrivaled.

We have the broadest capability in the industry and are leveraging it in the new markets such as small modular reactors, SMRs, and micro reactors. All of this is underpinned by our strong brand, deep customer relationships and partnerships. Our transformation is also making us stronger and more efficient and resilient. Transformation is driving high-quality earnings growth and more ratable and growing cash flows.

To achieve this, we need to work as one Rolls-Royce with different ways of working and driven mindset to make a difference and achieve win-win solutions with our partners; a differentiated culture -- performance culture, where performance is tightly monitored and actions are timely taken; a new organization to simplify, build capability and become more efficient; strategic clarity that enables a more focused and aligned organization, clear on accountabilities and sharing the same ambitions; a business which is externally focused and benchmarked. All of these will make us more differentiated. So you can see why I am feeling so confident about our future.

And of course, at all times, the safety of our customers and employees will remain of paramount importance. Let me take a few moments to talk about our advantage technologies. We are experts in systems integrations. Our customers are not just buying an engine. They are buying a solution that integrates into a larger system, an aircraft microgrid or yacht integrated seamlessly to create the power and propulsion they need.

Our advanced manufacturing techniques mean that we can consistently create complex and detailed parts to an exceptionally high specifications. Our expertise in controls and electrical systems underpins the high performance and reliability of our products. Our next-generation developments are also advantage.

Today, I will just cover two, UltraFan and Nuclear. UltraFan is distinctive, developed to be competitive in the wide-body and narrow-body segments. It has scalable trust ranging from GBP 25,000 to GBP 110,000, enabled by a gearbox that delivered 64 megawatt on test and aerospace power record.

The suite of UltraFan technologies delivered a 10% efficiency improvements on the most efficient engine available today. By the way, just to remind you, probably you know, but most efficient engine is our XWB-84. We can retrofit some of these technologies into today's engines, such as the Trent XWB to increase time on wing and fuel burn efficiency.

Next, Nuclear. Our distinctive nuclear capability means we are in the best position to play a leading role in the SMR and micro reactor markets. Our SMRs are based on a modular construction that reduces cost, risk and time to construct compared to large nuclear projects. Our micro reactor technology is being designed for off-grid nuclear power applications, answering the demand for energy security and low-carbon solutions.

Moving to our strategy. In February, we launched our transformation and strategic review to clearly set out how we could unlock the potential of the business. Our strategic framework is clear. There are 4 pillars, first, portfolio choices and partnerships, the markets we have chosen to operate in, businesses we want to invest in and the partnerships that will help create truly winning positions.

Second, our advantaged businesses and strategic initiatives, how we will create competitive business, expand our earnings' potential and sustainably improve our performance. Third, efficiency and simplification, the importance of a company-wide focus to drive synergies that will enable us to be more competitive and simplify the way we operate.

And finally, fourth, our commitment to the energy transition and capturing the benefits of becoming digitally enabled. This granular strategy will help deliver our proposition, to be a high-performing company with quality profits, competitive margins, growing sustainable cash flows and resilient returns.

Before I take you through each part of the strategy, let me share our midterm targets. We want to achieve these at pace. They are based on our expectations for 2027 time frame.

But if we can get there in an accelerated way, we will. These are compelling targets and mean a step change in Rolls-Royce performance. They are underpinned by our strategy and demonstrate we are creating a new company, taking Rolls-Royce significantly beyond any previous financial performance.

The high and achievable bar that we have set is reflective of our new winning mindset. We will quadruple operating profit from the 2022 baseline to achieve between GBP 2.5 billion and GBP 2.8 billion and we will expand our operating margins to between 13% and 15%, equal or better competitive performance benchmark against our peers.

We aim to grow sustainable cash flows to between GBP 2.8 billion and GBP 3.1 billion, more than 100% conversion of our improved profits. And finally, we are targeting 16% to 18% return on capital, improving by more than 10 percentage points compared to 2022, creating a compelling investment proposition.

Delivering these targets will mean we have created financially and operationally strong business. They are a milestone on our journey, not our final destination. I would like to emphasize this point, and we will continue to grow into the long term. As I mentioned in August, our progress in the coming years will be progressive, but not linear year-on-year.

We will provide guidance for 2024 at our results in February. This year, we are achieving good performance improvement. Our current trading is in line with guidance provided with our half year results, and it is unchanged. Turning to the operating margin targets by division. The targets demonstrate that we are building a business which will perform competitively or better than our peers.

Civil Aerospace has the biggest step change, moving from just 2.5% operating margin in 2022 to 15% to 17%. In Defense, we started from a stronger place but can still do better. We plan to improve to 14% to 16%.

In Power Systems, our most diverse business, we will deliver a step-up from 8% in 2022 to between 12% to 13% in the midterm. These are also all best on record performances and represent a significant performance improvement to unlock the potential in every division. They are underpinned by divisional strategic initiatives and efficiencies across the group.

Turning now to the first pillar of our strategic framework, portfolio choices and partnerships. Our strategy is granular. We are making choices and executing on them. This allows us to allocate resources more effectively and drive profitable growth.

We have segmented our portfolio into 3 categories: key investment areas for performance improvement and growth; partnerships to create truly winning positions; businesses and activities we will exit. Our strategic choices will drive value creation. We will focus our investments on areas where the market is attractive and growing, where we have or we could have a differentiated position with good market share, strong customer recognition, excellent products and technology that will generate midterm and long-term value so that we can win.

In Civil Aerospace, we will focus on wide-body and business aviation, leveraging the value from our Trent and Pearl engine families and investing for the future with the UltraFan. In Defense, we have opportunities for greater performance in transport, combat and submarines. We can also use our expertise in adjacent fields such as nuclear micro reactors.

And in Power Systems, we will focus on governmental marine and power generation end markets, where we see the strongest demand and an opportunity for better returns from our power dense and reliable solutions. In some cases, partnerships can help to strengthen our market positions, bring new skills, build capability and scale as well as derisk and reduce capital investment.

In Civil Aerospace, we believe we are well positioned to reenter the narrow-body market. By choosing a partnership approach for the next program, our UltraFan technology is a vital step towards this. At the right time, with the right partner, we will decide the next steps.

For SMRs, a broad set of partners will strengthen our position to deliver the overall solution and reduce the future capital call. We have extensive nuclear expertise, partnerships can bring funding and skills to complement this.

In Power Systems, our focused strategy in PowerGen will make this business more efficient and competitive and drive faster profitable growth. We are also considering potential partnerships to further grow our market position, broaden our power generation offering and benefit from cross-business synergies.

Battery storage systems are a logical complement to our stationary power generation business as we have transferable capability.

We are already developing a good position in Europe, a partnership with access to additional markets could strengthen our position. But this strategy is also about making confident choices on where we will not invest. We are looking to exit non-core businesses that are not a strategic fit for us, and we believe hold more value to others. In total, we expect to generate between GBP 1 billion to GBP 1.5 billion in gross divestment proceeds across all divisions during the next 5 years.

To be clear, we will only sell assets at the right time and at the right price. One point I would like to make, this GBP 1 billion and GBP 1.5 billion, obviously, is not included in our midterm targets. That free cash flow doesn't include that.

For example, in Rolls-Royce Electrical, we are looking at options to exit in the short term or alternatively for the right value, reduce our position to a minority share with an intention to exit fully in the midterm.

We believe, given the world-class capability we have built in advanced air mobility that this will represent good value to a third party and will allow us to focus on our core electrical engineering activities in Civil Aerospace, Defense and Power Systems.

Before talking about market growth, I want to talk about the current macro environment. Geopolitical outlook is uncertain. GDP growth in the next 10 years is expected to be lower than in the past. Inflation and interest rates continue to be higher, and this may continue for longer.

In the short run, we may see a recession and weakened demand in some parts of the world. Additionally, we expect industry-wide supply chain challenges in Aerospace to continue for another 18 to 24 months. However, despite these challenges, our focus is ensuring we are building a truly resilient business that is better able to manage this volatility and continue to grow.

Our strategic initiatives will enable us to grow at a rate above the market in some spaces. In some areas, we are somewhat insulated from market volatility. For example, there is a growing need for aircraft globally. Demand will continue to grow in data centers due to the increased demand for digitalization and AI.

We expect Defense budgets to continue to grow and these are partly insulated from GDP fluctuations. Looking at market volume growth rates, I will take each of these in turn, starting with Business Aviation. Market growth is forecast to be 3% to 5% per annum to 2030, growing above GDP, driven by an increasing number of high net worth individuals and new aircraft programs.

Rolls-Royce is advantaged in the large cabin market with a strong brand. Our position on the latest Gulfstream, Bombardier and Dassault platforms is driving higher than market growth. By the midterm, we will power 3 of the 4 fastest, largest, longest-range business aircraft, and we plan to have a fleet of more than 9,000 business jet engines.

In commercial aviation, in wide-body, market growth is forecast to be in the region of 5% to 7% per annum to 2030. This is driven by post-COVID recovery, fleet renewal and a growing middle class in markets such as India and China. We expect our wide-body business to grow faster than the market in the coming years mainly due to the platforms we are on.

We also have a new opportunity to grow in the freighter market due to the launch of Airbus A350 freighter. In Defense, the market in combat and transport is expected to be flat to 2% volume growth to 2030. We plan to grow slightly faster than the market as we delivered the newer aircraft programs we have won.

Submarines is also a growing market. Nuclear-powered submarines are critical in building strategic defense capability and our position as the provider of nuclear propulsion and power to the U.K.'s Royal Navy is unique. Australia will require nuclear propulsion capability under the August agreement with new boats that will be powered by our reactors entering into service in the early 2040s.

Over the long term, in Defense, our growth outlook remains really strong with up to 5% average annual growth expected from '22 to 2040. This is underpinned by our recent wins on FLRAA, in partnership with Bell, the B-52 reengineering program, Arcus and the Global Combat Air Program, known as GCAP.

In Power Systems, overall, we expect the market for power generation solutions to continue to grow at an average rate of 5% to 7% per year. We have a strong market position in mission-critical applications such as data centers, where we have more than 20% market share that generate more than 70% of our OE revenues.

Data centers are growing rapidly, driven by global trends for data processing and AI. Our Power System solutions currently back up every third e-mail sent in the world. Battery storage solutions are another growth market where we see growth of around 20% per year and an opportunity to benefit from the demand for low-carbon energy and expect to achieve profitable growth.

In mobile solutions, such as yachts, tanks, Navy and Commercial Marine, we expect average market growth of 4% to 6%, fueled by double-digit growth in governmental segments in the midterm. In summary, our portfolio is well positioned to capture growth in these markets. And given our focus on performance improvement, we will also be more resilient business, better able to manage and respond to external shocks.

Now let me take you through the strategic initiatives which underpin our profitable growth. On the left-hand side of the slide, you can see the relative contribution of each division with improved profitability in Civil, Defense and Power Systems. We also expect profits to benefit from portfolio choices, such as in new markets where we exit Electrical. The other exits are expected to have some adverse impact on profitability.

On the right-hand side, you can see the underlying drivers in each division, including the benefit of our group-wide efficiency and simplification program. The business presidents will take you through this in much more detail, but I'll give you the key points. I will start with the initiatives in Civil Aerospace, where we expect the most material uplift.

In Business Aviation, the market success of the Pearl engine family has been outstanding and we have a strong order book that is driving fleet growth. This positions us well to optimize commercial outcomes and grow our margin. In wide-body, there are 6 levers to improve LTSA margins that I have talked about before, three of which relate to cost and three to revenues. These are extending time on wing with better product durability and greater use of digital tools, lowering shop visit costs with better working practices, reducing product costs with better buying and engineering, keeping engines earning for longer with contract extensions and conversions, implementing a new value-driven pricing strategy to our new and renewing contracts as well as addressing onerous and low-margin contracts.

And finally, driving rigor on contractual terms and conditions. We have already made good progress on these items. In this period, we continue to improve our LTSA margins due to our performance improvements on 6 levers.

The same commercial and cost disciplines are being applied to other areas of our wide-body business too, with profitability improvements coming through in time and material, OE and spare engines. We also see a favorable spare engine mix with more XWBs contributing to our improved performance.

Growth comes on top of this. Our in-service fleet is growing faster than the market. We power 1/3 of the wide-body aircraft in service today. And in 2022, more than half of new deliveries in the industry were powered by Rolls-Royce engines. However, this growth along a '22 margins -- 2022 margins would only drive a small fraction of the improvement. We are guiding in the midterm.

We actually did this exercise. Our actions that are expanding the margins this year and in the midterm allow us to benefit from this growth.

Moving to Defense. This business was already performing well, but there is still an opportunity to improve through strong performance management, commercial optimization initiatives and efficiency. We have common growth drivers across transport, combat and submarines. Firstly, growth from volume and mix as we move from legacy programs to new funded programs. Secondly, the same focus on commercial optimization and value pricing behaviors as we applied in Civil. And finally, we are prioritizing investment as we focus our spend and benefit from an increase in customer-funded programs.

In Power Systems, our profit growth is being delivered by strategic initiatives, focused on Power Generation, Governmental and Marine end markets. In Power Generation, we are optimizing our cost structure and focusing on key markets to drive margin growth.

We are also expanding our micro grid solutions and extending our services offering in battery storage systems, which is moving to be a profitable business in the short run.

In Governmental, we are capturing near-term growth with scope expansion and investment. And in Marine, we are developing alternative fuel solutions to strengthen our synthetic fuel ready portfolio. As you can see in the graph, all our businesses see sustainable performance improvement from efficiency and simplification initiatives.

This brings me on to the third strategic theme. We had a total cash cost to gross margin ratio of 0.8 in 2022. And before that, 0.9 in 2019. I'm skipping for obvious reasons, all the COVID years. You can calculate them, but they are not positive numbers. This is around twice the best-in-class level for a business like ours. This will approximately halve by midterm taking it to a market-leading level.

To achieve this, we are tackling costs from multiple angles. Firstly, we are rightsizing the organization and ensuring it is structured to support sustained efficiencies. We have already announced plans to reduce the number of roles across the company by between 2,000 and 2,500.

We expect this to be largely completed by the end of 2025 with an annualized sustainable benefit of around GBP 200 million. We expect severance costs of between GBP 200 million to GBP 250 million, which will be taken as an exceptional charge.

The new organization will be aligned to strategic delivery, removes duplication, enables simpler, more agile ways of working. It will be underpinned by upskilling more efficient processes, better use of technology and a common operating model.

Next, procurement excellence. We have plans to deliver around GBP 1 billion of gross third-party cost savings over the next 5 years, which will help offset the impact of inflationary and product cost increases.

We announced last month a new enterprise-wide procurement and supplier management structure to further build capability and leverage scale. One recent example of procurement improvements was a review of our building services contracts, which cover around 70 sites worldwide and had not been reviewed for 8 years. We retendered this contract and achieved GBP 38 million savings over 5 years.

And finally, zero-based budgeting. We have set a 10% to 15% reduction in targeted areas. Starting next year, we are taking a clean sheet approach to spend. Both Helen and I have experience in this area. I am confident this level of benefit can be delivered. We are also aligning R&D spend to our strategy, for example, through the exit of Electrical. And we are benefiting from increased third-party funding.

TCCGM is an important metric. We track and pay attention to it because it is a measure of the operating leverage of our business and its resilience. Across the group, our efficiency initiatives and the choices we make will deliver sustainable and sustainable is the keyword here, sustainable annualized savings of GBP 400 million to GBP 500 million in the midterm, making us more competitively advantaged and fit for the future.

Turning to the first part of our fourth strategic pillar, lower carbon. We are committed to becoming a net-zero company by 2050 and supporting our customers to do the same. We will play our role to reduce emissions within this strategy. This will also create new growth opportunities. Our foundations to do this are already in place.

We are making good progress towards making our own operations net zero with a 60% reduction in our Scope 1 and 2 emissions achieved since 2014, but there is more to do to fully decarbonize.

For Aerospace & Defense, the best solution to decarbonize is sustainable fuels, which can deliver an 80% reduction in life cycle carbon emissions compared to fossil fuels. All the commercial air engines we produce and our most popular reciprocating engines are now all compatible with sustainable fuel.

We are excited to announce that today, we are powering Virgin to make the Rolls' first transatlantic 100% safe flight with a commercial airliner. I don't know if you have seen it outside. Unfortunately, it sort of had some delay, but it is now there. I'm told. So around 12:00, it actually took off. And given that we expect that to land in JFK around 3:30 local time. But this is not all because our Defense team supported RFA's first 100% safe flight on a voyage aircraft last year.

In Power Systems, we are evolving our engines and developing alternative fuel solutions such as methanol, hydrogen, hybrid and battery storage solutions. In partnership with super yachts shipbuilder, Lürssen, we are already working on offering methanol-powered engines for super yachts.

And in Nuclear, I already talked about the potential opportunities with SMRs and micro reactors, which will be needed to decarbonize the grid and can produce the power necessary to create synthetic fuels.

In addition to the U.K. interest in SMRs, we are deeply engaged with governments, developers and potential industrial customers in Czech Republic, Finland, Sweden, U.S.A., Poland and the Netherlands.

To summarize, we will transform our business to low carbon without requiring high levels of investment today or in the midterm and the energy transition creates new opportunities. Second element of our fourth pillar is digital enablement. We are focused on 4 areas of innovation: enhancing the customer experience, accelerating the product design, improving manufacturing, and empowering our people.

Let me give you some examples of where we are already in action and where we see further potential. Starting with customers. Our intelligent engine platform provides two-way communication with our engines, delivering vital health and performance data to our secure cloud. With digital twin capabilities, we

can predict the forecasted time an engine stays on wing. This is improving dispatch reliability and reducing disruptions for our customers and their passengers.

Our future vision is raising the bar to 100% availability. If you imagine that world where everything is planned and predictable improving the service we offer customers. Secondly, digital tools impact how we design, build and transport our customers' fleets.

Powerful virtual simulations can save up to 25% time in the rigorous development and certification testing of new engines. Taking this to the next level will accelerate product development of new technologies to market. Using AI will create new versions of existing products 15% faster, reducing the cost and accelerating the time of bringing new engine programs to market in the future.

In manufacturing, we continue to improve by having more insight into operational performance. Our turbine manufacturing process leverages AI machine learning using data science to better understand the turbine cooling hole, cutting process, predicting defects before human inspection.

If you want to know about more this process, here is the man, Simon, there. So for any questions.

But in the future, we will enhance this technology with visual AI to inspect parts given real-time results and revolutionizing routine maintenance. And finally, we are empowering our people to transform their working environment with the right digital tools and fostering a digital culture.

Looking ahead to the future, we aim to remove 20% of repetitive tasks using automation, Generative AI and digital assistance, reducing cost and giving our people more time to focus on higher-value activities. We are already in action, but there is also a lot more to do and therefore, more opportunity in this area.

Before I close, I want to share why am I -- I am excited about our long-term outlook, too. I have spent time on our strategy and shown the rigor underpinning our midterm targets. Obviously, division presidents will give you a lot more than I did. The same drivers underpin our long-term growth opportunities, too.

In Civil Aerospace, the long-term growth is being driven by the strength of our Pearl and Trent engine families, which will power the in-service fleet well into the 2040s. In Defense, we will see the benefits of recent wins, such as B-52, FLRAA, Arcus and GCAP programs. These programs will ensure we continue to grow in these markets with engines that will remain in service for 30, 40 years after they are delivered.

We also see long-term potential for our competitive portfolio of Power Systems products. Development of more fuel-efficient platforms and adaptation to new fuel sources will drive demand. SMRs have a compelling long-term growth story. We could have the first units producing power by early next decade if orders are placed soon.

And there are also new business opportunities such as narrow body aviation where we are well positioned to partner on the next generation of aircraft with the UltraFan and in Nuclear micro reactors too.

In closing, I am confident and excited by the potential I see across Rolls-Royce. We have the expertise, drive and the team to deliver this. We have a strategic plan to deliver our Rolls-Royce proposition to become high-performing, competitive, resilient and growing profit and sustainable cash flows.

We will also have a strong balance sheet and growing shareholder returns. We have made a good progress in 2023. We are accelerating financial delivery. Our progress so far and transformation actions give us high confidence in the delivery of our strategic plan and midterm targets.

Our strategy is granular. We are clear on the choices we need to make to shape our portfolio and prioritize investment. We have strong foundations and advantaged businesses in growing markets with performance improvement initiatives, which are underpinned and owned.

The organization is aligned and mobilized to succeed with a more efficient and simpler structure.

Our businesses are capable of delivering low carbon solutions and digitally enhanced processes and services. All this is enabled by our new mindset, better ways of working and our performance culture.

These elements combined will create a distinctive capability in the industry. This is evident in the targets we have set, targets, which represent a step change in performance to make Rolls-Royce financially stronger than it has ever been. We are building one Rolls-Royce, a company that will be able to deliver on the potential of our world-class technologies, invest to grow, lead the next-generation, thinking for our customers and play an important part in the energy transition. Thank you. Now I'm going to hand over to Helen.

Helen McCabe*CFO & Director*

Thank you, Tufan. Good afternoon, everyone. It's great to have so many of you with us today in the room and watching online. Tufan has set out our strategic frame and midterm targets.

I will now take you through my key priorities as CFO, our free cash flow growth and our plans to strengthen the balance sheet and our capital framework.

Before that, I'd like to share my initial reflections since I joined Rolls-Royce. First, I'm delighted to be here. Everyone has been hugely welcoming. We are all focused on working together to deliver Rolls-Royce full potential. Rolls-Royce is renowned for engineering excellence.

In my first few weeks, I visited our sites across Europe, the U.S., and the U.K. and saw this firsthand. It was great to walk the factory floors and see some of the world's most powerful efficient engines being built. Our products, power, protect and connect the modern world. That's quite a nice thing to be able to tell your kids when they say, so what is it you actually do at work all day.

I've also been struck by the passion, commitment and motivation of the people I've met. They are hugely proud to work at Rolls-Royce and rightfully so. However, we need to capitalize on our advantaged positions and be more deliberate in our strategic choices. We need to improve the quality and grow earnings and cash flows to deliver the financial performance we are capable of and that investors deserve and expect from us.

We have made substantial progress this year. That was evident in our first half results and our full year guidance, which we reconfirm today. We have started the journey, but there is much more to do.

Before Rolls-Royce, I spent 30 years in large complex global businesses with engineering and technology at their heart. I was a CFO of a global business with multiple divisions, which is a profit of more than \$10 billion, a business where Tufan and I previously worked together, including on material transformation programs.

In the last one, costs were reduced by \$3 billion and the earnings potential of the business expanded by more than \$5 billion. Transformation is not easy, but it can be done.

That's the opportunity that attracted me to this role. And it shapes the 4 big priorities I have as CFO. These are: first, integrated performance management. One of the outcomes of the strategic review is the need for improved processes and a stronger culture of integrated performance management. In my previous business, my approach was that strategic plans were linked to annual budgets, which in turn were linked to in-year performance management. We actively tracked performance and made interventions proactively. Targets were underpinned and owned across the whole of the organization. That was not done well at Rolls-Royce. That's already changing in 2023, and we will strengthen it further.

Second, commercial and cost optimization. My focus is to develop sharper commercial acumen and a more cost-conscious culture. I support a philosophy where everyone acts like an owner. They treat every pound spent as their own and make it count. That's the mindset we are driving for. We're already upping our game with new frameworks and better training in place to build skills and capabilities. Again, still more to do.

Third, delivering a sustainable improvement in working capital; and fourth, our capital framework. We need a strong balance sheet. I will come back to the last 2 as their key priorities. Before that, I will turn to free cash flow. We had a clear ambition for what Rolls-Royce can deliver. It is based on extensive

benchmarking, the rigor of our strategic review and our transformation plan. In the midterm, which we see as being around 2027, we are targeting between GBP 2.8 billion and GBP 3.1 billion of free cash flow, a growth of around GBP 2.5 billion compared to 2022.

Let me walk you through the main elements of this growth. Operating profit growth between GBP 1.8 billion and GBP 2.1 billion over the period is key. We achieved that by sustainably expanding the earnings' potential of the business, by being laser-focused on our strategic choices, by having all divisions firing in all cylinders and by driving for an improved quality of earnings as demonstrated in the margin targets we have set.

We are making good progress. 2023 profits and margins are forecast to be materially above those of 2022. Our investment approach will be disciplined with spend targeting strategic growth, including the innovation and engineering excellence we are renowned for. We plan for CapEx and R&D to be above depreciation and amortization across the period. This compares to 2022 but it was approximately GBP 300 million below.

We expect the net Civil LTSA balance to grow between GBP 0.8 billion and GBP 1.2 billion per annum. This compares to a net growth of around GBP 800 million in 2022. And on working capital, we are forecasting a release over the midterm.

Then cash tax payments. These will naturally increase in line with our profit growth. And as we pay down debt and strengthen the balance sheet, our financing costs should we just compare to the GBP 350 million outflow in 2022.

Last, the cash cost of closing out historical overhedged positions, which were a drag of GBP 300 million in 2022 will be going by the midterm. Our actions will make our cash flows more robust and ratable with our free cash flow to operating profit ratio improving across the period. Whilst we expect cash flows to grow in all years between now and the midterm, it is important to note, it may not always be linear, due, for example, to the timing and mix of shop visits.

I will now dive deeper into the Civil LTSA balance. A key driver of our Civil Aerospace business model is that we received cash inflows from engine flying hour receipts ahead of shop visit costs being incurred. The best way to understand the true cash impact to Rolls-Royce is to look at the net movement of the LTSA creditor, the offsetting LTSA asset and the prepayments we make to our risk and revenue sharing partners.

This chart shows that. It shows the expected growth in the net LTSA balance. As I said, we expect this growth to be in the range of GBP 0.8 billion to GBP 1.2 billion per annum to the midterm. Why? First, we have strong positions in growing markets, we expect robust growth in our engine flying hour receipts as the market continues to recover and grow and as our fleet expands, we expect large engine flying hours to grow between 120% to 130% of 2019 levels by the midterm.

Second, Business Aviation. Here, engine deliveries will grow to 250 to 300 per year, which compares to 165 in 2022. These engines are used less intensively than wide-body ones. So the time between shop visits is longer, driving the LTSA balance growth. Third, on a normalized basis, we're also achieving a higher average rate per engine flying hour from our contracts.

On top of these initiatives, we are seeing the benefit of some of our other strategic initiatives, including time on wing. As you'll hear from Rob, and if you get the opportunity from our great teams who are managing the expos, we have a comprehensive plan to extend the time and wing of our modern engines. However, we still expect large engine refurbs to grow to 700 to 750 in the midterm.

And finally, currency. The consumption of our legacy hedge book means our midterm guidance assumes a blended ForEx rate of around \$1.36 to the pound compared to \$1.50 in 2022. This drives a higher sterling equivalent for our dollar-based inflows.

So as you can see, there are several factors that influence the net LTSA balance growth. As the gross numbers, such as invoiced flying hour receipts are large, there can be a degree of volatility in any given

year. To recap in LTSA, the growth in engine flying hours, the shape and expansion of our engine portfolio and our strategic initiatives will drive growth in our net LTSA balance each year.

Working capital. It is a key focus for me -- for us as we look to strengthen our balance sheet and improve our return on invested capital. We have a detailed plan to drive a material and sustainable improvement across the period. However, some of this benefit will be offset as we address legacy headwinds and support the business as it grows.

Overall, as the chart shows, we expect a net release of working capital over the midterm which will further increase our net liability position. Let me unpack that for you. We have completed a detailed analysis of each business, including industry benchmarking.

We have detailed insights from this work, if I share just 2. First, we found that supply chain management and production plans were not as tightly linked as they should have been. And second, the supplier and customer terms were not always clear, consistent order Tier 2. It was clear that we were and are leaving value on the table.

Insights like these have helped us design programs that will support the sustainable release of around GBP 2 billion of working capital benefits. The largest opportunity relates to inventories. We are targeting a meaningful reduction in inventory days. Some of the steps we are taking across the group includes improved demand planning, ensuring we order parts and materials only when they are needed, reducing holding times in our warehousing and optimizing buffer stocks.

In Power Systems, for example, we found we were holding several years' worth of stock when it was not needed. The team will now own that. In Civil, we are reducing unnecessary buffer stocks by almost GBP 100 million this year. Across all our businesses, we are improving how sales and operation planning links to inventory planning. Mindful of current industry challenges, we are also improving our supply chain management. We are working closely with our suppliers and we are driving tighter management of lead times, ensuring we have inventory when and where we need it.

We are making progress. We expect to release inventory in the second half of this year. We also see an opportunity to improve receivables. Squads are in place to drive down unbilled debt and ensure it does not build again. For example, in Civil Aerospace, we have sped up by more than 25%, the invoice review process when engines are overhauled. And there is more Rob's team tell me they want to get after.

These improvements mean we had a clearer, quicker and consistent view of what should be built and when, better for us, more predictable for our customers. We are also reviewing customer payment terms and sticking to them more consistently. We have implemented a new tool across the group that gives us a more granular real-time view of customer debt than we ever had before.

It allows us to be more proactive and follow up on accounts before they become overdue. And we're also improving our payables performance through being more disciplined and consistent in supplier payment terms. So lots to get after and a lot still to do. The team are owning and driving these changes.

But there are a few headwinds, the largest being an outflow associated with concessions, totaling around GBP 800 million across the period. There are 2 roughly equal parts to this. First, deferred Boeing concession payments, GBP 200 million of which impact 2023, which we have already guided.

Second, an impact from historical agreements with customers to delay concession payments owed to them. These deals date back several years, in some cases, more than a decade. Our focus is now sustainable and quality cash growth.

Next, as group revenues grow between 2022 in the midterm, this will naturally result in a relatively small increase in working capital. But the big picture is we expect to release working capital over the midterm. We are managing working capital differently. We are managing cash differently. We are focused on sustainable improvements, delivering a higher quality of cash flow.

With that, let me move to our capital frame. Our capital frame is focused on 3 clear priorities: a strong balance sheet with an investment-grade profile, a commitment to growing shareholder returns, and a

disciplined approach to investments. Strengthening the balance sheet is a clear priority. We are positioning Rolls-Royce to better withstand volatility and external shocks and give us financial flexibility for the future. Better for us, better for our shareholders. Our cash flow growth will enable us to reduce our gross debt by paying down our near-term debt maturities as they fall due, namely the EUR 550 million bond in 2024 and the \$1 billion bond in 2025.

The increasing strength of our liquidity position means we may also look to close some of our more expensive undrawn facilities early. The result in improvement in our net debt-to-EBITDA ratio will make our balance sheet much more resilient and should position us comfortably with an investment-grade profile, which we intend to maintain.

When we are confident that the strength of the balance sheet is assured, we are committed to reinstating and growing shareholder distributions. Whilst we're not at this point today, we expect to be there in the near term. And our current thinking is our policy going forward will be based on an earning payout ratio.

This should result in growing shareholder distributions, consistent with our expectations of profit and cash performance. Once the criteria for a return to distributions are met, I will come back and share more.

The final area of our capital framework is our approach to investments. We will prioritize the most profitable growth opportunities across all of our businesses and allocate the appropriate level of funding to them to drive increased shareholder value. These investment decisions are ranked based on strategic fit, where we can and want to win.

We have strict investment hurdle rates in the mid- to high teens for our 3 established divisions. We also have a group-wide investment committee process where Tufan and I review and sign off on all investment cases above GBP 25 million. To summarize, we are building a strong balance sheet, which will underpin an investment-grade profile in the near term.

When we have strengthened the balance sheet, we plan to resume shareholder distributions. Thereafter, we will optimize between shareholder distributions and further investment in the business. And our investment decisions are focused on driving greater value creation.

To close, we are driving for a sustainable and higher quality growth in earnings and cash, with an improved return on capital. This is underpinned by better operating leverage. We have a clear capital frame centered around creating and maintaining a strong balance sheet with an investment-grade profile.

We are committed to resuming shareholder distributions in the near term. Our investments and allocation of cash will always be returns and risk-focused and anchored and strategy. We are ambitious for the business. These are big steps we are taking. There is more we need and want to do, and we have the detailed plans to deliver our targets. And I am confident that we are building the financial strength to shape and own our future.

With that, let's move to Q&A. Thank you.

Question and Answer

Tufan Erginbilgic*CEO & Executive Director*

Thanks, Helen. Okay. Now we are going to open up for questions. David, I think you have sort of somewhere -- yes, that should work, hopefully.

David Howard Perry*JPMorgan Chase & Co, Research Division*

David Perry from JPMorgan. I've got 2 on -- and maybe the only 2 I'm allowed today. On Civil Aero, the first is, I'm a bit surprised by your view of engine deliveries, I think it's GBP 300 million to GBP 350 million, which looks quite light compared to what Airbus and Boeing are guiding to. So can you just talk to that? Have you taken a haircut or have you assumed a very low market share on the 787?

The second one is more philosophical. But based on the plan outlined today, you're going to be very profitable and very cash generative in the next few years. Are you still wedded to the LTSA business model? We know other companies are trying to encourage some of their customers to go towards more time and material. Did you consider that in your strategy review?

Tufan Erginbilgic*CEO & Executive Director*

Okay. Thanks, David. I think, first of all, on your second point, sort of LTSA business model. I mean I said it all along that, that business model actually works well if you price the risk well. So because who is complaining in a high interest rate environment, getting the cash in advance. But it comes with a risk profile that you need to price well. Second thing I'm going to say on that, our strategy is not unbundling time and material.

So by doing that, we are actually creating flexibility for ourselves because your EFH rate effectively doesn't include time and material, and that gives us flexibility and that is a change in strategy without any doubt because that change we actually made this year, effectively.

So -- and I know you are keen to sort of do we have a margin on it. We definitely have good margin on LTSA. And I can categorically tell you, given the program, 6 levers I talked about. And frankly, Helen touched on time on wing as well, those levers will actually improve, not only contract profitability, but also our LTSA margin in this period. So I think your first question was -- I think our plans -- I'm going to make it very simple. Our plans are totally in line with Boeing and Airbus plans. They are totally aligned.

There was one question sort of 2 rows behind David. I don't know if still exists. But okay, over to you.

Robert Alan Stallard*Vertical Research Partners, LLC*

Rob Stallard from Vertical Research. A couple of questions, only allowed 2. First of all, on the disposals, GBP 1 billion to GBP 2 billion of gross proceeds. I was wondering if you could elaborate on what sort of assets you're looking to get rid of. You mentioned Electrical, but -- and also what revenues those businesses might be generating at the moment? And then with regard to the LTSA balance, the other part of that equation, of course, is the trajectory of shop visits so if you just give us some idea of how that's going to pan out over the medium term.

Tufan Erginbilgic*CEO & Executive Director*

So I think I'm going to pass to Helen in a minute for shop visits. On divestments, I actually said GBP 1 billion to GBP 1.5 billion, you inflated that to EUR 2 billion. But if we can achieve that, we will. But so -- but I think it is GBP 1 billion, GBP 1.5 billion. And I said it in my conversation, effectively, it is -- when you have granular strategy, day 1, some of you, I don't know how you help when I said, we need a granular

strategy. It does many things for you. It becomes performance management and engagement to, I won't talk about it in divestment context. But what it does is it gives you line of sight, not only at divisional level, really subdivision, subsegment level.

Then you decide with that kind of granularity, do you want to invest in that business or not. You can make decisions at that level. And that's what we are talking about here. Therefore, we set it across the group. That means all the divisions by definition, and it is true. And obviously, we specifically, why did we talk about electrical specifically today because it is, in a way, one division that I needed to sort of highlight, but others are actually subsegment, subdivision level.

Helen McCabe*CFO & Director*

I'll take the question on shop visits. So thank you, Rob. So as I said, so LTSA balance growth, we expect that to be in the region of GBP 0.8 billion to GBP 1.2 billion per year. As I said, there's a number of factors which does influence that, which is why we've given you a range. Shop visits and the mix of shoppers, it's being one of those. If I look out towards the midterm year, I think it's probably hold in your mind when it comes to shop visits in total around 1,400 to 1,500, that compares approximately to be about 1,000 or 1,100. And Rob, I think, will give you more detail. He's given me the thumbs up. He'll give you more details specifically on the large engine shop visits when he talks. I don't want to steal his thunder, but I've given you the total.

Tufan Erginbilgic*CEO & Executive Director*

The multi -- but you were the first one, then I'll come to you guys. Yes, go for it. Can you -- do you mind using microphones because nobody -- online, they cannot hear you.

Nicolas Ducarre*Spinecap SAS*

Yes. Can you hear me?

Tufan Erginbilgic*CEO & Executive Director*

Yes.

Nicolas Ducarre*Spinecap SAS*

Nicolas Ducarre from Spinecap. So just a question on tax. You mentioned tax is naturally supposed to increase going forward. I think there's a big element regarding tax, which is the amount of net operating losses that [Widerøe] has accumulated over the year. That's a giant amount. Some is disclosed and recognized in the statements, some is not. And it's -- at least for me, it's a bit complicated to understand to which extent you will be able to use those losses and offset them against profit. And it's not very detailed in the materials you provide. So do you plan to have a workshop on this? Because this -- I mean, this could be quite a lot of value, to be honest.

Helen McCabe*CFO & Director*

So great question. So I'm happy, so we can take offline with the IR team and take you through more details, but a couple of things I would say on tax. So you're absolutely right. I did say that we expect our tax charge to increase, as you would expect, in line with profit.

I think from a modeling perspective, if you hold a cash tax rate for certain mid-20s, that reflects our geographical spread. Some of the shields that we hold in relation to tax in the U.K., if you go back and you look at our half year accounts, we do have a deferred tax on the balance sheet of about GBP 2.8 billion. There's some of that, which is not recognized on the balance sheet. That becomes complicated.

But looking as we put the plan together, I do expect that deferred tax asset on the balance sheet to come down over the period.

But it is rather complicated by how you bring on some of the new elements that haven't been recognized so when -- but we have looked at that and modeled it, but that is not driving any of our, obviously, profit and cash flow growth going forward. But happy to take you through that in more detail offline.

Tufan Erginbilgic

CEO & Executive Director

On the third row, there's a lady and man. Ladies first, then we go from there.

Charlotte Anne Keyworth

Barclays Bank PLC, Research Division

Charlotte Keyworth from Barclays. I just had one question actually on pricing. You mentioned about the -- one of the factors in the LTSA balance growth was actually your engine flight hour for widebody increases. I know it's a commercially sensitive topic, obviously, but you've seen some benefit from that already in the first half of the year. How much -- how should we think about that from a sort of tracking perspective to the medium term? Obviously, you've been coming discussions. I should imagine some engines are easier to discuss than others in terms of potential uplift, but I'm just really...

Tufan Erginbilgic

CEO & Executive Director

Short answer is, obviously we want -- I mean, as I said, sort of, we always want win-win solutions with our customers. And that goes into also contract question. But contract improvements, the way you need to think about how do you improve profitability of contracts. We actually have 6 levers. Pricing is only one, right?

So I'll come back to your question. I'm not sort of deflecting on it, but it is important that we have other levers. When it comes to pricing, yes, we take commercial actions because we need to reflect the risks. My answer to David's question because new engines have more shop visits and so on. This is an industry issue, industry, more fuel efficiency, that means engines come to shop visits more often. So we need to price it in the right way. Yes, Helen said it already per rate, you should expect that to go going forward every year, and that is effectively what we have here. Helen, do you want to add anything to that?

Helen McCabe

CFO & Director

I think you've covered it. And I think -- I don't know if this is behind your question, but maybe just an additional piece, I think we're saying that by the midterm when we get to that year, then substantively. We have unwound the majority of the onerous contract provisions. So I think it's most definitely not back-ended by 2027 and we do expect to have worked most of that through. Yes. Thank you.

Tufan Erginbilgic

CEO & Executive Director

Thanks, Helen. We'll go -- okay, there are three. I didn't realize it is three. Okay. I thought it was two.

Unknown Analyst

I guess two questions [indiscernible] You said CapEx and R&D are going to increase going forward in [indiscernible] going forward? And second question on XWB-97 engine explaining about the durability of those in engines? You guys have like comments in it?

Helen McCabe

CFO & Director

You want me to repeat the questions?

Tufan Erginbilgic

Copyright © 2023 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

CEO & Executive Director

No, that's fine. We will repeat. Helen, do you want to pick up the first one? I'll take the second one.

Helen McCabe

CFO & Director

Fantastic. So two parts to your question. So CapEx and R&D. So we're not going to get year-on-year guidance. But I think easy way to hold the CapEx is our net investments are increasing each year. And if you use 2022 as a base, actually, over the midterm, they're going up by more than GBP 300 million, yes, versus 2022.

R&D, indeed, the simplest way to hold that is we expect our gross R&D spend to be broadly flat over the period. Now the important thing to remember there, when I speak to R&D and CapEx is because of the actions that we're taking as part of our strategic review, our portfolio will be smaller and more focused. So actually, that isn't a like-for-like portfolio base spend. But I think those two data points will help you with that triangulation.

Tufan Erginbilgic

CEO & Executive Director

Okay. I want to be done with that role, and we will go somewhere else. XWB, Sorry, 97. Let me tell you this, first of all, the best engine in the industry is XWB-84, right? So let's not be sort of -- it is the most efficient durability and reliability perspective best engine. If you count to XWB-97 higher thrust engine, the same sort of family, I should say. And it is actually a very good engine. It has been out there almost 5 years.

If you look -- we sell it really well, and Airbus sells it really well, therefore. In benign environments it is very good engines. Only in very harsh environment, like sand, et cetera, then obviously some Middle East sort of Middle Eastern countries sort of tend to be in that category. What we are looking to do in this period are time on wing improvement for all the engines that also include 97, and it will actually improve in that period significantly, and it will be like R84, if you like, because it will further improve benign environment, time on wing, but also it will significantly improve non-benign environment. So I'm going to move that way because otherwise, let's go there.

Charles J Armitage

Citigroup Inc., Research Division

Charles Armitage. A couple of questions. First of all, resilient. It's on either side of you. You are the least resilient or Rolls-Royce, [indiscernible] during COVID, GBP 4 billion outflow, GBP 1 billion of that was factoring, but so GBP 3 billion underlying, MTU had 0, Safran has cash inflow. How are you changing the way you do business to make that more resilient?

Tufan Erginbilgic

CEO & Executive Director

Very good. Great question. The heart of what we are doing. So let's talk about that, right? Your cash cost to gross margin ratio is [0.9] in 2019. So going into COVID, Rolls-Royce had 0.9. I run lots of businesses in my career. I never seen 0.9. Frankly, it is a revolution for me, right? So there is always learning opportunity in life. But -- so -- when you are a 0.9, what is it telling you? You don't need COVID. You need a good recession. We are going to be in negative territory, right?

That is the mindset. You may look at it, you may say too funny to scale this that today's targets telling you that is a mindset and the performance improvement and how you actually run the business, right? If you allow that to happen, you will never be resilient. Now you come to point 4, which is I talked about, if you remember, that business enormous, the resilient.

But I'll give you another lens on resilience, right? What this plan is saying because we are not creating value not only in similar space, but actually 2 more ratable businesses, Power Systems and Defense, their cash generation will be a lot more than in the past. What does it do? Ratable break? So you not only sort

of TCC GM resilience, you also create cash generation perspective, 2 rigs that actually not volatile as much as Civil Aerospace. And then you think you do [indiscernible] in similar Aerospace, you create that TCC GM lots of room to play with when the volatility comes. That is what we are doing with this program.

So this is not bunch of numbers, they look cash is good profit, whatever, however you hold it. It changes the shape of the business. Therefore, I say it transforms the business right? Those words there actually mean something for us, every one of them, and that's what we are doing. That is mindset. If actually roadshows did that in 2019, they would have dealt with COVID a lot better than I can tell you, a lot better.

Charles J Armitage

Citigroup Inc., Research Division

Excellent. Sorry, my second question, if I may. The -- you mentioned about LTSAs and pricing the risk correctly. Presumably, you have plans on how time on wing, how the cost of the overall -- the cost per hour will be coming down. How can we get comfortable as external people the -- how can we get comfortable that those are priced appropriately and that you haven't made on the downside, huge assumptions that time-on-wing is going to get up, you priced it accordingly. And if it doesn't come in, like that, those downside risk, how can we get comfortable with that?

Tufan Erginbilgic

CEO & Executive Director

So I think Rob will talk this afternoon. So the time-on-wing improvements, we are planning next 3, 4 years 40% improvement, right? All the engines will improve sort of varying degrees, not all the same, obviously. Most improvement will come from 97 and Trent 1000 as you may expect, frankly.

So I think that's the -- in contract accounting, frankly, when we deliver that time-on-wing, I think there is an upside, I would say. But we put normally contingency in case it is not delivered. What it does tell you is actually, when we deliver, there is going to be upside because of the contingency, right. So -- and I think Simon is here at break. He can explain to you how we are going to do that.

But I'll tell you, Trent 1000, we doubled the cycle time already. Once it is certified next year in Boeing, it is actually with Boeing, there is nothing we can do or should do. It is technically right. They know it is technically right. We need Boeing FAA certification effectively and that's going to more than double Trent 1000 cycle time already. This is not a sort of new work. Let's see what the engineers do. It is done. We know it works because we did the same in Trent 7000, it works. They are sort of broader engines, if you like.

Helen McCabe

CFO & Director

So we've also got the [indiscernible] outside actually with the teams and you'll hear the passion from them about what they're doing on time-on-wing. So it may be a nice one to visit, but you'll hear the motivation, the detail from that as well.

Tufan Erginbilgic

CEO & Executive Director

Very good reminder. I'll go there -- sorry, I need to go to you. Otherwise, we will have a problem, sort of revolution. Thank you.

Nick Cunningham

Agency Partners LLP

Nick Cunningham from Agency Partners. I hope you don't regret allowing me to ask my question. It's a technical modeling type question really, which is -- you're giving absolute numbers for 2027 for some numbers. Is there an inflation assumption built into that? And if so, what is it? Or is that all on 2023 prices?

And then if you like the sort of second, but very related question is that the cost reductions, for example, GBP 400 million to GBP 500 million total cost reduction you've talked about, is that an absolutely lower cost relative to 2022 base? Or is that relative to where you would be in 2027 based on the volume expansion you expect?

Tufan Erginbilgic*CEO & Executive Director*

Okay. We don't do small [indiscernible]. I'll tell you that. I think second part of your question is very clear. It is lower cost, GBP 400 million to GBP 500 million, okay? There is no -- it could have been this, it would have been this because this is not a financial modeling, right? We spent good time on strategic review. Then to me, financial plans are strategic plans. You just financialize the strategy you work. By the way, when you are working the strategy, you are already financializing, right? So what is the growth potential of this market? Are we differentiated? How much we can grow? That's in a way financialization already, right?

Then we translate all those into 5-year plan. Therefore, this is not a sort of less model things. So it is pretty much grounded in our strategic review and the financials. Yes, it has inflation assumptions, ForEx assumptions and so on and so forth. We won't share it with you, but sort of you can see where the world is going. Obviously, front-end higher inflation, lower than sort of less so. And then that applies to cost, et cetera and so on as well as obviously top line. Yes, we do apply. I'll go here.

Julian Cook

Julian Cook from ATKA Capital. It seems that on the narrow-body, you've already made a decision to partner as opposed to maybe going on your own. I mean we saw -- you used to be with Pratt and obviously decided not to go ahead with the geared turbofan, which with hindsight is probably a good decision. Why so early decision not to perhaps go on your own?

Tufan Erginbilgic*CEO & Executive Director*

So I think what we are saying is given the great work, Simon and team did it on UltraFan, frankly, for some years. That -- and the IPs we have on UltraFan, I think we are well positioned for wide-body as well as narrow body. Yes, we are seeing financially, I think sort of to derisk things a little bit, partnership approach will be a good approach for the next generation.

Obviously, partnership needs to work. If it doesn't work, we can consider alternatives because we are actually bringing a technology into this. So that's how we see it.

Unknown Analyst

Yes, following up on narrow body. Does it really make sense to entering that space through a partnership? It's a very competitive playing field and is it worth the investment?

Tufan Erginbilgic*CEO & Executive Director*

Okay. I will disagree with you. I never called duopoly very competitive place, but the economics books will disagree with you, I think. But -- and duopoly, it is. So -- and with [indiscernible], we can go in because of our technology and engineering and so on. But we are the probably only one who can go in. So therefore, for the -- we will -- I said it day 1. We will not do anything, which is not going to bring profitable growth. We are -- we don't want -- I want you to take away from this.

To deliver these numbers and grow beyond that, we don't need to answer narrow body. It is an opportunity. And given there are only few companies, I'm not going to name others in the world who can actually do that with partnership approach, I believe it can be a profitable place. And if it is not profitable, we won't do it because we don't need to do it. Roger.

Unknown Analyst

So if you're. Your financial targets are met, ballpark, not exact numbers, but something like over the next 4 years could generate, call it, GBP 10 billion of free cash flow, there are not that many high-quality growing companies in the world with high barriers to entry that could convert half of their market cap to cash over 4 years. So my question is, why isn't -- you talked about getting a good return on investment, why isn't buying back your stock, one of the better returns on that investment?

Tufan Erginbilgic

CEO & Executive Director

Sorry, why buying Microsoft...

Unknown Analyst

Your stock.

Tufan Erginbilgic

CEO & Executive Director

So let's go -- Roger, thanks for -- yes, your math is not too bad. So I think we will generate cash, definitely. One thing I will disagree with you, the half of sort of market cap because I'm hoping market cap will be a lot more than that at that time. But sort of -- but I take your point. So I think, frankly, when we create a strong balance sheet, which is our intent, and we will reestablish Helen talk about shareholders' returns. And then we are already investing quite a bit in this.

Frankly, one thing you should take away, our investments here, therefore, I said midterm targets is a milestone will actually deliver more in the future. Like take time-on-wing, you can actually integrate my friend drop in an hour time or so, you will see his time-on-wing and Simon's improvements will actually deliver in this period, but deliver more in the next period. I can tell you, genuinely tell you. So therefore, this is a milestone we will keep going.

That will then -- we would like to be in a position to say, okay, depending on how we see the world depending on share price, we can decide to give more to shareholders. It can be buyback. It can be whatever or further investment into the business. Frankly, when I came day 1, I mean I didn't have that luxury. So where do you want to invest? So it was an academic question. So [fright night] is becoming with the delivery of this plan. It is becoming a reality. But we will be very responsible. We are not after market share. I said it many times. We are after good high-quality profit and cash generation, but sustainable cash and profit generation of this company. So sorry, is there one more question or not?

Isabel Green

Head of Investor Relations

I was trying to get the one last question come from our audience online. But if you would like to give...

Tufan Erginbilgic

CEO & Executive Director

Let's get one last and then we'll go to Isabel. Apologies, we couldn't answer all the questions.

Ian Douglas-Pennant

UBS Investment Bank, Research Division

I appreciate you taking it. It's Ian Douglas-Pennant. I even move seats in order to catch your eye lines. So I appreciate you.

Tufan Erginbilgic

CEO & Executive Director

You did well by the way.

Ian Douglas-Pennant

UBS Investment Bank, Research Division

Sitting in the corner by the way, for those ones to ask you questions, sorry about that. So two questions, please. Firstly, for Helen. You said that the improvements is going to be progressive, but not linear. How not linear should we assume it is? I mean, given the performance that you had in H1, is it like 80% in the first half of the planning period? Can you help us think through that?

And secondly, if I think about the cash flow targets that you've given, at least versus my numbers, the big difference is the time-on-wing or the shop visit assumptions. Could you help us break down to find just like philosophically the magnitude of the different interventions that you're making and how important they are in driving the difference, just holistically speaking.

Tufan Erginbilgic

CEO & Executive Director

So I'm going to ask Helen to cover the first question, but let me pick up your second question. I think this is important, okay? Because I realize, frankly, before we announce idealized sort of you may not get to the free cash flow that we are getting to, but there are good reasons. This is really high quality and sustainable cash flow. So what is in it? It is driven by operating profit. And in 2027, we have more cash-based operating profit in 2027, i.e., rather than provisions, et cetera, et cetera. Therefore, more of the profit converts to cash. That is very important.

Second important thing is LTSA growth and Helen talked about the drivers of LTSA growth. I'm not going to repeat those drivers. But if you take those drivers, let's break that apart. It is effectively your installed engine base is growing and with an extended time-on-wing and your commercial practices increasing your unit rate, that is sustainable as long as you continue to increase your installed base. And if you look at our forecast, therefore, I'm saying LTSA growth will be sustainable because if you look at for a while, probably maybe 10 years, you should expect those drivers enforce and with growing installed engine base.

If you actually combine the two high-quality cash-based operating profit with sustainable growth in LTSA and the margin profile on that LTSA balance is improving every year. That's going to be the case. Suddenly, you have a pretty sustainable model for a long time. That's how philosophically you should actually think about this.

Helen, over to you.

Helen McCabe

CFO & Director

Fantastic. So thank you. So to your question on progressive, not linear. So the way to hold that is we do expect year-on-year profit and cash growth, but can't necessarily take a straight line and draw it from '22 to '27. I don't think that's experience of how our transformations have gone in the past. And indeed, there's too many variables in there.

But a couple of things that I would just reinforce year-on-year profit and cash flow growth we expect. And in case there's any concerns, it's most absolutely not back-end loaded. I think I already shared two data points on that. Working capital, we expect a release over the period. That is not a big release by the midterm, and we already spoke around onerous contracts and catch up yet that, that is not coming towards the back end as well. So hopefully, that helps.

Tufan Erginbilgic

CEO & Executive Director

So Isabel, over to you.

Isabel Green

Head of Investor Relations

Thank you, Tufan. We have got a very large audience online. So I'm going to quickly squeeze in a question from [indiscernible] at Deutsche Bank, who mentioned, would we consider retendering for debt to accelerate our deleveraging. And also ask now we're mentioning investment-grade profile as opposed to

investment-grade rating, could we confirm that the latter is still the priority before resuming shareholder payment?

Tufan Erginbilgic

CEO & Executive Director

So I'll let Helen to answer the first one. Investment grade, we talked about profile because that is in our hands, which we can create that profile. We are not a rating agency. Therefore, we cannot rate ourselves. That's why we talk about profile. And Helen talked about it in near term, we expect to get there. And frankly, you can -- you have nice models, model it. You will see that in near term, we will get there. And therefore, we talk about investment grade profile.

Over to you, Helen.

Helen McCabe

CFO & Director

Thank you. So to the question on debt, as I shared, we actually have plans to reduce our gross debt from our cash. So we have maturities that fall due in '24 and '25. We're very clear that we will close those down through cash, and we have no intent of strengthening the balance sheet and getting back to that investment-grade profile by raising cash. So that is not our intent.

Isabel Green

Head of Investor Relations

Thank you, both. And we are just very slightly behind schedule. So we're taking a break now. The schedule does say we'll return at 10 past 3. I think we'll make that near 20 past 3. I'm sure everybody has got enough time to get through the expo. So if you're watching online, please take this opportunity to enjoy the videos that we shared on our website. For those in the room, you've got a map in your bag showing the layout of the exhibit.

You will see we have a dedicated exhibit area on the outside of the auditorium near you came in this morning. We are restricted on the number of people we can have in the area, so we'll be operating that on a first come first serve basis.

Presentations and Q&A in that area. We'll take about 15 minutes for each stand and there are other exhibits outside the doors. If you could leave please through the doors down here on the right that will help with your flow into the Expo area. We're going to be using this auditorium for two of the exhibits. These 2 are not repeating at the end of the day, but the presentations will be around later if you want to ask them. So please do some of you stay here or come back to me or that team. Our executive team will also still be on hand in the coffee area, if you want to ask them questions.

So enjoy your break and see you back here at just under an hour. Thank you very much.

[Break]

Presentation

Isabel Green*Head of Investor Relations*

Settle down. We are, I think, live again online. So welcome back everyone in the room and online. We will now continue with the formal part of the afternoon with presentations from each of our business presidents. There's more time for Q&A with all of the presenters at the end.

So now it gives me great pleasure to welcome my colleague, Rob Watson, President of Civil Aerospace to the stage.

Robert Watson*President of Civil Aerospace*

So good afternoon. Welcome back. I hope you had a great break and took the opportunity to explore the Expo either in person or online. And for those in the room, I also hope you had the chance to talk to some of our inspiring colleagues to learn more about the actions we're taking to turn Rolls-Royce into a high-performing, competitive, resilient and growing business.

I'm Rob Watson, President of Civil Aerospace, and I've been at Rolls-Royce for 13 years and have worked across all the divisions in Defence, with Power Systems and in global and operational roles across the group. I'm going to build on Tufan and Helen's presentations and take you a little deeper into the Civil business, our view of the market opportunity and the strategic levers we're focusing on to drive the margin improvement Tufan mentioned saving us from just 2.5% to 15% to 17% in the midterm.

Firstly, most of you know our business, put simply, we make and service gas turbine engines for airplanes. You'll see in the civil fact sheets that we power more than 35 types of commercial aircraft and today, we have more than 12,000 engines flying around the world. On this slide, you can see how we think about the core product portfolio for the business.

In business aviation, we have roughly 70% market share of all aircraft in service in the large cabin business aviation market in 2022. We actually have closer to 85% share of the very long range and ultra-long-range aircraft, which is the most valuable segment of the business aviation market. This positions importance because while the very long range and ultra long-range segment is forecast to grow between 3% and 5% by 2030, our growth will be between 8% and 9% per year as we bring new engines into the market. And in the midterm, we expect to see engine flying hours for Rolls-Royce powered business aviation aircraft, increasing to between 120% to 130% measured against levels from 2019.

In widebody, we had a 55% OE delivery share in 2022 and 36% market share of installed engines. We power 4 out of 5 new generation widebody aircraft, and we're sole source on 3 of those. It's a great position to be in. While the total widebody market is forecast to grow between 5% and 7% per annum to 2030, we expect to grow above the market rates due predominantly to the growing installed base of Trent XWB engines and the related growth in engine flying hours that drives our revenue. In the medium term, we expect to see engine flying hours for Rolls-Royce powered widebody aircraft recovering to between 120% to 130% of 2019 levels.

Our competitiveness has been proven this year as we've won major orders, for example, from Air India and Air France, more recently with [EVA], Egyptair and Ethiopian Airlines. And we also see further upside potential from freighter orders to I'll talk more about that later. As I mentioned, we also have a strong presence in the regional market and with the V2500 with 2,000 regional aircraft in active service and more than 35 million to 40 million engine flying hours still ahead of us. And we also see an opportunity to continue to support the V2500 into the 2030s.

So to recap, we're in valuable market segments. We're building on a strong industrial base and our installed base strength and forecasting new deliveries means we expect to grow materially above the market rate for both business aviation and the widebody market. Let's talk a little about how we see

our growth in the medium term. Our operating margin target range is 15% to 17%. And judging by the reaction on people's faces when Tufan shared this, you appreciate it's a big improvement.

So how will we get from 2.5% to 15% to 17%? We'll achieve this by executing granular focused plans that will underpin profitability in our business aviation and widebody businesses as well as the enterprise level focus on transforming our business into a simpler and more efficient operation. I'll explain each of these initiatives over the next few minutes. But in essence, the market success of the Pearl engine family in the business aviation market has been outstanding. And as a result, aircraft deliveries will grow 9% per year over the midterm, and we'll see aftermarket growth, and we'll focus on commercial optimization.

Then in widebody, we focus on 6 levers, which underpin delivery of the margin growth, keeping our engines flying for longer, value-driven pricing, contractual rigor and then staying focused on controlling shop visits and product costs and extending time on wing. These commercial and cost disciplines will drive our aftermarket margin improvement.

And finally, we're leveraging the power of one Rolls-Royce to simplify our organization and drive efficiencies. We're already seeing tangible benefits in areas such as third-party spend and disciplined capital allocation. All of this activity is underpinned by our culture. It's our people who will deliver this improvement, and we'll retain our focus on products and people safety that you would expect from a world-class engineering organization. And the great news, we're already seeing tangible results. Our margin in the first half of this year is already double digit, and we have clear plans to continue to build on that progress for the midterm.

So business aviation. Let's talk a little more about how we're on track to deliver returns that are materially above industry average. And basically, there are 3 drivers: first, we're increasing our market share with our new Pearl engine family, which is seen as today's engine family of choice in this growing market segment. We've won the last 3 major campaigns due to the engine's superior performance. And if you've not already, [Dirk and Allen] are available to talk at the Expo about this fantastic engine family. By 2030, the main platforms in this market will be Rolls-Royce powered. Bombardier's aircraft with a Pearl 15, Gulfstream with the Pearl 700 and Dassault with Pearl 10x.

And why are these wins importance? Well, we're playing in the biggest business jet segments, which accounts for more than half of the total value of the business jet market. Second, there's a similar growth story in the aftermarket. Our installed base is growing. We delivered 165 engines in 2022. And we see that growing to 250 to 300 engines in the medium term. That's growth of 80%. We're seeing continued growth in flying hours. Business aviation bounced back strongly. We're currently at 110% for 2019 levels. And we also have a very popular and differentiated services model, corporate care, which provides comprehensive support and maintenance for our customers. And here, we're seeing 2% to 3% annual growth on top of an already large installed base of BR710 and 725 engines.

Finally, to maximize this market growth, what really matters is our commercial and cost discipline. Over the midterm, we'll deliver 100% operating profit growth by reducing our unit costs, improving our commercial terms and implementing value-based pricing.

Okay. For widebody, as I referenced, we have 6 levers to improve our margin performance. So let's talk about the first 3. Firstly, we have a significant installed base, which is incredibly important to us. We're absolutely focused on keeping our engines flying and earning for as long as possible. For example, with the Trent 700, our most profitable wide-body engine today, we're focused on contract extensions and transitions, basically the transfer of ownership from one operator to another. And in addition, the A330 passenger to freighter conversion market, a rapidly growing market is a really good opportunity for us.

Our Trent 700 has 80% market share of all committed freighter conversions on the A330. This is important as the engines are likely to fly much longer as freighters than as passenger aircraft. Commercial optimization is also critical. As you would expect, we're also reviewing our contracts and working hard to get better value propositions for ourselves and our customers. And we're doing this by creating win-win opportunities identifying areas where we can provide additional value to our customers, such as additional service coverage or enhanced engine availability, whilst securing better terms for Rolls-Royce. By doing

this, we aim to increase our operating margin and in some contracts, released some of our onerous contract provisions.

We're also adopting a value-driven pricing strategy for new contracts, spare engine sales and our time and material business. This ensures we capture the maximum value from our engine and the aftermarket services that we sell. Our strategy takes into account market trends, customer needs and competitive dynamics. It also sets the right price for our aftermarket service contract based on the risk and service we offer over the contract duration. This is hard work for the team, but we're already having an impact. And importantly, our teams are confident they have my and a wider management team support in driving these negotiations to successful outcomes.

Finally, engine volumes and mix drive a lot of opportunity. We plan to grow ahead of the total widebody market growth through to the end of the decade, there are some significant metrics behind this growth. Over the medium term, OE deliveries will increase from 190 to between 300 and 350 a year. Major refurbishments grow from nearly 250 to between 700 and 750. Annual total shop visits grow from just over 1,000 to between 1,100 and 1,200. And our LTSA engine flying hours grow from 10 million to over 18 million over the same period growing to between 120% to 130% of pre-COVID levels by the midterm.

The next 3 strategic levers really focus on how we underpin profitable growth. First, let's start with time on wing. Put simply, this is extending how long our engines stay on wing, and therefore, lowering the number of shop visits. The real determinants of time on wing are the operational profile of the engine, where it flies, at what rate, for how long and the consequent durability of the engines parts. To keep engines on wing, we're continually investing in product development to drive durability across the fleet, and we continue to forecast at least a 40% improvement in time on wing in the medium term. For example, we've been improving the design of HP turbine blades in our Trent 1000 and Trent 7000 engines to give them a longer operating life. And where we have life limited parts, we're focused on extending that life in as it's often the expiry of these parts that drives a shop visit.

Secondly, when we do get to a shop visit, we are focused on reducing the cost of each shop visit across all engine types. By midterm, we'll have halved the cost of a Trent XWB shop visit. In fact, at that point, the XWB will be the cheapest of the Trent's overhauls, a major opportunity for us given its position in the product portfolio towards the end of the decade. And we're achieving these cost savings through multiple initiatives, including using AI tools to manage the work scope of the shop visit, optimizing how we strip and build the engine to keep time in the shop to a minimum, investing in technology to improve our repair capabilities rather than replacing parts and where possible, making better use of service used material.

Finally, we're continually focused on product cost reduction. Here's 2 examples that bring that to life. Firstly, focusing on our high-performing suppliers. We're transferring work to them from underperforming parts of the supply chain. Of our total GBP 2.5 billion spend in the external supply chain this year, GBP 685 million is spent with this group. And since 2020, we've awarded GBP 3 billion worth of work to our high-performing suppliers.

Secondly, with roughly 200 engineers focused on driving technical cost out, identifying how we can reduce costs through better parts design, manufacturing methods and reducing scrap and waste. And we continue to wrap a digital thread around our operations, whether this is using our intelligence engine to support in-service engine performance or our smart factory, which connects supply chain data to create a manufacturing digital swim. This enables data-driven decision-making to minimize capital expenditure, working capital and waste.

In summary, this laser focus on our 6 strategic levers will improve margin performance and profitability. And if you're not already, I encourage you to speak with some of our brilliant team in the Expo or watch the videos if you're joining us virtually to learn more about some of these exciting initiatives.

As well as focusing on operating margin improvement, we also remain focused on our future, critically the energy transition and the drive to reduce emissions in our sector. Our starting point is to maximize the efficiency of our current fleet as many of these engines will remain in service for the next 2 decades and beyond. The Trent XWB-84 really sets the benchmark here with 15% better fuel burn than the original

Trent's engine and great reliability to match. I think as Tufan mentioned earlier, is delivering 99.94% on-time reliability for departures for our operators today.

The Trent 7000 powering the A330neo is the latest addition to the Rolls-Royce widebody family and has a similar step-up in efficiency. And we've demonstrated that all our production engines are 100% SAF compatible. And excitingly today as Tufan mentioned and hopefully you saw out in the Expo, we're powering the world's first commercial transatlantic flight fueled by 100% SAF. And my Customer Director, [Yuen] is on Board, I spoke to him before the flight took off, and he said the buzz was electric. And this is a big step forward, not just for Rolls-Royce, but the whole of the aviation industry and for Yuen's selfie collection with Richard [Branson], I imagine.

And part of the SAF story is around achieving scale in production volumes, which is not within our control. What we can do, though, is continue to focus on ever more efficient gas turbines because whatever the fuel source, it will be a gas turbine powering large aircraft for decades to come. And here, our UltraFan technologies play a critical role. Earlier this year, we started testing our UltraFan technology demonstrator engine in Darby, and we've now run the engine at full power. It's another major milestone. And as the engine architecture is scalable, it can be considered for both widebody and narrow-body applications on future platforms.

And while we expect this geared architecture will be 25% more efficient than the first Trent's engines and therefore, a critical step in our sustainability road map, some of the technologies can be used in today's engines to play an important role in driving time on wing for our current fleet. So as well as continuing to invest in technology, we're embracing earlier opportunities to exploit this technology in our current fleet.

So to recap. We're in valuable market segments. We have a strong installed base, and we expect to grow materially above the market rate for both business aviation and the widebody market. We're focused on commercial and operational discipline, and the levers outlined today will ensure we deliver 15% to 17% sustainable operating margin growth over the midterm. We've already made good and tangible progress, as you saw in our half year results and fundamentally, enabling the energy transition remains a priority for our future.

If you were to ask me what's different and why I'm confident our plans to deliver this level of performance improvement will deliver, my simple answer would be we're clearly aligned as one Rolls-Royce. We've got detailed granular plans, and we're rigorously performance managing our operational execution. We know what we need to do and how we're going to do it. And as you've seen in 2023, we've already made a great start.

I hope you found this session informative and insightful. I'd be happy to answer any questions in the Q&A. But now I've got a great pleasure in handing over to my esteemed colleague, President of Power Systems, Jörg Stratmann.

Jörg Stratmann

CEO - Rolls-Royce Power Systems AG

Yes. Thank you, Rob, for handing over, and congrats on the flight today. I think this is some kind of historic. So also, a very warm welcome from my side or guttentag, as I would say, at home. It's really a great pleasure for me to introduce Power Systems, which is a substantial pillar of the Rolls-Royce Group.

But before I start, I'd like to say a few words about myself and also my passion. I joined Rolls-Royce about 1 year ago, coming from the automotive supplier industry, which is known for its emphasis on continuous improvement, process optimization and also rigorous cost management. And my goal, when I joined Power Systems was to transfer this knowledge and experience. And I'm happy of all the improvements we have already today implemented and the momentum we have generated for the changes to come.

And this is exactly why I wanted to be part of Rolls-Royce. I'm often asked if my expectations have been met. And I can tell you, they have been exceeded, and this, for many reasons. Our great markets with diverse applications and our extensive customer base. But also, I'm impressed by our outstanding technology and by the continuous efforts of our highly engaged employees who enable us to achieve successful and sustained business performance.

So today, I want to set out our strong positioning in highly attractive growth markets. Our strategic initiatives to capture market performance improvements and how we are already transitioning to lower carbon solutions. So let's talk about how we will explore the full potential of Power Systems.

Power Systems operates in highly attractive growth markets. And based on our strong product portfolio and our unique sales and service network, we are a leading player with double-digit shares across our markets. So in Power Generation, we are a leading supplier for a variety of applications, such as the rapidly growing data center market. In governmental, our propulsion systems are well placed for the current investment cycle into military vehicles and naval vessels with a strong market share of above 30%.

In Marine, we have a market-leading position in the highly profitable Yacht market and also a strong position in Commercial Marine. And in Industrial, we are a key supplier to service-intensive applications with high running hours like rail and mining. All our markets show an excellent outlook with an annual growth rate of 2% to 7%. And often -- and this is important, often decoupled from GDP development. So for example, our Power Generation business benefits from the global digitalization growth leading to significant investments into new data centers and resulting in an average growth of 5% to 7% per year. And in governmental, the current investment cycle leads to a market growth of about 10% per year in the next 3 to 4 years.

Our broad positioning in different industries further makes us resilient to market volatility in individual sectors. And across our markets, we can leverage an installed base of more than 160,000 units. And this installed base is the basis for our service revenue, which represents about 1/3 of our total business. Compared with our peers, we have structural advantages. And these include a higher share in the more attractive high-power segment. The unique and great mix of products, systems and solutions and a very good market understanding through direct customer access. So building on these advantages, we have defined clear strategic initiatives to outgrow the markets and significantly increase our returns.

So now let me set out our plan to build on these advantages -- this is a [indiscernible], doesn't matter. So again, I would like to set out our plan how we build on these advantages and how we will significantly improve our performance. So we will deliver our strong profit growth through 4 key strategic initiatives and additional efficiency and simplification measures across our business. So first, in Power Generation, we are focusing on optimizing our cost structure and further scaling the business, benefiting from our strong position with key data center customers. And these scale effects will also create additional benefits as the engine platforms are the same across our different markets.

Second, in governmental. In our governmental business, we are aiming to capture strong growth through our leading market position and also expanding our product scope. Third, in Marine. We will strengthen our market position and realize further growth through our system strategy. And fourth, our Battery Energy Storage Systems business complements the Power Generation business, which is strong data center segment, and it expands our markets towards new applications, such as utility scale storage. We expect that the demand for battery storage will grow at around 20% per year, and we will continue to leverage our existing system capabilities and market access to even outgrow this market.

And finally, we will increase efficiency and drive simplification in our business. So to give you some specific examples. We will streamline our organization. We will reduce third-party spend by an optimized supplier portfolio, and we will create additional synergies with Rolls-Royce. And we believe these strategic initiatives will unlock our potential and bring us to an operating margin of 12% to 14% midterm. And yes, there's a lot to do, but our teams are unified behind this.

So next, I will give you further details on the first 3 initiatives, starting with Power Generation. So Power Generation is a highly attractive growing segment with a huge profit pool and also significant margin improvement potential, with the 9% revenue growth per year is also 1 of our biggest growth drivers. And this growth comes particularly from more than 20% increasing annual spend into AI-ready data centers. This is a great colleague, yes? So -- and thanks to our strong position in this market today, we will capture this significant growth.

We also see great potential in service through additional offerings, such as upgrade and retrofit kits, also digital services. So we are planning to double our service business midterm. Significant potential also comes from an increased focus on commercial optimization. So first, we are optimizing our internal cost structure and investments. Second, we will benefit from volume effects. And third, we will leverage our global production footprint. So for example, we will benefit from an increased localization of our engines by 40 percentage points in China.

On top of these measures, we are investigating to further broadening our offering and improve our cost structure through strategic partnerships. This will help us to share investments, capture market share and also lower our cost base. So just -- thank you, a second 1. So just on the -- on a side note, might be interesting. So do not worry about any blackouts today as this building and also this room are backed up by our Power Systems engines. So there are 8 of them on the roof of this building.

So let's talk about our governmental business. The governmental market is highly attractive for us with strong growth, good margins and a leading market position. And here, we are a key supplier for tank programs of the NATO partners, and we also see increasing demand of the NATO allies. So in fact, we serve major tank platforms around the globe, such as the Leopard, the Puma, the Boxer or the [anti-bunker]. And current geopolitical tensions have resulted in increasing security needs globally. And therefore, we see more than 10% annual market growth in the coming next 3 to 4 years. And we are in a strong position to capture that growth and even outgrow the market from both, the sale of new equipment and also higher service revenue.

In addition, we see opportunities to provide our customers not only with the perfect propulsion system, but also with more integrated solutions such as ship automation products. And we are well positioned to triple our revenue in this area. We're also focused on disciplined investments and technologies to strengthen our longer-term opportunities and to underpin our leading position.

So now let's come to our Marine initiative. Marine is a key profit contributor for us with even further potential for profitable growth. Here, we plan to strengthen our #1 position in yachts and improve our position in Commercial Marine through the following key levels. So first, we will create profitable upsell potential and differentiation by providing our customers with fully integrated solutions from bridge automation to propulsion systems. And as part of this bridge-to-propeller approach, we acquired the company team Italia this year, a high-value player with strong automation capabilities enabling us to offer integrated bridges for luxury yachts. And let me tell you when you are on a ship or even better on a yacht, as you look into this engine room and hear the engines running, power systems engines, this is spectacular. It's really spectacular. It's fantastic. Whenever you have the opportunity, please do so.

Second, we will secure our leading portfolio position by offering alternative fuel-ready engines to support our customers' transition towards sustainability. And alternative fuels will play a key role, especially in short and midterm transition, and our key engine platforms are already being released step by step to run on this. In the long term, we see methanol as the prime decarbonization path and are therefore also developing methanol-based solutions for our engines.

And finally, our high-margin service business provides us with great growth opportunities. With a revenue share of more than 40%, it is a substantial profit contributor. And to capture additional potential, we are developing new digital solutions, such as equipment health monitoring, which provides our customers with higher availability of their equipment. 1/3 of topic that we are driving is energy transition. And here, we have made already significant progress towards offering lower carbon solutions, enabling our customers' journey to net zero.

The speed of transition and customer demand strongly varies between our market segments. Many of our customers, such as data center and governmental clients will continue to use combustion engines well into the future. Combustion engines will remain highly relevant for many years, but increasingly powered by sustainable fuels. So by the end of 2023, I'm really pleased to say that all our major engine platforms will be released to run on these fuels. And we already see first customers such as the mining corporation, Rio Tinto using our engines with a sustainable diesel substitute HVO.

In Marine, we are developing methanol-based solutions and for Power Generation, we see hydrogen-based engines as a future solution. These developments are based on existing engines. And given the progress already made, we are well prepared to deliver this transition. Hybrid solutions will be key in various segments. So we already offer them in the yard or the rail business. So in the U.K., for example, you can enjoy our hybrid rail system by taking the Chiltern Railways Line from London Marylebone to Aylesbury. In our important Power Generation business, engine-based systems will continue to dominate the market. Yet, we are also very well prepared for the gradual transition towards battery-based solutions as we have the required capabilities and products already today.

And finally, digital solutions will contribute to the decarbonization by increasing efficiency of our products. Digital products like asset and fleet management and equipment health monitoring will enable us to generate additional value streams.

So let me conclude. In summary, Power Systems will contribute significantly to the success of Rolls-Royce. We have a resilient business model with strong market positions and opportunities ahead in growing markets to unlock the full potential of our business. And we have a clear strategy to deliver this. It's built on a resilient business model and the combination of cost efficiency and substantial growth in attractive markets. This will significantly contribute to the profit and cash improvement of Rolls-Royce.

In addition, we are well prepared for the energy transition to secure future business opportunities. So all Power Systems employees, including the management team and, of course, myself, are aligned and mobilized to deliver on this strategy and to succeed with the One Rolls-Royce mindset. So together with Tufan's leadership and the entire company worldwide, we are really looking very positively forward into our future.

And now with all these great opportunities in front of us, I think you can understand why my expectations about Rolls-Royce and Power Systems have been exceeded. So we have achieved a lot, but we are just getting started. There is much to do, but we are all really excited to continue our journey.

And with this, I will now hand over to my dear colleague and friend, Adam for Defence. Thank you.

Adam Riddle

President of Defence

Thank you, Jörg. Jörg and I have now worked together for a year, and I have great admiration for him. His passion and dedication of Power Systems is all on display is highlighted in his remarks.

I also want to acknowledge Rob. He was one of the first people I met in Defence when I joined Rolls-Royce 10 years ago, and it is a real pleasure to be here with him today.

Good afternoon, and thank you for attending. Today, I'm going to discuss how Defence is playing its part in creating a One Rolls-Royce that is to fund outlined, delivers on its potential. For me, it also marks the culmination of the strategy view that I worked on in my previous role. So it's a big day. I plan to take you through a quick overview of our business today, show how transformation is improving our midterm performance and highlight how our recent program wins can unlock the door to long-term growth.

Before I start, I would like to acknowledge my 11,000 Defence teammates. As a former U.S. Army Officer and longtime member of the Defence industry, it is a real honor to represent them. All of them are dedicated to our customers and to ensuring they can accomplish their missions, providing assistance when natural disaster strike, providing deterrents in the air and sea or medevacating those in need of medical care. All those customers depend on us every day, and we take our role in delivering for them very seriously. We also take our role in delivering to our shareholders very seriously, which I will address shortly.

As you'll see in the fact sheet, the Defence business largely includes aero and naval gas turbines and nuclear submarine propulsion. Indianapolis is the mainstay of our transport engines. Bristol is the center for combat. Raynesway in Derby is home to our nuclear submarine business. And our sites in Mississippi, Massachusetts and in Canada focused on our naval capability. In all, we have over 16,000 engines in

service with around 160 customers globally, and we work in close partnership with the U.K. MOD and the U.S. DoD.

I've spent most of my career in strategy here at Boeing and Anheuser-Busch. So I concur with two funds analysis of how we make decisions about our portfolio: Is the market attractive? Are we differentiated? Can we generate competitive financial returns? And when I look at our Defence business, I believe there is strong evidence that we tick all 3 boxes and therefore, enjoy advantaged market positions.

Our financials have demonstrated that the defense market is resilient. We maintained our customer and shareholder commitments throughout the COVID pandemic. In the global security situation that has developed since has led to governments increasing their commitment to defense. Our half year results showed strong revenue growth and order pipeline. Our customers continue to invest in capability in our core markets and we have demonstrated that we are differentiated.

The versatile AE engine family has enabled us to win positions on the C-130J, V-22 and MQ-25 in transport and 13 others if you're counting. Our full engine combat capability enables us to power today's aircraft and position us as an international partner for the development of future platforms.

Our capability in nuclear submarine propulsion is unique. We are the only company that can design, manufacture and support naval reactors. The high-power density of our naval gas turbines brings real advantage as mission systems require more space on modern warships. And in helicopters, we've accumulated huge experience in military and civil programs.

We also believe our business model is differentiated. Defence programs typically generate positive financial returns throughout the life cycle to include design, development, production and service. And the life cycle last 40, 50, perhaps even 80-plus years. In transport, we are still making T56 engines for the Hawkeye, over 60 years since they first rolled off the production line. We are proud to have enabled the U.K. continuous sea deterrent to operate since 1969. And our model 250 remains a mainstay, the small helicopter market over 60 years after its first deliveries.

Our customers have benefited from the technology and capability that we have developed in partnership with them. Our shareholders had benefited as well, and that continues. Products we are designing today will be generating sustained and profitable returns for this company many decades into the future.

But we know we can do more to contribute to the Rolls-Royce transformation in the short to midterm through a combination of prioritizing our growth markets and delivering improvements in areas that are within our control. Our half year results demonstrated margin improvement through work already underway. This will help us unlock our full potential. Looking forward, over the midterm, we aim to grow that margin to 14% to 16%.

Revenues are increasing in our core markets of transport, combat and submarine, which has a positive impact on our operating profit. I will take you through some of the growth drivers on the next slide.

As with our other divisions, we believe that transformation will deliver tangible efficiency and simplification benefits in the short-term. I've already mentioned the significant margin improvement we have realized through its early stages. The work we are doing on organization design, third-party cost, inventory reduction and other work streams will further improve our financials and sharpen our competitive edge.

For example, I believe we will find synergies as a result of consolidating our engineering and procurement activities that will enable us to prioritize resources and generate significant financial benefits. While we will experience some legacy retirements over the midterm, the actions I have mentioned will enable us to improve our overall operating profit performance.

We are targeting key areas to provide margin uplift over the midterm. For instance, on volume and mix, the overall transport fleet is growing, generating higher flying hours and more shop visits. For example, AE shop visits increased by 22%. In combat, changes to the products mix yield higher profit due to the scale of newer programs. It's a similar story in submarines, which will see an increase in volume, funded development and infrastructure. All of this is underpinned by our exceptional order pipeline, GBP 8.5 billion at the end of 2022, which provides high certainty to our midterm revenue projections.

On commercial optimization, all of our major contracts will be renewed over the midterm, which provides us with the opportunity to work with our customers to offset external impacts such as inflation and ensure we capture the fair value for our products and services.

From an investment prioritization standpoint, the strategic review process enabled us to take a more focused view on where and how we invest. Our major customers strongly support our core differentiated strengths in transport, combat and submarines. And as a result, our customer-funded R&D is due to increase by 150%.

And there are more opportunities for funded programs in these areas. Our choices are customer-led and reflect their priorities. And on cost management, our half year results demonstrate that Defence is already making progress in this area, and we'll capture additional benefit from the group-wide transformation activity.

So in the midterm, we are improving performance largely through being smarter about how we operate, making sure we are doing all we can to achieve our potential. And this is positioning us to better execute the new generational programs that we have won.

Early in the last decade, we realized that our portfolio was maturing. We needed new programs to replace anticipated fleet retirements or our competitors would replace us. So we focused on winning big programs in our core markets, and we did this by utilizing our strengths. We leveraged our partnership experience to secure our position with Bell on the U.S. Army's future long-range assault aircraft and also on Tempest in the global combat air partnership.

We worked as one Rolls-Royce to win the United States Air Force contract to re-engine the B-52. And our capability enabled our selection to power the new AUKUS submarine fleet. All of this underpinned by the innovation, which is in our DNA.

These wins start to increase our volumes just beyond the midterm horizon, and our position on them can unlock even greater growth over the long-term. We are anticipating a CAGR of between 4% to 5% between now and 2040, which will be faster than the market.

In transport, the U.S. Army's FLRAA program is just one element of the future vertical lift market. With this win, we are in a good position to capture other DoD and international sales that are likely to follow. If you would like to learn more about these opportunities, please talk to [John, Shay and Jenere] in the [indiscernible] side. They led our FLRAA team and are excited to tell you how we did in partnership with Bell.

In Combat, we are very proud of our B52 win, which enhanced our reputation as a major U.S. defense supplier and has opened doors as a result as we re-engine an aircraft that has been in service for around 70 years. We are also positioning to power the Air Force's future autonomous combat platforms. We can offer a military variance of civil engines in this space. We also have proven rapid development capability through the MOD funded Orpheus program, which offers international opportunities in which, again, you can learn more about via the online expo.

In the U.K., our leading partner status in Tempest has led to our participation in the global combat air program, which has further international export potential while our full engine capability is providing other opportunities to partner with governments seeking to develop their own combat capability.

It's also worth pointing out that digital capability was crucial in winning B-52 and continues to be a game changer for us as we develop our GECAT power system.

And in submarines, what we always thought of as a U.K.-only market has now expanded to include Australia through the AUKUS agreement. It represents a large expansion for our submarines business in Raynesway. And the unique capabilities that we have developed there have the potential to be leveraged into other growth markets. For example, micro reactors can play a big role in helping energy security and resilience and energy transition, both in the defense and civil environments. Again, you can learn more about this in our online expo.

So in summary, we have a strong and resilient business today. We know we can do more and are taking specific actions to realize greater value and grow our margins tomorrow. We are transforming as part of One Rolls-Royce to deliver even better performance in the midterm through improving volumes, commercial optimization, investment prioritization and cost management. We are leveraging our recent wins to deliver an exciting future with long-term growth in programs that will run for decades.

And finally, I want to finish where I started. That last picture shows the importance of what we do. It is the inside of a Rolls-Royce powered aircraft during an evacuation, taking people in peril out of harm's way. We are here today because somebody somewhere is keeping us safe. They're relying on us to deliver each and every day and we are exceptionally committed to our duties.

Thank you. I will now hand you back to Isabel.

Isabel Green

Head of Investor Relations

Thank you, Adam. So I'm now going to welcome all of our presenters back up on to the stage for our second Q&A. We've got about half an hour for that. As a reminder to those of you in the room -- don't do this corner because Tufan can't see you, so I think Ian has now moved. But make sure you use your microphone. Everyone online does want to hear your question. If you are online, if you put a question to Q&A box, we are monitoring that. I hope we will get time for 1 or 2 questions from online at the end. Over to you, Tufan.

Tufan Erginbilgic

CEO & Executive Director

Thanks, Isabel. I'll try to pick people that -- who weren't actually able to ask questions in the first session. So -- but anybody, let's go. Let's start there, then we'll go there.

Question and Answer

Ross Law

Morgan Stanley, Research Division

It's Ross from Morgan Stanley. A couple for Rob, please. Firstly, on your shop visit assumptions. You said 1,100 to 1,200 total shop visits, 700 -- or 700 to 750 of which are large overhauls. That implies that C&R shop visits are actually lower in 2027 versus 2022. Is that math correct? And if so, what's driving that?

Secondly, on fleet size, how many large engines do you expect to have in service in 2027? And what proportion of that is the new generation programs, so T1000 XWB and the 7000?

Unknown Executive

So Ross, just so you can hear, thanks for those questions. So yes, your math is correct. So we see a significant increase in our large refurbishments and therefore, there is a corresponding slight drop in C&R about 10%. That's largely driven by Trent 1000 coming out of a more intense program of check and repair by the end of the medium-term plan.

Second question was what's the distribution end? I mean, around 60% of that large engine fleet in 2027 is XWB, so 84 and 97. And then I would say probably about 80% of the total fleet of those new engines with the balance to 700, 800 and 900. I'll have to get you the absolute number.

Tufan Erginbilgic

CEO & Executive Director

Thanks, Rob. There was one question there, if I can go there.

Unknown Analyst

A couple of questions. First of all, this morning, earlier today, you mentioned that electric air mobility is something you're not basically going to pursue. Is that because you don't believe in the overall opportunity or it doesn't reach certain thresholds in terms of profitability that you think can make out of it? Because you get your views. It's obviously an area that's getting a lot of hype there, some very highly valued company, which obviously we wonder where the value is. But so your thoughts on that?

And the second question has to do with the engine issues that you faced when you came out with the 787s with the Trent 1000, I believe. And obviously, the problems that Pratt is facing today with DTF. What is -- what are the lessons learned? How will Rolls-Royce look in the future to mitigate and not have these issues? Because as we know, these are multibillion-dollar cost issues for a company like yours.

Tufan Erginbilgic

CEO & Executive Director

So I'm going to ask the second one, Rob, to answer. Let me pick up the first one, electrical. I see -- I don't want to say more because there are confidentiality around some of the conversations. But one thing I will say, if you look at what the team presented, we have great growth opportunities in our business -- in our core businesses. Then in addition to that, we are actually, like take micro reactors, given our distinctive position, we are -- we should be natural leader, not a player, leader in micro reactor.

Battery storage in Jörg's team that's highly transformable skill set. And in this time period, you have seen it from my chart as well as Jörg's chart, that business in a very short period of time will be profitable, then grow from there. In this period, actually, it is becoming profitable. And not to mention the growth picture in the core businesses that Adam, Jörg and Rob talk about. So it is really simply to say two things that we have great growth opportunities and we need to actually allocate our resources more effectively there.

Second thing, we believe we built very good capability in advanced air mobility. We believe it is going to be a better value to a third party. But having said all that, people need to understand, we are not ruling out like regional aircraft with hybrid. I mean, I can totally see our technologies is there, so I need to be

Careful. But I can totally see hybrid, and we are actually working on it, hybrid solution in regional setup. And that business already established business, it needs to be transformed to lower carbon version, if you like. And I can totally see us playing there. Therefore, in the presentation, I talked about keeping the capabilities to support Aerospace, Defence and Power Systems business. Rob?

Unknown Executive

So on the Trent 1000, I think there are two elements to consider. I think the first lesson learned was around just making sure that when we bring an engine into service that we're satisfied with the maturity of the technology in the engine and then we've done the right level of maturity testing to support it once it's entered into service. So the right testing regime in advance of entry becomes really, really important. So you properly understand and you have a stable set of products attributes.

The second point, learning specifically for Rolls-Royce, I think, was our reaction to the Trent 1000 after we had an issue that we needed to respond to. And we were a huge amounts in how we need to scale up and prepare as an organization for that kind of in-service events. So alongside making sure when we do new NPI programs that we've got the right testing schedule and that we're pacing that program properly.

The second element, which gives us greater confidence is, we absolutely understand what we need to have around us to support that engine EIS and in the early years of its service so that we can respond quickly and intervene if we need to rather than we end up something of a larger scale magnitude. Thanks, Rob.

Tufan Erginbilgic

CEO & Executive Director

I'll go sort of same name sort of faces. So why don't we start with you? It seems like -- all right.

Robert Alan Stallard

Vertical Research Partners, LLC

Rob from Vertical Research. A couple of questions. First of all, Adam, that margin increase in the Defence division in the industry that would generally come from a mix shift, but I was wondering if your split cost-plus and fixed price is altering materially in this medium-term time period?

And then sort of a bigger picture question for you, too Adam and Helen as well. Both of you have spent a lot of time in the energy industry, obviously. What would you see as the key similarities and differences you've identified coming over to Aerospace and Defence?

Tufan Erginbilgic

CEO & Executive Director

Okay, Adam, do you want to start?

Adam Riddle

President of Defence

So when looking at the margin, I think it's important to look at all the contracting types we have throughout the globe. So when specifically focused on Pearl 15, the US SSRO and here, that is a place where we have to make sure that we fully substantiate our cost and maximize our org.

Specific to your question, there is volume growth in combat, transport and submarines in that growth there are places where we are benefiting from mix.

And then on the margin and margin point, we also have to focus on, as I mentioned in the presentation, transformation, reducing costs, focused investment, being as efficient as we possibly can, TCC to GM ratio and being good stewards for our customers as we run our business.

Tufan Erginbilgic

CEO & Executive Director

So on the second question, I'll start and Helen, please jump in. I think -- I mean, I'm not sure. Some of it energy sort of driven, but most of it is really similarities coming from one aspect of it, large, complex, multi-business, multidivisional global business, managing that business is very different because obviously, when I was coming through the ranks I -- first business I managed was not a global business. I know the differences, right? So it is very different. You need to know how to think about that. It is very different. And that's common.

Second comment is this business is driven by technology, engineering and safety is very important, including obviously our customer safety and the people safe to use our products. Again, those 3 are very critical. Frankly, I come from the businesses all technology we use as a differentiator, okay? Same thing is obviously happening here. And I think those are big similarities.

And then Helen and I from sort of customer end of i.e., downstream. So we deal with customers and all the airlines were my customers, right? So just to give you an Air BP, all the -- Air BP was in my portfolio. All of them were my customers. So sort of you have a view about B2B, B2C branded business and customer management aspects of it is very, very sort of important.

And energy transition is the last one I'm going to say. You come obviously spending lots of time on energy transition. And it comes handy on some areas right now because we have a view, like I talked about SAF versus hydrogen, for example, and so on. Helen?

Helen McCabe
CFO & Director

Thank you. So I'll be additive. So a couple of similarities. So -- and I worked together in a previous life, we did a couple of transformations together. I think two we did together. This is our third. And I think the rigor in the successive transformation is quite transferable, and there's a couple of things which are fundamental to how you think can go about transformation.

The importance of being really clear as to what your strategy is and take that to a granular level cannot be underestimated, which is why you've heard us today I'll talk about the depth and the detail and the process that we've gone through. I think, Tufan, you talk about 400 to 500 people being engaged in this process. It's not just us sitting up here.

So a clarity of strategic thought direction very, very important. Your ability then to galvanize the organization behind that and to align the organization behind that strategic clarity is incredibly important so that everyone knows what they're working on service of and the objectives are aligned, and we saw that in our previous transformation.

And then two other things, I would say the importance of execution discipline and the rigorous performance management around that is very important things always haven't that you don't expect. So having that fleet of foot of ensuring that you are rigorously performance managing your strategic performance, day in, day out, and that's why I talk about integrated performance management that you link it from strategic objectives through to your annual plan through to your in-year performance management.

And because some things always don't work as you expect, the importance of resilience, ensuring that your strategy has to have the right balance between top line and bottom line growth and that you actually build up that very, very solid base from which to grow. So that as you capture margin improvement, that actually falls to your bottom line and you're building a very, very strong foundation. So those are a couple of additives.

Tufan Erginbilgic
CEO & Executive Director

Very good points, Helen. Thank you. I'll go there, then one.

George Zhao
Sanford C. Bernstein & Co., LLC., Research Division

George Zhao from Bernstein. So a lot of discussion on margins so far, so I wanted to ask about the revenue side. If I take your midpoint of the operating profit and margin guide, that implies about GBP 19 billion of revenue by 2027 at the midpoint, about a 7% CAGR from where we're this year. So if we assume Civil Aerospace above that, Defence and Power Systems somewhere in the low to mid-single digit, is that what you're assuming in the targets there? And related to that, given the plans to dispose some of the Electrical business, what is the 13% to 15% margin target assumed for the absolute losses for the New Markets division?

Tufan Erginbilgic

CEO & Executive Director

So I'll -- I mean, I'll very briefly answer it. So we are not going to give you sort of numbers because this event is not about that. But I think you can calculate revenue the way you did. Obviously that would be a perfectly legitimate way of calculating.

Effectively, in New Markets, if you actually think about this period, is benefiting effectively from 2 things, obviously, exit on Electrical, although we will keep some capabilities, as I said, to support our businesses. Second thing, it is going to benefit from, effectively, we are planning, in a value-creating way, we will still be the biggest shareholder, but we are going to be less than 50% on SMR.

That is sort of our thinking in this period. And that happens not immediately but in this period. And those 2 things, effectively, you may want to think when you think about New Markets. I won't give you numbers, but you will sort of figure out what that means.

Okay. Let's go there.

Ian Douglas-Pennant

UBS Investment Bank, Research Division

It's Ian Douglas-Pennant at UBS. Jörg, could you help us understand within the power business, which of the subdivisions within your business where the -- there are greater or lesser synergies with businesses outside of power, let's say?

And Helen, inventory release and the cash flow that comes from that, what allowances have you made for the supply chain getting better or worse from here, especially given the ramp-up in volumes?

Tufan Erginbilgic

CEO & Executive Director

Jörg, do you want to take that?

Jörg Stratmann

CEO - Rolls-Royce Power Systems AG

Yes. Question #1, if I got the question right, you are asking for synergies, Power Systems with Rolls-Royce, right? So -- and I would say the beauty of our business model is that we are using the same engine platforms across our applications. And we do then application engineering to have them ready for the different markets. And with some -- we have some large volume business, some smaller, but the large volume business gives us the scale to be very competitive in the smaller markets, in the niches.

So when we talk now about synergies, it's across the platforms. This is what I want to say. So it's not in single applications. But it's, for example, if you look to ET&S, it might be in software. It might be in electronics. It might be also in the arena of procurement, in particular, indirect but also some direct and of course, across the board for processes, methods, tools we are using. These are actually the synergies we are looking for.

Tufan Erginbilgic

CEO & Executive Director

Thank you. By the way, ET&S, you may not...

Jörg Stratmann

CEO - Rolls-Royce Power Systems AG

I'm sorry. It's our R&D, so engineering and technology.

Tufan Erginbilgic

CEO & Executive Director

We now created new organization, as you know, which is going to serve all 3 divisions. We call it Engineering, Technology and Safety, and Jörg was referring to that. Thanks, Jörg.

Yes, sure.

Adam Riddle

President of Defence

So one thing to highlight on synergies, Jörg's business, the Defence business is commonality of customers. So we often work together in working with our customers. For instance, our 2 teams were just together in Washington, D.C. at the AUSA conference. That's the place where there is overlap in synergy between the 2 orgs.

Tufan Erginbilgic

CEO & Executive Director

So to summarize, I think you will see sort of synergies at customer level. Definitely, engineering and technology synergies, you will see. Then the procurement and supply chain synergies is the third area, which we haven't really explored before. None of the things -- except the customer one, which we can get better and better. Others actually will be new synergies, if you like.

Helen McCabe

CFO & Director

Inventory. So thank you for the question. So actually, we were just as a leadership team discussing risks last week. And supply chain and inventory risks was something, which Adam, Jörg and Rob all spoke to. So yes, we are mindful for those. You see the next particularly probably 18 to 24 months remaining challenging.

However, that said, as I mentioned earlier, we still expect to release inventory the second half of this year. Why? Because we've identified areas in the supply chain where we weren't being efficient. So Rob and the team getting after pockets of buffer stock that they were holding, which were not required, 100 million. Jörg has had his team out looking at sites, factories where they were actually holding inventory of quite a few years of stock, which was not required.

So there are some areas of, I don't want to say low-hanging fruit, but areas of inefficiency that the team are getting after at the moment where they're improving processes and systems. And we will continue to do that, but we are mindful of the industry supply chain challenges out there. Despite that, we have a detailed plan where we do expect to release inventory over the midterm.

And to your question on growth, have we built growth in for inventory? Yes. If you go back to and have a look at the chart that I showed when I spoke to working capital, you can actually see that we have built some growth in both for inventory and as we think about our debtors and creditors. So we have built growth in to support revenue growth going forward.

Tufan Erginbilgic

CEO & Executive Director

Thanks, Helen. If I can go there.

Christophe Menard

Deutsche Bank AG, Research Division

It's Christophe from Deutsche Bank. Two questions. The first one is on the shop visit cost reduction on the Trent XWB. Last year, I think you mentioned minus 40%, which was a good target. It's minus 50% this year. So what enabled that further improvement? And what headroom do you further have on this?

And the other one is on Power Systems. Services seems to be one of the areas where you can do some improvements. It was highlighted already in the CMD in 2018. You were looking for a target of 40% of the total sales. Do you have similar targets now? Or is it more specific to power? I think you said a lot on power generation. But is it other areas as well?

Tufan Erginbilgic
CEO & Executive Director

Okay. Rob, then Jörg.

Robert Watson
President of Civil Aerospace

On shop visit cost reduction, I think a good example of the progress we're making, I was in Singapore a couple of weeks ago and we have a joint venture there with Singaporeans. And we've been investing in some repair technology that we'll use in that shop. So we need to build capacity across our MRO network. We're looking at how we scale that up for the midterm, and we've been really thoughtful about how we use that opportunity to address costs.

So Singapore partnered with EDB, government agency, which provided some funding to allow us to focus on developing some technology, some R&D activity that would drive some short-term benefit for the group by looking at introducing repair technology, repair technology sell on the shop floor with the shop that allows us to identify and repair components rather than just replacing the new parts.

What that does is bring the cost down. It means we don't have to wait for the parts to be delivered to the shop, so we're speeding up the amount of time that the engine spends in the shop. And it's that kind of example where we're getting some good government gearing. We're prioritizing our R&D spend for those short-term returns, and we're thinking about how we improve time in the shop and the scope of the work that we do on an engine to give us access to that kind of improvement on shop visit cost.

Tufan Erginbilgic
CEO & Executive Director

Thanks, Rob. Jörg?

Jörg Stratmann
CEO - Rolls-Royce Power Systems AG

Yes. On service, service is obviously a very important part of our business. I said this is roughly 1/3 of our business. And so we have some areas where the service share is higher. I mentioned this for Marine, where we are above 40%. But we see the, let's say, the opportunity to grow here actually in all the different applications.

So I mentioned PowerGen. There will be retrofit solutions. There will be upgrades. We see this also in governmental. So don't forget, governmental is very important on the new equipment but also in the in-field service. Also here, we see product upgrade. So we stay on the same platform, but we upgrade the product, and with this comes additional service; industrial, high-running hours applications. I mentioned rail. I'm mentioned mining. We have really opportunities across the board in service.

And it's not only -- it's very important to grow it and to take this opportunity. But if you offer a great service, it's also a competitive advantage you can play in the new equipment because this is the reason why customers want our products. So service will gain importance in the midterm.

Tufan Erginbilgic
CEO & Executive Director

Thanks, Jörg. Yes?

Nick Cunningham*Agency Partners LLP*

Nick Cunningham again from Agency Partners. A couple of questions. One, on the LTSA balance, that's increasing GBP 800 million to GBP 1.2 billion a year through the 5-year period. At what point do you expect that to neutralize? Or do you indeed expect [this new focus]? From memory, I think that was expected to have happened before that point. So sort of kind of what's going on with that, if you like?

And then the other thing is we used to talk a lot about the unit loss on large engines, OE, \$1 million or GBP 1 million, whatever. That's not been specifically brought up in this presentation, although, I guess, it's covered by product cost. But do you foresee a point at which, at least in terms of direct costs, an OE engine can get to breakeven?

Tufan Erginbilgic*CEO & Executive Director*

So I'm going to ask Rob to answer the second question. But obviously, Helen and Rob, feel free to add to first question as well.

Frankly, LTSA balance, like you, I was seeing, okay, well, how should I think about this sort of going to the future. It is actually more straightforward than you think. So a short answer for a long time, therefore, you need to think about LTSA balance increase as a sustainable increase.

Why? I think Helen covered that. But it's very -- I mean, it's very simple and very complex, but I'm going to simplify it. So as long as your installed engine base grows, right, and you are increasing your unit rate, not to mention time on wing improvements we will be making, but even if you don't make, let's say, status the time on wing at some point, if your installed engine base continues to grow and your EFH rate improves because of your commercial optimization, LTSA will continue to grow, especially if your engines are young. And that is the case in our case.

Therefore, I said earlier today that actually you need to think about our cash delivery is effectively better quality operating profit, better quality in the sense that it is more cash-based. Okay? It's good quality right now as well, but it is more cash-based in midterm. In that sense, cash terms and LTSA, which is actually sustainable beyond this period because our engines will grow well beyond this period, right, our installed engines.

And because we are actually capturing market share, Rob talked about it, I talked about it sort of and that's how you need to think about. Those are the drivers in force here effectively. Rob, on the second one.

Robert Watson*President of Civil Aerospace*

Yes. So you're right. I mean product cost is the focus for us, and it's one of the biggest drivers that underpin that margin improvement. We have made huge progress last 5 years on the OE cost reduction, and we're always focused on it both because of the OE benefit that it brings and also in our services business if we're bringing the cost of parts down.

So we continue to target improvement in that. We're more or less around the industry benchmark. I think it's about 3% gross product cost out each year, and we continue to prioritize allocation of engineering resource and CapEx to continue to drive that cost reduction program.

Isabel Green*Head of Investor Relations*

Sorry, we're running out of time. I'm going to get the last question online if you may.

Tufan Erginbilgic*CEO & Executive Director*

Please, go for it.

Isabel Green*Head of Investor Relations*

So the question comes online from [Michelle Blite] from J O Hambro, saying your slides in the first section indicated SMRs could be bigger than Defence and Power Systems in the long term. Please, could you comment on the clarity you've had from the U.K. government on plans there and where internationally, you could take the Rolls-Royce SMR technology? And I think you did give a list of some of those nations in the earlier presentation.

Tufan Erginbilgic*CEO & Executive Director*

So I think that's the revenue chart. I just remind everybody. So yes, I think if you go to the future, I mean, you need to think about big picture. Somebody said I came from energy industry. So I have a view, right? I always took a view. Frankly, Europe will never go to net zero unless nuclear plays a roll, right? U.S. has few other options. I'm not going to dwell on it here. But that's the big picture.

When you come to nuclear, you have choices. You have SMR or nuclear projects -- big nuclear projects. Their risk profile is very different and history demonstrates that that's true. So then you conclude SMRs need to play a big role. And we are actually bringing know-how from our submarine business. It is a proven technology.

In that sense, so let's go to your question, but big picture, it makes lots of sense. Yes, U.K. process continues at this point. I think it is important that, frankly, if you think about how advanced we are in generic design assessment, we are probably 2 years ahead of anybody else for Europe and U.K. because technology is sort of specific for U.K. and Europe. That is -- we are actually ahead of anybody else.

So second thing is, therefore, it's not about we will be selected or not. I would be very surprised, frankly, if we are not. So it will be hard to explain to anybody, to myself as well. But so -- but the point is not that. Point is actually, this process, I said this to the government, frankly, very openly, you need to come with committed projects at the end of it so that we go into execution and with some funding.

So -- but given latter part of that question, what other countries you are working with, I actually listed there. I'm not going to give you the same list, but I'm going to say, Chris and the team is working very, very closely with Czech Republic so that we have actually joint work streams and so on. And we also have even a sort of an opportunity in the U.S. as well that Chris is progressing. And other countries I mentioned, Scandinavian countries like Sweden and Finland, et cetera, they are actually genuinely interested.

Once this thing sort of gets on the ground, people can touch and feel because with new technologies, there is always some hesitation, when you start to touch and feel, frankly, this is going to be a little bit like, again, energy sort of industry talking offshore wind. This is going to explode. I actually say to Chris, worry about the supply chain catching up with you, but he is working with -- on supply chain already. So I think there is the opportunities set here in the period that I was talking about.

With that, I think we are going to -- I'm going to make some sort of closing remarks given that Isabel disappeared. That's my cue to say, actually, maybe it is time to conclude.

So first of all, [indiscernible] than we could answer, but hopefully, we answered many questions you had. And if you have more questions, Isabel and team, definitely, they are waiting for you to help you there.

But before we close, I would like to remind you of the key messages from today. Rolls-Royce is at a pivotal point in its history. We are transforming our performance, and we have a clear vision for the journey we need to make.

We have a strategic framework that will deliver a step change in financial performance in the midterm. We are making choices about where we will invest and the shape of our future portfolio where we should partner and where we should exit. We have advantaged businesses in attractive markets with

differentiated technologies. Our strategic initiatives will unlock our potential and create more value for our -- all of our stakeholders.

Our group-wide efficiency and simplification program will deliver sustainable benefits, making us more resilient and competitive. And we are becoming a lower carbon and digitally enabled business. Playing our part in the energy transition and benefiting from the advantages AI and data can bring, we are already in action, and there are lots of opportunities for us here in the future.

I think this part, we haven't spent lots of time, but the second part of -- lower part of this slide, but that is a very key part of key difference, which is actually causing these outcomes that I would like to sort of summarize very quickly.

We are working as one Rolls-Royce. All of our people are aligned and mobilized to succeed. We have a new mindset and stronger performance management. We are embracing new ways of working and over time, this will develop into a distinctive performance culture.

We are executing with strategic clarity. This strategic clarity, combined with granular strategic plans, focuses and aligns the organization and makes strategic delivery relevant to all our people. So everyone has a role to play, and we will manage performance closely to ensure delivery.

We are externally focused and benchmarking our business against the competition, commercially and financially, so that we constantly improve our business to world-class levels. And we have simplified our organization and are strengthening our capabilities in key areas.

I am confident and excited about the opportunities we have at Rolls-Royce. Now that I laid out our plans, I hope you are too. We have the expertise, the drive and crucially, the team that can deliver. All of this will help us deliver our Rolls-Royce proposition: to become a high-performing, competitive and resilient business with growing sustainable cash flows, a strong balance sheet and growing shareholder returns.

This Rolls-Royce will be able to do things tomorrow it wasn't able to do before. We are transforming our business ready for our changing world, fit for today, tomorrow and the future.

Thank you for joining in the room and online today, and I hope to see you all in the near future in our February results presentation. But before we close, I would like to also thank whole leadership team. It's a very strong leadership team. It is actually privilege and pleasure to work with them not only because what they have done today but what they have delivered so far and more importantly, what they will deliver in the next couple of years.

And one last word, these events don't happen without lots of people working really hard behind the scenes. And I would like to thank, really personally thank all of our employees who make this happen. Thank you very much. Have a great day.

Presentation

Isabel Green*Head of Investor Relations*

Hello, and welcome, everyone, to our 2023 half year results presentation. I'm Isabel Green, Head of Investor Relations, and I'm joined today by our CEO, Tufan Erginbilgic; and also Panos Kakoullis, our CFO. Our presentation today will take around 30 minutes, leaving plenty of time at the end for Tufan and Panos to answer your questions.

And welcome to UBS, first time we've been here in a while. [Operator Instructions]

Moving on, before we take -- begin, we take note of the safe harbor statements on Slide 2, as always. The results information can be downloaded from our website with the full risks and disclosures. I will now hand over to Tufan.

Tufan Erginbilgic*CEO & Executive Director*

Thanks, Isabel. Good morning, and welcome. I will start by presenting the highlights of our first half before handing to Panos to cover the financials in detail. I will then talk about transformation progress. We pre-released our results headlines a few days ago. So the key messages of today's presentation should not surprise anyone. First, improved operational delivery is helping us deliver stronger financial results.

In Civil Aerospace, OE deliveries and LTSA shop visits rose year-on-year by 26% and 24%, respectively. Our planned time-on-wing improvements are progressing well. This is 1 of the 6 levers that we are pulling to improve LTSA margins. We have applied for certification for the latest Trent 1000 fix, which will more than double the time-on-wing of that engine.

Our order book has grown in all 3 businesses. Our large engine backlog group for the first time since 2018, including a large order from Air India in the first half. We also performed the first successful test of UltraFan demonstrator engine. The first time all the technologies have been tested together. This program will position us well for the next generation of aircraft. Technologies from UltraFan will also improve the time on wing of existing engines.

In Defense, the AUKUS submarine agreement builds on our already strong pipeline, underpinning the long-term outlook for profitable growth in the business. And demand remains strong in Power Systems. Revenues grew more than 20% in the first half, with record level of order cover for '23 and '24. Transformation delivered strong initial results and helped us raise the guidance for the full year, even though our February guidance already included some expected benefits from transformation without which it would have been a lot lower.

Commercial optimization is driving commercial actions and pricing improvements across all divisions. We are tightly managing costs across the group as revenues have grown and improving the productivity of our operations. We are also making choices and allocating capital at the group level to the most profitable projects. Our transformation program is progressing at pace, but we still have a lot more to do.

Our early interventions have had a significant and sustainable benefit on our financial results. This is actually in line with my experience of past transformations that suggests the rate of improvement is higher in the early stages.

Finally, our financial results. We delivered a 9.7% margin in the first half of '23, with the improvements driven by Civil Aerospace and Defense. The strong results in the period reflect end market growth and transformation benefits, notably from commercial optimization and cost efficiencies.

As a result, we are expanding the earnings potential of the business and accelerating financial delivery. They also support the increases to guidance we announced last week. We are transforming Rolls-Royce into a high-performing, competitive, resilient and growing business. Our progress in the first half was

delivered, despite a challenging environment. Large engine flying hours recovered as expected to 83% of 2019 in the first half of the year. But the supply chain remains challenging, particularly in Civil Aerospace, where we have also been impacted by the 2 supplier fires.

Inflation remains high, but we have managed to more than offset the impact at the group level through cost efficiencies and pricing increases. Interest rates are rising. All our debt is currently fixed, but deleveraging and returning to an investment grade credit rating is a priority. This slide shows some of the metrics that we presented to you in February.

All metrics show significant progress versus last year. Operating profit was GBP 673 million in the first half with a margin of 9.7% and in Civil Aerospace margin of 12.4%. These margins are the highest delivered in both the group and Civil Aerospace since the introduction of IFRS 15.

This demonstrates expansion of earnings potential and accelerated delivery. Free cash flow in the period was GBP 356 million. This compares to an outflow of GBP 68 million in the first half of 2022. The next TCC to GM, i.e., total cash cost to gross margin. This is a measure of the operating leverage of the business, and it is resilience.

Our TCC/GM ratio was 0.6 in the first half of 2023. This compares to a ratio of 0.8 in '22 and 0.9 in 2019, pre-COVID. We are already making Rolls-Royce much more competitive and fit for the future. Finally, our credit rating. This year, Moody's and Fitch, both raised their outlook on Rolls-Royce to positive, and S&P also raised our rating from double minus -- BB minus to BB.

Our net debt has fallen from GBP 3.3 billion to GBP 2.8 billion. We are happy with our first half results, which show a significant improvement in the underlying performance. What encourages us is that these results demonstrate the interventions that we are making are working.

However, we still have a lot more to do to continue to expand the potential of the business. With that, I would like to hand over to Panos.

Panos Kakoullis
CFO & Director

Good morning, everyone, and thank you, Tufan. In the first half of 2023, group revenue increased by 28% year-on-year to GBP 7 billion. Revenues increased across all divisions, with Civil Aerospace up 38%; Power Systems up 24%; and Defense up 15%. Operating profit increased from GBP 125 million to GBP 673 million with a margin of 9.7%. This was driven by continued revenue growth, coupled with early transformation benefits, notably, cost efficiencies and commercial optimization across the group.

The increase in operating profit was driven by 3 things: higher aftermarket profits in Civil Aerospace; increased large spare engine sales compared to the prior period, again, in Civil Aerospace; and revenue growth and margin improvements in Defense. Free cash flow improved from an outflow of GBP 68 million in the prior period to an inflow of GBP 356 million. And that reflected higher operating profit in both Civil Aerospace and Defense and increased large engine flying hour receipts. And that was partly offset by a working capital outflow in the period.

Our net debt position decreased from GBP 3.3 billion to GBP 2.8 billion. We've got GBP 7.4 billion of liquidity, comprising cash and cash equivalents of GBP 2.9 billion, and undrawn facilities of GBP 4.5 billion. Our strong liquidity position enabled the cancellation of a GBP 1 billion bank facility in the first half that we deemed surplus to requirements. Our next debt maturity is a EUR 550 million bond loan note in 2024, which we expect to repay with underlying cash flows.

Now moving on to performance by individual business unit and starting with Civil Aerospace. Operating profit and cash flow improved significantly. This was driven by an underlying recovery in large engine activity and continued growth in aviation, coupled with cost efficiencies and commercial optimization.

Large engine flying hours were 83% of 2019 levels in the first half of '23, that compares to around 60% in the prior period. We delivered 188 engines, including 115 large engines, of which 18 were spare engines.

We carried out 591 total LTSA shop visits, including 144 large engine refurbishments. So that compares to 477 total shop visits and 113 large engine refurbs in the first half of '22.

Civil Aerospace revenue was 38% higher at GBP 3.3 billion, with OE and Services up 58% and 30%, respectively. Revenue is higher across our portfolio, with growth in large engines, business aviation, regional and V2500. Civil Aerospace profit of GBP 405 million compared to a loss of GBP 79 million in the prior period, with an operating margin of 12.4%.

That increase in operating profit is driven by 3 things: Firstly, higher aftermarket activity. That included more shop visits, greater shop visit, individual shop visit profitability and a greater contribution from both large engine T&M and also from business aviation aftermarket growth; secondly, increased large spare engine sales; and thirdly, cost efficiencies, notably the tight control of indirect costs.

Targeted contract improvements were GBP 105 million in the period compared with GBP 270 million in the first half of last year. That included contract catch-ups of GBP 70 million compared with GBP 219 million in the prior period. But you remember that prior period benefited from strong inflation-driven price escalation. Onerous contracts improved by GBP 35 million in the period compared to GBP 51 million in the prior period, again, due to our actions on commercial optimization.

Trading cash flows improved from GBP 63 million to GBP 401 million, primarily driven by a GBP 479 million improvement in operating profit. In addition, the LTSA balance grew by GBP 727 million in the period compared to GBP 433 million in the prior period. That growth reflected EFH growth and our commercial optimization actions, notably improved average rate per flying hour, driven by escalation and customer pricing negotiations.

It also reflected the anticipated collection of overdue debts that we previously provided for. A portion of our LTSA receipts are payable to our risk and revenue-sharing partners and that reduces the amount of cash retained by Rolls-Royce. So of that GBP 727 million LTSA balance growth, approximately GBP 500 million benefited our cash flows in the period. Those improvements were partly offset by increased working capital outflows. We expect inventories to fall in the second half of the year, reflecting the normal seasonality of the business as well as the impact of our working capital initiatives coming through on the transformation.

We expect Civil Aerospace's operating profit in the second half of the year to be broadly similar to the first half. Turning now to Defense. We've had major contract renewals in both combat and transport and are focused on commercial optimization to support profitable growth. Our successful run of new orders continued. The AUKUS agreement benefits us as we are the sole source provider of power and propulsion system for the U.K. nuclear submarines.

Work has now begun on the V-280 Valor program this year, and we secured funding for our global combat air program activities. The robust forecast of defense budgets in most western geographies underpin the long-term outlook for the business. Revenue growth was strong, up 15%. This reflects increased underlying demand and a first half-weighted delivery profile. OE revenue was up 17%, helped by the increase in funded development programs in both combat and submarines.

Services revenue increased 13% with growth in all 4 segments. Operating profit grew by 33% in Defense and was driven by strong revenue growth and product mix. Operating margin of 13.6% compared to 11.7% in the prior period, with the increase driven by pricing actions, a more favorable product mix due to the timing of high-margin spare parts in the first half and cost efficiencies.

Trading cash flow was GBP 76 million, which compared to GBP 89 million in the prior period. Higher operating profit was offset by the absence in advanced payment from one of our customers in the prior period. For the full year in Defense, we expect modest revenue growth with a slightly lower operating profit in the second half of the year. And we expect stronger trading cash flow in the second half of the year as a result of two things: key milestone payments on newer programs and our actions to reduce inventory.

Moving now to Power Systems. Our order inflow remains robust, with a book-to-bill of 1.1x and a record level of order cover with revenues fully covered for the remainder of 2023 and 32% covered for 2024.

Revenue growth was up 24%, driven by stationary power gen equipment and continued strong sales of mobile power solutions in both marine and mining.

Operating profit was GBP 125 million, which is broadly flat versus last year. Margins were lower than in the prior period with the initial benefit of pricing increases, offset by the negative impacts of both product mix and higher costs. We expect margins to increase in the second half of 2023, due to the second half weighting of pricing actions and seasonally higher volumes. So we expect full year margin to be higher than in '22.

Trading cash flow was an inflow of GBP 22 million compared with an outflow of GBP 76 million in the prior period. That was driven by operating profit broadly flat versus the prior period. There was an increase in inventories, reflecting strong volume growth in the first half of the year, so a bigger business, and the expectation of seasonally higher revenues in the second half.

We expect improved cash conversion in the second half as we unwind those inventories to meet demand and also due to the impact of the working capital initiatives coming from the transformation. Finally, new markets, reported an operating loss of GBP 78 million. That's in line with our expectations and compares with a loss of GBP 48 million in the prior period. The electrical testing has begun on a new small gas turbine to power hybrid electrical flight as part of a turbo generator system for advanced air mobility.

Our SMR business is progressing well through the regulatory process in the U.K. and has now entered Stage 2 of the GDA process. We saw a trading cash outflow of GBP 42 million compared with GBP 30 million in the prior period, with SMR costs continuing to be largely covered by third-party funding.

Now the next slide sets out our summary funds flow. In the first half of '23, we had a GBP 356 million free cash inflow compared to an outflow of GBP 68 million in the first half of 2022. This can be broken down into three broad categories. Firstly, our operating performance has improved by GBP 0.8 billion compared to the prior period. This was driven by higher profits in both Civil and Aerospace and the increase in engine flying hour receipts ahead of shop visit costs, which resulted in our LTSA balance growth.

Secondly, working capital was an outflow of GBP 600 million, which is around GBP 300 million higher than the prior period. That increase was driven by an increase in inventories of approximately GBP 600 million, due to continued supply chain constraints and anticipated higher revenues in the second half. There was a net outflow of around GBP 300 million from receivables and payables, offset by net inflow from advanced payments receipts.

Finally, other impacts change by a net GBP 100 million outflow compared to the prior period. With that, I'll hand back to Tufan.

Tufan Erginbilgic
CEO & Executive Director

Thanks, Panos. In February, we set out the Rolls-Royce proposition based on three pillars: First, creating a high-quality and competitive business with a focus on profitable growth and operational efficiency with higher EBIT margins and returns; second, growing sustainable free cash flow with growing cash from operations and disciplined capital investment; third, building a strong balance sheet and growing shareholder returns.

Our immediate priority is to return to an investment-grade credit rating, then resume shareholder distributions. We also talk about priorities we are focusing on to deliver the Rolls-Royce proposition, which are shown on the slide here. Of this, safety at the top remains our first priority, taking care of our people and products.

These priorities all have an underlying philosophy, which is what I would like to focus on today. This is how we are now running the business. This is different to the past and is helping us to improve our financial delivery and strategic progress. This is shown in bold on the slide. First, we are primarily focusing on the quality of earnings and cash, not market share. This impacts how we approach new and existing orders and contracts.

This is a change in mindset. We are concentrating on profitable growth. However, I still expect our volumes and market share to grow as we continue to improve our operations and our service to customers. We are aiming to achieve best-in-class operating leverage levels. Again, this is a change in mindset in terms of driving higher gross margins and driving cost efficiency to ensure that our business is more competitive and resilient to the external environment.

Our TCC/GM improved materially in the first half of '23. But there is still more work to do to achieve best-in-class ratio. Next, we will target cash as an input, not as an outcome. This is another important philosophical difference. Previously, group cash flow was an outcome based on the expectations by divisions. Now group cash flow is an input into a framework, which is used to inform the divisional targets.

Our strategy and annual planning is done on this basis. Choices are made to invest in profitable projects and growth opportunities. This leads us neatly to capital allocation. We are allocating capital to the best projects on a group-wide basis. Before, we allocated capital by division. This new approach enables us to allocate resources more effectively and efficiently to the highest priority areas strategically and for profitable growth.

We are prioritizing projects based on their strategic and financial value and execution risk. Finally, we remain committed to becoming a net zero company by 2050 and advocating for policies that support the industry sectors we operate in. We continue to progress our energy transition activities. A stronger Rolls-Royce will play a more powerful role in the energy transition.

Our transformation program launched at the start of this year with 7 work streams to deliver a step change in performance. We are in action. Initiatives have been identified for delivery in '23 and beyond. But we still have a lot more to do. The early interventions that we have made in 2023 have given us the most immediate and significant impact. This is why we talk about accelerating financial delivery.

I would like to talk to you about 3 of these work streams and how they help our financial delivery in more detail. First, efficiency and simplification. We are getting clearer on the operating model for the group, focusing on synergies across divisions and functions, optimizing spans and layers and simplifying the organization. At the start of the year, we intervened to reduce indirect costs and tightly control headcount and made -- we made some activity choices.

We are also improving productivity in our operations. We will manage all indirect third-party costs globally to leverage synergies across the group. By doing so, we expect to achieve a material reduction in indirect third-party costs. We are taking the same approach with direct procurement, where around half of the categories overlap between the divisions. Again, this will enable us to capture economies of scale and optimize commercial opportunities.

An example of direct cost synergies relates to castings and rings. Previously, these were procured separately by Civil Aerospace, Defense and Power Systems. A cross-divisional team was formed to find ways to reduce the cost of these items, which have identified potential procurement savings of up to \$20 million per year.

Second, commercial optimization. The objective of this work stream is to improve contract profitability and take appropriate commercial actions. We are focusing on three main areas: wide-body margins, business aviation and Power Systems pricing.

In Civil Aerospace, we are pulling on 6 levers to improve our LTSA margins, 3 of which relate to revenues and 3 to costs. These are time-on-wing improvements, reducing the number of shop visits will drive up our LTSA margins.

Shop visit cost reductions. We are focusing on driving down the cost per shop visit by optimizing our overall process, reusing and repairing parts. Product costs. We redesigned parts to lower the cost of building and servicing engines.

Fourth, rigorously enforcing our contractual terms to ensure that we are paid what we are owed. Fifth, we have a new pricing framework in place to ensure that all new and renewing contracts have a satisfactory level of profitability. All new and renewing contracts are now reviewed by the Investment Committee.

Finally, engaging directly with the customers to address onerous and low-margin contracts. We have an onerous contract provision of GBP 1.4 billion. We must rebalance these contracts. A strong Rolls-Royce will be a much better partner to our customers and deliver superior service. I have personally spoken with each and every customer with which we have an onerous contract. Our immediate focus has been on the 6 most onerous airline customers, who represent more than half of the onerous contract provision.

A further 10 customers have been identified as key opportunities. We have set up joint task forces with the customers to work together for a win-win solution. In business aviation, we have almost a 70% of the installed base of large cabin business jets. Our market share is growing based on our position on new jets. We are working on customer segmentation on the aftermarket with a view to offering customers a premium aftermarket offering. Time-on-wing and cost improvements in business aviation drove contract catch-ups in the first half of the year.

In the first half of the year, we also raised time and materials pricing for large engines by 12%. This contributed to first half results significantly. We also continue to improve the profitability of our OE business.

In Power Systems, we have applied a similar approach to Civil Aerospace with detailed analytical work by business segment on the pricing of OE and spare parts. We have enacted price increases across the portfolio that had provided some benefit in the first half, which -- with much more to come in the second half. We have also benefited from this in Defense, where we had major contract renewals in both the combat and transport segments. We have focused on commercial optimization to improve profitability.

Third, working capital. We have identified opportunities to deliver a sustainable improvement by optimizing each of the components of working capital as part of a multiyear program. Progress on this so far has been slower than I would have liked due to the challenging environment. We are increasing our focus on this now.

In the first half, working capital deteriorated, as you heard from Panos, by GBP 600 million, driven by higher inventories, reflecting continued supply chain challenges, including the impact of the 2 supplier fires and in anticipation of higher volumes in the second half. This is largely as expected, and we still expect to release inventories in the second half.

We have already made some encouraging progress with overdue debts and collecting customers' advances. This is based on rigorous data analysis and new digital tools to analyze overdue debt by customers. We have more to do on working capital in the second half of the year, and this will continue into next year and beyond as this is a multiyear program.

Finally, let's look at our guidance for 2023. As you will know, we communicated our upgraded guidance on 26th July. The external environment is largely as we predicted in February. We still expect large engine EFH at 80% to 90% of 2019. Our guidance for shop visits and deliveries are also unchanged. The supply chain remains challenging, notably in Civil Aerospace. And we expect that to remain to be the case into 2024. We delivered strong first half results, helped by transformation and performance management.

We are accelerating our financial delivery and our upgraded guidance reflects this. We now expect operating profit of GBP 1.2 billion to GBP 1.4 billion in '23 versus our old guidance of GBP 0.8 billion to GBP 1 billion. This factors in targeted contract improvements of GBP 200 million to GBP 250 million, including catch-ups and onerous provision releases. We now expect free cash flow of GBP 0.9 billion to GBP 1 billion in '23 versus our guidance of GBP 0.6 billion to GBP 0.8 billion.

This guidance includes an LTSA balance change of GBP 1 billion to GBP 1.2 billion, of which GBP 0.8 billion to GBP 0.9 billion is expected to benefit our cash flows in the period. Our free cash flow also factors in GBP 200 million of legacy Boeing concession outflows, a GBP 150 million impact associated with supplier fires and new GBP 100 million relating to a legal judgment.

To summarize before we go to Q&A. We have delivered strong results in the first half, helped by transformation and rigorous performance management. These have been achieved despite the challenges associated with inflation and supply chain. We are accelerating our financial delivery and have raised our full year guidance. We are working at pace on our transformation plan, but there is still much more to do.

We will come back to you in November to present the outcome of strategic review and set medium-term targets. Before we open for questions, I would just like to take the opportunity to thank Panos for his hard work and contribution over the past 2 years and wish him the best for the future. Thank you. We look forward to your questions.

Question and Answer

Ross Law

Morgan Stanley, Research Division

Ross Law from Morgan Stanley. Firstly, on pricing. Clearly, a key pillar of the transformation plan. Can you maybe give us some context on how this benefited in the first half and also maybe some color by segment? Secondly, on supply chain, where are the bottlenecks currently? You mentioned 2 fires, but where else are you seeing issues?

And lastly, on Power Systems. You also mentioned negative mix. Can you maybe give us some details around the margin delta between, for example, marine and power gen?

Tufan Erginbilgic

CEO & Executive Director

Okay. So I'll take it in that order. I think pricing question, that is what I tried to give you sort of color there. But effectively, what we did, we were very focused with that work stream. And that work stream, the way you should think about it, it works together with the line management, obviously. So they are the same in that sense.

But effectively, we thought widebody and LTSA but also time and material was a focus area because, for obvious reasons, we thought potentially is big there. Business aviation was a big focus because I was very public on that, that business aviation, we have a great platform, but we haven't commercially leveraged that platform. Therefore, that was an obvious area to focus on.

And both on OE level as well as aftermarket, by the way. And then the third one, Power Systems pricing. And one word on that. Yes, first half was weak in Power Systems, but we knew. And frankly, that should tell you how we intervene because when we actually started our program, which was almost as January as you know sort of, it was already first half -- to a great extent first half pricing or lack of pricing was locked in. And Panos talked about higher costs also in terms of hiring, et cetera. They already hired people were coming in.

Therefore, our interventions will play out on both dimensions second half, right? So I think -- and then what we did, frankly, we didn't deploy that work stream on Defense. But what we did is -- because the opportunity set was smaller. But what we did is we transferred the learnings pretty quickly, and they applied that. Actually, Defense numbers include both on OE as well as aftermarket, pricing and commercial actions. I hope that gives you a sense on that one.

Supply chain question is, I think I said it, frankly, industry, everybody is talking about it. As you know, airframers talking about it. Right now, limitation in the industry is supply chain. And we have the same issues. And our issue was a little bit multiplied because of 2 supplier fires. And that actually -- we talked about GBP 100 million -- GBP 150 million impact. But actually, initial impact was going to be a lot more than that when we analyze.

But team has done a great job to minimize the impact to GBP 150 million that we are sharing with you. But the gross, without interventions, actually number was a lot because I've been heavily involved. I did at least 5 reviews with the team on that. So therefore, I know pretty well our starting position. But supply chain, frankly, unfortunately, because of this V-shape, supply chain issues, I don't think Civil Aerospace supply chain, gas turbine supply chain will stabilize anytime soon.

I definitely expect that definitely next year, maybe beyond, so. But we also see other supply chains. So there are some overlaps, obviously, between Power Systems and Civil and so on. But Power Systems supply chain after COVID had this similar issues of COVID recovery, but it is stabilizing because they didn't have V-shape that industry, they had more like U-shape, if you like. So that is stabilizing.

Your last point on Power Systems sort of margin, I'm not going to give you specific numbers. But yes, marine business margin profile because your specific question marine versus power gen. Marine business

power -- margins profile is much better than power gen. And we are actually improving power gen this year, even with the numbers you see and second half more, we are actually improving power gen margins. But structurally, that margin structure differences like that. There is one question there. I'll come to you David after that.

Nick Cunningham

Agency Partners LLP

Nick Cunningham, Agency Partners. Obviously, you have substantially beaten expectations, to say the least, both in the half and in guidance. And that, as you said, is despite the fact that the external impacts are -- have not really changed in terms of what you're expecting. So obviously, a large component of that is cost and pricing.

First question is, what's the risk that you're getting the inflationary benefits in your pricing before you suffer the adverse impacts of inflation in your cost? So is there a danger that you're going to end up giving back some of this gross margin benefit that you've seen so far?

Second question, you've been generating a lot of cash despite inventory increases. So you're obviously carrying, I presume, much more inventory than you think it should be. Is it possible to put any kind of quantity on that inventory? And finally, normally, even in a good year, Rolls-Royce uses a lot of cash in the first half, I mean, typically hundreds of millions and then gets a lot more than that back in the second half.

This year is completely different than that. Is that a structural change? Should we expect that to be the case going forward? Or would there something special happen in '23 to shift that balance?

Tufan Erginbilgic

CEO & Executive Director

There are three questions. I'm going to let Panos answer the second one around working capital. But let me tackle the inflation question. I don't think so because, actually, in a way, what is going on here is we already got big inflation impact in our numbers, if you think about it from last year onwards.

And then this year, we continue to see that. The way to think about it -- now this is -- I'm giving you a 30,000 feet view. The way you may want to think about these results, you are absolutely right, commercial actions and cost efficiency named self-help drivers here. The way you should -- we effectively neutralize with our cost efficiencies, neutralize inflation impact.

And we -- actually, all the pricing actions, not only pricing because commercial actions, multi. I'll give you a commercial action example, right, beyond pricing. I think pricing, everybody understands. But in our LTSA balance, we talk about sort of -- Panos talk about debt that we actually provided for. Basically, that's the debt we've written off because we -- company thought we would never get it back, COVID and so on and so forth.

Therefore, everybody focused on what we do. I'm not denying what we do is not important, very important, but how we do is equally important because I've been involved in, as I said, all the onerous contracts. But on this one, I wasn't. But the tone you said, framework you create, what team did, they look for opportunities. They start, yes, I'm going to go and negotiate this because I know if they call Tufan, probably, he is going to defend me.

Suddenly, these things come through. And that is GBP 100 million, right? It's not a small change. That's GBP 100 million we never had, frankly. I mean reality is we written off by definition. We never had. So therefore, when you think about, I call commercial optimization, everybody says, he's talking about pricing. Including pricing, but I am thinking about commercial actions because in business aviation, we are doing customer segmentation. And that is creating value.

So you need to think about commercial actions wider than that. So I think -- your last question, then I'm going to pass it over to Panos for working capital. So there are -- in our business, there are some structural reasons why first half, second half play out. But there are some reasons that we make it

that way. So what we tried to do this year, tried to push some of those things, you will say, why Tufan? Because it actually reduces the risk profile of your delivery. That's why that was a focus area.

We didn't do anything sort of -- but we effectively, whatever in our power that in normal sustainable business improvement sense, we can do because I cannot overemphasize all our improvements here, sustainable improvements. That is what we are interested because this is initial results, we want to continue to build on it. So over to you.

Panos Kakoullis

CFO & Director

Yes. I'd probably add one little thing to the first answer as well. Just from a profit perspective, LTSA margin recognition is based on forecasting your future costs. So that will have though your inflation concern would be built into those future costs. So that's the basis of that being recognized that's built in.

In terms of your cash point, you're right. The cash performance in the first half was driven by that increase in operating profit across Civil and Defense, as we highlighted. The LTSA balance increase, again, as we highlighted, together with those commercial optimization actions that are in there that drove some of the areas that Tufan was covering, it was offset by GBP 600 million negative outflow on working capital.

Then when you work through it, you'll see inventory went up GBP 600 million. We expected it to go up in the first half, partly as a result of that seasonality because Power Systems is heavily second-half weighted in terms of unwind of inventory. Civil Aerospace, we've got more shop visits and more OE deliveries in the second half, again, some of that seasonality, but also some of that impact of supply chain is bumping up. We do expect an unwind, but think of that as an unwind from H2 -- H1 into H2, not from year-to-year.

Tufan Erginbilgic

CEO & Executive Director

David?

David Howard Perry

JPMorgan Chase & Co, Research Division

David Perry from JPMorgan. Of course, so many questions. I know I'm going to have to decide which are the most important. So can -- let me choose these three. First of all, the EBITDA guide. You've given us the year for the group and you've given us Civil Aero at double H1 800 . It doesn't imply a particularly good performance for the rest of the group. It's 400 to 600 in aggregate for the rest of the group, which is either equal to last year or well down on last year. So just at a high level, can you comment on that, please?

The second question is the free cash flow guidance for the year, to me, looks quite low, given the LTSA inflow. Are you assuming a very big outflow in other working capital ex LTSA? So you just speak to that. And then I guess the third one would be, if I just pick up what Panos just said, which is LTSA profit is based on a forecast of future profits. And your comment, Tufan, about the rate of progress at the beginning of your program is much faster than later. How much of the journey on the Civil Aero margin improvement have we just seen already this year or in the first 6 months?

I mean should I take a 9% margin this year and now dream of 20%? Or am I thinking it's 9%, but a lot of the goodness has happened and there's just a bit more to go?

Tufan Erginbilgic

CEO & Executive Director

Thanks, David. As usual, good questions. So first of all, operating profit guidance, your first question, I think, is GBP 1.2 billion to GBP 1.4 billion. Yes, I can totally see why it may come across sort of conservative. I think let me reiterate what we said in that write-up. We said Civil will have similar operating profit second half. And that should tell you, frankly, first half benefits when I look at it, they are all sustainable benefits. And second half, frankly, similar profile. I cannot see there anything that I would say this is one-off.

So that is how you should hold Civil. I think that will play into your last question as well. And then we said, in Defense, we expect operating profit lower second half and Power Systems, the other way around. Then you look at the environment, we have lots of uncertainties in the environment, especially supply chain challenges and uncertainties.

And because supply chain challenges, frankly, they -- because of this V-shape that we talked about was bad, but it was actually coupled by some other world events like interest rate increases and funds flow getting tightened to the supply chain, some of the companies. When you are in V-shape trying to expand your capacity, funds flow sort of tightened. I'm talking about smaller companies, right, that is actually creating lots of issue.

So we effectively, in our guidance, reflected some of the risk profile of external environment. So if I move to your free cash flow point, I'll say a few things, but I might -- Panos to say what he would like. But is how I hold it. I think take our operating profit guidance, which is around GBP 400 million better than our previous guidance, give or take GBP 100 million of it comes from onerous and catch-up. So that means GBP 300 million coming from operating profit and another GBP 200 million cash coming from LTSA.

So GBP 500 million upside, then we highlighted 2 items there, which are new. They weren't in our February guidance. One is we said supplier fire impact is now GBP 150 million, not GBP 100 million. And second thing is this new legal judgment. Frankly, we are going to appeal that. That is -- I think it is public, I can tell you, that's the Collins court case, which goes back to, I don't know how many years, but it's not a new court case, but the judgment came in July.

So -- and we provided that for in income, but obviously not in cash. So that is -- that's creating. So that is your GBP 350 million. So if you look at our increase, GBP 200 million to GBP 300 million in cash, the difference is we are a little bit more conservative on working capital release than we were in February. I hope it sort of math works there for you.

Panos Kakoullis
CFO & Director

The only thing I'd add to that, the Collins provision that you referred to was made in prior years. So it's not in -- it doesn't hit this year's profit.

Tufan Erginbilgic
CEO & Executive Director

Yes. That's what I meant. We provided in previous years because, frankly, to the team, obviously, I'm new. But to the team, this wasn't a surprise. Anyway, and your margin improvement, I mean, this is one of those questions you know I won't answer, but a good question, nevertheless. So I think -- what I said is true. I think ideally because when you're around 250 miles an hour, so you don't think about it every day. But I went back 1 week and one sort of everything must coming together, I said, okay, let me see how it compares with my previous experience.

And 2 experiences, I can tell you, almost identical, almost identical. I know you got surprised why these results. In that sense, I'm not. And the thing that rate of improvement is really high early on. And I talk about why that is the case because you analyze the business and you make obvious interventions. When I say obvious, I don't mean easy because if it was easy, somebody else would have done it.

But obvious interventions based on your analysis, and then that creates that sustainable, which is all good because sustainably, you are getting to a new level. But from there, I really caution you guys to extrapolate it on a linear basis or anything like that rate of improvement will be different at different stages.

So last thing I'm going to say, David, I think when we come in November, obviously, with strategy review outcomes, we will then talk about midterm targets. But I should say one other thing because some of you were still probably thinking this is too good to be true. But one other data points always help in this kind of conversations, right? One data -- 2 data points for you when we talk about operating profit margin. One is 12.4 and 9.7, both of them, actually the best on record since IFRS 15 change.

And if you make IFRS 15 change adjustments to the history, you may actually find most likely that they are also the best on record, when the flying hours still 80%. So why am I saying that? That is, one data point should tell you how much self-help improvements there. But second data point is equally important, and David, you will relate to this.

Almost a year ago, Rolls-Royce set a midterm target of single digit for Civil Aerospace, probably they were thinking that is '25, '26 in terms of years when you say midterm at that time. We obviously overachieved that by a margin. So those are 2 data points tells you rate of improvement is high, and it is self-help because when they set those targets, I'm sure they assume full recovery on the flying hours and so on and so forth, right? So I think that should tell you the self-help improvement here. But never forget about my caution that rate of improvement will be different going forward.

George Zhao

Sanford C. Bernstein & Co., LLC., Research Division

George Zhao from Bernstein. First one on the collection of the overdue debt. Is that mainly behind you? Or how much more of the opportunity from that is still ahead of you? And second, on the increased pricing in Civil Aero. Is the contribution more from new contracts or revisiting older contracts? You mentioned the 12% T&M price increase. Is that comparable for the LTSAs? And how much portion of the LTSA contracts have been able to -- have you been able to renegotiate?

Tufan Erginbilgic

CEO & Executive Director

I'll let Panos to answer the overdue question. On your pricing question, I think, frankly, it is coming from everywhere a little bit. But time and material is important in this because we always talk about LTSA contracts, et cetera. When I say time and material, some of you may be thinking, but 80% to 90% of your stuff is LTSA contracts, how do you actually make that much impact by time and material price increase?

Remember, almost 50% -- these are rough figures. Almost 50% of our LTSA contracts, actually LLPs in a way unbundled, therefore, the customer pays for them separately. When you make a price increase 12%, half of with the shop visit increase because time and material, obviously, more shop visits, more need for that, that actually makes an impact. So that's how you should hold it in your mind.

Obviously, it is both profit and cash in that case, unlike sort of LTSA improvement. So it is everywhere, frankly. We also increased our onerous contract and catch-up numbers, as you know, from February guidance, roughly, roughly GBP 100 million. I'm rounding. So that's how you should think about it. Overdues?

Panos Kakoullis

CFO & Director

Overdues, we talked about this at the February announcement. There was a collection of some overdues in last year's numbers in the second half. We said there was more to come. Some of that came through in the first half, but there is still more to come. And there is -- there are some elements that even -- won't even recognize this overdue as Tufan highlighted earlier on, where we previously provided around some minimum utilization that we didn't think we would get that is now being built and will be collected.

Chloe Lemarie

Jefferies LLC, Research Division

Chloe Lemarie from Jefferies. The first one I was going to ask about what surprised you in the pace of transformation. But based on your prior answers, I'm going to ask you what actually delivered in line with what you expected, but pretty fast compared to our, I guess, expectations? Whether the willingness of customers to come back to the table and renegotiate contracts, was it the actual leverage that you could get on some of the transformation plan? Or just the cost -- other cost savings benefits?

The second question I had was on the LTSA invoicing. We're now in H1, well above the 2019 levels, GBP 2.3 billion compared to, I think, around GBP 1.7 billion. So could you explain what drives that significant

improvement when we just -- we're still below the 2019 volumes? Or maybe going forward, how should we think of the pound amount for incremental flight hours?

Tufan Erginbilgic

CEO & Executive Director

Okay. Two good questions. So I think -- I mean, one -- I'll specifically answer that question. But one thing I really want you guys to think about how these 3 divisions -- and some of you are saying Power Systems is sort of disappointing or whatever your wording is. Effectively, this is -- these results are not one thing. Don't look for a silver bullet, okay? And that's my experience. And that makes these things more powerful because you mobilize the whole organization with a clear purpose, with a clear framework and then interesting things happen.

And that is the stage we are at, right? Therefore, it is -- I'm saying to you, we haven't deployed commercial optimization work stream in Defense. Frankly, they know what they did. They called the commercial optimization team. And we didn't do it. One reason we didn't do it, price was smaller. The other reason was confidentiality. Frankly, you need to get lots of clearance to go in there. And we didn't have time. We were in rush. But they called the commercial optimization. They sat down with them, then they went and took OE and after pretty tough OE and aftermarket actions. So that's how you should care.

But specifically, I always talk about 6 levers, right? I talk about in my script. Therefore, our LTSA improvements will not always come from because customers are coming forward. But I can tell you this. Those 6 levers are there, and we will derive them in a very rigorous way, okay, number one.

Number two, we are partner to customers. If you think about partnership because you may be thinking, why are they even entertaining you, right? Because there isn't one I can tell you, which didn't agree to establish a joint workforce. There isn't even 1 OEM or aftermarket sort of airline, I should say. And you may think what is going on here. Thinking about what we do, we are a long-term partner, more than airframers are, right?

Because you sell the plane, at least, for that transaction you are done. You sell the plane, our engagement is still another 15, 20 years on that plane, right? We are a true partner up. If my true partner comes to me and says, this is really one-sided contract, Tufan. So you got 2 options, you call us not a partner and transactional, then I deal with you next 15 years on that basis. Or you come to the table, we resolve this. We create win-win, then we build on it together and create even a much better future. That actually brings people to the table, right?

That is the sort of your second question, LTSA and Panos, please jump in. But here is how I hold it. We gave you a rule of thumb in the past. We won't give you another one. Do you know why? For two reasons. Because we are in transition and industry is in transition. What do I mean by that? Industry in transition because new engines like XWB coming. Without any doubt, they are better engines, fuel efficiency, et cetera, but they cost more.

Therefore, they are priced differently on EFH level, right? Therefore, mix changes, your EFH rate is going up. We are in transition because we are taking commercial actions and pricing actions that is also increasing that. So therefore, we won't give you a rule of thumb because it is going to be a moving target. One thing you should expect, it will continue to go up because of those two factors, right? Per rate -- per unit will continue to go up.

Ian Douglas-Pennant

UBS Investment Bank, Research Division

Ian Douglas-Pennant at UBS. So just continuing on that answer you were just giving, I guess, on pricing. To what extent do you need to go back and have conversations with Airbus themselves? To what extent is that kind of base contract that you've built on need to be negotiating in some way?

And secondly, on cost reduction. In Civil business, at least, the commercial and admin and R&D costs declined in absolute terms in H1. How did you achieve this in such a short time frame? You have a heavy

unionized workforce. I mean is there just no travel going on? Is it stuff as basic as that? Or like how do you even do that?

Tufan Erginbilgic

CEO & Executive Director

Okay. Very good. On Airbus, I won't comment on individual conversations. You shouldn't expect that to happen. But I would say Airbus is a great partner. And obviously, we have had long and good relationship and that will continue going forward. I think on cost efficiencies, it is sort of what we did, obviously, industry is in the recovery, right, i.e., you are scaling up, sort of more OE, more shop visits and so on.

Therefore, you want to invest. If you look at our first half capital spend is higher than first half last year. I think Panos shared that. Why is that? Because we are investing in that recovery, right? Because R&D and capital, we will do the right things for the company, for sustainable growth of the company.

So -- and we are increasing first half, towards first half because, actually, when recovery is coming, we didn't want any of our machinery to fall apart while sort of scaling up sort of that was the reason. But for the same reason, we also increased direct labor, but our eye has been on productivity improvements when that happens. Therefore, no cost reduction there.

But then indirect labor and indirect headcount, we -- and the activity choices, I talk about indirect sort of let me talk about both of them separately. I think indirect, by definition, that's not your variable cost, right? So -- but some companies don't manage that rigorously. And frankly, Rolls-Royce has been in that journey. That's why I made the comments I made about Power Systems, so. And but I think when you rigorously manage that and we put a system in place, really, system in place for indirect headcount and cost management, and that actually made sure that we did the right things, but we didn't do unnecessary things.

Second thing is, when I talk about granular strategy, some people are saying, this guy is talking textbook language. It's not textbook language. It is my experience. I didn't learn strategy in textbooks, but I did it by doing. So I think when you are that clear with strategy, you are not here, you are here. You can make activity choices because you are here, right?

You can make activity choices. It tells you what you will do, what you want to. So combination of both has been driving. Obviously, activity choice, you make it, that activity is gone because I don't like options management in business. If you don't have choices, you don't have a strategy. So I don't know if it answers your question, but that's what I would say.

Isabel Green

Head of Investor Relations

By the way, we're pushing it a little bit on time, and we are -- but I do have some fairly couple of questions online, probably more than questions we've got time to answer. But if I might just take two of them as the -- to answer if I may ask you, if I may, Tufan. The first one comes from Phil Buller, Berenberg. It's a two-part question, I'm afraid. So I'll probably talk the question for maybe longer than the answer. But the first one, thank you for the comments on philosophy, including the focus on quality of earnings, not just cash.

Philosophically, do you believe earnings are as important as cash or as a function of each other for Rolls-Royce as they are typically for other industrials? And related to that, how should we think about the LTIP frameworks? Is it cumulative cash concept likely to be deemphasized in favor of clean earnings?

He also asks, we talk about being well positioned for the next-gen aircraft with UltraFan. Rolls-Royce has always been well-positioned from a technology standpoint. The issue has always been extracting positive returns on the technology. So is it a must to do? And how do you think about the payback period you would be happy with on a new platform? And I'm sorry, the question probably took longer than the answer.

Tufan Erginbilgic

CEO & Executive Director

spglobal.com/marketintelligence

No, no. There are 3 questions there, I think. Let's deal with it. So first, earnings versus cash. Frankly, I'm a guy, I want all of the above. So I think that's what I would say, I think. And even in Rolls-Royce, I know our accounting sort of makes it a little bit timing-wise different. But even in Rolls-Royce, I think both earnings and cash are important, so. And they are actually a function of each other in a way.

Therefore, I'm not going to say I like this more than that. But obviously, for any company, cash generation is critical. I mean at the end, that is -- earnings is a proxy of your cash generation, if you like. And therefore, they should go hand-in-hand. But obviously, cash generation has to be there as sort of if you really push me, I said, "Oh, I want both of them."

But if you really push me, I think I will go for cash because that's effectively the value creation. LTIP, I'm not going to comment on it right now. As you know, we are at the stage that our remuneration policy is expiring. So there is a work that Board leads, obviously, Remuneration Committee leads on the new remuneration policy. And it's not right for me to comment at this point in time.

And UltraFan, there are -- even within UltraFan, there are multiple questions there. But I would say the following. I think first of all, UltraFan team has done a very good job. And it is a technology demonstrator. You need to think about that way, okay. And it has 2 purposes. One is to position us well for the next generation of engines, and it does exactly that.

Second purpose is -- but I'm going to come back to the first purpose. Second purpose is actually because we test the technologies there, we are going to use them right now, especially on time-on-wing improvements in the -- for the existing engines. And we have a very systematic program to improve time-on-wing for all the engines we have. I talk about Trent 1000 today. But all the engines in the next 4 years, frankly, we are going to get all the engines to what I call their destination level. That's our program.

So -- but if I go back to first purpose, UltraFan, it is built, if you have seen it, in fact, in my first slide, there is a picture, nice Tiffany colors. By the way, that's part of IP. So -- but that is a big engine, so -- intentionally, because we will scale down to wide body even to narrow body. It is scalable.

And that's how you should hold it in terms of -- profitability, absolutely. I'm not going to give you a payback period right now because next-generation aircraft is not going to happen before 2030, and we need airframers, obviously, to go there first. But I will say this. We won't do anything not profitable. I will say that categorically.

Isabel Green

Head of Investor Relations

And just one last question I'm going to squeeze in because it's come up on from a number of questions have come in, but it actually is Ben Heelan at Bank of America, who I'll read out, which is asking, with the cash flow improving materially, how are we thinking about the time line of getting to investment grade? And adding on for a couple of the other investors online, if we've got any plans to reintroduce the dividend this year and our preference for dividends versus buybacks, if you have any comments on those, please?

Tufan Erginbilgic

CEO & Executive Director

Okay. Good question, Ben. So I think we said it in February, I think we want to get to investment grade at pace. And given the progress we are making, I think I believe that will be reality. We will get there at pace. I don't want to give a time because, as you know, you hit the investment-grade metrics, then rating agencies need to get there. So therefore, our first task is to hit the metrics, and we are making excellent progress towards that.

And therefore, I won't give timing, but it is our first priority, which goes into the second question, dividend. And frankly, our first priority is to get to investment grade. After that, yes, we would like to reestablish dividend, absolutely. Dividends versus buybacks, we are now doing some work on the -- frankly, until you get to investment grade, it's a little bit sort of not important point.

But once we get to investment grade, it is important point, what kind of capital structure we want and what's the cash framework for the company. We are already doing that work as we speak. And obviously, that will play into whether it is buybacks, dividends, et cetera. It is too early, Ben, to comment on anything like that.

Isabel Green

Head of Investor Relations

Thank you. We'll call it there because I know we have other meetings to start at 10:30. Thank you very much.

Tufan Erginbilgic

CEO & Executive Director

Thank you. Thanks for coming.

Presentation

Isabel Green*Head of Investor Relations*

Okay, I'm just looking for a way from the back to let us know ready. We are. All right. So thank you. It's lovely to be back here at the Stock Exchange again. Thank you all for coming out on person on such a busy morning, and welcome to our 2022 full year results presentation. I think most of you know me, but I'm Isabel Green, Head of Investor Relations. I'm joined here today by our CEO, Tufan Erginbilgic; and our CFO, Panos Kakoullis.

Before we begin, I'm required to show you our safe harbor statement on Slide 2. As always, the full set of results materials can be downloaded from the Investor Relations section of our website. We're going to start today with a short introduction from Tufan, and then Panos will present the 2022 results. Tufan will come back then to talk about his observations and priorities in the future.

The presentation today is going to last around 45 minutes, so there will be plenty of time for your questions at the end. So with that, thank you very much. Over to you, Tufan.

Tufan Erginbilgic*CEO & Executive Director*

Thanks, Isabel. Hello, everyone. To those in the room, it is good to see you in person. For everyone watching online, welcome too. As this is my first results announcement at Rolls-Royce, I will introduce myself before handing to Panos.

When I was approached last year about the opportunity at Rolls-Royce, I was drawn by the strong brand and reputation, and it is important as a global company. There are only a handful of companies whose products have helped shape modern society, from the development of jet engine itself, to the wide range of engines and systems we make today. Our ingenuity has helped bring the world closer. However, I also found a company that wasn't achieving its full potential operationally or financially. I saw an opportunity to make a real difference and take Rolls-Royce to a much stronger position.

Before joining Rolls-Royce, I spent 20 years at BP. I led the onstream business, and before that, the lubricants business through their turnarounds. I also spent several years on the Board at GKN and most recently worked in private equity. In all my previous roles, I have driven step changes in performance, set clear strategies and delivered sustained improvements in profit, cash flows and returns. Everything I've seen since arriving has made even more confident in the potential to do the same at Rolls-Royce.

I'm now going to ask Panos to run through the 2022 results. You are going to hear that business has delivered improved performance last year. However, you are then going to hear from me that these results are not good enough for a company like Rolls-Royce. We have higher expectations for this business, and we are clear on how we are going to deliver on them. Over to you, Panos.

Panos Kakoullis*CFO & Executive Director*

Good morning, everyone, and thank you Tufan. In 2022, group revenue increased 14% to GBP 12.7 billion. We had strong growth in revenue in Civil Aerospace and Power Systems, which were up 26% and 23%, respectively, as volumes started to recover. There was a more modest 2% growth in defense. Operating profit increased by GBP 197 million to GBP 652 million, and that was driven by three factors: firstly, improvements in long-term contract margins in Civil Aerospace. Secondly, increased profit from spare engine sales again in Civil Aerospace. And thirdly, significant revenue growth in Power Systems.

Now that was partly offset by the non-repeat of the GBP 140 million foreign exchange credit in 2021, which was in Civil, lower spare parts sales in defense, increased R&D in new markets. And also, common with many others, the impact of inflation, notably in Power Systems. Free cash flow improved by GBP 2 billion year-on-year from an outflow of GBP 1.5 billion in 2021 to an inflow of GBP 505 million in 2022.

And again, that was driven by 3 things: firstly, the improved cash flow in Civil Aerospace, which reflected strong growth in engine flying hour receipts ahead of shop visit growth; secondly, higher defense cash flows; and thirdly, a reduced working capital outflow. Our net debt position have improved from GBP 5.2 billion at the end of 2021 to GBP 3.3 billion at the end of '22. And that was due to the completion of our GBP 2 billion disposal program and the free cash flow that we generated during the year.

Moving on now to the performance by business unit, and I'll start with Civil Aerospace. We saw a continued recovery in international travel in '22, driving up our large engine flying hours to 65% of 2019 levels. The reopening of China towards the end of the year drove a further improvement in January, up to 79% of 2019 levels. This supports our expectations for large engine flying hours to be between 80% and 90% of 2019 levels as we move in 2023. The recovery in large energy flying hours was also complemented by robust performance in business aviation. We carried out 1,044 total shop visits in '22, which is a 10% increase against the 953 million in 2021. For 2023, we expect between 1,200 and 1,300 total shop visits with a step-up in large engine shop visits as higher flying hours activity converts into increased demand for aftermarket services.

Engine deliveries rose by 15%, driven primarily by business aviation. We delivered a total of 190 large engines, which is 5 fewer than the prior year. We delivered 44 large spare engines, which is 8 more than the prior year. Large spare engines represented 23% of total OE deliveries, which is higher than the usual 10% to 15% as we build the spare engine pool to underpin fleet health and improve resilience ahead of the anticipated increase in shop visits. We expect spare engine volumes to remain at a similar level that's in total terms in 2023 and '24.

As in all our businesses, supply chain management and wage inflation were more challenging in 2022. We manage this through commodity hedging, long-term supply contracts and pricing. Now they have also recently been 2 fires at important suppliers, one in late '22 and one in early '23. These have put additional pressures on our operations. Whilst they did not impact 22's results, they will impact cash flows in '23. Civil Aerospace revenue was up 25% on the prior year to GBP 5.7 billion, with OEM services up 23% and 26%, respectively.

Revenue is higher across all of our portfolio, large engines, business aviation, regional and V2500. Civil Aerospace profit of GBP 143 million, compared with a loss of GBP 132 million in '21. The year-on-year increase was driven by 3 things: firstly, improved profitability on LTSA contracts, reflecting commercial discipline on pricing, costs and contractual terms. This resulted in GBP 319 million of contract catch-ups in '22, which compared to GBP 256 million in the prior year. There was also a GBP 51 million decrease in the onerous contract provision, which compares to a charge of GBP 122 million in '21. That's which reduced the expected losses on those contracts. Secondly, higher volumes and a different mix of large spare engine sales with more third-party sales to capacity providers than in the prior year; thirdly, higher aftermarket profit driven by V2500, business and regional as well as increased large engine shop visits. These were offset by GBP 140 million headwind from the one-off foreign exchange revaluation benefit in '21, which did not repeat in '22.

Our trading cash flow was GBP 226 million, which is a GBP 1.9 billion improvement prior year. This reflected the recovery in engine flying hours ahead of shop visit growth, which resulted in growth in the Civil net LTSA balance of GBP 792 million. Higher cash flows from spare engine sales and also a smaller working capital outflow compared with the prior year, driven by a reduction in overdue debts and a lower cash outflow on the Trent 1000 engines.

In 2023, we expect the change in the LTSA balance to be between GBP 500 million and GBP 700 million, which reflects a slightly lower level of growth than in '22 due to an increased number of shop visits, including more wide-body refurbs. We expect to continue to collect on overdue balances and target continued contract improvements, which could result -- should result in contract catch-ups of between GBP 100 million and GBP 200 million.

If we now look at defense, revenue was up 2% organically, and we expect a similar level of growth in 2023. Submarine revenues grew by 18%, which were at a relatively lower margin. Transport and combat revenues grew modestly at 4% and 2%, respectively. Naval revenue fell by 19%, which reflected supply chain challenges. Defense is a long-cycle business and does not immediately benefit from rising defense

spending and geopolitical tensions. However, there is a supportive budgetary backdrop, and we've been successful with some large order campaigns. In 2021, we were selected to provide the power plant for the B-52 engine replacement program. In 2022, the Bell V-280 powered by AE1107F engines were selected by the U.S. Army for the Future Long Range Assault Aircraft program.

Operating profit of GBP 432 million was down by 10% year-on-year. The 11.8% operating margin was 1.6 percentage points lower than '21, but at the upper end of our expected range. The year-on-year decrease was mainly due to the non-repeat of GBP 45 million of high-margin spare part sales in '21 that we called out at the interim results.

R&D spend increased by 9% as we invested in long-term programs that will create value in future years. Trading cash flow was up 13% from GBP 377 million to GBP 426 million. This gave a cash conversion of 99%, which is up from the 82% in 2021, mostly due to the favorable timing of our customer advance payment of around GBP 60 million, which is not expected to repeat in 2023.

Moving on to Power Systems. Order intake in '22 totaled GBP 4.3 billion, which was 29% higher than in '21 with a book-to-bill of 1.3x. Power generation continued to perform well with growth in orders for power solutions to provide backup power for critical locations such as hospital and data centers. Revenue was up 23% in '22 to GBP 3.3 billion, a significant rise despite the constraints to deliveries from the supply chain. Although absolute operating profit increased by 17% to GBP 281 million, Power Systems operating margin fell by 0.4 percentage points. That was due to higher costs, some of which were due to inflation and supply chain disruption, increased self-funded R&D and some one-off charges, including impairments and write-down of assets due to the Russia-Ukraine conflict.

Trading cash flow was 28% lower in '22. Cash conversion was only 56% due to increased inventory to manage supply chain disruption as well as meet the volume growth. That was partially offset by structurally higher advanced receipts from customers.

Finally, New Markets. These are our early-stage businesses, Rolls-Royce Electrical and Small Modular Reactors. In '22, New Markets reported an operating loss of GBP 132 million, which compares to a loss of GBP 70 million in '21 and a headcount increase of around 80% to approximately 1,000 people. This is in line with the guidance we gave in '21, and for SMR was largely covered by third-party funding.

Now the next slide sets out our summary funds flow for '22. We saw a GBP 505 million free cash inflow from continuing operations compared with an outflow of GBP 1.5 billion in '21. The GBP 2 billion difference year-on-year can be broken down into 3 categories: Firstly, our operating performance has improved by GBP 1.2 billion. This was driven by trading growth in our established businesses and the increase in engine flying hours receipts ahead of shop visits costs, which caused the steep increase in our LTSA balance. Secondly, working capital was an outflow of around GBP 500 million in '22 versus GBP 800 million in '21, which has a GBP 300 million improvement year-on-year. Inventories increased by around GBP 900 million due to supply chain challenges across the group as well as volume growth. This was partially offset by just around GBP 400 million of the inflow from receivables, payables and contract balances. This was led by advanced payments in Defense and Power Systems and a reduction of overdue debts in Civil of around GBP 180 million.

Finally, other movements, that was an outflow of GBP 1.5 billion in '22 versus an outflow of GBP 1.9 billion in '21, a GBP 400 million improvement year-on-year. This reflected lower lease payments and derivative settlement costs as well as similar tax and interest costs. Pension costs were lower than in the prior year as the U.K. defined benefit scheme is now fully funded and in a surplus position.

Turning now to the balance sheet. We ended '22 with GBP 3.3 billion of net debt, which is down from GBP 5.2 billion at the end of '21. We completed our disposal program in the year and used the proceeds to pay down GBP 2 billion of debt. We retained strong liquidity. We agreed a new 5-year GBP 1 billion sustainability-linked facility which is 80% guaranteed by the UKEF and that remains undrawn. We've seen positive momentum this year with rating outlook upgrades from Moody's, Fitch and S&P, but there is more to be done. We're committed to returning to an investment-grade credit rating through systematically improving our underlying cash generation as well as our profitability.

I'm going to hand back now to Tufan to show his observations on and priorities for the business.

Tufan Erginbilgic

CEO & Executive Director

Thanks, Panos. In the future, I look forward to being more emotive in presenting our operational and financial performance. Now I would like to start by sharing my early observations and some key issues that I see. I spent the last few months learning about our company with the teams, including time in our largest sites in U.K., U.S. and Germany. We have great people, who are dedicated and committed to the work we do. We have some of the best products and solutions in the world, supporting the needs of our customers in complex and heavily regulated industries with high barriers to entry. We have good market positions in our key segments.

The businesses we have today are improving as our end markets recover. As Panos showed, our results improved in 2022, helped by recovering markets and some benefits that will not repeat at the same level. We cannot rely on market recovery alone to deliver better performance in the future. I have much higher expectations from the business and improvements need to be delivered on a sustainable and underlying basis.

Rolls-Royce has been underperforming for an extended period. Our 5-year TSR of negative 67% is evidence of this and shows this is not just a COVID issue. Cash generation is unsatisfactory, and our debt is still too high. Too much of our gross profit is simply covering our overheads and interest payments. A weak balance sheet and sub-investment credit rating limit our ability to invest in growth for the future.

We have recently completed an extensive benchmarking study that confirmed our margins are below the competition on a like-for-like adjusted basis. Our low operating margins and relatively high fixed cost base leaves us financially exposed when uncertainty impacts our markets. As a result, in the last 5 years, even excluding 2020 due to COVID, we have averaged a return on capital employed of just 3.5%. We have also not had sufficient strategic clarity to make investment choices. Instead, we have been trying to keep too many options open.

More importantly, let's turn now to the overall proposition we are looking to create for investors. I believe we have the potential to be a much higher quality and more competitive company, a company focusing on sustainable earnings growth and cash generation with a winning mindset and culture that drives and rewards outperformance. Underlying performance improvements will drive higher operating cash flows. This coupled with disciplined capital allocation, will grow our sustainable free cash flow. A strong and flexible balance sheet will allow us to grow shareholder distributions and fund future growth. We will build a strong Rolls-Royce to deliver this proposition. We are already in action, and we are proceeding with a sense of urgency.

This slide sets out our priorities and in a way, our philosophy, how we are thinking about running this business, which is different from what has been done in the past. These are the priorities we need to focus on to deliver the Rolls-Royce proposition. They deliberately overlap. They will drive better performance independently and collectively. First, we will improve earnings and cash potential of the business. The focus will be on quality growth in profits and cash rather than just revenue and market share expansion. Second, we will create an efficient business with a competitive cost base and improved operating leverage. This will make us more robust to the external environment.

Third, we will target sustainable cash generation and will deleverage our balance sheet at pace. We remain committed to recovering our investment-grade credit rating and resuming shareholder returns. Fourth, we are delivering -- we are developing a clear and granular strategy to prioritize investment opportunities. We will allocate capital centrally to the attractive market opportunities and programs. And fifth, we have an important role to play in the energy transition and remain committed to achieving net zero.

We will develop a robust framework to make the right choices. We will focus our investment on the most attractive market spaces and programs, evaluating all energy transition opportunities to ensure we are delivering the best value for Rolls-Royce and the shareholders. We must only invest in new technologies where we are differentiated, where the market opportunity is sufficiently large and where there is a viable

business model and synergies with our existing activities. By adding complementary capabilities, we can build winning propositions and derisk the group. Partnerships will be a purposeful part of our strategy. All this will be underpinned by our most important priority, to ensure that our people and products are safe. This is the right thing to do. We care about our people and the people that rely on our products.

We have launched a transformation program to deliver a step change in performance systematically and at pace. I'm chairing the weekly transformation planning group and the whole executive team will spend time together each month to focus on this. Work has already started on critical workstreams. To support this, we have appointed a Chief Transformation Officer reporting to me directly. We have several workstreams. We have appointed senior leaders to the first for efficiency and simplification, commercial optimization, working capital and strategic review. I will talk about these in more detail on subsequent slides.

The business improvement workstream is being led at the business unit level. We have set challenging targets based on rigorous peer benchmarking analysis. This identified the performance gaps, our relative position in key businesses and scale the potential for improvement. We are now working on the detailed plans to deliver that potential.

The remaining 2 workstreams, changing the culture and performance management are critical to lasting change. We will drive them by bringing the right mindset with our teams to be proactive and timely in our actions so that we can manage performance effectively. In January, I got together with our top 80 leaders for a working session on delivering change. We focus on how we will lead the business through this transformation together as an aligned organization where everyone is mobilized and knows their role. We have also engaged the whole organization in an extensive communication effort on the opportunity ahead. This will be an ongoing activity.

I'm going to share more details about some of the workstreams, starting with efficiency and simplification. This is about identifying and delivering sustainable improvements across the whole group focused on 3 things: organizational review, footprint consolidation and optimization, direct and indirect third-party cost efficiencies. This will improve our operating leverage so that we are competitive and robust to the external environment.

As you can see on the slide, our costs are high compared to our gross profit. And we are a long way from best-in-class. Across the group, we have work underway to identify synergies across all our divisions and functions and to simplify our whole organization. A significant part of the cost reductions during COVID were activity-related, and largely in our civil business. These costs have been going up again as activity levels come back. Our efficiency and simplification plans look to achieve sustainable cost efficiencies across the group that take the activity increase into account. We will also be looking to capture efficiencies -- efficiency opportunities within each division and function. We are already in action on this. For example, in Power Systems, we are already removing duplication and optimizing the organizational setup to accelerate decision-making.

Commercial optimization is about getting the right reward for the risks we take and the value we create for our customers. It will focus on Civil Aerospace and Power Systems. A stronger Rolls-Royce will be a better partner for our customers, more able to deliver operationally and invest in product development. To support this, as part of our executive process, we established a group operating committee. I have already met with a number of our largest customers and they understand this. We have also changed our commercial discussions on new contracts and renewals. In Civil Aerospace, for example, we set up a task force to review all the large engine LTSA contracts. We are also working to lower our product cost and drive up the margins in contracts to ensure we achieve the returns that are aligned with the risks that we take.

It is early days, but the results are already starting to come in. We improved several onerous contracts on the balance sheet at the end of last year, and we achieved double-digit price increases on spare parts. We will drive further improvements this year to the margins of both profitable and onerous contracts. And in Power Systems, we have already been able to renegotiate the prices with a benefit to profit and cash flows. These efforts continue as we speak.

We are becoming a commercially-minded and capable organization. At the end of 2022 -- let me talk about working capital, by the way, right now. But -- and which is actually very linked to commercial optimization in a way. And at the end of 2022, we have GBP 25 billion gross working capital tied up in the business. Our net working capital, GBP 2 billion higher than our position before the pandemic despite being -- revenues being lower. We are confident that we can deliver a significant and sustainable reduction in working capital across the group by deep diving into the operational value chain and optimizing each of the components of working capital. Our immediate focus is on improving inventory management and recovering overdue receivables.

The final workstream is our strategic review. This is already underway. Let me start by making it clear that this is not just about what businesses should stay in the portfolio and what we should sell. My early take on the portfolio is that all of our established businesses have the potential to create significant future value. One of the outcomes of the strategic review will be to determine which areas we will invest in and which we will not. To support this new strategic rigor, we will centrally allocate capital to the most attractive market spaces or programs. This is a change from the past when there was more autonomy within the individual businesses. This more disciplined approach will mean more effective resource allocation of limited available capital. We will continue to support critical safety programs as well as investment to enable the business to execute on the opportunities presented by the market recovery, but we cannot continue to allocate capital to projects that have low returns.

Beyond strategic clarity, a granular strategy will be an effective alignment and performance management tool as well as changing the culture. A clear strategy supported by the right performance management can be cascaded down and used as a powerful engagement tool to align the whole organization. We will have a strategy implementation plan that makes it clear and meaningful to individuals how their business performance and individual objectives contribute to the strategy and midterm goals.

With the right engagement and processes, this not only aligns the organization but also becomes a good performance management tool. We will have the new strategy and midterm targets for you in the second half of this year, along with the metrics, we will be reporting against to track and measure our progress.

Before I wrap up, I want to share our view of 2023 and our guidance for financial performance this year. In 2022, our performance improved, driven by good underlying progress, but there are also some benefits that will not repeat at the same level. These are detailed in the supplementary slides for you, along with some additional guidance detail we hope you find useful.

We expect to achieve a higher operating profit and cash flows this year, reflecting the actions we are taking and the market growth as wide-body flying recovers and as we convert our order book into profits. For 2023, we expect to deliver operating profit of GBP 800 million to GBP 1 billion, which includes a benefit of GBP 100 million to GBP 200 million from targeted contract improvements versus around GBP 300 million last year. We expect free cash flow of GBP 600 million to GBP 800 million, which factors in GBP 500 million to GBP 700 million of LTSA creditor growth versus the growth of around GBP 800 million in 2022 as shop visits increase. It also factors around GBP 200 million year-on-year headwind associated with the unwind of legacy or [indiscernible] concessions and around GBP 100 million impact of 2 fires at suppliers late last year and early this year. We expect this GBP 100 million cash impact to reverse next year. There are environmental uncertainties and challenges in this guidance. We will need to be agile and commercially minded as we manage the external risks of inflation, supply chain disruption, interest rate rises and recession.

So to summarize the key takeaways. We aim to create a high-performing competitive, resilient and growing business. We have a significant opportunity to expand our cash generation and profitability. We are already in action to improve underlying performance. We will set a granular strategy with midterm targets. We have a lot of hard work ahead of us, but we are moving fast and there are big potential rewards for all of our stakeholders when we get this right.

Thank you for listening. I will now open the meeting for questions.

Question and Answer

Tufan Erginbilgic

CEO & Executive Director

[Operator Instructions]

Nick Cunningham

Agency Partners LLP

It's Nick Cunningham from Agency Partners. You've spoken about the restructuring and actually answered quite a lot of questions that were in my mind. But there's another few that come out. I mean one is Civil has been through a really tough, really 4 or 5 years because you have the Trent issue and then you had the pandemic and you've cut the size of the business by 1/3 already. So how do you bring the people with you with yet at a round of change? And in particular, how do you avoid losing the good people that you want to keep when you're in the sort of labor market that we're in at the moment?

And then a separate question. And I guess it's something you'll probably be talking about in the second half. But how do we work out where the Rolls-Royce is outperforming, what recovery would have brought anyway? Now how do we assess, if you like, your performance above what the market would have brought?

Tufan Erginbilgic

CEO & Executive Director

Okay. Very good, two good questions. Let me pick them up in that order. You are absolutely right. What Civil did, I guess, in COVID, you are referring to job cuts and so on. That's exactly what Civil needed to do because activity disappeared in the market. And therefore, the company was bleeding cash, and as a result company did what it needed to do in the Civil business. But that kind of when activity comes back, as I made it clear in my remarks, that kind of thing is necessary because you are bleeding cash. But when activity comes back, those costs come back in, and that has been actually happening. And now we are intervening with that because when the costs come back, I showed you the cost chart, your competitiveness doesn't change, i.e., if you're uncompetitive, and I believe facts are there that we are uncompetitive. Our benchmarking study demonstrates clearly that we are underperforming on a like-for-like basis our competition. So therefore, that process was necessary but doesn't make you a better company in a sustainable basis. So what we are trying to do is with our transformation program is really create a business sustainably more competitive and stronger company. And that's what we are trying to do. But second part of your question is how do you bring people with you. Interesting, I know in the press sort of some comments have been made, but reality is when we engage our people, they are actually very excited about this future because who doesn't want to work for a successful company. Who wants to work for an underperforming company. So I believe we will be able to unlock the potential actually with our people. Yes, in this process, in the transformation process, everybody has a role, and we need to actually mobilize to whole force. And I would say, frankly, apart from many things, I think one thing will make a big difference is to make sure, and therefore, I talk about strategy and everybody knowing their role, everybody has a role in this. And that way, we will make this very different with -- starting with clarity why we need to change. Very clear strategy, everybody knows their role in their strategy and then performance managed in a way that actually we performance manage strategic progress.

So if I come to your second question, recovery, I'm sure you all have your models, how much recovery would take this business to, and obviously, last year, Civil business gave you some numbers as well for midterm. I would say when we come back with our targets, we can actually talk about how we are going to measure our success. But I'm going to say this -- I'm not going to talk about targets right now, but I'm going to say this, I have higher expectations from this business. And once we set midterm targets, then you can measure our progress against that. It won't be only my success though. I don't hold it that way. This will take the whole organization. And that's the power of this. Thanks for your question. There is one question on the back, then I'll come here.

Chloe Lemarie*Jefferies LLC, Research Division*

Chloe Lemarie from Jefferies. I had a first one for you, Tufan, actually. So your predecessor focused really on fixed costs. You seem to focus a little bit more on positioning and focused investments. So first question is, is there more to do on the fixed cost side. And in terms of positioning, et cetera, is there something to do in the portfolio, i.e., some areas that you've identified do not belong or is this just a matter of steering investment where it needs to be spent? Second question would be for Panos, if we could go to the free cash walk between '22 and '23. You already gave the LTSA elements, but I wanted to see if you could give some more color on the Trent 1000 concession payments, please?

Tufan Erginbilgic*CEO & Executive Director*

Okay. Let me pick up the first question, fixed costs and investment. Let me start with fixed cost. Do I believe we need to reduce the cost base of Rolls-Royce? Absolutely. Therefore, we -- if you look at the structure of our transformation program, one of the workstreams is about efficiency and simplification. And I gave you -- I realized for this industry a new measure, I used that in the past, this total cash cost to gross margin. That measure is, in a way, operating leverage of the company, right? And how much of our gross margin is actually consumed by our cost. And that is very high right now in Rolls-Royce. And we will need to reduce that. And our hope is to get it to the best-in-class levels in the graph that I demonstrated. That way we are going to be much more competitive company, and frankly, much more robust company if there are external shocks because any company needs to be ready for external shocks, but it will also create space to make investments.

Second part of your first question is investments here and there. I think our strategic review is pretty extensive review. I said it in my speech, I don't believe Rolls-Royce today has a granular strategy to make the choices. And that will allow us to make the choices and there will be investment choices, there will be partnership choices. I don't want to right now double guess, but it is a pretty robust process. And again, we don't run, that is not -- because strategy is an alignment tool as well as obviously a management tool. But we run this strategy in a way that lots of people actually already involved. So that is -- but at the end, we will make choices and we will focus to our organization, though I believe Rolls-Royce needs to be a more focused organization and make more choices, investment choices and so on, absolutely. So Panos, over to you.

Panos Kakoullis*CFO & Executive Director*

So I think your question was around the walk from '22 to '23. So -- on free cash flow. So a material increase in free cash flow between '22 and '23. You've seen in the supplementary slides, we've called out the lumpy items. We've done that both for profit and for cash year-on-year. The way I think about it, so we've got increased profitability in both Defense and Power Systems, obviously driving increased cash flow there. On the Civil side, higher EFH receipts driven by the 80% to 90%. That's partially offset by that ramp-up in shop visit costs, and you can see that coming through in the lower number on the movement in LTSA creditor of GBP 500 million to GBP 700 million. Tufan has talked about the workstream from working capital. So we are anticipating within that a structural improvement in underlying working capital that comes. We can talk a little bit in a minute around phasing, especially on cash flow. We have got some headwinds that we've called out, again, in the supplementary, and Tufan called out in the guidance. So the concessions, the legacy Boeing concessions of GBP 200 million outflow on that. And then the GBP 100 million as a result of the fire at the suppliers or the 2 fires at suppliers, which we expect to reverse in '24. So that's effectively a move from '23 to '24. The other lumpy items we've called out, the hedge closeout costs, that goes up slightly year-on-year. Tax is broadly flat. There's a little bit of an improvement in interest of 25 to 75. As a result of the fact, we paid down the U.K. [EF] debt. Other items sort of are broadly similar. So material increase.

Just the other point I'd highlight for you on free cash flow. We've always been a second half weighted business on free cash flow. That will be the case in '23 as well, particularly driven by some of the supply chain challenges that we've highlighted the impact of those 5. So there is a heavy weighting and

the benefits of transformation would likely to be second half weighted as well, will then increase that weighting.

George Zhao

Sanford C. Bernstein & Co., LLC., Research Division

George Zhao from Bernstein here. First one for Tufan, you talked about turning around the subpar performance of the company from recent years. But I think we can agree that Rolls-Royce certainly did try to improve itself during that stretch. Even excluding the cuts during COVID, there were numerous rounds of restructuring in the last 5-plus years. So you believe was the shortfall of the company to improve the performance in the past? And what will we do that is different from what has been attempted before to drive a sustained improvement?

And second one, just how do you assess the supply chain as you look to ramp up on the widebody new engine production as the targets laid out by Airbus recently, do you think that's feasible?

Tufan Erginbilgic

CEO & Executive Director

Okay. Thanks for the questions. Frankly, I don't want to comment on what was done, what wasn't done in the past in terms of structuring. I already talked about how I hold the COVID restructuring. When it comes to, therefore, I would rather talk about what I am -- what we are going to be doing. And frankly, as I shared with you before, I have some experience in turnarounds. And I'm afraid I'm going to repeat, in any turnaround at least 3 things are very important, really get the organization to understand the reality and why they need to change. Second thing is get very clear strategy that you can make it relevant to everybody. And I talk about that being an alignment tool as well as performance management tool, I actually seen it in action. It can be very, very powerful. And then very good performance management, which we need to improve in Rolls-Royce. We need to improve performance reporting as well as performance management. All those three areas, frankly, sort of needs to take place in Rolls-Royce. And you need to go at pace. And therefore, we create a transformation program. In these things, you need to be very systematic and go at pace. And we could have chosen to say we are going to improve the performance and deploy it to the business units with no central governance, et cetera. That was one way of doing that. I didn't think that was going to create the right outcome. This is one difference I'm going to overemphasize. This is group-wide program, not Civil Aerospace. Obviously, Civil Aerospace is included in it. With a very clear transformation program, which is very holistic, it goes from performance management and culture to all the way clear actions on efficiency, optimization and so on. So you need to have those components in place and then align the whole organization then interesting things happen in a positive sense. So that's what we are looking to do, and that's the journey we are on.

On supply chain point, yes, I think we have -- I would say we have slightly 2 different supply chains because Power System supply chain is slightly different than Civil Aerospace and Defense. Because of activity disappearing in Aerospace with COVID, as you know. So the whole supply chain really reduced the capacity, reduced labor, they took -- now they are all trying to bring that up while activity is recovering. That is becoming a challenging thing for the whole industry. I'm talking about industry. And therefore, my view is actually that supply chain will only stabilize between 12 to 18 months for [indiscernible]. Power Systems didn't have the same level of dip with COVID. That supply chain is actually stabilizing more and it will stabilize and improve much earlier than the other one. So that's how I hold it. Our Airbus targets, they are in line with our production targets as well. So we are totally aligned. There's one question there, then I'll come here.

Charlotte Anne Keyworth

Barclays Bank PLC, Research Division

Charlotte Keyworth from Barclays. I just got one question. I was just picking up on your comments around opportunities for better terms on LTSA contracts. Obviously, you can start that endeavor straight away with the new ones. But for the renewals, I think the average length is about 12 years. And I just wondered if you could give us some idea in terms of phasing of when the roll off of those contracts would peak? And when you start, you get the opportunity to renegotiate.

Tufan Erginbilgic*CEO & Executive Director*

Okay. Let me -- and Panos, you may want to sort of talk about the average life of the contracts. But let me pick up the question on sort of -- here is how I hold it. Obviously, any new contracts and renewals, we want to make sure that actually everything commercial terms reflect the value we create. And when I say the value we create, I take it seriously. I -- we have some things to do to improve our operating efficiency and effectiveness, right? So therefore, we can actually serve better to customers. Therefore, I'm actually thinking about this win-win. For existing contracts, though, it is clear that some of our contracts are not good. As you know, in balance sheet, we have onerous contract provision. So therefore, we are actually engaged even for those contracts to find win-win solutions with our key customers. I already met, as I said in my speech, some of our key customers. And the key here is we need to improve our operational effectiveness and create more value for them and then get better terms, and that's the win-win because any sustainable partnership will have to be win-win. That's my experience. So that's how we are actually going about it. Panos, in terms of how much left in our sort of...

Panos Kakoullis*CFO & Executive Director*

The average earnings life term is a little bit lower than the number you said. It's closer to 8, 9 years rather than the 12. The other I would add as well, it doesn't just have to be a pricing discussion on an existing contract. There's also effectively contract management. So how an engine is flowing? Is it flowing in the way that's contractually agreed because there are different rates depending on how it's flown. And maybe in the past, people were more forgiving on how it's flown. We're being much tougher on making sure the contractual terms are enforced within that.

Unknown Analyst

This is Alessandro [indiscernible] from JPMorgan. I'd like to ask Tufan two questions on behalf of David Perry and one question to Panos please. For the first question, Rolls-Royce, as a net LTSA liability of GBP 7.4 billion on its balance sheet. Have you done a specific audit of the contracts behind this liability. In other words, are you happy with the pricing charge for future shop visits and expect that future profitability as this liability converts into actual work revenue and profit? Second question is Rolls-Royce has net debt of GBP 3.3 billion plus a number of other liabilities on its balance sheet. Why are you confident that organic deleverage is the right solution? And the question for Panos, apologies if I've missed it, but I can't see any 2023 guidance for divisional EBITDA. Please can you help us here?

Tufan Erginbilgic*CEO & Executive Director*

Very good. Best regards to David, by the way. So let me pick your -- in the order you asked actually. So LTSA GBP 7.4 billion. My answer would be, first of all, we have obviously margin in that LTSA creditor balance that you are referring to 7.4%. And secondly, our commercial optimization workstream specifically targeting actually multiple workstreams plays into this. Let me talk to that, specifically targeting improving -- we already have a margin in LTSA creditor balance, just to be clear. Second thing is commercial optimization and some of the things we shared on the earlier question, will obviously look to improve commercial terms and our take from those contracts but also, we are focusing on efficiency and cost because by doing to -- I always believe you need to play on both ends, if you are going to have a turnaround, gross margin improvement as well as cost. So we are going to be focusing on the efficiency as I articulated in my presentation, and that cost efficiency actually includes shop visit cost as well. So there is the product cost out on OE and there is also a shop visit cost as well as sort of cost of the whole organization. So both of them will actually improve our margin on LTSA credit. On your second question, we have -- why I believe organic cash generation. I think I see the potential of the business. This business, if it is managed in the right way, and that is what we are looking to do, I believe has good potential to generate cash. And that will require, as I said, we are now already into performance improvement effectively our agenda. What -- the way you should think about what we presented is -- because we presented lots of things. The way we structured this with transformation program and business initiative plans at business unit level, we are looking to drive performance improvement as we

speak. So we are actually in action as we speak. Because we didn't want to wait even for 1 day. So there is a huge sense of urgency there, right? That's how we -- then strategic clarity will follow that. And then we are going to combine the two. Then you have a very clear strategy, which will allow you to make choices and performance improvement, transformation program is already progressing. Both of them will actually come together what we will call strategy implementation plan with midterm targets, and we will push that plan down to the level that actually a whole organization can relate to that. They know their role in it. That's the game plan here. But we are already on performance improvement side of it and strategic clarity will follow that. Panos.

Panos Kakoullis*CFO & Executive Director*

I think that the last question was around divisional guidance. We haven't given divisional guidance, so you didn't miss it. So the guidance we've given around operating profit is the GBP 800 million to GBP 1 billion for '23. And we've called out within that GBP 100 million to GBP 200 million of targeted contractual improvements. We will come back later this year, as Tufan has said, around medium-term targets.

Harry William Freeman Breach*Stifel, Nicolaus & Company, Incorporated, Research Division*

It's Harry Breach here from Stifel. Maybe one for each of you. Panos, will have the easy one, and forgive my ignorance and lack of time earlier on. Can you help us with the dollar revenue increase in 2022 for the T&M side, and then the LTSA side separately? And whether when we look to '23, we should be thinking about similar numbers. I won't embarrass you by asking for the number, but if you could give us a sense of that. Maybe for Tufan. Tufan, one of the -- as I'm sure you know, one of the tremendous challenges is in trying to normalize for differences versus peers at Royce and currency exposure and hedge book in installed base maturity and aftermarket intensity with fewer takeoff and landing cycles, the more narrow body focused competitors and in the broader portfolio outside Civil, and the comparative R&D burden on the business as it is today. How confident are you normalize for them? And then secondly, can you share at all where you think the normalized margin was in '22 and where the peers were like-for-like in their businesses in '22, so we can see what the gap is normalized?

Tufan Erginbilgic*CEO & Executive Director*

Okay. we actually done that work, normalization work in the benchmarking that I talked about in my speech. And what that study did is really -- because there are -- you are right, there are structural differences between the peers. And we actually look at Power Systems as well. It wasn't that benchmarking was not only about Civil Aerospace, it included all 3 divisions, all big 3 divisions, I should say. And what we did in that study, we said, okay, what are the structural differences. And we then -- we know what they are because I want to know, frankly, because some of the structural differences, you can do something about it as well. Then we look at the performance gap outside that. It is very clear. I won't give you numbers right now. But when we come back with midterm targets, sort of you will see the signs of it there. It is very clear we have performance gap. I mean performance gap rather than total gap in all divisions especially in Civil Aerospace and Power Systems, to a lesser extent in Defense, partly because of the nature of that business. But -- so we actually done that work. And obviously, it is informing already, as I mentioned in my speech, our performance actions. Because what we did with that, not only we are putting that into sort of transformation program, i.e., what we need to go with that. But actually, we created a business unit level targets based on that so that business units are already working on it. So that is how actually we have done that. But you are right, there are differences.

Panos Kakoullis*CFO & Executive Director*

So I think the other question was on time materials, [indiscernible] pounds rather than dollars, so the time materials increased from -- in terms of revenues from GBP 629 million to GBP 865 million, so still around about 20% of service revenues within that. The primary driver of that increase was the V2500, and the other elements of the increase will relate to LTSA customers, so those elements that aren't covered by

LTSA, I think, as we've talked about in the past. As you look at '23, you can expect a sort of a continued recovery in V2500. That will be the sort of the main driver of 23% revenue growth in that area. Okay, David.

Unknown Analyst

So two further questions, please. The first one is, do you think the Power Systems is a core business for Rolls-Royce? Does it have synergies with the rest of the group? And the second question is, how committed are you to the new market strategy?

Tufan Erginbilgic

CEO & Executive Director

Okay. Two good questions, as I should expect. So let me start with Power Systems. When that business properly managed, it is actually a very good business. It's got a structural advantage from the previous question, actually, that when we did the structural part of it in benchmarking, it got a structural advantage versus competition. And it got really good potential to be a growth -- really good growth business with very good returns. And therefore, create value. I think that is where my focus is because that will create value for Rolls-Royce and shareholders. But also, I'm not sure that business fully understood in terms of 2 other things. Actually, I spent 7 years of my life -- last 7 years of my life on energy transition, looking at everything, frankly. Pace of energy transition in Power Systems, in the key segments of it will be slow. Second thing is even more important, some of the really most profitable key segments in Power Systems because Power Systems is not one thing, really. Some of that actually not a new engine development, but actually modification. Let me give you an example. Like take Marine, which is a very profitable, good business. Commercial Marine as well as yards for Power Systems. Take that, everybody is talking about energy transition. I spend lots of time on it even long before I joined Rolls-Royce. Methanol or ammonia will be the net zero solution for Marine. Either of them can run in diesel engines. So all you have to do is a modification and some test rather than a new development, new this, new that. It is the same business model with some modification. So that's actually important for this business. So in summary, it is really a good business. That doesn't mean we are not going to -- some aspects of it partnering with somebody may be a good idea, and that's all part of strategic review. So I will never rule out anything like that. That's not what I am talking about because at the end, this is about actually creating the winning positions for every business we have out there. So that would be my power.

Your second question was new markets. I think we need -- we are going to have a strategic review definitely, and that will tell us for those businesses what the right answer is, what's the best way forward. But I would say the following for SMR, definitely. I mean if you look at SMR, it is actually a very proven technology and interesting technology. And it definitely creates 4 things for the U.K., I would say. Because U.K. is a big factor in the success of that program, frankly. But definitely, it can play a big role in net zero for the world, but also for U.K. Given the world we live in, I think supply security is increasingly important. And for U.K., it will be important from a supply security perspective. And then two other things, I believe it will actually contribute to U.K. economy significantly because it has the potential to create significant employment and create significant exports. But for that to happen, obviously, we are working with other countries as well. But naturally, all the countries are expecting first U.K. government to support it, i.e., for the first project, then that will give confidence to all other countries to go there. So therefore, we have been engaging with U.K. government and will continue to engage. But there is an urgency there because we've built a very capable team on SMR. It's a big team and capable team, and it is important to sustain that team. And without project, it is going to be difficult to sustain. Second thing is there's competition. We are not in an isolated world. And in a new technology, first mover advantage is important. Therefore, there are other competitors. Therefore, actually, we need to land this as quickly as possible with U.K. government so that we can go ahead with the project. That's what I would say there.

Isabel Green

Head of Investor Relations

I have got two questions from the web side.

Tufan Erginbilgic

CEO & Executive Director

Yes, sure.

Isabel Green

Head of Investor Relations

So I've got a few questions that have been submitted online. Firstly, a 3-parter from Ben Heelan from Bank of America. So Ben has asked, Tufan, you talked about a high fixed cost base versus peers, but Rolls has been through 3 large restructuring programs since 2015. How easy is it going to be to improve this? He also asks how we feel about the makeup of Rolls-Royce' portfolio. Does it make sense in its current form? And the third part of this question, Airbus announced production increases, how confident are you on the ability to manage the production increase? How should we think about the medium-term headwind to earnings and cash from the production ramp-up? I do have more questions, but that's all from Ben.

Tufan Erginbilgic

CEO & Executive Director

Okay. Let's deal with this. I think -- so cost reductions was the first question, I believe. I mean, in a way, I covered that Ben in some of the questions. But effectively, I'll say that GBP 1.3 billion cost reduction was mainly in Civil Aerospace. It didn't actually include other divisions or the group to a great extent. And second thing is that was activity driven, i.e. activity demand disappeared, therefore, Rolls-Royce did what it needed to do. Actually, they've done the right things. I'm not in any way -- I'm not saying they didn't do the right things. They absolutely did the right things. But it was activity-driven. When activity recovers, those costs have been actually coming in even last year. So what we are now trying to do is really intervene with that, starting from this year and then create a more sustainable and more competitive cost base but improved cost base going forward because the idea here is to make Rolls-Royce more competitive. There is a purpose. It's not about managing liquidity, managing this, actually taking Rolls-Royce to a much better level. So -- that's what we are trying to do. Is there room? Yes, because there is another angle on that. I already talked about how I hold Civil cost, but also -- let's face it, Rolls-Royce has been run as 3 decentralized divisions. We are not going to run it that way. We are one team, one company and we will take all the synergies not only between divisions, but divisions and group -- and the functions the same because even the functions within functions, actually, we have synergies. So there is a big synergy opportunity because it has never been actually looked at because of the operating model and the mindset being very different. And then there is a simplification opportunity beyond that, I believe. So yes, I believe there is room for efficiencies for the reasons I mentioned. On the portfolio question, in a way, I tackle that, Ben, in my speech as well, how I hold established businesses at this point. But we will do the strategy review. And as a result, we will come back where we need to do what and how we are going to prioritize investment opportunities. So I don't want to repeat the same thing there. And Airbus production increase, yes, our plans are aligned with their plans. Yes, supply chain is challenging, as I covered that earlier, but our plans are aligned to Airbus plans.

Isabel Green

Head of Investor Relations

And apologies, some of these questions get submitted earlier in, but I didn't want to edit them out. So I've also got a multipart question from Ian Douglas-Pennant of UBS. So he asks, when can we expect the revised medium-term targets from the strategic review? What does engine flying hours at 80% to 90% to 2019 levels in '23 imply in terms of the China recovery? Are you expecting a slow ramp-up? And when you did the benchmarking exercises on efficiency versus peers, what do you think the potential for the business is at Rolls-Royce for cash flow and margins? And then finally, from Ian, do you have the right senior team around you, more hires needed similar to the Transformation Officer already hired?

Tufan Erginbilgic

CEO & Executive Director

Well, Ian, you got some questions. I think this flying hours, I'm going to also ask Panos for his views. But on the targets, midterm targets. I mean, as we said, we are going to complete this strategic review and come back to you in the second half of this year with midterm targets as well as the findings of a

strategic review. So that is that. 80%, 90% flying hours, let me say this. January number is 79%. So in that context, Ian, we are actually confident if China doesn't go backwards in terms of COVID, it will continue to improve. Therefore, 80% to 90% looks good in terms of assumption. But obviously, within that number, we still expect sort of Europe and U.S., almost 100% levels and China slightly lower. And therefore, more room for China to improve because in some other regions like Europe, actually, we may be higher than 100%. So -- but do you want to add anything?

Panos Kakoullis*CFO & Executive Director*

That's the right numbers. I would say the other -- I would add, in '22, China was around about 10% of total engine flying hours compared to 2019, it was about 18%. So you can sort of see the scope for increase. But that 80 million to 90 million is a combination of China getting up towards that level, but coming from a low base and the stronger than that performance in Europe and Americas.

Tufan Erginbilgic*CEO & Executive Director*

On your last 2 questions, i.e., on the benchmarking efficiency versus peers, I can categorically tell you there was efficiency potential in all of our divisions. Some are more than others, but definitely in all of them in the benchmarking study that also supports the comments I made earlier. So -- but I'm not going to give you any numbers at this point. Again, when we come back with our midterm targets, hopefully, all this will come together. But I don't want to go into the numbers at this stage. I think on senior team, I will say as an executive team, we actually -- they all embrace the change, and they all embrace the transformation program. They are actually driving it. And therefore, we are able to go fast. So I wouldn't say anything more than that, Ian.

Isabel Green*Head of Investor Relations*

Okay. So in the interest of time, because I think we are sort of running up against the clock now, I'm going to apologize to those who have submitted questions by pulling a few together into my own multipart version of a question. Otherwise, I think we'll never get to the next stage of the day. So the questions that have come in include any timeline we have in mind for getting back to an investment-grade credit rating? And also any timeline for the assumption of shareholder payments? Do we expect to take any restructuring charges related to the strategy review? And also any guidance we can give on the phasing of free cash flow in 2023, particularly in regard to that earlier part about any restructuring charges we might need to take.

Tufan Erginbilgic*CEO & Executive Director*

Okay. Lots of questions there. So I think starting sort of -- let's do the work, and once we do the work, we will obviously -- if restructuring charges necessary? Absolutely, we are going to come back to you. But at this point, we need to do the work. That is definitely potentially be there. And at the right time, we are going to be informing you. Other questions?

Yes. I think our priority is articulated in a way in the press release as well as in the script. Our priority at this point is to get to, obviously, the cash generation, and with that, get to investment grade at pace. I'm not going to give you a time on that at this point. But we would like to go there at pace because strong balance sheet will allow us, which is your second part of your question to resume shareholder returns as well as invest in the future. The way you may want to hold, and I have it in one slide, actually. But in terms of -- obviously, cash generation is our focus. The way you may want to hold the priorities, with that, first, we are going to deleverage the balance sheet and get to investment grade. And then we are going to look to reestablish shareholder distributions, and then it will be between shareholder distributions and investment in the future, and we will make those choices. So that's how you may want to think about how we are proceeding.

Panos Kakoullis

CFO & Executive Director

I think the final part of that question was around phasing of free cash flow. And I think we picked that up in one of the earlier.

Tufan Erginbilgic

CEO & Executive Director

Yes, I think Panos covered that, I believe. Okay. First of all, it was 1.5 hours. You have been very generous with us. Thanks for listening. Thanks for your questions. Thanks for your engagement. I think my key message are there. Well, we are really looking to create a very competitive, growing and resilient company here. Secondly, we believe in the potential for cash generation as well as for profitability and to take Rolls-Royce to a much higher level.

And third point there is very important because we are really in action. We designed this in a way that performance improvement actions are happening as we speak right now. And obviously, strategy and midterm targets, we will come back to you. One thing personally, I should say, I'm really excited about the opportunity, and we have a great team. And I'm looking forward to engaging with you at the right time, and I'm sure we will have lots of conversations. With that, have a great day.

Presentation

Isabel Green*Head of Investor Relations*

Hello, and welcome, everyone, to our 2022 half year results presentation. I'm Isabel Green, Head of Investor Relations, and I'm joined today by our CEO, Warren East; and our CFO, Panos Kakoullis. As usual, today's presentation will begin with a summary of our operational and financial highlights from Warren, followed by a more detailed review of our financial results and Panos, and then Warren will talk you through how we are securing a sustainable future for the business. Our presentation will take just over 30 minutes, leaving time at the end for Warren and Panos to answer your questions. Before we begin, please take note of the safe harbor statement on Slide 2. As always, the full set of results materials can be downloaded from the Investor Relations section of our website. I'll now hand over to Warren.

David Warren Arthur East*CEO & Executive Director*

Thank you, Isabel. Good morning, everyone, and thank you for joining us today for our results presentation. I'll start with a summary of our performance. We've made good progress in the first half with growth in order intake, revenue and cash flow, and that's based on demand for our products and services, which are improving meaningfully with another period of record order intake in Power Systems accompanied by continued recovery in civil aerospace engine flying hours, and we have good visibility of revenues in defense with a strong order book.

Second point, middle of this slide, we're taking the necessary actions to protect our business from the risks of inflation, supply chain disruption and a tightening labor environment. We can see the benefits of productivity and efficiency improvements, and we expect to see more progress come alongside us being ever more disciplined on our commercial terms. And these actions taken together enable us to deliver on the commitments we've made, working right across the group to deliver better performance for all of our stakeholders.

Now let's turn to operational highlights. In Civil Aerospace, shown in the top left-hand box, picture of Dassault 10X Falcon. We've seen some great milestones in the first half of 2022. Our new Pearl 10X engine powering that plane, successfully underwent its first test run, and it didn't miss a beat. And Gulfstream's G800 business jet, which is powered by our Pearl 700 engine achieved its maiden flight. In fact, some of you may have seen it across at Farnborough a couple of weeks ago. We've also assembled the first UltraFan large engine demonstrator, which will go on test later this year with 100% sustainable aviation fuel. The cover picture is a picture of that engine. And more generally, for our newest engine programs, we're continuing to invest in ways to improve time on wing between services to maximize the value for us and for our customers. In Defense, that's top right-hand box, we have a strong order book and we have achieved our first milestone on the B-52 program. That was a critical review in support of activities for the integration of the F130 engine onto that airframe.

In Power Systems, moving to the bottom left of the slide, we're delighted to announce another period of record order intake in the second quarter. Demand has been especially strong for power generation with orders including mission-critical backup power for data centers, and orders for some large customers like semiconductor companies worldwide. Finally, in our New Markets segment on the bottom right, we've seen great progress, too. This is a picture of us signing an MOU in Farnborough in July with Hyundai Motor Group to collaborate on bringing all electric propulsion and hydrogen fuel cell technology to the advanced air mobility market.

And with Rolls-Royce SMR, as demand for power and energy independence increases, we've announced a short list of sites for our first SMR factory in the U.K. As a reminder, this is important because we anticipate that 90% of our SMR products will be built in factories before being transported to sites for assembly. And that factory-built modular approach will drive a significant reduction in the cost of continuous zero-carbon electricity, and that's an important part of the solution for energy independence.

So turning to our financial summary. Free cash flows have improved by GBP 1.1 billion, and that reflects the higher engine flying hour receipts, which were up 43% versus the first half of 2021 as well as cost control and working capital discipline.

At the same time, we are facing the impact of global supply chain challenges and cost inflation, but we're actively managing these through a sharper focus on pricing, productivity and costs. You'll hear quite a bit more on that from panels as we go through. Some examples. We're partnering with key suppliers, ensuring that we have contractual pricing protection in place through long-term contracts. We're looking at innovative changes in our manufacturing processes to manage rising costs and supply chain bottlenecks, for example, by repairing and reusing spare parts where we can. And where necessary, we're derisking our customer deliveries by temporarily increasing inventories. We're also delivering on our commitments to rebuild our balance sheet in the medium term. And we've now received the required regulatory approvals for the sale of ITP Aero, and we expect that transition to complete in the coming weeks. The proceeds will be used to pay down the GBP 2 billion U.K. export finance supported loan.

Our liquidity position remains strong with GBP 7.3 billion of liquidity, including GBP 2.8 billion in cash at the end of the period. We had net debt of just over GBP 5 billion, including leases, and no significant debt maturities before 2024.

In terms of the guidance, the group targets for 2022, which we set out in February are unchanged. This is despite the increasing challenges and risks around the pace of market recovery, global supply chain disruption and rising inflation that we think may continue into 2023. And with that, I'll now hand over to Panos for a deeper dive into our financials. Thank you.

Panos Kakoullis

CFO & Executive Director

Good morning, everyone, and thank you, Warren. Despite a challenging external environment, we've delivered materially improved cash flows versus the first half of 2021. But we still have more work to do. And let's just take a look at the numbers. The results on the following slides were they're presented on an underlying basis for the continuing businesses in the group. Group revenues, GBP 5.3 billion. That's 4% higher than last year on an organic basis. Revenue growth was strong in Civil Aerospace and Power Systems with lower revenues in Defense, which had a tough comparator last year.

Operating profit of GBP 125 million was below last year's GBP 307 million, lower principally due to the absence of a foreign exchange revaluation credit in the first half of 2021 in Civil Aerospace. That doesn't repeat this year. It was a one-off accounting adjustment of around about GBP 270 million, about half of which unwound in the second half of 2021. And that was already factored into our full year 2022 guidance, and as I said, it's not something we expect to repeat going forward. Defense profits last year, where they benefited by around about GBP 45 million from legacy spare parts sales, which again did not repeat in the first half of 2022.

We reported a free cash outflow of GBP 68 million compared with an outflow of GBP 1.2 billion in the first half of last year. That continues our trajectory from the GBP 4 billion outflow in 2020 and the GBP 1.5 billion outflow in 2021 and moving up towards a modest positive for the full year this year. In Civil Aerospace, total engine flying hours, including business aviation and regional flights where they were up 33% year-on-year, showing a continued recovery in large engine business and a sustained high level of demand in business aviation.

Large engine long-term service agreement flying hours, they rose by 43% in the first half to 4.5 million. You have to remember, we're still in the early stages of that recovery. So that's still only around about 60% of 2019 levels. Large engine major refurb, where they rose by 22%, although total shop visits were only up 6%. Again, we expect further growth in the second half of 2022. Civil Aerospace revenues grew 8% year-on-year, and that's higher shop visit activity and long-term service agreement catch-ups, offset by fewer OE large engine deliveries. The catch-ups where they reflect strong execution and commercial discipline. That means we've got higher anticipated profitability across the life of these contracts going forward.

Civil Aerospace, reported an operating loss of GBP 79 million against a small profit last year. As I noted earlier, last year's profit included that one-off foreign exchange credit of around GBP 270 million. Adjusting for this, catch-ups and some small favorable provision movements in the period means that Civil's underlying profitability was broadly flat year-on-year. Civil delivered positive GBP 63 million of trading cash flow again, a significant GBP 1.1 billion higher than last year. With costs rebased, as volumes recover, we see Civil Aerospace becoming the cash engine for the group.

In May, we held a Civil Aerospace Investor Day in Derby. If you didn't attend, I'd really encourage you to watch it on our Investor Relations website. We set out 5 key value drivers for the business: one, maximize service receipts; two, reduce service costs; three, improve OE margins; four, grow business aviation; and five, make sure we benefit from a favorable point in the investment cycle as we exit what has been a period of intense product development. And we're going to be reporting on these drivers on a consistent basis going forward.

As part of that day, we also set out medium-term financial targets based on engine flying hours recovering to 2019 levels by around 2024. Within those targets, we expect a low double-digit compound annual growth rate in total revenues based on 2021 as the start year, a high single-digit operating margin and trading cash flow to comfortably exceed operating profit. We remain confident in our ability to deliver these targets and in the operating leverage of the business as our revenues grow. Our defense business, that's a long-cycle business. And it doesn't immediately benefit from the big geopolitical changes we're seeing at the moment in the wider world. However, rising budgets in most Western countries do underpin our confidence in the long-term outlook for this business and its annuity-like cash flows.

We've recently won some very important contracts, that Warren referred to, the B-52, and there are other contracts we're bidding for, such as the Future Long-Range Assault Aircraft for the U.S. Army to reflect -- replace its fleet of Black Hawk helicopters. And we are expecting a decision on that in the coming months. Underlying Defense revenues, GBP 1.6 billion, they were 9% lower than in the first half of last year, and operating profit was GBP 189 million. That gives you an 11.7% margin.

As I noted earlier, the first half of 2021 included an unusually high level of legacy spare engine sales, which added roughly GBP 45 million to profit. Trading cash flow, GBP 89 million, was equal to last year. In Power Systems, we've seen very strong demand, 53% growth in order intake in the period and a book-to-bill ratio of 1.5 with a record quarter for orders in Q2. Order cover is already at 100% for the rest of 2022.

And in fact, in some of our end markets for 2023, we are close to full capacity already. Revenues in the period grew by 20% year-on-year. And that's despite some challenges around Ukraine and the supply chain that Warren referenced. Underlying operating profit, that was GBP 119 million, giving an 8.7% margin against 3.5% in the prior period.

Trading cash was an outflow of GBP 76 million compared with an inflow of GBP 71 million in the prior period. And that partly reflects some working capital investment to support the currently very high levels of revenue growth. We've also got some issues in the supply chain there, and that's resulted in inventory build, which we are working very hard on to make sure we reduce in the second half.

Finally, let's look at New Markets. That includes the SMR and Electrical businesses. New Markets reported an operating loss of GBP 48 million in the first half of 2022. And that, as you'd expect, reflects the ramp-up in R&D costs as we grow our teams. We've got just under GBP 0.5 billion of committed funds in place to cover the R&D costs for our SMRs over the next 5 years. And only 10% of that is the amount we will fund ourselves. The investments that we're making in this segment have a broader synergistic benefit across the whole group, and Warren is going to touch on that later.

This next slide that sets out our group cash flows starts at underlying operating profit. Our free cash outflow was GBP 68 million in the first half. That compares with an outflow in the prior period of GBP 1.2 billion. Our stronger cash flow performance year-to-date gives us confidence in our ability to deliver modestly positive free cash flow for the full year. That GBP 1.1 billion cash flow swing can be broken down into 3 broad buckets. Firstly, we saw an operating profit performance improvement of around about GBP 490 million. And that largely reflects the growth in large engine flying hours in Civil Aerospace.

Secondly, working capital, that was GBP 350 million better as inventory build was partly offset by strong customer collections in period, particularly in Civil Aerospace and improved performance on payables. And thirdly, other impacts were GBP 230 million, better than the prior period with a lower pension contribution and derivative settlement costs. and higher profits coming through from discontinued operations, offsetting higher interest costs. We saw limited impact in the period from concession payments. We started the year with around about GBP 300 million of net concessions slipped from 2021.

Now at that time, we thought those would largely unwind in 2022. Since then, we've seen those further delays in 787 deliveries and the associated concession payments. Important to note though, that's largely offset by a reduction in concession receipts on new Trent 1000 deliveries as Boeing itself manages its own inventory. So as a result, concession outflows were expected to be slightly lower than we originally anticipated. But there is a larger headwind coming in 2023 as those growth slips are compounded in '23 by continued low receipts from Trent 1000 new engine deliveries.

Now when I started this role, I set out 3 clear priorities for the business: deliver on our commitments, simplify how we report and invest wisely for the future. And I just want to give you some examples of our progress in each of those areas. So firstly, delivering on our commitments. We all know how challenging and uncertain the external environment is, given the war in Ukraine, the impact on supply chain, rising inflation, phase of recession and continued intermittent lockdowns in China.

Nevertheless, we stay committed to delivering on what we have promised. I want to share with you some of the ways in which we're actively managing the current situation. Firstly, through commercial discipline and on pricing and also on contract management. In Civil Aerospace, we've been able to contractually pass on higher input prices on both OE and aftermarket through indexation clauses.

In Power Systems, that's a shorter cycle business, we've also been able to raise prices in an environment where demand is very strong and margins are very closely leveraged to volumes. And in Defense, we're working hard to manage supply chain costs through long-term purchasing agreements and focusing on pricing with customers.

Secondly, we are focused on controlling our cost base to ensure that there is operating leverage as revenues grow. We focused on our supplier list, seeking to work with the very best performing suppliers. And in most cases, we have long-term agreements in place, which offer us good protection from near-term price pressures. A case in point, titanium. We've already secured a long-term agreement with a U.S.-based titanium supplier, which means that we continue to be increasingly less reliant on titanium from Russia. Another example, on the Pearl 10X, where our innovative digital sourcing approach has allowed us to achieve a 10% cost reduction on parts by consolidating our spend with 4 high-performing suppliers. And more broadly in civil aerospace, we've taken proactive steps to further strengthen our focus on supplier management in the first half.

That included very careful selective hiring to support and manage the supply chain. We've established tiger teams in those severely stressed parts of the supply chain, including the use of external specialists. On the commodity side, we've also have hedging in place to protect us for near-term volatility, and an example would be nickel. We currently hedged 75% for 2022 with significant levels of hedging in place for the next 4 years. Jet fuel, we're 80% hedged in 2022 with a ramp down out to 2025.

Now finally, working capital remains a key focus and in particular, customer collections and driving down inventories. Next up, simplify how we report. An example of how we are driving simplicity across the business is our new approach to foreign exchange hedging, which is more cost effective, brings us into line with our peers to allow comparability and allows us to more proactively manage risks. Historically, we've hedged a declining percentage of our foreign exchange exposure across a rolling 10-year horizon, and that was based on our projected U.S. dollar revenues.

Now the issue that gave us going into COVID was we were carrying a very large hedge book, much larger than our peers. And because the material impact COVID had on our medium-term forecast of U.S. dollar revenues, we found ourselves over hedged. And you're all aware, there was a GBP 1.7 billion cost to unwinding these hedges that we charged in 2020, that we feel the cash flow impact of until 2026. And it's worth remembering every \$1 movement in the hedge rate impacts our operating profit and cash flows

by around about GBP 25 million to GBP 30 million. Under our new approach, we're going to be carrying a smaller hedge book with a declining percentage of cover over a 5-year period, which will mean that market movements in foreign exchange will impact us sooner.

The chart on the slide that shows our current hedging position. We've got some flexibility to move these hedges around, but we are largely hedged at \$1.50 to the pound until 2026. From then, you'll start seeing the benefits coming through from the new hedging approach. And my third priority, making sure we invest wisely. We've got strict criteria that we follow when considering new investments. Firstly, they need to be aligned with the group's strategy and focus on sustainability. Warren is going to pick up on that theme shortly. 75% of our R&D investment in the medium-term will be on lower carbon technologies and making our existing products compatible with net-zero.

We also continue to invest in improving the profitability of our products by increasing time on wing, efficiency and productivity. Now whilst we're seeing increasing investment in New Markets, our established businesses are critical to. Around 80% of our CapEx and R&D this year will be focused on Civil, Power Systems and Defense. Next, we very carefully consider the risk reward profile of each investment based on an estimate of its IRR in a range of scenarios. Our investments, where we aim that they generate a combination of near-, medium-term and longer-term returns. That gives us a balance of protecting and growing our established businesses and pursuing longer-term growth opportunities at the same time.

An example of an investment that will generate return in the near-term is the work we've done on extending the time on wing in the Trent 700 engine. At the other end of the spectrum are our investments in electrolyzers and in SMRs. Now for these more longer-dated investments, we make sure that we have a sufficiently high IRR on a risk-adjusted basis.

Just to give you an idea from a process perspective, all investments over GBP 5 million are reviewed by our group investment review committee. That meets monthly, I've shared all of those meetings since I started with the business. We set a very high bar when considering new investments, and there are many examples of projects that didn't make the grade. And we continue to focus on in-flight reviews of investments to make sure we improve the accountability and delivery on existing projects. And I'm going to keep coming back to these 3 themes in the future. So delivering on our commitments, simplify how we report and making sure we invest wisely.

Now my final slide. Despite the challenges around inflation and the supply chain, we are confident in our ability to deliver on our commitments. At the group level, we still expect to deliver low- to mid-single-digit revenue growth. a broadly unchanged operating margin year-on-year and modestly positive free cash flow. And that guidance is based on expected improvements in civil aerospace, driven by higher large engine sales and also increases in shop visits.

Our divisional guidance has changed slightly. In Civil Aerospace, we now expect to deliver good revenue growth in 2022. In Defense, we're now guiding for a low double-digit operating margin in the full year for 2022. That's lower year-on-year due to higher investment spend and also the nonrepeat of those legacy spare parts sales I mentioned earlier.

And lastly, just to help the modeling, a word on tax. We're still expecting group cash tax payments to be broadly similar to the GBP 185 million paid in 2021. Now we expect the P&L charge to be lower than this, but due to the geographical mix of our profits and losses, we will see a higher-than-normal P&L tax rate this year and in 2023. And with that, I'll hand back to Warren.

David Warren Arthur East
CEO & Executive Director

Good. Thank you, Panos. Now securing a sustainable future. When we talk about sustainability, of course, we mean in terms of the energy transition and addressing climate change, but we also mean ensuring business sustainability with disciplined investment for sustainable returns. But before I talk about the future, I'd also like to touch upon last week's announcement regarding the new CEO appointment and a few personal reflections. It's been a great privilege to have been entrusted with the stewardship of this company over the last several years. And I've enjoyed support from loads to people. I especially want

to thank the amazing people at Rolls-Royce who make it all happen. In spite of some really challenging events and indeed, all the changes that I have thrust upon them.

We've dealt with some major challenges in that period. And I'm pleased to reflect on how much the company has changed in that time. Indeed, the appetite for further change that we've developed. Rolls-Royce is now much leaner, more agile and more focused than it's ever been. We've taken significant costs out and developed a more cost-conscious culture across the whole organization. But we've not lost the focus on excellence, nor our ingenuity, which enables us to punch well above our weight.

We've developed more efficient, durable and sustainable products and services that will serve our customers for decades to come. And in addition, we've embarked on a net-zero pivot. As you know, in my book, disruption like this spells opportunity. So I'm more optimistic than ever about the future. I'm also proud of our broader leadership team, which like our people at large is, on average, younger, much more diverse and much more agile. That gives me the confidence to pass the baton to Tufan, who joins us in January. Together, they will create that sustainable future for Rolls-Royce. Now on a sustainable future, the #1 thing is to make the group sustainable as a business. Key to this is leveraging the asset which is our installed base. The largest earnings potential lies in our large engines powering the world's youngest wide-body airline fleet, where we power the majority of aircraft types available for airlines to buy today. Alongside this, we have over 9,000 business jet engines and more than 16,000 defense engines as well as over 40,000 customers for our Power Systems product. And as we outlined at our Civil Investor Day in Derby recently, we work intensely to increase the profitability of our installed base, and that's the asset with significant barriers to entry that drives our sustainability from a business point of view.

Now I want to shine a light on the technology behind the business opportunity in the other sense of the word sustainability. We're a business that's focused on power, more accurately, perhaps turning stored energy into useful power in particularly difficult applications. This offers challenges, but it also creates excellent barriers to entry once you've developed that domain expertise. Now you hear today about alternative forms of stored energy, and it can all sound very complex. But actually, this is a continuation of our long journey. For much of the time since, say, 1940, we've worked with 2 forms of stored energy, fossil hydrocarbons and nuclear power.

Looking forward, sticking essentially with the same difficult applications where we draw on our decades of expertise and those barriers to entry, I mentioned, we moved from 2 forms of stored energy to 4. If we look at the hydrocarbon stream, we anticipate that over the next 20 years, we will see a switch to synthetic fuels. It will remain prevalent for decades in our reciprocating engines, but in particular, it's going to be relevant for our gas turbines for long-haul aviation. We're ensuring that our gas turbines are ready now for that transition.

Looking to nuclear, moving up the slide, we have multi-decades of experience in providing safe nuclear power in a really challenging application, and that gives us the confidence in our capability to deliver our SMR solution. The huge reduction in the cost of continuous zero-carbon electricity that our SMRs provide makes us firm believers that it is the right solution to decarbonize the grid and to enable stand-alone industrial applications such as producing the synthetic fuels and at the top of the slide, the hydrogen.

There are even future opportunities in space applications with micro reactors. Now electrification is an established trend with progress in battery technology. And for us, initially, this means using battery storage for hybrid propulsion and microgrid solutions on land. However, this is rapidly becoming relevant in aviation. We have several contracts in urban air mobility and commuter aircraft for full electric power and propulsion. And these subsectors will produce revenue and profit relatively soon. We can see full electric and hybrid and more electric solutions moving from smaller aircraft to larger ones as the technology matures.

Now in order to achieve true net-zero, we will, I'm sure, be deploying hydrogen-based power and propulsion solutions in time, even to our widebody customers in long-haul aviation. And I'll show how we prioritize and invest into those alternative forms of energy storage using hydrogen as an example, if we move to the next slide.

Let's just look at the hydrogen pathway. We can deploy hydrogen in a reciprocating engine in a gas turbine with hydrogen fuel cells in between. The gray areas on the slide represent the investment periods and the green areas show where we can make revenue and earn profit. Hydrogen is gaining relevance in many markets, and our customers look to us to help them decarbonize. And some of these are way off, but we need to be ready with the technology as that technology and infrastructure matures. And you can see that whilst we must be active and present, hydrogen and the gas turbine together for wide-body aviation is a minimal investment today. And based on what we can see, revenue is not likely before the late 2030s. But we're investing now where we see short-term potential for deployment and business return at the top of the slide, for example, around reciprocating engines and coming down the slide in fuel cells moving from land-based stationary to mobile and later into the air.

There are opportunities, too, for inorganic growth -- for instance, the recent acquisition of the electrolyzer specialist Hoeller, will help us to move to market quicker in Power Systems. Alongside disciplined prudent investment in some cases. The best approach, though, is to form partnerships. At Farnborough, the partnership that we announced with Hyundai that I mentioned earlier, includes hydrogen fuel cells. And we also announced the partnership with easyJet, and that's all about hydrogen in gas turbines.

Now these investments and partnerships are creating knowledge, skills and capabilities that flow across our group, creating benefits and applications between our different businesses. It isn't just about the technology, it's about the people. You've heard me say many times before that our key differentiator is our people. So I'm pleased we continue to be a company where talented individuals are keen to work. Since 2021, we've seen an increase of 48% in applications for our early careers and 58% of the graduate hires in 2022 are female and 36% from ethnic minority backgrounds.

In addition to hiring though, it's even more important that we create an environment where all our people can deliver to their full potential. And that means being really inclusive. We support over 20 employee resource groups across all diversity strands, including faith, ethnicity and gender networks. The largest one of those is Prism, which supports our lesbian, gay, bisexual and transgender community here in the U.K. And we're proud that this network has received multiple externally recognized awards.

We can see how inclusion, coupled with the right incentivization, encourages the right business outcomes. For instance, looking at our patent award scheme, in 2022, nearly half of the new inventions filed related to our net-zero ambitions. We've introduced a new approach to learning and this includes a refreshed digitally enabled approach for all of our people to get learning out really quickly. One key aspect of this is a digital internal marketplace for so-called gigs. These are bite-sized pieces of work that are matched on the basis of capability to people anywhere across the organization, leading to much more agile working and ensuring that we develop a capability irrespective of any internal organizational boundaries. And that's especially crucial for highly sought after fields like electrical engineering.

So let's conclude. A reminder of what we have covered. We've progressed well in the first half of the year with substantially better cash flow as we manage our costs and the markets recover. It's a tough environment, though, and we're addressing this with a focus on the operational and commercial actions that can protect our performance. And we're sticking to our commitments. The disposal of ITP has been approved and it will complete in the coming weeks, and we're well positioned to achieve our guidance. I'm convinced that with the best people and breakthrough technologies for the energy transition and a more modern and much leaner business with a bright and exciting future ahead. And with that, I'd now like to hand over to the moderator to open the meeting to Q&A.

Question and Answer

Isabel Green

Head of Investor Relations

[Operator Instructions] Thank you. And so a question here from the webcast and to Warren, actually. So Warren, your results today have got quite a lot of noise, and you say you're progressing well, but I can't see it coming through in the numbers. Can you tell me a bit more about what's going on in the business?

David Warren Arthur East

CEO & Executive Director

Yes. I'd say we're progressing well because we can see growth. We can see growth coming through in revenues. We can see growth in orders. Our Power Systems businesses just had a record quarter for orders. And actually, the first quarter was very strong for orders as well. So we now have a record order book there. And I can see a massive swing in the cash flow. A reminder of the trajectory, COVID, minus [GBP 4.2 million], last year, minus [GBP 1.5 million]. This year, we said we'd be modestly cash positive and the first half has set us up very well for that being just a GBP 68 million outflow.

And what's really driving that is a recovery in engine flying hours in our Aerospace business as well, large engine flying hours up 43%. And so I think that's the indications of progress. Now when you look at our profit and just compare first half this year to first half last year, then I think that's what's caused a little bit of noise this morning. I think it's important that we understand the moving parts behind that. So I'm going to ask Panos to explain that one.

Panos Kakoullis

CFO & Executive Director

And I think you're right, at first blush, when you look period-on-period, or what's happened to operating profit, and I called it out in the presentation, GBP 125 million versus GBP 307 million, it does look. And what we tried to do is just to be helpful to pick out what's really going on behind that? And particularly when we're in the environment we are now of going through breakeven, relatively small numbers either way, it can have a distorting effect. So what we've tried to do is pick out things that are effectively one-off, and we tried to do that in a balanced way. So you'll see that there is a nonrepeat of a revaluation credit. There's a foreign exchange revaluation credit of around about GBP 270 million in last year's numbers due to the change in foreign exchange rates.

There was also a GBP 45 million benefit from the legacy spare parts sales within the Defense business last year, didn't repeat this year. Again, that's consistent with what we expected. Year-on-year, we're benefiting from more positive catch-ups this year than last year, and you can see a benefit of around about GBP 50 million coming through from that. And also this year, we've got a one-off write-off on a legacy contract from a business that we sold just under GBP 30 million.

So when you strip all of those elements out and say, right, what is going on with the underlying business, you end up with an operating profit a little bit up year-on-year. again, it's sort of indicative of the underlying progress.

Isabel Green

Head of Investor Relations

Now we're going to start to take questions from audio lines. And the first question from the line of Robert Stallard, Vertical Research Partners.

Robert Alan Stallard

Vertical Research Partners, LLC

Yes. A couple of questions from me. First of all, Warren, you mentioned the -- that you're enforcing indexation in your contracts and the Power division is seeing good pricing. Is this enough to cover the

cost inflation that you're seeing coming through the system? And is there a bit of a timing mismatch here that you're getting the price benefit and for the cost impact? And then secondly, Panos, my phone was giving me grief when you were talking about the 787 payments and how that's going to flow out. I was wondering if you could clarify what you said?

David Warren Arthur East

CEO & Executive Director

Yes. I understand your point, Robert, about price before cost, and we're very, very tuned in to that. And the first thing to do is, of course, pass on as much of the inflationary pressure as you can from a contractual perspective. And then you have to look to your costs and think about how we can control those costs. which we're absolutely doing. And part of that is softening the blow of the inflationary pressures by things like hedging, things like long-term supply agreements with our suppliers, focusing on the smaller number of suppliers so that we can actually strike better agreements. Some of these supply agreements, fortunately, do stretch out for a very long period of time. And so we consider that we're well protected. There is a balance to be struck between the pressure that you're getting from costs going up and how much you're able to pass on. And when I talk about commercial discipline, I mean tilting the balance of that so that it is largely within our favor.

Panos Kakoullis

CFO & Executive Director

Yes, just a bit to add to it. And you can look at the 3 businesses in different ways. So the Civil Aerospace business, we are -- and I think you talked about enforcing indexation. We are being robust around how we do that. You can see a little bit of the benefit coming through -- the future benefit effectively coming through from the catch-ups. And a lot of those catch-ups are driven by the expectations through that enforcement. From a cash perspective, it actually comes a little bit -- it has a little bit of a lag because it sort of catches up year-on-year. On the Defense side, it tends to be through contract renewals, which happen regularly. So again, a little bit of a lag there. Within Power Systems, when you have got record demand and a very strong order book, you can be much more regular around price increases. And as Warren has said, the other element is you control costs. So we would have been clear around focusing down on the critical suppliers, the ones that are the best performing supplier. And to be a best-performing supplier, it's not just about cost. It's about being able to deliver to the highest quality as well. And you'll have heard in the -- maybe in the presentation, we talk about digital sourcing on the Pearl 10X. That's a fancy way of saying we had a supplier conference and a 10% reduction in pricing going forward, and that gets locked in with very low levels of indexation. And that together, as Warren has said, with hedging around commodities, put us in good shape around that. On the 787 payments, coming into the year, we talked last year about that GBP 300 million slip from '21 into '22 on concession payments we expect to go out. Those haven't happened yet. They look like they might slip in into the following year. It doesn't actually have as big a benefit in terms of lower outflow happening this year as you would have anticipated because Boeing themselves are managing their own inventory.

So new concession receipts are lower than we expected. So the net-net impact is not big this year. It does, though, create a little bit of a headwind for next year as some of those slip into next year. Those payments without necessarily having new orders coming in for and that would generate new concession receipts.

Operator

Now we're going to take our next question. [Operator Instructions] The next question comes from the line of David Perry from JPMorgan.

David Howard Perry

JPMorgan Chase & Co, Research Division

Yes. Do you hear me. okay?

David Warren Arthur East

CEO & Executive Director

Yes, we can. I've got great 4 questions. I don't know if that's too greedy. They're quite short. The first one, the Defense guidance of low double-digit margin, I just wanted to clarify, I mean, are we thinking 10% to 12%? And then is that a baseline going forward? Because Defense margins historically have been hard to forecast. The second one is the finance charge was a lot higher than I expected in H1. I just wondered if you can help us think about the full year. And maybe even going forward because obviously, you've got ITP proceeds and you're going to pay off some debt. Tax charge, clearly very high. Will the second half be the same as the first half? And then the last one, please, the fourth one. The LTSA inflow, GBP 433 million in H1. I think that at the CMD, you talked about the 500-ish a year. So is it still GBP 500 million for this year? Or is it going to be meaningfully higher than that.

Panos Kakoullis*CFO & Executive Director*

I'll try and keep them, as you said, quite short ones. I'll try and keep them short and sweet. I think on Defense, it's consistent with where we were expecting this year to be. We wanted to be more explicit about that guidance as we went through the -- into the second half, just to make -- to be as helpful as possible around that.

Last year, we did have a little bit of the number being flattered by those legacy spare engine sales. So that's why you see that coming down. It is now representative, I would say, of the mix going forward. So some of the older work was a little bit of a higher margin, and we got the impact coming through of the single-source regulations as well. So you can think of it as that sort of level going forward and the range you talked about is a sort of sensible range to be thinking about, maybe a little bit towards the higher end of that 10% to 12%.

On finance charges, in terms of the actual P&L charge this year, there's a little bit of extra this year because last year, the U.K. EF loan, the GBP 2 billion we took out sort of midway through the first half. So you've got the anniversary-ing effect of that for a full 6-month period. But think of that as being sort of the charge going forward adjusted for ITP proceeds. So as we said in the release, ITP proceeds, we're going to use to pay down the GBP 2 billion U.K. export finance loan. And that's our only floating interest rate loan. All the other loans are at a fixed rate. So that will give you an idea.

On tax. The tax charge does look unusual because we've got 2 territories, the U.S. and Germany, where we are taxpaying. In the U.K., we made taxable losses and we've got a lot of loss to use going forward. So there's no actual charge that comes through from that. So you do get a slightly odd-looking number because you've got 2 taxpaying jurisdictions and the largest one isn't. From a cash perspective, I think of last year and this year being broadly the same. And in terms of the LTSA, you're right, back at the -- back in Derby on the 13th of May, we sort of talked about in the medium-term being around about a GBP 500 million number on the LTSAs. It is going to be meaningfully more than that this year. You quoted the GBP 433 million for the first half of this year. It's going to be, again, meaningfully more than that as those engine flying hour receipts come through.

The relationship of that with actual shop visits happening and some of that LTSA creditor effectively ending up being -- taking through revenue, that's one of the sort of judgments that we have to take, but it will be meaningfully more than the GBP 500 million this year.

David Howard Perry*JPMorgan Chase & Co, Research Division*

And just a follow-up on that. The GBP 500 million a year then, do we -- is that an average? If it's much better this year, is it lower in the future years? Or is it just this year is a one-off and it's still the GBP 500 million a year going forward?

Panos Kakoullis*CFO & Executive Director*

I think we said GBP 500 million by the medium-term, so over the next few years, it is going to be higher levels than that, depending on trajectory of engine flying hour receipts and the level of shop visits going forward.

David Warren Arthur East*CEO & Executive Director*

Yes. I mean I think an elevated rate in the short term is a logical consequence of the sector is recovering from COVID, flying is starting to happen and the shop visits are going to follow. I mean don't forget, we've got a load of shop visits that pre-COVID would have happened over the last year or so, that have effectively been delayed, and that's what's causing the LTSA increment to be at a higher rate right now.

Operator

Now we're going to take our next question.. And the question comes the line of George Zhao from Bernstein.

George Zhao*Sanford C. Bernstein & Co., LLC., Research Division*

My first question is now, how do you assess the health of your supply chain as you and the OEMs consider potential wide-body production ramp-up? We're seeing a lot of supply constraints on the narrow-body side of engines right now. And while clearly, the wide-body, they're not taking the same level of ramp-up as the narrow-bodies. Are there risks that some of your suppliers that are involved in the different programs could take some challenges in ramping up?

And secondly, I wanted to understand a bit more about the price indexation on the LTSAs. We've heard some of the other peers comment that they are more preserved against inflation on the time and material versus the long-term agreement. So how do you contract your work here? Is there more of a cap within the LTSAs where which we can pass on the cost inflation, that may be less favorable than the time of material agreement.

David Warren Arthur East*CEO & Executive Director*

So I think the key difference between narrow-body and wide-body is obviously the absolute volumes. And that's why the situation is very intense in the single aisle space at the moment because everybody didn't quite come to a grinding halt, but everybody suddenly went very, very slow and now they're being pressured to ramp up very steeply, but the numbers are all large. Obviously, as you pointed out, wide-body is a slower recovery, which gives us also breathing space. But also the absolute numbers are much, much smaller. Now we talked about and Panos cited a supply chain conference a moment ago in an answer to an earlier question. And that's the sort of engagement that we are having with suppliers. Basically, we are spending more with fewer suppliers.

The relationship with those suppliers is richer, the contract terms can be longer and more rigorous. And so those are the steps that we are taking. Obviously, there's real world risks that all of these suppliers face -- but by close working relationship with those suppliers and we've hired people, we're hiring people specifically to manage suppliers at the moment. And we also have task forces from within our business working with suppliers. And I think those measures taken together put us in reasonable shape. And we do anticipate the widebody volumes recovering not sort of immediately, so we do have some time for this, but we can see them recovering. I've been quite vocal in the media about commercial discussions taking -- ramping up and that is going to result in new OE demand over the coming years, but we think we're pretty well positioned for it. LTSA price escalations and the like...

Panos Kakoullis*CFO & Executive Director*

Just a couple of sort of points of detail around the management and the supply chain. It's procurement specialists, and we've hired around about 70 extra people, specialists in that area. And as those of you who were at the Civil Day back in Derby, will remember Sebastian Resch, our Operations Director. He always talked about -- it's about boots on the ground. It's about spending time with the suppliers to make sure that we're in the right place in the queue. And we understand day-to-day, and we manage day-to-day what's going on around that supply chain. On the indexation point, I think you asked, is there a limit? Is

there a ceiling effectively? Is there a cap? Actually, there's a color. So first few percentage points, we can pass on directly. Then there's a color, a couple of percentage points. And then beyond that, what's called hyperinflation from a contract terminology perspective, we can pass that on again. But each contract will be negotiated on its own terms, but that's the broad shape.

Isabel Green*Head of Investor Relations*

Isabel, again, I've got a question from the webcast. Chloe Lemarie from Jefferies has written her question in. So I'd like to be 2 questions out from her, please, if I may. Firstly, stripping out or the one-offs in Civil, it appears there was a GBP 100 million year-on-year increase in operating profit for the division. Can you provide some color on what drove this between OE and aftermarket or between large engines and others? And the second question from, Chloe, please. Can you detail what drove the catch-up recorded in Civil this half? Additionally, how are you seeing the Trent XWB aftermarket trending in terms of operating performance?

Panos Kakoullis*CFO & Executive Director*

So just in terms of stripping out the one-offs, when I gave the response earlier on, I was looking at the one-offs across the whole group. The one-offs that specifically apply to the Civil business are the GBP 270 million foreign exchange credit from last year. It doesn't repeat. So you strip that out. The net year-on-year benefit of the catch-up, which is just around just over GBP 50 million. And then we had a little bit of provision released this year versus last year, which gave us a benefit. Actually, when you strip those out, you end up with Civil in the first half being broadly flat.

So it's -- I don't think it's the GBP 100 million you talked about. It is broadly flat. If you unpick that, to say, right, what is behind that from both an OE and Services perspective. OE, we are broadly flat. You can see the sort of installed deliveries at first half this year versus first half last year. It's broadly flat. The mix is actually more in favor of business aviation than wide-body. So that gives us a little bit of a margin uptick. Services, on the other hand, you can see quite, I think, about 22% for memory increase around Services. But that's more -- that's on the wide-body and 6% overall on all shop visits. The mix goes the other way a little bit on that one. So that's -- if you look at those underlying -- underlying operating drivers. -- and that will get you to the broadly flat once you strip out those one-offs. In terms of what happens going forward and what underpins our view around the outlook for the full year, there is a significant ramp-up in shop visits in the second half, which generates a significant amount of profit and a number of spare engine sales.

We'd originally thought there'd be a few more spare engine sales in the first half, but those have now moved into the second half. And that's a combination of, as I mentioned, of engine sales to customers and also to third parties that operate a pool. In terms of what drove the catch-ups, a lot of that catch-up is around pricing, and it's around that pricing, that commercial discipline that we've been talking about, particularly around business aviation, as those indexation clauses effectively come into effect and mean that we've got greater profitability on those contracts going forward. And I know I've stressed it a few times around the importance of looking at catch-ups and what they are telling you because they are saying that over the life of those contracts, if it's a positive catch-up over the life of those contracts, we expect those to be more profitable going forward, and there is a catch up now when we look at -- how much we've traded in the past. Works both ways. So we need to be balanced around that. So within Defense, you'll see there's a GBP 22 million charge in defense around some risks on inflation. XWB performance.

David Warren Arthur East*CEO & Executive Director*

Yes. XWB performance, I'm actually not quite sure whether you mean how the shop visits are going or how the engine is performing and therefore needing shop visits. But let me have a go. We continue to be pleased with XWB. The actual sort of in-service performance of the engine is excellent, and we get great feedback from our customers. We are -- have been gradually pushing out the service interval on

the 84,000s through a process of inspections because obviously, we don't want to do a shop visit until we absolutely have to. And that's been encouraging, and we've spoken about that before. And then those who came to Derby, I think, saw lots of activity aimed at systematically extending the service interval, and we expect that to continue on both the 84,000 and the 97,000 over the coming years. If that's what you meant by the performance in shop visits, then that's the story.

Isabel Green*Head of Investor Relations*

Thank you. I've got 2 more questions. They're quite short. So I'm going to ask them both one after the other. The first one from [indiscernible]. Very short question. Where do you expect working capital to come out for the year? And then secondly, from [Spinecap], could you give us a bit more detail on what changed on the FX hedging and how much net U.S. dollar exposure you expect to have by '24 or stroke '25?

David Warren Arthur East*CEO & Executive Director*

I think you can do both of these.

Panos Kakoullis*CFO & Executive Director*

I can pick that up. In terms of working capital for the full year, you'd expect to see a sort of slightly negative working capital. That unwind of inventories is going to be a little bit more than from where we are now, it's going to be a little bit more than offset by the increase in the performance on payables. So expect it to be a sort of slight negative for the full year. In terms of the FX hedging, current book, I think it's around about GBP 21 billion in terms of exposures going forward. As I said in the presentation, the aim of the new policy is to make life a little bit simpler for everyone in comparing us with others, also allows us to be more proactive in how we manage that risk as well. So you'll see a policy going forward of a declining cover over a 5-year period. For that to fully be in effect, it's going to take a few years because we've got a hedge book at the moment. That's, I guess, the past policy means we're 100% hedged for the next 5 years. And as that unwinds and we put the new policy in place, you'll see that start coming down over time.

Operator

The next question comes from the line of Olivia Charley from Goldman Sachs.

Olivia Charley*Goldman Sachs Group, Inc., Research Division*

My first question is just a follow-up on the shop visits. I know you just mentioned with clearly that you're expecting to see a big step-up in the number of shop visits happening in the second half. And I was wondering if you could just give us some more color on that. I mean, I can see the release on the first half. There's only been a pretty modest step-up in shop visit numbers in the first half guidance, I think that you've given for the full year implies a sort of 20% increase in the midpoint. So I'm just wondering what's driving that really material step-up in the second half? And what kind of is giving you confidence in the ability to sort of step those volumes up? And then just a second question around engine flying hours. Could you give us a sense of what the exit rate is for the first half or where you're tracking roughly now and therefore, what you're expecting to see in the second half? And then also just sort of what gives you confidence in this path to full recovery by 2024? And what are you seeing in sort of Asia Pacific and China as well.

Panos Kakoullis*CFO & Executive Director*

Okay. I'll take the first 1 yes. Just in terms of shop visits, Olivia. So -- you saw just over, I think, just over 400 in the first half, and we're guiding to around between 1,100 and 1,200 over the full year. And the big driver of that, frankly, is the engine flying hours growth. As that growth comes back, the shop visits follow.

So that's what we're seeing, that's what we're seeing effectively being scheduled as we go into the second half. So that's the big driver around that.

David Warren Arthur East

CEO & Executive Director

Yes. And on engine flying hour trajectory, then -- as I said a few moments ago, for the first half as a total, then we're at about 60% of 2019 levels. We guided for between 60% and 70% for the year as a whole. We're reasonably comfortable with that now because, obviously, having got to 60% for the first half, the exit rate is above 60%. We track it on a weekly basis. And we're around about -- or we have had over the recent weeks around about 65% or so. Now exactly how much of that is going to continue into Q4, it's hard for us to say. But we -- having reached 65% -- we're pretty confident we can see through our Power Systems business actually, early signs of the actual lockdown situation in China starting to get a bit better. The lockdown situation in China has been the key retardant for the Rolls-Royce fleet of engines in terms of keeping our engine flying hours back. So I think that's going to be a contributory factor in the second half to move up from these rates towards the 70% as we get to the year-end. And elsewhere in Asia, we are seeing demand and flights full. We spoke to a lot of airlines at Farnborough a few weeks ago, and people are reporting full flights and challenges with actually being able to sort of deliver on those. So it's not a demand issue at the moment.

So we're still confident of that recovery in '24. I think it will depend -- the actual rate will depend on the broader economic climate. And it's a little bit too early to speculate on that actual rate, but you can see us getting very close to 2019 levels by 2024.

Panos Kakoullis

CFO & Executive Director

And just maybe just give you a little bit more color around China. So I think when we look back to 2019, China was around -- China Airlines were about 17% of engine flying hours. They're around 11% at the moment, and they're at 40% of 2019 level. So there's quite a lot of scope for growth within that as those lockdowns ease.

Operator

The next question comes from the of Andrew Humphrey from Morgan Stanley.

Andrew Edward Humphrey

Morgan Stanley, Research Division

I've got a couple on Power Systems, if I may. Firstly, it seems like a lot of the strength you highlighted in orders there was around backup power supply and the like. Can you go into a bit more detail on what is driving that particular strength in the short term? Clearly, a lot of the discussions that we're having at the moment are around potential gas shortages in Europe over the winter? Is there any kind of overlap there with your business? And secondly, on that, I wanted to ask a bit more about inventory. You've highlighted that you're expecting some unwind in the inventory you've built up over the second half of the year. I wanted to kind of ask about the character of that. I mean is that inventory build in the first half? Has that been sort of prophylactic to protect against some of the supply chain issues that we're seeing? Or are there kind of project delays that we need to keep an eye on? And to what extent are those within your control?

David Warren Arthur East

CEO & Executive Director

Okay. Let me kick off. I think some of the demand that we're seeing around power gen at the moment is a little bit of recovery from projects that were held up during 2020 and 2021. And so we're seeing the orders come through from those now. And yes, Power gen has been strong. With regard to the sort of overall energy situation, gas -- potential gas rationing in Europe and so on. Actually, this is being a positive driver for us not so much in terms of power gen, but in terms of demand for engines for fracking as people seek to mitigate the gas supply challenges. So we've actually seen a positive impact as a result

of that. I think the inventory build is -- no, it's not to do with project delays. It's to do with a combination of proactive building for the second half, which under normal circumstances, we do anyway in Power Systems, to manage our load throughout the year. But also the supply chain challenges and the blockages. I think, Panos said a few moments ago, mentioned about the semiconductors that we've seen holding us back in Power Systems. And some of it is undoubtedly due to that one of these task forces that Panos referred to and is specifically around semiconductors in Power Systems.

And we have been successful there and we've secured supplies for ourselves and for our suppliers. So that we can get that inventory shifted in the second half of the year. And we're continuing with that task force, by the way, because we do anticipate that to be a very tight situation at least into the middle of 2023. And so we want to clear the way ideally through to the end of 2023 as far as that particular part of the supply chain is concerned.

Panos Kakoullis

CFO & Executive Director

Maybe just to give you a little bit of a broader feel around supply chain within our systems because it was, I think at this time last year, we were highlighting it as we could see some of that coming and it's maybe an advantage of having a shorter cycle business within the group that we can see that a little bit earlier than maybe in the longer cycle businesses. But -- every week, there's broadly 30 to 50 suppliers that the team there are constantly monitoring what is going on there because anyone -- and not just my presume it could be across a number of areas, that anyone of those could cause a bit of a line stop. So they manage it at a very tight level. And you can see that -- what that trend looks like on a week-to-week basis. So it's that sort of level of granularity to make sure we keep production going.

David Warren Arthur East

CEO & Executive Director

And tracking that we saw through the second half of last year, and we reported in fact, at our full year results. So that trended down during the second half of the year and into Q4, but it has trended up again in the first part of this year. And what we're seeing is the impact of that right now. I think that's it.

Operator

The next question comes from the line of Nick Cunningham from Agency Partners.

Nick Cunningham

Agency Partners LLP

Yes, coming back to EFH, it looks very much like you'll hit the 80% number sometime in '23, perhaps on average '23 as a whole. And you used to say not so long ago that, that 80% was key to a free cash flow of, I think, as much as GBP 750 million. And does that you still recognize that number, does it still stand? And if not, what's different? In very broad terms, what are the big deltas if you like? And then second question -- general and sort of geopolitical around China risk. I mean Russia is obviously same as the risk, the trapped assets for Western corporate. China is an order of -- several orders of magnitude bigger than that, plus also a much greater supply chain risk, and it's a really big end market [indiscernible] or wasn't. Is there anything at all Rolls Royce can do to manage that risk? Or is it just there? Or at least is there something you can do to manage that risk on a medium-term basis is just something you think about it?

David Warren Arthur East

CEO & Executive Director

Yes. I didn't actually fully hear that second part of that question. Did you?

Panos Kakoullis

CFO & Executive Director

No.

David Warren Arthur East

CEO & Executive Director

Let's do the EFH one. I mean, broadly, Nick, yes, we, at the same time, gave a rule of thumb that said approximately GBP 30 million for 1%. And if we are around about 60% to 65% for somewhere between 60% and 70% for the year as a whole. Then the extra sort of 15% gives us an extra GBP 450 million, which broadly puts us into the zone. So I don't think we're sort of too far out. Obviously, there's been -- since we made that comment, there's been a huge number of puts and takes and changes in the boundary conditions around there. But yes, I think if you peer at those numbers, you can still see it.

Panos Kakoullis

CFO & Executive Director

I guess, the bit I'd add on that -- but lots of things have changed since then. We talked about some of the other risks and challenges. We'll give guidance on '23 when we get that.

David Warren Arthur East

CEO & Executive Director

Absolutely. Nick, is there any chance you could sort of repeat the China bit?

Nick Cunningham

Agency Partners LLP

Yes, sorry. What I was saying was that there's clearly increasing geopolitical risk around China, around supply chain end market demand, trapped -- potential trapped assets [indiscernible] in Russia. Is there anything that Rolls-Royce can do to manage that risk, perhaps not in the near-term, but in the medium-term? Or is it just too big to be able to manage that.

David Warren Arthur East

CEO & Executive Director

Yes. Well, look, China remains an important market for us for both Civil Aerospace and for Power Systems. And for the time being, we are continuing to do that business in China. And I see huge demand for air travel in China on wide-body jets. And I don't actually see the Chinese getting those jets from anywhere else right now other than the Western suppliers. And so the Chinese airlines remain important customers for us, I think, for the foreseeable future. Yes, there's geopolitics, which is going to happen around that. But we can only control what we can control, and that means supporting our Chinese customers.

In terms of the supply chain, then -- we totally understand that there may be some tightening of the export control sort of in regulations and what we're allowed to source from where and so on. But we aren't hugely dependent on Chinese suppliers and in most cases, we have multiple suppliers for every vital commodity that we really need or every vital part. We do have a small handful of single-source suppliers, but we're not really seeing China as a major risk there at the moment. It's [going] to be monitored. It's clearly in the discussion for us as an executive team. It's clearly in discussion for us as a Board. And I think you can rely on us behaving quite sensibly around that.

Panos Kakoullis

CFO & Executive Director

And I think just pick on that, specifically coming into this year. A lot of things changed geopolitically as we came into this year. And what we've been very active in doing and Warren talked about as an executive as a Board, making sure we properly scenario plan, and we looked at to particular new emerging risks coming into the inflation and how we were going to manage and risk manage around inflation and the other one was around China. What if there was something very dramatic on China? We're not just going to wait to react to it, what can we do now to make sure we're in the right position.

Operator

The next question comes from the line of Harry Breach from Stifel.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

Yes. And I'm sorry if I've missed something as the line quality here has been a bit troublesome. Two ones, if I can. Firstly, guys, time and material, we almost don't talk about it anymore on the calls, but it more than doubled in the first half and it was more than all of your P&L aftermarket revenue growth. Yet we're still less than half below our previous 50% low below our previous sort of first half sort of peak levels in T&M. I'm just wondering if you can give us any flavor in terms of shop visit demand on that side of the business, how that's trending?

And then secondly, guys, just so returning to a popular theme of escalation. On the OE side, my understanding is that it applies to your schedules of PDPs and PUDs, right? So therefore, is going to accelerate the cash you get coming in. So you should, in fact, get on the OE side at any rate, you should be getting a benefit from timing from higher escalation rates, right? We firm cash in. Is that a correct understanding on the OE side? Or is there something I'm missing?

David Warren Arthur East

CEO & Executive Director

Yes. We were able to look at the detail on T&M just then.

Panos Kakoullis

CFO & Executive Director

Yes. And the interaction that's going on T&M. So -- and I think you're probably looking at one of the notes in the accounts around things that are a point in time as opposed to over time. Within T&M, there will be pure T&M that you're referring to, but there will also be elements that are covered under our long-term service agreements that aren't within the scope of that. So there'll be some parts, for example, that end up being within that. Going forward, we see sort of T&M being as we get to a more normalized level, it's still around about from the Civil Aerospace perspective, think of it as around 20% of the business. When we're at the levels now and as we're going through that recovery, you can get some of the distortions that you're talking about.

David Warren Arthur East

CEO & Executive Director

Yes. And the escalation clauses on OE and the timing. I think this is a variation on the very first question, actually, about the timing of us getting cash payments and escalation and the costs coming out later. And it's the same answer. We've managed the contracts. Obviously, it's good to be able to enforce escalation and then we have to manage the cost side of the equation. And we -- that's what we're doing, and that's what we've described. And if we can tilt that balance so that the customer and the supplier piece is in our favor, and we can do that in a win-win way with our suppliers, then that's good news, and that's what we're setting out to do..

Operator

Now we're going to take our last question. And the last question comes from the line of Zafar Khan from Societe Generale.

Zafar Khan

Societe Generale Cross Asset Research

Good morning, everyone. I've got couple of clarification questions, please, and then 1 on costs. Starting with the cost one. I noticed the commercial admin costs in the first half, it's up by about 15% half-on-half. Just wondered if there was some one-off in there? Or it's just as business resumes and starts to take off, the cost inflation then comes in.

And then the 2 clarifications, please. Just on the indexation, I imagine there must be a cap in terms of how much inflation can be charged in any year and then there's kind of acts of god. And with inflation running at 9%, 10%, will you have to bear quite a bit of that increase yourselves because I imagine you'll have to share the pain with the customers. And then just a clarification on the cash and shop visits. I

think in answer to David's question, Panos, you were saying that you expect a lot more shop visits and therefore, that should help the LTSA cash inflow. I'm getting confused here. I was under the impression that shop visits means you can recognize revenue, which is basically a P&L item. But if you're doing the work, then you're incurring cash costs, so more shop visits that you have, okay, benefits the P&L but it's negative for cash flow. So just need a clarification on that, please.

Panos Kakoullis

CFO & Executive Director

Sure. Let me pick -- I can pick up all 3 of those. So I think you talked about the C&A growth around about 16%. There is an element that's effectively underlying growth of the businesses as in fulfilling on the Power Systems side, that sort of growth? And then a Civil Aerospace picks up, you have also -- you're anniversary-ing a one-off 2. So in last year's comparative, we have got a benefit of furlough for part of the period. So that as we get into the full year, you should see a more normalized level of growth. In terms of indexation, I think there was a question earlier on similar sort of theme. It's not a cap, it's a color. So up to a certain level, we can pass it on. Then there's a color of a couple -- 2 or 3 percentage points that we can't pass on. And then beyond that, what's called effectively a hyperinflationary clause kicks in, which means we can pass on again. So there's not a ceiling on this. You're bound to have customer discussions around how that is going to be enforced and how it works.

What's going to be important for us is, we apply rigorous commercial discipline in having those in having those discussions. The point I was making on your final question was, I think, because David was asking how much is that LTSA creditor going to grow? And what causes it to grow is engine flying hours, cash comes in. What causes it to shrink is shop visits happening. Because as the shop visit happens, it comes out of that and goes into revenue in the P&L. So that's -- that's -- I was -- when David was asking me how much is it going to grow by? Engine flying hours cause it to go up, shop visits cause it to go down a bit. That's how I would read. In terms of what that means from a cash perspective, if you think about it from a P&L perspective, the costs that go with the shop visit would similarly go into the P&L at the same time. So you'd see the revenue and the cost to do with the shop visit going through the P&L. That turns into operating profit from -- in terms of the start of your bridge from operating profit to free cash flow.

David Warren Arthur East

CEO & Executive Director

And I'm being told there are no further questions. So just to quickly summarize, the message that we've been talking about this morning is one of good progress. And we measure good progress by growth in revenue, growth in orders, big swing around in cash driven by a strong recovery coming through now in Commercial Aerospace, driven by continued strength and record orders in our Power Systems business, and good visibility on Defense. We've also talked a lot about the operational challenges that we are seeing, just the same as everybody else and just the same as we've been talking about. But we're doing a lot of blocking and tackling. We're doing a lot of anticipation and put a lot of long-term protection in to ensure both supply and protection against inflation. And taken together, that progress, combined with the discipline, the operational discipline, commercial discipline, protecting us against those external pressures is what's enabling us to maintain our guidance. And yesterday, we announced completion of the conditions or the final approval, regulatory approval for the ITP transaction. And so we're delivering on that commitment of strengthening up the balance sheet, and we'll be paying down that debt just as soon as we get the proceeds. So that's it. That's the summary of the message. And thank you all very much for joining us.

Presentation

Rachel Walker

Good morning, everyone, and welcome to our Civil Aerospace Investor Day here in Derby. We are delighted to have so many of you here in the room with us in person today, and also joining us online on our webcast. My name is Rachel Walker. I'm the Senior Vice President for Services Systems. What that basically means is I'm in charge of delivering a world-class operating system for our services business through things like our intelligent engine, which I'll be telling you a bit more about this afternoon. But for now, I'm going to let you know what's in store for you all today.

So we want to start the morning with a presentation of our key value drivers and we'll explain how we expect those to translate into improved performance over the next couple of years., We have around 40 minutes for Q&A following the presentation. And at that point, we will need to draw the live feed online to a close. But for those of you still in the room, there'll be plenty of opportunity for further discussion with our colleagues, both through the launch and throughout the afternoon.

This afternoon, we're going to be taking you on a tour of our civil business. There will be 4 tours in total. One with my team and I of our services business. We'll have one with our finance team with our Civil CFO, Arvind Balan and his team. So we've got the opportunity to delve further into some of the financial details. And we'll have two tours of operations; one of our production test facility, which will be hosted by our EVP for Civil operations, Andy Greasley and one of our turbine blade facility, which will be hosted by our EVP for turbines, Gareth Hedicker.

So [William] to get you back from the tours at 3:30 so that you can collect all of your belongings. Unfortunately, we won't be able to do a live stream of the tours today, but we will be videoing some of the best bits and make sure that, that's available online for any of you joining us virtually today.

So I will be giving you some more details of the tour just before we break for lunch. So enjoy the presentation. But just before I hand over to our CEO, Warren East, I need to tell you that there are forward-looking statements in our presentations today that have some risks and uncertainties. So as such, our actual results may differ from our expectations, but you will find all the usual full disclaimers in the presentation packs today.

So that's it for me for now. I'm going to hand you over to Warren East. Thank you.

David Warren Arthur East *CEO & Executive Director*

Thanks very much, Rachel. And thank you very much, everybody, for making the journey this morning, and you're in for a good day, I promise you. You're quite used to hearing from me and from Panos about the great market position and opportunity that we have in our Civil Aerospace business. You're used to hearing from me about the great engineering and technology that sits behind it. And you will probably [bored silly] with hearing from me about the efforts that we've been making to improve our business, the resilience and the operational leverage and so on, that is leading to increased profit as we look forward.

We want you to go away from today having met the people behind all that, understanding why our business is more resilient, understanding the quality of that operational gearing and the strength and resilience of the team behind that. And so I knit forward, you're not actually going to hear any of that from me. You're going to hear it from the people that actually do the business.

So the team is led by Chris and Chris will be up here in a moment, and he runs our Civil Aerospace business. You'll be hearing from Arvind, our CFO in Civil. We'll be hearing from Dominic, who runs our services business, and Sebastian, who masterminds the operation. Now those four presenters are a balanced team in themselves, both Dominic and Chris have been with Rolls-Royce for many years. And so they bring a huge amount of experience, customer knowledge, customer relationships and a deep understanding of the products that they're dealing with.

That's balanced with Arvind and Sebastian who've been with us who are relatively new and bring a wealth of outside-in experience outside in perspective to this team. Of course, you're only going to hear from four presenters this morning, but the rest of the Civil leadership team is shown here on the bottom of the slide, and the team, I'm not going to make them stand up now because we'll be here all morning on introductions. But the Civil leadership team has scattered amongst the room.

And you'll also be hearing if we move on to the next slide, as you go on the tours, you'll be meeting a bunch of the people that sit behind that leadership team and make it happen. So I hope you have a good day, and I hope you go away with a real feeling and understanding of the strength of our Civil business. Over to Chris.

Chris Cholerton

President of Civil Aerospace

Well, thank you, Warren, and good morning, everyone, and welcome to the heart of our Civil Aerospace business. I, too, am delighted you're here to join us today. And I hope on the tours, people will be sharing with you all that's been done to drive change in the business and to make the business stronger, leaner, more simple and more efficient. And after a few very challenging years, I believe, now very well placed to prosper as our market recovers. So when you go around the facilities, you will, of course, see the drivers of value in action. But I also hope that you feel the pride, the passion, the care for the company and see the expertise of the people who are doing the work because we do have great people.

And they do important work, just a thought to have in your minds through the day, a Rolls-Royce Civil Aerospace powered aircraft takes off about every 20 seconds. And those trips are connecting societies, connecting businesses, driving economic growth. So what we do has real purpose and importance.

So as mentioned by Rachel, you're going to hear a lot about services, about operations and about the financial outlook, in a bit more detail than we gave yesterday. But let me start with a summary of our strengths and priorities.

So why am I confident in our ability to deliver results? Really, four key strengths I want you to have in your minds. We have leading products in growing markets. Clearly, our core markets are the wide-body aircraft market and the top end of the business aviation market, both are attractive, both are growing, and we have a large share in both. And consistent investment over many years in growing that installed base has delivered a large embedded value. And now is the time from the actions were described to release that value, and a few of the levers there.

And when we put an engine on aircraft, we capture, through its life, about 90% of the services value. We have deep customer relationships with great longevity. And as the engines mature, both industrially and technically, tremendous opportunity to take out costs and increase margins. We've had intense focus, both before the pandemic and accelerated through the pandemic in driving cost reduction, efficiency and focus on margin. And you're going to hear a lot about that has already been described. But let me just say here that I'm confident that the cost reductions we've achieved will be substantially sustainable as our load returns, and we will get that gearing that Warren mentioned. And finally and importantly, very few companies can do what we do. And we continue to invest in the technologies, which will both enable us to get greater value from our existing products, but also to shape the future in aviation.

Let's just take a look at our journey to this point because I think it's important context for the day. And there are 3 distinct phases. In the decade prior to 2018, we're investing heavily in bringing new products to market, developing those products and all the enabling technologies. We were investing in ramping up our industrial capacity with industrial output peaking in 2019. And we were growing our installed base. That actually doubled when you take the large engines and our business aviation market consideration. And you can see the market shares, there's large market shares, which I mentioned.

I started this role at the start of 2018 and as well as the operational ramp-up we're focused on, clearly we're also driving and focused on productivity and efficiency, which has been a good start for when the pandemic hit. But of course, there were 2 key headwinds which -- to our financial performance: One was the disruption we were causing with the durability issues on the Trent 1000. That disruption is now behind

us, and we've made very good progress in validating and implementing permanent fixes to those issues; and secondly, of course, the pandemic, which caused the biggest restructuring in our history. We took out some GBP 1.3 billion of cost at the group level, that value dominated by the savings we'll describe in Civil Aerospace.

So with that now behind us, I look forward with optimism. Because as our market recovers, the better operational gearing from the cost reductions we've made, we're focused on sustainable cash generation and margin expansion and some 5 key levers of value, which I would describe. And our 2024 outlook, which we gave yesterday is a reflection of that. But of course, it's not the destination, it's the next step in the journey. We will continue to improve beyond that.

Very briefly, let me just start talking about our products and its embedded value. This is a quick reminder, it's in your pre-read packs, but it just shows our product portfolio. We have a very strong position in business -- at the top end of business aviation. We're powering the flagship products with Gulfstream, with Bombardier and with Dassault with our new Pearl engine taking those positions. It's an attractive market, a buoyant market and a resilient market. In our wide-body portfolio, we power 4 of the 5 of the new widebodies, all 4 of those, which are actually in service, with 3 sole-source positions with Airbus. And we also have the leading product on the -- of the old ranges on the A330 with the Trent 700, which remains a very important product for us.

This portfolio is, I believe, very well placed to perform strongly and allow us to release significant value. Our legacy large engines are relatively young. And the most important of those, the Trent 700 is only 11 years old. It's the market-leading product on the A330. It's the most attractive to our customers. It will be the first to transition and the last to retire. And remarkably, considering it entered service in 1995, we believe still over 40% of the flying hours of that program is still to come in the future.

On our modern wide bodies, very much higher market share, powering those leading products, which I spoke about, and over 90% of the flying hour is still ahead of us. And as we mature industrially and technically and pull our value drivers I described, that's the great opportunity to release value. And in Business Aviation, it's very strong position at the top end of the market, the most valuable part of the market, still 70% of those flying hours ahead of us.

Looking now at market recovery, which will drive our profitable services growth. The freighter market has been very strong for us. And it's way above where we were in 2019, a very buoyant market. And some opportunities we have to keep our fleet flying. A good example being the passenger to freighter conversions that we're seeing on the A330s, where over 85% of the available capacity for conversions is taken by Trent 700 powered A330s. And of course, beyond this timeframe, the fantastic new opportunity that we're powering the A350 freighter, a real growth opportunity for us.

Business Aviation, I've spoken about, is already recovered in terms of flying hours and very strong market indicators. Number of billionaires continues to grow at about 8% a year, [they've virtually used] aircraft available, very high book-to-bills out of the airframers. But of course, the most important sector to us is the large passenger aircraft. And here, we've had some stumbles in the recovery and some differences around the world. Long term, that is linked to GDP growth. If I look around the world, very strong recovery so far in Europe and the U.S., encouraging indicators now in Asia Pacific, but China currently lagging with the lockdowns, which is having a near-term impact.

Growth going forward, as I said, correlates to GDP -- base -- the fundamentals are strong. When you consider only in 2018, only 4% of the world's population actually took an international flight, plenty of growth ahead of us. And we anticipate like most market commentators and based on our own fleet by fleet, customer by customer analysis that flying hours on the passenger market will recover in 2024.

So turning now to our focus on cost and the value drivers. When the pandemic started, we took tough decisions at pace and executed the largest restructuring in our history and completed ahead of schedule. And I'm proud of what we achieved in that time because it sets us up to grow again from a far stronger base.

The numbers here show what we achieved. If you compare 2019 to 2021, we took about 1/3 of the business cost base out in operating costs in headcount, including about 1/3 of management. reduced footprint in both our OE facilities and in services footprint and reduced investments, some from the natural investment cycle and some from choices made. But Importantly, it was also determined that it's not just about cutting costs, we needed to emerge with a fundamentally more efficient operating system.

And so to that end, we've tackled organizational structure, reviewed what we make ourselves and what we buy, what we do ourselves in transactional areas and what we buy. We've looked at -- we've driven process simplification, and we've driven digital enablement and digital tool sets, which have matured after many years' investment to help drive efficiency. But importantly, we've also focused on leadership and a shift in mindset and behaviors to the organization. And I think this has been a real accelerator to some of those -- some of that mindset. In particular, I'd pick out a far deeper cost consciousness in the organization, having relentlessly reviewed every flavor of cost in the business that has stuck deeply. So far higher commerciality and cost consciousness.

Very clear accountability for ownership of connecting activity to results in financial results and improvement results in the business. And after challenging norms so hard through our restructuring, and achieving those results, a greater belief that ambitious targets can be met and exceeded, and that will stick with us and be very valuable. So more to do certainly, but a deeper culture of that continuous improvement drive.

So what are the drivers of value in the business? What really matters in the business? Five themes in the next presentation, we'll give more color to these. The first is maximizing customer receipts. And clearly, the most dominant driver there is the recovery of the market, recovery of flying hours. But we also, as actions we can take in keeping our fleet flying and managing the contract extensions, the aircraft transitions that Dominic will speak a little bit more about, maximizing our flying hours.

And importantly, as we look through the life cycle, adapting our servicing -- services scope and making sure pricing truly reflects the value we bring. We're out of launch pricing phase. So frankly, we're also looking to operate with greater commercial edge.

Secondly, services cost reduction. Dominic will talk about this, and you'll see more of this in the tours, but making sure engines last longer on wing and when they do come off wing spending less money on them. Sebastian will talk about our improvements in OE margin. So driving operational efficiency, cost reductions on the product, purchasing strategy to drive reductions in what we buy. I pick up business aviation growth because we're at a point of transition from our very successful BR series of engines to the Pearl family of engines -- so we'll see a growth in those 3 new platforms, as I described, and driving cost reduction on that product is an important driver.

And finally, the investment cycle. We're entering a less intense period of new product introduction, a greater proportion of our engineering talent and horsepower being applied to engineering maturity and cost reductions. And also, driving a more capital-light approach utilizing partnerships -- facilitated by partnerships where applicable. So they are the key value drivers, and you're going to see a lot more -- see and hear a lot more about those.

So now looking to the future. This chart shows the market segments of our industry. And below the technologies which we're investing in to position ourselves to win in those market segments when opportunities arise, as we've done in Widebody and in Business Aviation and more recently in commuter and eVTOL.

So if I look at the technology strategy, 3 key pillars. Firstly, we continue to drive a step change in the efficiency of gas turbines. Gas turbines will remain hugely important in aviation. They're going to be powering long-range aircraft for decades to come. And we pursue this technology over a range of sizes. So the smaller size, we're investing in technology, which we're going to bid on the Embraer -- or bidding on the Embraer turboprop. We believe there we have a compelling proposition. And the larger size, our UltraFan technology demonstrator, which is at the heart of our strategy for future widebody and indeed any future narrowbody opportunities.

Sustainable aviation fuel is key to decarbonizing aviation. We've been running ground test and flight test to show compatibility of our engines and making very good progress. And also some of the thought leadership on -- to encourage and promote the ramp-up of SAF in the industry.

And finally, investing in the demonstration of some of the more disruptive technologies like electrification, hybrid electric and indeed hydrogen. And you'll see in our world speed record with the all-electric aircraft, you've seen our wins with vertical and others. We've also run the world's most powerful hybrid electric demonstrator. And our aim here are to capture key IP, which will position ourselves for future commercial opportunities.

So we will play a vital role in the decarbonization of our industry and see it very much as an opportunity for us. And very briefly because we like exciting pictures. Here in Derby, the world's most advanced gas turbine is in its final stages of build, and we hope to test that in the coming months. So shown here are just some of the pictures, the world's most powerful gearbox, our composite fan blade, enormous composite fan case and the core of the engine being built.

I should stress that the UltraFan technology demonstrator, yes, it can -- it positions all the technology for future large engine applications, but also has technology which can add value to our existing engines. An example being, some of it may be just composites and high-temperature technology shown in the top corner. So more to come on this on Farmborough, but we believe absolutely that we have a world-leading capability.

So to summarize the 4 key strengths of our business. We have great products on the right aircraft, huge embedded value created from many years of investment and now is the time to release that value, intense focus on cost and efficiency and expanding margins. As Warren pointed out, I've been in the business a long time, and I can very genuinely say to you that our focus and traction on cost reduction in all its flavors and the engagement of our teams in making money is the best I've seen.

We've always had great engineering talent, which leads in the future of aviation. And we're investing in the technologies that will position us to win. So overall, I'm confident that we have a stronger business, a business that will get even better and with some exciting growth opportunities ahead of us.

And with that, I'll pass it over to Dominic, who will talk to us about services. Thank you.

Dominic Horwood

Good morning, everybody. It's great to be with you today. Thank you for coming to see us. I'm going to be speaking about how we're driving improvement in our services business. We fully recognize the need to improve our financial performance. The services team is completely committed to doing this. You'll meet some of them later in the tours. You'll hear from them, you feel their passion, their excitement and their commitment to drive improvement in our business. Together, we all really do believe that this is a time for releasing, for delivering the potential of our installed fleets, as Chris has described.

I'm going to be talking about the 3 drivers of services improvement that you saw in Chris' presentation. We're going to start with maximizing services receipts. Securing the value that every engine represents and driving improvement and driving growth. We're then going to talk about how we attack cost in services and improve margins under LTSAs. There are 2 big drivers, the first is to extend time on wing, reduce the shop visit frequency, lower the cost under the curve. The second is to reduce the cost of those shop visits when, of course, they have to occur.

So let's start with maximizing services receipts. It all begins, of course, with having great engines on the right airplanes, as Chris said. And we are confident that we're going to see continuous growth of our fleet as Hugh, and who's here, continues to sail with Airbus and Boeing into the future. And we see significant growth in the Trent family fleets and in the Business Aviation family fleet. Both will grow faster than the market because of the respective position we have on the right airplanes and our market share.

Now these fleets are still young, ahead of us is so much opportunity, so much flying. You can see here that the vast majority of the flying hours for these engine programs are in the future. Now we've always had a goal of getting as much value from the engine as every engine represents in service. Building out from

our Total Care and Corporate Care services, we've now established our Care Store, which is the leading industry menu of services for customers, offering choice and flexibility. This has allowed us to capture an unparalleled quantity of flying hours across our plans with long-term service agreements.

Now it is not enough to grow fleets. It's not enough to grow market share. We want to deliver a better financial performance. So as Chris said, the services team and Hugh and his customer team are absolutely totally focused on getting better commercial outcomes and driving the right pricing solutions. As our fleets mature, as we move decisively beyond the launch phases, as we reach the first renewals of some of those early contracts, we see opportunity to drive that together. Of course, all of this has to be done while supporting our customers. That, in the end, is the core of any services business.

Now it may surprise some of you to see that our expectation is to see 40% of the future of the Trent 700 fleet is ahead of us, as Chris described. I'd like to talk a little bit more about that. I would hope if you ask anybody in our industry, they will say the best engine on the A330 is the Trent 700. It is also the youngest engine on that aircraft. That's because of the market share we had towards the latter stages of the production of the aircraft.

Airlines still like A330s. We are being successful at extending TotalCare contracts. The A330 represents a different economic solution to a new airplane, but it is still one that works, particularly for young airplanes. Of course, we reached a point where we need to work with the airline to transition an airplane, often when the airplane is a leased airplane reaching the end of the lease. And we're getting better and better at working with our leasing partners at transitioning airplanes, and we've transitioned more than 200 A330s so far.

What's new in this market is passenger to freighter conversions. We've seen a significant increase in the available slots to convert A330s, and they make good freighters. We expect to see 300 slots made available by the end of this decade. So far, of the aircraft that have been selected to put into a slot, the Trent 700 powers 80% of those aircraft. Again, the Trent 700 is the engine people want on their future A330s. This is why we believe the Trent 700 will remain a strong foundation for the large engine business. And this is why the shop visit quantities of Trent 700s, the revenue and the profitability will continue for us.

Now of course, all of these efforts, growing fleets, keeping engines earning, it's all about getting airplanes to fly. Our business model relies on airplanes flying. It's driven, of course, by engine flying hours. Engine flying hours drive our services receipts. We know that as the COVID restrictions reduce, we will see increasing flying hours across the world. We see that today in Asia, in Europe and in the U.S. The China, of course, is a notable exception at the moment given the restrictions they're still under. We expect to see progressive growth of flying hours out into the medium term.

Now when routes open up, we are seeing pent-up demand, which gives us even more confidence that we will see the flying hours return. Flying hours drives engines to shop visits, and it is the new generation Trents reaching their first refurb that will drive the growth in shop visits and the recovery. And by 2024, we expect -- sorry, by 2023, we expect to get back to the same amount of shop visits in larger engines as we had in 2019.

Business Aviation, reasonably stable. We are going to see a drop in regional aircraft shop visits, but actually, we knew that before COVID. It's driven by the retirements of the U.S. regional fleets, most notably the Embraer 145. This is the fuel of the growth of our business that Arvind will be talking about later.

So that gives you a view of what we're doing to drive maximize service receipts. But top line growth is not enough. We've got to drive to improve margins through attacking cost. The very best way of attacking cost in long-term service agreements is to push the time on wing extend the period where the engine stays on the airplane, reduce the frequency of shop visit costs.

Time on wing is improving across all of the new generation Trents. If we take the Trent XWB-84 as our example, we've already achieved the level that we set ourselves in our business. We have plans to go beyond that level, and we won't stop. As we've shown on the Trent 700 over its life, we will continuously

improve. Every day is truly a learning opportunity to get more from these engines, and they remain very, very young.

The Trent XWB-84 is a much more reliable engine as well, whether it's delays and cancellations that you as passengers may experience or it is in-flight shutdowns, of course, more severe, we see a dramatic improvement in reliability. Bring all this together and the average time on wing improvement across the new generation Trent fleets is going to be 40% by 2025. And that is what the whole of the services team is driving for.

So how do we draw him on wing? Well, it starts with product improvements, improving the design of the components working with Simon Burr, making the engines fundamentally better. The most notable example, of course, is the HP turbine blade and you'll hear more about that in the turn. We can also do analysis, work with our regulators and push out the relatively conservative positions we took at the beginning of the programs on life-limited parts.

We can also test engines beyond the point they were tested in the original certification, explore the boundaries of the capability of the engine and demonstrate again to ourselves first, our customers and our regulators that the engine can tolerate higher temperatures for longer.

Lastly, we need to work with our customers, work with the pilots of the airlines and make sure they're operating the engine as well as possible to get the best possible time on wing. The great thing about our services, TotalCare, CorporateCare is that airlines want the same as us. They want the engine to stay on wing. We are aligned in our incentives. It's a very powerful part of our service business model.

It may surprise you perhaps to know that it's really important to keep engines clean. A clean engine is an efficient engine, and efficient engine runs cooler, a cool engine will last longer on wing. You're going to see some of these new technologies in the tour. So these are 4 things we're doing to drive time on wing.

Perhaps the most exciting development of technology is the use of new digital capabilities, analytics, big data, twins, artificial intelligence to drive our thinking to give us insights on how to improve time on wing. Imagine if you like, that when we deliver an engine, we're not just delivering a physical product, we're rolling out a digital connection, a thread between us and the airline, us and the airplane. Down that thread is flowing terabytes of data, and it's getting more rich in its use all the time. We're using this data to give us unique insights to life of a particular engine, to life of a specific part within the engine.

This is advancing at a tremendous pace. We haven't been able to do these things before. It is definitely giving us an advantage on these new generation Trent engines. We call this the intelligent engine. Rachel leads that work, and you'll be hearing more about that in the tour later.

Now once you've really driven time on wing as much as possible, you do each shop visit, you've got to get the cost out of that shop visit. Taking our example again of the Trent XWB-84, we've taken 40% out of the shop visit cost in 2 years. We've gone fast down that maturity curve. We've done just over 100 of these first refurbishments. Now we won't keep up that pace, of course, but we will keep learning. The fleet remains young. 80% of the Trent XWB-84s we delivered have not even reached first shop visit, let alone the ones to be delivered in the future. Every shop visit we do truly is a learning opportunity. And we're applying this to all of the new generation Trents.

Again, we know the levers to pull. It starts with working out how to overhaul the engine, how to apply the lean thinking that Sebastian will be talking about to get the labor cost out to speed up the overhaul and there are new techniques that we're using to do that. But again, you're going to hear more about from the team. They're really excited about what they're doing.

You do ultimately get to the point, you must focus on the parts and the materials that we're using. The best thing to do is simply to reuse the parts. As we learn more about the engines, we can reuse parts more often. Ultimately, you can't just reuse the part. You have to do something. But before you throw it away, really should strive to repair it as much as possible. Repair generally is economically more effective, and we can apply a lot of learning from the Trent program to these new engines to accelerate and drive repairs.

What's also exciting is new technology like additive manufacturing, 3D printing to bring new types of repairs into the business. All of this is helping us drive down the cost of the shop visits. The intelligent engine comes in here, too. All of that data coming from the airplane helping us to predict what we need to do when the engine reaches the shop. But it's also the data from the shop itself, everything they're seeing, feeling inside the engine, pictures, information helping us to judge how to improve shop visit cost in the future.

So we're absolutely determined to pull on these levers, but we must also work closely with Sebastian because ultimately, we do have new parts going into these refurbishments and we need Sebastian to drive down the cost of those as he's going to talk about later.

So I hope this gives you a quick but powerful feeling that we're really trying to pull on these drivers that Chris described. Maximize services receipts to capture the services value that an engine represents and to drive the growth, fuel the growth that Arvind will be talking about in our outlook. Then driving margin improvement by extending time on wing, reducing the number of shop visits, but when they occur, really driving down the shop visit cost. The services team are excited, passionate, committed to do this. And we really have got a relentless focus. And I share what Chris said, I've been here a long time, too. I think what we have created as a culture and a focus is really the best it's ever been in this regard. Thank you.

Sebastian Resch

Thanks, Dominic, and great energy in the room, by the way. And I'm looking forward to see the shiny eyes as soon as you see the engines. I'm certainly energized to talk about operations and more energized even to talk about the improvements which we have done. So operations in Rolls-Royce, what is operations? That's basically make and buy of parts, modules and whole engines and basically both for the OE customer, for the airframer and it's for the aftermarket. But you might not appreciate the majority of the make parts and defense is also done by Civil Aerospace.

So the ratio between make and buy is very important for us, and we continuously improve it. If you look to an engine, roughly 30,000 parts need to come all together in the assembly and test line. And from a value perspective, 25%, we are making on our own footprint and 75%, we are buying in our supply chain or with our risk and revenue sharing partners.

One of the core make commodities is turbines. It's quite exciting. I was running that business for some of our peers 5 years long and this turbine technology, this is a 97K turbine plate HP1, very very potent, and it's cutting-edge technology and when I say cutting-edge technology, this blade is running constantly at a temperature above melting point of the metal. It's producing energy and power, more horsepower than a Formula 1 car. And that is only possible because of cutting-edge technology, that means single crystal, casting, advanced cooling, advanced coating. That's what we are doing in turbines. And it's very important, as Dominic said, it's very important for service, for shop visit cost, for time on wing, very important. And it's a very challenging supply chain, by the way, I can tell.

You might have read a Bloomberg article about short force, a recent article about short force in delivery on the narrowbody and long [indiscernible] engine. But the root cause of that article, casting of metal, right? And we are very proud and very privileged that we have invested heavily into that capability end-to-end, which only can do a handful of people in the past and now harvesting that in the future and having more resilience in our supply chain.

So that's quickly an overview about what operations is. More importantly, let's talk about what we have done and even more importantly, the appetite going forward to do more. And basically, I will divide my section, again, in make and buy. On the make side, it is a structural cost out. The sustainable cost out, cost out on the make side when we're making parts, costs which are not coming back when volume is rising. And the second piece will be all about buying and getting the value, the well-deserved value as a company out of our supply chain. Hope that makes sense so far. So let's have a look where all and a lot comes together.

It's the OE margin of widebody engines, which we are building. And clearly, it's in our industry, one of our business models that we are losing money at the beginning and then generating cash and make money

in the aftermarket. We will and we are changing that game. And that's actually what you see on that slide because despite the fact that the volumes on the OE side have been reduced by roughly 50% in the last 2 to 3 years, we have reduced the OE losses by more than 30%. It's quite powerful, more than 30%, if you're losing 50% of the volume. If you add spare parts to that basket, we will breakeven even in this year. And that is super important and was only possible with rigorous cost management and unique cost management in the whole organization. But it's not only important for OE margins. It's also really, really the foundation that Dominic and his team in service can be successful because a lot of that cost out also contributes in the aftermarket.

So how have we done that? Let's go first of all into the make side of business, so making parts. The best way to describe how we have improved efficiency and effectiveness, but also productivity in operations is this chart. And what it basically is, is you take your operating cost and divide operating cost by volume. That's what this is. We talk about cost rate. That's basically the average cost rate in our domestic footprint.

And what you see here is quite an amazing picture. What you can see here is that we have already achieved pre-COVID cost rates in our factories, despite the fact that we have still 30% less load. So what we have done is we have broken the link between volumes and costs. So you might wonder, okay, Sebastian, how have we done it? We have done that through a new operating model, more centralized, leaner and being able to be more agile in our decision-making. We have done that through a rigorous focus on indirect variable cost.

We also have invested heavily in lean. I started my career as a lean consultant, so I'm really passionate about lean. And I can say we have invested in lean and see now the great results, results which you see on the slide and results, which you can see, feel during the shop tour. Because shiny eyes because we have the greatest engines is nice, but now we have people getting shiny eyes because of cost out, because things are leaner, because things are working in a different way.

And last but not least, the whole consolidation, which Chris already mentioned, was a significant contributor to the slide, what I've showed you, breaking the link between volumes and costs. Let me give you 2 evidence points, and you will see much more evidence points during the tour. First one is on the indirect variable costs. You see 2x 15% cost out. The first one is consumables. It's very important. It's a cost -- one of the cost drivers in operations is consumables. And formally, we have bought that with 100 to 200, depending on the commodity suppliers. And now we are using integrators. Integrators who help us to consolidate that volume, and so we can leverage buying power through different industries.

The second example is I talked about the small turbine blade, right? Let's talk about the big blade, the fan blade at the front of the engine. You will see it later. And shipping these fan blades, it's very, very expensive, very expensive. And what we have done is, basically, we have done -- we have applied a better planning for our logistics, and we have developed new transport solutions. And frankly, we have just copied with pride because in service, we have done that for years. And now this new transport solution gives us 5 million benefit. Only this transport solution gives us 5 million benefit per year going forward. Also that shows the new cost culture, getting things scaled up, copy with pride using the power of the group.

And the last example, I think the most powerful way of telling that story is just to do it afterwards because it's about the consolidation. Formerly, we had 3 assembly and test sites, one in Germany in Dallwitz, one in Singapore, and one in Derby in the U.K. Now we have one center of excellence where we will visit that center of excellence in the afternoon. And this center of excellence gives us a lot of operating cost benefits because of that consolidation.

So I talked about make. Let's now come to the buy part. The best way to describe how we are getting more value out of our supply chain is simply that we are now using the best suppliers in the world. We have started 3 years ago, a journey which is called high-performance supplier group, so best suppliers in their commodity. And this class leading suppliers, they are best with regards to quality, cost and delivery. And we have more than doubled that sourcing at the class leading suppliers over the course of the last 3 years. This will give us a lot of benefits commercially but also frankly, it will give us more resilience, which is really important.

You can see some of that is externally recognized with the Financial Times headline. For me, it's important that sometimes it is misunderstood. Okay, Rolls Royce is stopping collaborating with suppliers? No, it's more the other way around. Working with high-performance suppliers, what it really means is a next level of collaborations and the next level of trust between a supplier and a customer because it is a partnership. And I think that is really important.

So how have we done that? Again, a couple of evidence points and more on the tour. First of all, through consolidation, as I mentioned, rigorous digitalization and investment into our people, procurement excellence, and last but not least, I want to talk about resilience. So let me give you again 2 evidence points. The first evidence point is, again, the consolidation. The [Beach] conference, the Pearl 700 precision machining conference, that is a nice example of describing how we are doing that. So we entered that conference with 14 suppliers. And we ended up in that conference with four suppliers, four leading suppliers, class-leading suppliers who are giving, going forward, us a lot of benefits. And you see 3.2 billion is now the sourcing volume with these class leading suppliers.

The second example is the digitalization of supply chain, end-to-end, which really means, in this example, more than 4,000 contracts are now digitalized. And with intelligent tools, we avoid contract leakage. Basically, understanding what the fair value is what we deserve. I can't talk about supply chain management and procurement in these days without covering resilience. We all know these days, there is quite some supply chain disruption. And this supply chain disruption, we believe with consolidating to the high-performance suppliers, we are managing quite well and discuss it's resilience. But also, our financial exposure is something we have done our homework.

We have put several long-term agreements in place. The majority of our contracts have flat pricing -- of our top value contracts have flat pricing. Of the remaining contracts, we are using indices. And the majority of these indices are kept, and they are using the same indices we are using on the customer side, and they flex quite nicely and give us even an advantage. Also on the hedging of material, I think we have done our homework. The majority of our material, we hedge. And we not only hedge for ourselves, we also hedge it for our suppliers because we are having a directed buy model, which is using the Rolls-Royce buying power.

Let me summarize quickly what I said. I talked about the changing game on OE margin, how we have reduced the OE losses by 30% despite the effect of 50% reduction of load. I talked about how we have broken the link between volumes and load. And last but not least, I talked about on the buy side, how we have restructured the supply chain. And with this new civil and new civil operations and having the appetite for improving, improving and improving, that's the lean mindset, which we now have. I'm very, very confident that we are ready for the ramp-up, which is ahead of us.

And with that, I hand over to Arvind to give us more details on the financial outlook.

Unknown Executive

Thank you, Sebastian. Hi, everyone. My name is Arvind. I'm the CFO for Civil Aerospace. I've been in the role for 5 fascinating months. So with that immense depth of experience, I'll be telling you the financial story today. I've got to do the clicking myself. All right.

I tried to think of our business as in value drivers, in metrics as blocks of value. It helps to understand it better, it helps to manage it better and explain it better. So I'm going to use that framework, but I'll maybe just take you through the framework to start with. On the top, we have operational inputs. These matter to us, we track them. OE deliveries is where we spend our money and we create assets and these assets, we put them in the sky and they fly around. And they're backed by engine flying hours. The longer they fly, the more flying hours we have, the greater our cash is.

You put enough flying hours behind that asset, you get a shop visit. And that's where all this cash turns into profit for us, roughly speaking. So I'd like to -- I think of my business as in value drivers of OE, services and investments. OE is about cost management, productivity, efficiency. We spend money there, we break even on OE. And then services is about time on wing. It's also about cost, but it's about

collecting that cash in at the right time and turning that cash into profit. So we are an aftermarket business. That's where we make our money.

And then the third value driver is investments. As a CFO, you'd expect me to talk about that. That's how we spend our capital and how we make sure that we spend it really wisely. These value drivers manifest themselves in what you see in the last line, and that's the outlook we put out, revenue, operating margin and cash flow. So I'll be talking about revenue, operating margin and cash flow as building blocks today, and I'll be sort of dipping into the value drivers.

So let's get on with it. The first one, revenue OE. We see OE growth at mid-teens CAGR over the medium term. Most of that is driven by the Airbus programs and by some return of the 787 production. We see really good growth on Business Aviation. Business Aviation, OE growth, especially with the new Pearl family is expected to grow faster than widebody. And so our outlook on revenue on OE is low teens CAGR, and most of that is because of the mix, which you can see on the little donuts. It's a higher proportion of business aviation in that mix.

The second building block, revenue services. We see services volume over the midterm, grow at low double-digit CAGR. We're seeing a lot of engines come back into the shop after COVID. And we're seeing a greater proportion of major refurb. It's in the region of about 20%, 1/3 in the medium term in the outlook period. And so what we see on services revenue is a growth of high single-digit CAGR. You put the 2 together and overall in revenue, driven by volume growth, driven by growth in wide-body and business aviation, our outlook is low double-digit CAGR on revenue. There's an impact of mix. There are headwinds. There are a few tailwinds as well, but that's where we expect to be in the next few years.

The next building block we spoke about is margin. Now I admit when I came into Civil Aerospace, we were very much as a business on a journey over the last few years, our focus was on market share. We were a market share business, and Chris has talked about on the segments that we are in, how high our market share is. But we've made a conscious change to focus on profitability as well because that matters, too. That's normal. Many businesses go through this evolution. And so we haven't been great on margin than on profit in the past. But that's definitely not where we want to be in the future. Our outlook is that in the medium term, will be at high single-digit margins in our business. And we would try to show you the breakup of where that comes. A big chunk of it, of course, comes from shop visits, shop volumes. Dominic talked about all the amazing things that are being done in that space.

You see a little blue sliver, and that's a great story. We make some money. We make some margin on OE. We don't lose money on OE, this is OE with spare engines -- OE and the spare engines contributes to our profit picture. We've also reduced our overhead since 2019. We spent about GBP 1 billion in 2019. We've reduced it by 1/3. I've spent a lot of my time in large industrial companies to take overheads out by a third, I have very, very rarely seen. We need to take a step, we need to pause and just think about it. That is a huge chunk of change to take out of a business, and it comes with discipline. It comes with the management focus because that's structural takeout, that cost won't come back. That's footprint that's gone out, that people that's gone out.

And then the last driver is lower R&D spend. R&D spend will be in the region of 5% of sales going forward. And the combination of these factors makes our margin where it is high single digit. If you said, is that enough Arvind, I'd say they're definitely not enough. We have a much greater ambitions than that. But I'm happy that in the medium term we would be at this point, but there's a lot more juice. There's a lot more things to squeeze. The cost journey is very much in its evolution. We know how to take costs out. We've got the governance, the infrastructure, the metrics, the KPIs, the internal cadence, and it's about keeping that focus and growing on that journey. The same with OE margin. Dominic talked about shop visits. This is a good place to be. We're in the foothills of much better profitability with the medium-term single high digit.

And then we go into the last block, which is cash flow. And the first bit on cash flow is how we spend our investments. I joined Rolls-Royce from Shell, which is a company that used to spend a lot of money. And there's one thing that I've learnt -- two things, actually, that I've learnt about investments. One, always get your capital allocation right, but two, that's the hard one, don't spend money at the bottom of the

cycle when you shouldn't. It's very, very important for us as a business that we're disciplined about our capital, and that we sweat the capital that we've already spent, we need to make sure it returns.

So we've come off a peak as you see there on the slide, we come off a peak of very large capital spend. And it's important that we're disciplined now and focused on getting the value from that capital. So I believe our investments are at the right level today and they ought to be in this place.

When I looked at where our investments are going. Back in 2019, more than half of our investments was on what we call NPI, new product introductions, new stuff, and maybe a quarter on time on wing. In the medium term, we're looking at more than 60% of our capital spent on time on wing. And what that means is our capital allocation now is well aligned with our corporate strategy which is our capital allocation will drive and maximize value from our installed base. And I think this is a great story going forward.

The other part of cash, engine flying hours. Now I don't have a crystal ball, but we believe that in the next couple of years, flying out should be back at 2019 levels. So our outlook says high teens CAGR in the medium term. Some of the flying receipts will go into aftermarket revenue and through Dominic's cost management will turn into margin. And the other part of it will sit on our balance sheet as an LTSA balance.

Now I see LTSA balance as accrued revenue. It's cash that we've gotten, we're waiting for a trigger event, a shop visit to turn that into revenue. It's a good thing. Now it can vary based on the ratio between shop visits and flying hours. And we expect through the medium term and beyond, that would be approximately a \$0.5 billion per annum of flying receipts on the balance sheet.

This is my last slide. So I'm going to recap before I get to it. There's a story here, but it's -- we're very much on a journey. And the story is good take -- cost take out. There's volume growth. There's discipline on investments. There's a better understanding of LTSA balances, but most importantly, there's a business that's gone through a very difficult time to the Trent 1000 issues, through COVID, to restructuring, to cost takeouts that has learnt and has developed the muscle to manage its finances in a better way.

We have the internal processes. We have the internal mindsets. We have the internal drive to win to get even more out of this. And so what this means from a cash point of view is we go from GBP 1.7 billion cash out in 2021 to a position in the medium term, which will comfortably exceed operating profit. We'll break even this year, maybe a bit more, but we'll be in a very comfortable cash position in the medium term. And that won't be the point at which we plateau, there will be a lot more beyond that.

Now there's one thing that I must say as a CFO when I look at this business, it's not just the quantity of cash that matters, it's the quality of that cash. And it's very important that we [dwell] with good quality cash. So what I've been telling you today as an outlook does not include concession slips, does not include deals, it doesn't include invoice discounting. This is good old clean cash. And in the teach-ins today, in the tours, we'll explain to you how we walk from profit to cash. Our commitment to you is that we will keep our focus on cash generation, but it will be good quality cash over the next few years. So thank you for listening. And I'd like to invite my colleagues back on stage for Q&A.

Question and Answer

Rachel Walker

Thank you very much Arvind, Chris, Dominic and Sebastian. So just whilst we get ready for the Q&A, a reminder for people on the webcast that if you want to send us any questions for Q&A, if you could send them to the Investor Relations e-mail address, which is investor.relations@rolls-royce.com, one of my colleagues is monitoring that inbox and will hopefully let me know nearly end if we have any questions from you.

Just to reiterate in the room, we have a relatively short Q&A time. I know we could probably spend all day in this room taking your questions, but I've not refer to get you out and see things. So we're going to have a relatively short session. Please give the microphone back to the, one of my colleagues when they pass it to you to ask your questions after you've asked it. If we can get as many questions in, I think it'll benefit everybody we can. So in the room does anybody want to put their hand up to ask a question. I think probably Table 6 was quickest on the buzzers, if someone can get a microphone to Table 6.

Nick Cunningham *Agency Partners LLP*

Nick Cunningham, Agency Partners. You've taken your charts out to 2024 when you've looked at overhauled volumes. And so clearly, what's happened in the last couple of years is that you've had low utilization and use of the installed base. And you've extended the time on wing by the work that you've done. But doesn't that mean that it's a timing issue. There's still going to be a wave of overhauls to come, they are just after 2024 now? So that's question number one. Question two, really arises from having paid 7 quids for a coffee and a bun at St Pancras this morning. Inflation is clearly a big issue. And so I think there's a lot of interest in the industry from our side, in how the pricing formulas work, both on the supply side and the customer side, how much of it you have to take particularly as it goes through different levels of inflation? That's basically it.

Chris Cholerton *President of Civil Aerospace*

Okay. Thanks. Let me start on the second question first, and then I'll ask Dominic to talk about the shop visits question. Inflation, clearly, we're not immune, obviously. But we do think, overall, we have reasonable protection. I mean, if you can break it down into a few pieces, one on sort of the operating costs and paying benefits, synergy and such like. Secondly, on the supplier contracts, as you mentioned, both OE and MRO and the customer contracts, both OE, LTSA and some time and material.

And as was mentioned, we have escalation formulae in those supply contracts and customer contracts. On the supplier side, as Sebastian said, a lot of flat pricing and some capped pricing. On the customer side, also escalation, both on OE and LTSA. And I think our pricing escalation is always at least as good as the cost escalation. And perhaps Sebastian, do you want to say a little bit more about our hedging as well because that's another aspect of the elemental and how it protects against inflation there. I think actually our biggest exposure currently is on the pay inflation. But of course, the guidance and an outlook we've given, we made that with full consideration of the inflation environment we're in.

Sebastian Resch

Yes. I start maybe with hedging. So hedging is, for us, important because roughly 30% of our spend is raw material. So elements, metal elements are very important for us to protect. The majority of our material spend on the raw material side, we have hedged for this year, we have hedged basically nearly every material over the 5-year plan. Nevertheless, over the years, it clearly also goes down. They have a tight governance. In this tight governance, what I really mean is we have a hedging committee where we discuss what we are hedged because hedging is not coming for free. So where we invest. But maybe I'll give you one specific example. Nickel, for example, is important for us.

In nickel, I think today is \$28,000 per metric ton. And what we have done is this year, 70% is hedged, 70%, so significant hedging, and we have hedged because that is important with pre-war levels. And that story is true through our whole portfolio.

Nick Cunningham
Agency Partners LLP

Thank you. Dominic on the services future?

Dominic Horwood

Yes. Thank you for the question. I think as we described, the shop visit growth over the period, I was discussing, was driven by the new generation Trents reaching their first refurb. That will continue. The fleets continue to grow, though that fleet will continue to age. It will be tempered to a degree as we look forward by improving time on weighing. That is a good thing. We will continue to see shop visit grows well into the next decade. And indeed, we'll have to keep expanding our MRO network to support that, and you'll see future announcements from us with partners to do that. So yes, some tempering of the shop visit growth because of that time on wing improvement, but it is fundamentally the growth of fleet, the growth of flying hours that continues that journey.

Rachel Walker

Thank you. Sorry, we'll move back to Table 4 before -- I know Table 6 has kept the microphone, but I'm just going to let them move around a little bit. Good try. Table 4 next question, please.

David Howard Perry
JPMorgan Chase & Co, Research Division

It's David Perry at JPMorgan. I guess my questions are both for Arvind. The first one is the journey to high single-digit EBITDA margin, can you just talk us through it? Is it linear? Is it back-end loaded? And then the second one, just following the comment, the question Nick just asked. So this LTSA cash flow of GBP 500 million a year, I think not dollars, so where does the TotalCare creditor peak on your balance sheet and in what year?

Unknown Executive

I can answer the first one relatively easily. It is pretty linear from now the high single-digit growth. Where does the creditor balance peak, again, this is subject to the shape of the curve on engine flying hours, but we expect it to peak a little after the medium-term outlook that we've given. But it's -- I must disclaim it, it's subject to the shape of the EFH recovery curve.

Rachel Walker

And just for those of us in the room to let you remind you, we do have finance as one of our tours later, so we can talk about it and quite a lot more in LTSA. For those on the web, there will be some appendices slides that go up at the end of the day, with a little bit more detail there and obviously happy to take any extra questions into the Investor Relations team for follow-ups. Hands up again for the next question. I'd like to come forward to Table 7, please.

Unknown Analyst

[Hassan] from Morgan Stanley. You guys have talked about increasing the receipts you get from your customers and reducing costs from suppliers. But some of them have been saying, taking the opposite side of the client, suggesting that they might spend less on some of their maintenance costs. What makes you think that you can take this value? Has something changed in your supplier power or bargaining power in general?

Unknown Executive

Sorry, just repeat the crux of the ...?

Unknown Analyst

The crux of the question is, you're trying to get more money in your invoices and less on your suppliers. Has something changed in your bargaining power in general?

Sebastian Resch

Its Sebastian. As has been described, the work we've done on getting the class leading suppliers and the contracts we put into the base of the purchasing strategy. And we've done a good job on securing flat pricing in a high proportion, not all, of those highest spending contracts and the ones we don't have escalation caps. But it was articulated in our pricing caps, they're at least as good as that.

Unknown Executive

Yes. So in general, because we have no narrowbody. We have some disadvantage on buying power. And we only can compensate that with consolidating our volume. That's exactly what we did, and I described, and we have more than doubled that consolidation of volume, and we are using the best suppliers. And we are partnering with them and also have installed long-term agreements. And that gives us then the advantage, and this is the value which we are now seeing.

Rachel Walker

Hands were up again. I feel I'm going to go back to Table 6 because I do feel like I slighted them slightly by steering the microphone away.

Robert Alan Stallard

Vertical Research Partners, LLC

It's Rob Stallard from Vertical Research. A couple of questions. First of all, for Arvind, this is hopefully quite a simple question. Normally, when an aerospace supplier sees OEM growing ahead of aftermarket, the margin goes down, not up. So I was wondering of what I'm missing there. Is that something to do with the Bizjet OEM or spare engines in there that are making that slightly different? And then secondly, to follow up with Sebastian on the whole inflation thing that Nick mentioned. Isn't there risk that if you're not allowing your suppliers to pass on inflation, you're financially damaging them and that you could be ending up with supplier stress down the line?

Unknown Executive

Yes. Rob, it is business aviation. Business aviation growth. Chris talked about number of billionaires. Business Aviation growth is really, really strong, and that's changing the skew and the mix.

Unknown Executive

Yes. And to the second question, so we take it clearly serious, and we are monitoring the risks which we are seeing in the supply chain continuously. We call it watch tower. We have 5 criterias how we are mapping and monitoring and controlling our suppliers continuously. We're doing that with external available data, but we also have third-party support. We have roughly 600 suppliers. And in that watch tower, we have 24 suppliers and 4 in treatment. So if I look back in the last 2, 3 years, that financial risk coming from the supply chain is manageable. But clearly, we are not immune, and our suppliers are not immune. So it is a watch area. And even more, it is important to work with the class-leading suppliers because they are much better able to deal with the headwinds which we are seeing these days.

Rachel Walker

And I think Table 4 were next in the queue.

Charles J Armitage

Citigroup Inc., Research Division

Charles Armitage at Citi. Extending the time on wing is clearly massively positive. But equally, you've also got some assumptions when you started signing of those LTSAs that you were going to extend the time on

the wing. So how -- from an external viewpoint, can we be comfortable that you are extending the time on the wing faster than you thought you were going to when you first sign those LTSAs?

Dominic Horwood

Thank you for the question. I mean I think there's obviously a spectrum of time on wing across the products. We talked about the Trent XWB-84 and the confidence we have in that and that has actually got the capable of exceeding the levels we were targeting, as I showed. You know about the situation we've had on the Trent 1000, that would obviously be an example of an engine that hasn't managed to achieve the time on wing we initially wanted. We continue to improve that to get it back to where it needs to be. So I don't want to get into individual programs, but I understand your point and our goal is to drive all of the programs to a time on wing that meets our business requirements or exceeds it.

Rachel Walker

Any more questions in the room, and then we'll check on the lines in there is any -- sorry, one over here.

Unknown Analyst

[indiscernible] Investments. What are the prospects on the 787? And what does that program look like going forward for you because you've obviously clearly got a lower market share there?

Unknown Executive

Yes, thanks. And clearly, the 787 currently got its own delivery challenges, and we continue to work very closely with Boeing and helping where we can to get that moving. And clearly, our reputation took a knock on the statement on the 787. We've worked very closely with those customers through that period or for disruption. But the way we handled it through the disruption has now at least got some credit in the way we treated customers through that period and the way we -- and our customer focus through that period. We're now in good shape. The engine, take out the particular issues we have, is no different in its reliable statistics and [job statistics] and any of reliable statistics as any other Trent.

So we put a lot of money into making this engine as it should have been. And we have that -- there's closed customer relationships. So we intend to keep pushing and we know our share is low. We're not going to do anything silly, of course, on pricing to do so. But we think with the engine performing as it now does, we have opportunities still to have -- to make wins. I mean the last win there was in Lufthansa, which is a flagship customer, and we believe we'll win again in the future.

Rachel Walker

Table 7 has a question.

Unknown Analyst

I'd just like to come back to a point Arvind mentioned about Rolls-Royce being previously market share-focused business versus now also focusing on margins. So I'd just like to get a sense of the profitability of the old programs versus the new ones and just try to understand if you guys have been very aggressive on pricing, previously? And therefore, if we should expect structurally lower margins in the long run? And also just to clarify what timeframe that you mentioned by medium term. You talked about the engines being 2030, should we understand the medium term as being 2030 as well?

Unknown Executive

So I'm not going to get drawn into buy engine program, what this means on profitability and margin. This is a mindset that I'm talking about, which is -- which in the past was about trying to get more of our engines out there at any cost. I'm not suggesting we didn't focus on profit, but it was on market share. Today, we're seeing a lot more focus. If I look at the way [indiscernible] in the room, I look at the way we do our business evaluation when we bid for deals, there's a very clear focus on profit. It's a question on, does this make sense? What's our return on sales, et cetera? And it's -- that's what I meant by the shift. It's become very important for us to recognize the value of our product and help our customers

understand the value we provide and have them pay for it as well in the most collaborative way. So it's that mindset and I wouldn't want to go into specific engine programs at this stage.

Now on your second one, I think this is a question I expect, what is medium term? And the bigger question is why don't you just put a number there and make our lives easier? And the reason is because we want to stand here today as a business and tell you that we've been on this journey, and we're really proud of where we are today, and we recognize there's a lot more to go. So we want to be transparent to you. But we also recognize that I do want to make commitments to you that I can't meet. That's not what we're about. And we live in such a volatile world. I really can't tell you where EFH will go. Dominic's talked about some of the geopolitical events in front of us.

So the reason why it sounds ambiguous there is that it's intended is because we want to tell you the journey we're on, but we can't tell you when we'll get there. I'm assuming 2, 3 years but that's as far as we can go in terms of certainty. And I'm sure you appreciate that as well.

Unknown Executive

I'll just add as a leadership team, clearly, with that view of 2 to 3 years, of course, intensely focus was on making that as early as we can, but it's around when some of the uncertainties are a little more stable.

Rachel Walker

I think we have back Table 6 again.

Aymeric Poulain

Kepler Cheuvreux, Research Division

Aymeric Poulain from Kepler Cheuvreux. Just to understand if you are back to 2019 peak engine flying hours of 15 million plus, do I understand correctly that you're targeting EBIT of more than GBP 500 million and something that is of the same magnitude for free cash flow, operating free cash flow, I mean, is that a reasonable assumption?

Unknown Executive

I mean our outlook is in the medium term, which we've just answered is of the order of 2 to 3 years, of which one of the factors is that we anticipate also then flying hours being back at 2019 levels, high single-digit margin and cash flow comfortably exceeding profit.

Rachel Walker

Sorry, I can see one of the back table, I think got the hand up first. Sorry, we'll come back to Table 6 again afterwards.

David Howard Perry

JPMorgan Chase & Co, Research Division

It's David Perry, again, if you don't mind. Just so we can understand because this whole thing of medium term, it's a bit arbitrary, I think. I mean is it medium-term and then your cruise at that level? Or is it medium term? And then this excess cash flow versus a bit falls away? And then the second one, Arvind, I know you said you didn't want to comment on programs, so maybe if I make it more high level. We're in the home of the widebody business here. I mean where is the widebody business in the medium term? Is it breakeven? Is it profitable?

Unknown Executive

David, I feel like you're asking me to tell you something I don't want to tell you. We've guided in the medium term. And you said what happens after the medium term? The whole point of being ambiguous about the medium term was because we're not sure of when we'd get there, like I said, 2, 3 years, we hope it will be in the shorter end of it. So I really don't want to be drawn about what happens to the world after that. I still maintain, we want to be transparent, but we want to make commitments that we can meet.

What happens to the widebody? We expect volume growth. But in the medium term, given it's a few years, we don't expect a significant change from the current portfolio mix that we have today. So it'll be fairly constant.

David Howard Perry

JPMorgan Chase & Co, Research Division

But profitability better.

Unknown Executive

Yes. Profitability better of course. Yes.

Unknown Executive

And in the -- this point beyond, as I said in -- when I spoke, it's not the destination, clearly, we know we need to further improve returns. And our ambition will be to approach the returns enjoyed by our competitors as our engines further mature.

Rachel Walker

And there's 2 questions waiting from Table 6, and I'm going to try and keep us on time, so that's probably going to be the last 2 questions.

George Zhao

Sanford C. Bernstein & Co., LLC., Research Division

George Zhao from Bernstein. On the UltraFan, I guess what kind of assumptions on future aircraft programs, when do you need to make the business case for that program to work? And you talked about trying to get on to the narrowbody competition. But I guess what is the realistic path to get there considering the competition and exclusivity we've seen over the programs there?

Unknown Executive

Yes, I'll take that. So the UltraFan is the technology demonstrator as I described to service the future opportunities that we'll see in widebody or narrowbody, and of course, the widebody being our absolute core market. So we're -- we've chosen to invest well ahead of a market need because you need to put demonstration of technology, showing you got a ticket to the game with customers is absolutely critical. So we're pursuing the technology demonstrator. And then we'll -- just the phasing, depending on the actual reality of any market opportunity, which is going to be well into the 2030s we'd anticipate on widebody and now it is 2030s on narrowbody too. But we have to invest now and demonstrate it, want to feed the technology to our existing engines, but also because this is complex stuff and we need to understand our risks early so that we can then better adjust the phasing of investment.

Your question on narrowbody. When you've got that technology and put so much money into it, you want to [indiscernible] across the biggest possible market opportunity. And it is highly relevant to the narrow future narrowbody engine. So our ambition would be enter into narrowbody to better utilize over a wider [indiscernible] technology. The opportunity isn't there just yet. So I'll be trying when that opportunity arises, I'd anticipate running to next decade. And we'll no doubt do execute that as we have in many of our -- all our Trent programs actually in partnership, so we start to think of the sort of partnerships that might be valuable to us for that opportunity in our strategic planning. But there isn't -- it's not such in front of us just yet.

Rachel Walker

And final question to the main Q&A. Just to remind you, we do have the full Civil leadership team with us today, scattered on the tables will be around at lunch. So if you didn't get a chance to ask your question, one more last one -- sorry, last one on Table 6, and then we will -- that will be our last question for you to wrap up then, Chris.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

It's Harry Breach here from Stifel. Just 2 very simple ones. Maybe first one for Arvind. Arvind, just on the large civil engines, just to be super clear, were you saying presently large civil engine OE, including spare engine is breakeven at the operating profit level or the gross profit level? And then next one is a kind of conundrum and that I think I'm probably not the only one that has wrestled with it over time, which is trying to understand the meantime between refurbishment shop visits on large engines. Historically, Rolls used to say, well, it's between 4 to 6 years. And I could never get that to correlate with what we knew about the deliveries of large civil engines historically. Can you give us some idea of where we are now in terms of meantime between refurbishment shop visits and how you see that moving?

Unknown Executive

Shall I take the first one first. All right, I'll give you the first one. Yes, Harry, right? Did I get your name right, Harry? Yes. We expect in the medium term for large widebody engines OE to be breakeven, including spare engines.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

Just to be clear. Just trying to understand that.

Unknown Executive

I'm giving you an outlook.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

Including spare engines at operating profit levels?

Unknown Executive

Including spare engines at operating profit levels. Dominic?

Dominic Horwood

Okay. Thanks for the question. So we spoke earlier about the work we're doing on improving time on wing. Obviously, there's a range of operations with the airlines, different airlines fly in different ways. I think your estimation of 4 to 6 years' time on wing is broadly in the correct space as an average of the fleet and where we're driving to get the engines to in the time scale that we discussed. Obviously, on the Trent 1000, we're not at that point today. As you know, we're rolling out the modifications very successfully that will get us back to that location. So 4 to 6 years, time on wing is where we want these engines to be.

Chris Cholerton

President of Civil Aerospace

Okay. Well, thank you for your questions and your interest. I recognize there's no doubt many, many more if we could have another half hour. So of course, we are around with you over lunch and on the tours this afternoon. And that will -- they will no doubt prompt even more questions and follow-up beyond. But thanks for your attention, and we'll just break for lunch.

Rachel Walker

Okay. So yes, thank you all again for your questions. If we didn't quite manage to get to your questions today, you also have the option to post an e-mail into Isabel Green and her team. and we'll provide our contact details at the end of the presentation as well. Now we've come to the point where we now need to end our live feed. So for all of you who have joined us virtually today, I want to thank you all for listening. And please do look out for the videos of the tours that you'll be able to view on our website online next week. But for now, thank you very much.

Presentation

Isabel Green*Head of Investor Relations*

Hello, and welcome, everyone, to our 2021 full year results presentation. I'm Isabel Green, Head of Investor Relations. And I'm joined today by our Chair, Anita Frew; our CEO, Warren East; and our CFO, Panos Kakoullis.

Before we present our results, I'll hand over to Anita to say a few words on our other announcement this morning.

Anita Margaret Frew*Independent Non-Executive Chairman*

Thank you, Isabel, and good morning, everyone. You'll have seen our announcement this morning that Warren plans to step down at the end of this year. By then, Warren will have spent 9 years on the Board and almost 8 years as CEO, a relatively long tenure and a tribute to his strength and commitment.

As a result, we're now starting an open and transparent search process for Warren's successor. Warren has a real passion for the business, which engenders pride in our people and confidence amongst our stakeholders. In his time at Rolls-Royce, he's created a dramatically different business and has positioned us well to generate substantial value from the drive to net zero.

Finally, I would just like to thank Warren on behalf of the whole Board for his tremendous work. It's not over yet, though. I know that while we carry out the search for his successor, Warren will continue to lead Rolls-Royce with all the dedication he has shown throughout his time at Rolls-Royce.

I'll now hand back to Isabel to introduce today's results.

Isabel Green*Head of Investor Relations*

Thank you, Anita. Today's presentation will begin with a summary of our improving performance and an update on our commitments from Warren before handing over to panels for a more detailed review of our financial results. Warren will then conclude with an update on our ambition for sustainable growth and value creation. In all, our presentation should take around 40 minutes, leaving time at the end for Warren and Panos to take your questions.

Before we begin, please take note of the safe harbor statement on Slide 2. As always, the full set of results materials can be downloaded from the Investor Relations section of our website.

I'll now hand over to Warren.

David Warren Arthur East*CEO & Executive Director*

Thank you, and good morning, everyone, and we appreciate you joining us on what I know is a very busy day for many of you.

Now as Anita mentioned, I have decided to step down at the end of this year. I'm extremely proud of what all of us at Rolls-Royce have achieved since I joined the company. Rolls-Royce today is a culturally and strategically a very different business. We're also a completely different organization commercially and operationally, much more efficient and productive with sound operational gearing that will create value from additional growth.

I'm sure you'll see some of that in our results presentation this morning. You'll also see that we have a clear vision and direction to lead the transition to net zero, and we're already seizing opportunities with tremendous future potential. I understand no Chief Executive's job is ever really complete, but I feel

that with the advances we've made and the momentum and energy we've shown and our firmer financial foundations, now is the right time to look for the future. Now there'll be a time for reflection at a later date. Right now, as you would expect, I'm fully committed to leading the business. So let's get on, and we'll talk about that.

So let's look where we've got to and turn to the results for last year. I'd like to start by celebrating what an important year it's been for Rolls-Royce and to think about some of my own personal highlights from 2021. Now in November, I joined my colleagues at COP26. A few years ago, we wouldn't have even had Rolls-Royce at the Climate Conference. But today, our business and the future of our business is all about the energy transition.

In the picture on the left of the slide, I'm with the Nuclear for Climate team. You can see they represent the young workers of today, and they're drawn from multiple nations all working in the nuclear industry. They're all really passionate about protecting the world, their world, from the negative impacts of climate change. And they're concerned about the positive contribution that nuclear can make to the future energy mix. It was particularly encouraging to speak with them and many others at COP26 about the need for our technologies in this space and, in particular, the role for our SMRs.

Furthermore, we showcased a number of our technologies in the green zone, as you can see in the photo on the top right of the slide. Exhibits included our double world record-breaking spirit of innovation aircraft, which helped visitors to understand how we, at Rolls-Royce, can be part of the Climate Change solution. However, it's not just our new businesses that we should celebrate. Our established businesses are also driving our journey to net zero, and the image here on the bottom right shows the launch of one of our latest MTU hydrogen fuel cells in a microgrid at our facilities in Friedrichshafen. That's it being switched on for the very first time. It took 6 months for the microgrid demonstrator to go from decision to commissioning of the first MTU battery energy storage system, and that's a great example of our agility and how quickly we're delivering new solutions.

Let's move on now to our 2021 operational performance highlights. I'll begin by focusing on civil and, in particular, the restructuring program. And this was an enormous undertaking building on earlier productivity and efficiency programs. It's really transformed our Civil Aerospace business. The picture here is of programmable machine tools at our turbine blade facility in Darby. These machines have been transferred across from Crosspointe in the U.S., and they can easily switch between designs and have absolutely minimal manual oversight. This means one person can now do the work of several previously, and what used to be a time-consuming manual setup is now fast. It's largely software, creating flexibility as well as much greater throughput, and that's just one example.

Moving on in Defence. We're very proud to have been awarded B-52 engine replacement program in the U.S. This award secures new business for the coming decades after entry into service in the late 2020s, and it's a huge achievement for our Defence colleagues. And I'll talk more about Defence opportunities later in the presentation.

In Power Systems, you'll remember at the half year, we were seeing orders well ahead of the year before. And in the second half of 2021, order intake accelerated with record order intake in the fourth quarter, giving us the largest order book in Power Systems history.

Moving to the bottom of the slide. In Rolls-Royce Electrical, we're thrilled with the success of our 2 world records with the Spirit of Innovation aircraft. This demonstrates the real pace at which electrical technology is accelerating into the world of aviation and creating new opportunities. We're excited to be exploring the varied applications for air mobility.

In the middle at the bottom, in Rolls-Royce SMR, as you know, we decided some time ago focus our civil nuclear activities on SMRs, small modular reactors. In the second half of the year, we have secured U.K. government grant support alongside equity investment to progress the project to the next phase.

And last, in the bottom corner, but certainly not least, we're making good progress with disposals. Back in October 2020, we committed to undertaking a series of disposals to reshape our balance sheet. Three

of these disposals have already completed, and the sale of ITP Aero is agreed. It's announced, and it's expected to complete this year.

Let's have a look at our financial summary. We have 3 great outcomes from the progress we made in 2021. One, we have improved financial performance. Two, we're delivering on our commitments. And three, we're still investing for growth and sustainable value. Our cost reductions and market growth have helped us to return to profitability in 2021. And while we still had a cash outflow in the year, you can see from the histogram on the left of the slide, this was substantially improved from 2020 and is expected -- and is ahead of expectations.

And as mentioned in a moment ago, our restructuring program has delivered more than GBP 1.3 billion run rate savings, and our disposals are on track to achieve the total proceeds of around GBP 2 billion. Our sustained investment in research and development is enabling us to deliver market-leading technology focused on net zero. And this unlocks opportunities to deliver long-term and sustainable value in both our established businesses and the new ones that we're reporting on separately for the first time today. And our ability to maintain investment even in these difficult times is supported by a strong liquidity position with no debt maturities before 2024.

Now moving on to the next slide. I'm going to add some color on just a couple of topics. Let's start with the restructuring program. The activity here was mostly about Civil Aerospace. It was about rightsizing in the short term and then taking advantage of efficiency and productivity enhancements so that we can scale up output without a corresponding increase in operating costs. Not only have we exceeded our run rate savings target and we've removed more than 9,000 roles across the group, we have done so 1 year ahead of schedule.

Our Civil business operation is now about 1/3 smaller than it was in terms of footprint and headcount. And that makes Civil leaner, a much more efficient and productive business and one that is ready for future growth. The focus now is on ensuring that the benefits we've achieved are sustained.

Now some pictures of friendly faces. Before passing over to Panos, I'd just like to take a moment to focus on our executive team. The real breadth of experience and expertise is enhanced by these recent additions. So last May, we mentioned -- we welcomed Panos Kakoullis, our CFO, who joined us from Deloitte with over 30 years experience of managing large multinational, multidisciplinary teams helping major organizations to deliver change.

Top right on this slide, Grazia Vittadini has joined us as Chief Technology & Strategy Officer. Grazia brings to us extensive expertise in both Aerospace and the emerging and disruptive technologies from, amongst other things, her 20 years experience at Airbus laterally as their CTO.

I think it's important that a balanced team brings a combination of fresh thinking from outside the organization, but also deep knowledge from within the organization. It's important also to demonstrate to others internally that career development to the very top level is just part of how we do things around here. So in January this year, we promoted Sarah Armstrong to the role of Chief People Officer. Sarah has been with Rolls-Royce for more than 15 years, most recently as the leader of HR in our Civil Aerospace business, where she had a pivotal role in delivering that restructuring program I talked about a moment ago.

And in January, Rob Watson, President of Rolls-Royce Electrical, joined our executive team. Rob has been with us for 10 years. And over the last 4 years, he has played a fundamental role in the development of our Rolls-Royce Electrical business as we invest for a more sustainable future. We have a strong, capable and driven executive team, and I'm very confident in their ability to deliver our vision for the future.

So thank you. And now over to Panos to talk about our financial performance.

Panos Kakoullis
CFO & Executive Director

Good morning, everybody, and thank you, Warren.

We are very proud of our achievements in 2021. Against a backdrop of challenging and unpredictable market conditions, we've delivered improved financial performance that's been driven by cost reduction and market growth. Results you can see on these slides, where they're all presented on an underlying basis, and that's for the continuing businesses in the group.

Revenue that stayed steady. So it's less than 2% lower than 2020, and we've seen a much more balanced contribution from across our businesses, with Civil Aerospace now contributing around 40% of the total. Lower wide-body volumes and lower shop visits in Civil Aerospace were balanced by growth in both Defense and Power Systems.

Operating profit, that's GBP 414 million, and that's a GBP 2.5 billion improvement compared with 2020. And that reflects the significant cost savings from the restructuring program that was largely focused on Civil Aerospace. Defence performed well and more than covered its increased R&D spend.

Power Systems, that grew strongly. It benefited from recovering end markets and better utilization on the shop floor. The underlying loss of GBP 2 billion in the prior year, we had included GBP 1.3 billion of one-off charges in Civil Aerospace, and those were mostly related to the impact of COVID-19.

Free cash flow in 2021, that's an outflow of GBP 1.5 billion. But again, that was substantially improved on the prior year. We saw great progress on cost reduction, stronger operating performance included higher flying hour receipts in Civil Aerospace and much more targeted capital expenditure. The working capital outflow that you see, GBP 800 million, that was mostly driven by concession payments and lower OE deliveries in Civil Aerospace.

If you can look at the improvement on prior year, the prior year also included the non-repeat of GBP 1.1 billion negative impact from the termination of invoice factoring in 2020. On the whole, a very substantial step in the right direction on our recovery journey.

If we move on now to Civil Aerospace. The Civil Aerospace financial performance, again, significantly improved as we neared completion of our restructuring program. Gradual market recovery and the non-repeat of those COVID-related one-off charges from 2020, that also helped enhance our financial performance. Overall, revenue was down 10% on prior year. If you break that down, OE revenues were down 29%, reflecting the reduction in engine deliveries as fewer large engines were required to fulfill customer build schedules, whilst sales of spare engines where they increased.

Business Aviation OE deliveries were down as we transition to newer engine programs, which are now growing well from a low base. Services revenue was up 6% on the prior year and included GBP 214 million of positive long-term service agreement catch-ups compared with a negative catch-up of GBP 1 billion in 2020. They also reflected lower shop visit volumes and a reduced contribution from the V2500 engine program. The underlying operating loss of GBP 172 million was significantly better than the GBP 2.5 billion loss in 2020. We continue to focus very heavily on those areas that are in our control, and we're seeing sustainable cost benefits from that restructuring program.

Our trading cash outflow was GBP 1.7 billion, again, a substantial improvement from last year in 2020. That was driven by engine flying hours. They were up 11% compared with 2020. In fact, second half engine flying hours were up 57% year-on-year. As COVID vaccination programs, they enabled key routes to reopen, although they are still at reduced volumes. Lower operating costs, lower CapEx and working capital outflows in 2021 as well as the non-repeat of that invoice factoring termination in 2020 also contributed to that improvement in cash flow.

If we turn now to Defence. Our Defence business continued to perform well, with strong demand for both OE and services driving growth in all of our end markets. That's combat, transport, submarines and naval. Underlying revenue, that increased by 5% on an organic basis to GBP 3.4 billion, with services revenue up 6% and OE revenue up 3%. Underlying operating profit was GBP 457 million. That's an increase of 3% compared with 2020. It was driven by sales growth and a positive mix towards higher-margin spare parts and spare engine sales. Now that profit growth, that occurred despite a 28% increase in R&D spend. That was made to support our ongoing product development and the growth opportunities ahead of us.

Trading cash flow was GBP 377 million. That gives a cash conversion of around 80%. That's a fairly normal level for our Defence business. The prior year, that trading cash flow, that included an adverse impact from the timing of deposit receipts.

Finally, we have a strong order book in Defence that follows several years of high intake with a 5-year average book-to-bill of 1.1x and 85% order cover for 2022.

Moving on now to Power Systems. Our end markets recovered well over the course of 2021. The order intake of GBP 3.3 billion was 24% higher than the prior year with a much faster conversion seen to sales in that business than we would typically see in Defence and Civil Aerospace. Order growth was strongest in Marine, Defence and Power Generation. Underlying revenue of GBP 2.7 billion was up 3%. Services grew at 10% as product utilization increased. OE broadly flat. Sales were higher in Industrial and Power Generation, partly offset by lower activity in China.

Underlying operating profit, GBP 242 million, up 37%. Operating margin was 8.8%, that's 2.2 percentage points higher than the prior year. That's due to the mix of sales towards higher-margin aftermarket spare parts as well as improved utilization in our manufacturing facilities. We also experienced lower warranty costs. Trading cash flow, GBP 219 million, representing a cash conversion of around 90%, despite an increase in inventory related to the global supply chain disruption we experienced in the second half of 2021.

I move on to new markets. Now we've separated out our early-stage businesses. Those that have got high growth potential, we put them into a distinct reporting segment: new markets. This gives increased visibility to the investments we're making to address the new opportunities that are being created by the transition to net zero and the Energy transition.

There are 2 businesses currently in this segment: Rolls-Royce SMR and Rolls-Royce Electrical. These businesses where they leverage our existing engineering expertise and capabilities to develop new sustainable products. Rolls-Royce SMR secured GBP 490 million of funding in 2021, including GBP 50 million we committed ourselves. We've already received around GBP 30 million of that funding. And the remaining cash inflow, that's going to be phased over the next few years to align with the underlying specific spend.

In 2021, a ramp-up in investments saw R&D costs of GBP 68 million, GBP 16 million of that in SMR and GBP 52 million of that on Electrical Power and Propulsion technology. Over the next 5 years, we anticipate spending over GBP 1 billion in R&D in these businesses, although our cash spend will be considerably lower due to that third-party funding for SMRs.

New markets, they are naturally more challenging to forecast given the pace of customer demand ramp-up and also the regulatory approval process. What is clear, though, is the fact that the potential opportunities for these businesses are significant. We believe they could generate more than GBP 5 billion of combined annual revenues by the early 2030s.

If we turn to the next slide, we set out here our summary funds flow. We saw a GBP 1.5 billion cash outflow in the year from continuing operations. That's a significant improvement on the GBP 4.2 billion outflow in 2020 and much better than our expectations that we set out at the start of 2021.

If you break the movement down, you can break it broadly down into 3 buckets. Firstly, we saw an operating performance improvement of around GBP 2 billion. That was thanks largely to our cost savings in Civil Aerospace and also revenue growth in both Defence and Power Systems.

Secondly, our GBP 800 million working capital outflow was GBP 700 million better than 2020. That was mostly due to that non-repeat of the unwind of invoice factory. That was partly offset by a planned increase in inventory in Defence and Power Systems to meet both expected sales volumes as we went into 2022 and the impact of global supply chain disruption in Power Systems.

And thirdly, around about GBP 100 million of other impacts. That reflected lower CapEx, partially offset by the higher hedge book closeout costs in the year. Our free cash flow is continuing to improve. The

combination of restructuring and growth driven by recovering end markets is putting us on track to get back to positive cash generation.

Turning now to our balance sheet on the next slide. We are committed to rebuilding our balance sheet and returning to an investment grade credit profile in the medium term. We're on the pathway to achieve this as we benefit from reducing uncertainty, improving financial performance and our strong strategic focus on the energy transition. We've previously announced 4 disposals, which are expected to generate around GBP 2 billion in total proceeds, including approximately GBP 200 million of retained cash. The final and largest of these disposals, ITP Aero, is still expected to complete in the first half of this year, pending the necessary regulatory approvals.

Disposal proceeds, together with the underlying free cash flow generated by the group, will be used to reduce net debt. We ended the year GBP 5.2 billion of net debt, including GBP 1.8 billion of leases. Our liquidity position is strong, GBP 7.1 billion of liquidity, including GBP 2.6 billion in cash at the end of 2021. And that is after we repaid during 2021 -- the 2021 EUR 750 million bond and also the GBP 300 million COVID corporate financing facility. A strong balance sheet is very important for us. We will balance the pace of that rebuild with the investment opportunities across our portfolio to make sure that we maximize the long-term return for our shareholders.

Moving on to investments. Our technology and engineering expertise gives us a critical role in enabling the transition to a low-carbon global economy. We have significantly upgraded our approach to analyzing investment cases to place an even greater focus on sustainability and broader ESG considerations whilst maintaining investment discipline. Our investment spend is very much focused on making our existing products compatible with net zero, pioneering new technologies that can meet the accelerating demand for cleaner technologies as well as identifying additional applications for our current portfolio of technologies. It is key that we optimize our investments in order to most effectively deliver our strategy, maximize our return and achieve our net zero commitments.

Our investments in both SMRs and electrical propulsion create net zero solutions and opportunities in new end markets. We have best-in-class products in markets with high barriers to entry. And taking advantage of that, generating a healthy return on our investments, well, that's a priority for us.

Now we've seen the 2021 financial performance. I just wanted to recap on the priorities that I set out to you all back in August. As a reminder, 3 priorities: deliver on our commitments, simplify how we report and invest wisely for the future.

Firstly, delivering on our commitments. Right now, I feel very comfortable that we're making great strides. We've delivered the sustainable savings from our restructuring program, and we continue to make sure that a large proportion of the costs that have gone out stay out even as the load grows as demand grows. We've exceeded our GBP 2 billion free cash flow guidance for 2021 by over GBP 500 million. And GBP 300 million of that was due to concession slippages, and we shared that with you in December. And I'm not going to claim any credit for that. That's not controllable. The rest, though, around GBP 200 million is due to our improved trading and cost performance and surpassed the commitment despite engine flying hours being worse, frankly, than we expected when we set the guidance right at the start of 2021.

Secondly, we do need to simplify, break down the complexity around our financials. There is progress to be made in having more straightforward financial communications. Now I've taken some steps already to reduce the complexities, easy-to-understand disclosures, helping comparability between years and across peers. There is more to come during the course of 2022. I'm making sure that the changes we make align from the ground up with how we drive the businesses and reward performance.

And thirdly, we will continue to invest wisely for the future, creating sustainable value. We are at a very exciting point, huge opportunity to lead our markets in the journey to net zero. We also have the opportunity to take our innovation and technology into new markets with incremental growth, and we won't stop investing in our current products either. There are good near-term returns available from increasing durability and efficiency. So as I said, 3 things: deliver on the commitments, simplify how we report and invest wisely.

If we move on to outlook. We are well positioned for the anticipated growth in our end markets. Despite some challenges around the pace of market recovery, global chain -- supply chain disruption and rising inflation, I am confident that we will see continued positive momentum in our financial performance. We expect low to mid-single-digit revenue growth in 2022. That's supported by a strong order book cover in both Defence and Power Systems and a continuation of the gradual improvement in civil aerospace, along with an expected increase in spare engine sales. We expect our operating profit margin to be broadly unchanged as underlying operational improvement is balanced with increased engineering spend to develop sustainable growth opportunities with a gradual shift in spend towards new markets, Defence and Power Systems.

We expect to generate modestly positive free cash flow in 2022, representing a substantial improvement on 2021. Now that increase comes despite the concession slips that I mentioned earlier, going from '21 into '22. As has been the case in prior years, cash flow will be seasonally weighted towards the second half of the year.

Looking further ahead, long-term revenue growth will be driven by technology and innovation opportunities and rising global demand for sustainable power. This will be supported by well-targeted investment. We aim to spend around 75% of our investment on lower carbon growth opportunities in the medium term. So a lot of opportunities ahead, a lot of growth from the energy transition, a lot of variables to manage and a much more agile and balanced business geared towards capturing that growth in a profitable and sustainable way.

And with that, I'll hand back to Warren.

David Warren Arthur East

CEO & Executive Director

Thank you, Panos. Now the title on this slide reflects the terminology that I used last month actually at our Annual Senior Leadership Conference, sustainable in both centers of the world, given our products and markets clearly sustainable in terms of climate and impact or not on climate change. But my internal message was very much more focused on sustainability in the business sense, meaning generating profits and cash from our activities and seeking growth.

From a behavioral point of view for our senior leaders, that means adopting a restless pursuit of ever greater levels of profit and return, holding our heads high, seeking out and capitalizing on growth opportunities. And I'd like to focus for the next few minutes on how we're driving growth and sustainable value in our established businesses: Civil Aerospace, Power Systems and Defense before then moving on to the new markets.

So I'll start with Civil. The fundamental restructuring program that we've delivered means that we now have much lower costs, much improved operational gearing. Now we can see significant growth in demand in our factories, and that's accompanied by only small incremental growth in our operating costs. This is extremely important as we continue to generate value from our large installed base. Around 2/3 of our engines are covered by long-term service contracts that will deliver value way out into the future.

We also have more than half of the market share for new large engines with more than 1,500 on our order book. Our current order book includes 58 Trent XWB engines for Airbus' recently launched A350 freighter. The A350 F represents a great opportunity for us to take share in a market that has been until recently dominated by Boeing and GE. We're also seeing fantastic growth opportunities in Business Aviation, where our family of Pearl engines is now offering market-leading power and efficiency and outstanding low noise and emissions performance.

The slide here shows a picture from Dassault of their Falcon 10x. At the launch, we and Dassault revealed that they've chosen our Pearl 10x engine to exclusively power their brand-new flagship aircraft. And Gulfstream have chosen our Pearl 700 to exclusively power their new ultra long-range business jet, the G800. That's in addition to its use already announced on the G700. Pearl 700 testing is progressing very well, and we're now in the final phase of regulatory approvals. And we and Gulfstream are delighted with the results of the flight test program, and we expect to receive certification later this year.

So now I'll move on to Defence. And we're seeing good growth opportunities in this business. And that's critical to -- this business is critical to protecting people around the world. In 2021, we concluded a multiyear program of investment to revitalize our facilities in Indianapolis, creating a world-class campus with advanced manufacturing capabilities on a smaller and more efficient footprint. And that's a very similar story really, but on a smaller scale to the restructuring program that we just spoke about in Civil, baking in operational gearing, which enhances the benefit of future growth. And this was recognized last year as we secured the award for the highly competitive B52 engine replacement program, generating \$2.6 billion of business for the coming decades with entry into service towards the end of this decade.

We intend to bring that operational gearing benefit to future growth as well as we pursue further design wins, and we remain in a competitive process, for instance, for the Future Long-Range Assault Aircraft program in the U.S. in partnership with Bell Textron. And a win here would be very significant driver for our long-term growth in Defence. Of course, back in the U.K., we continue to work with our partners: The Ministry of Defence, BAE Systems, Leonardo and MBDA on the Tempest program with developments, including the recently announced collaboration with Japan on a Power System demonstrator. We also continue to support the U.K. MoD in the collaboration announced last year between the U.K., the U.S. and Australia on nuclear submarines.

Looking further ahead, Defence, of course, is a very long-cycle business. We are supporting customer demand for novel products that deliver advances in technology and sustainability. Investment opportunities include areas such as hypersonics, small engines and even power in space.

Now I'll move on to Power Systems. We saw order intake accelerate in Power Systems with the business achieving the best ever order book in its history. We have a strong established position with our MTU brand engines and a loyal sticky customer base of over 40,000 customers. We're focused on supporting the transition to net zero, and we've set some challenging targets to carbon dioxide emissions. For many, that means deploying microgrid solutions like the one in the picture here with renewables, storage combined with backup from reciprocating engines. And of course, in future, those reciprocating engines will be powered by synthetic fuels or hydrogen as we continue developing those technologies.

In 2021, we formed a partnership with cellcentric to develop hydrogen fuel cells. Following on from this, we've been awarded a significant contract to provide the first-of-a-kind net zero microgrid, which will combine fuel cells and hydrogen combustion engines for the port of Duisburg in Germany. And hold on to that thought for a moment because I'll talk about airports in a little while.

Some of the strongest demand this year has been from data center customers. Our standby power solution was recently chosen by a hyperscale data center customer. And as we expand our geographic reach, we'll grow market share in this space.

Right, so that's our established businesses. Now we'll turn to what we call new markets. Our newly established reporting segment, including both Rolls-Royce SMR and Electrical. Whilst these businesses are at an early stage, as Panos explained, they come with huge growth potential focused on addressing the opportunities created by the transition to net zero.

Starting with Rolls-Royce SMRs. We're using existing technology, which we've been taking to market for decades, over 60 years, in fact, in our nuclear submarine work. The diversification here is into new markets with nuclear power plants for both on-grid and off-grid applications. And we're seeing enormous amounts of support for this technology. In 2021, we secured a sizable third-party funding through a U.K. government grant and equity investment from strategic and financial partners. And this is helping us to fund our SMR design through the regulatory approval process and support us as we search for sites for those factories that will manufacture the first units.

First, orders for the U.K. market are anticipated within the next couple of years. SMRs are a core part of the U.K. government's 10-point plan for a green industrial revolution. Our SMR is designed to deliver 470 megawatts of power on a size that is -- a sight, rather, that is only the size of 2 football pitches, and that's very power dense. They've been engineered for low-cost and repeatable manufacturer, making them competitively priced with solar and wind, but without the associated intermittency challenges and costs and including all the costs of eventual decommissioning and waste management. What's also really

exciting about SMRs is how they can support our other businesses in the necessary production of green hydrogen and net zero synthetic fuels.

Now moving on to Electrical. In Rolls-Royce Electrical, we see, again, high growth potential. This is where we take a relatively new technology to a market sector that we know very well. Rolls-Royce has the mix of technologies and the skills that we've built through decades of sector-specific knowledge and experience combined with market access, and that's what makes us win.

With lots of people -- well, I mean, lots of people have the technical ability to work in the electrical propulsion and power markets, we have aerospace in our DNA and a track record of success. It's relatively easy to build electrical machines. They're all around us in many different shapes and sizes, typically low compared with the world of aviation, the power capabilities that this is relatively low to lift a heavy object into the sky and move it through the air for hundreds of miles needs much more power, and the energy required has to be carried in that vehicle as well. And that is getting into the realm of hard stuff: weight thermal management, structural integrity, all very challenging and extreme levels of safety and reliability too, and it all becomes extremely difficult in a narrow application.

But that's where the decades of experience and the depth of knowledge at Rolls-Royce makes the difference. We are highly differentiated. We have the experience and the expertise and the safety track record to succeed. And this is a growing market, too. We've partnered with vertical aerospace, and we power their VX for all electric urban air mobility vehicle. Vertical has \$5.5 billion worth of preorders for over 100,000 rather of these products from some of the world's biggest and most innovative airlines.

We're also strategically partnered with Embraer's urban air mobility spin-out, EVE. By the end of last year, EVE had already secured over 1,700 of aircraft preorders worth \$5.2 billion. And we have a collaboration with Tecnam and Widerøe announced at the half year for an all-electric powertrain for the commuter market, and that's targeting entry into service in the mid-20s.

Our electrical business is not just for airborne solutions. We're combining our expertise in electricals with our experience in power systems to develop a business opportunity for energy and charging infrastructure for airports and for vertiports in preparation for the advanced air mobility market. All in all, it's an extremely exciting time for our Electricals business with many tangible opportunities in the pipeline.

So to summarize today's presentation and our full year results, we're proud to confirm that our financial performance is improving, thanks to both cost reduction and market growth. We are delivering on the commitments that we promised and we're investing to drive growth and deliver sustainable value into the future. Together, these make Rolls-Royce a better, balanced and more sustainable business. And with that, we'll turn over to Q&A.

Question and Answer

Isabel Green

Head of Investor Relations

[Operator Instructions] And we've got a question on the website from [Lavinia Sherwood], who asks, how is restructuring helping to support the anticipated business ramp-up.

David Warren Arthur East

CEO & Executive Director

Okay. Well, thank you very much. I'll answer that a bit qualitatively. I mean the restructuring is all about inserting operational gearing into the business so that when activity increases, it delivers real value in terms of profit. And we're confident that operational gearing will persist because the costs will stay out, and we can look at our civil business and say it's 30% smaller in terms of footprint and in terms of headcount. Now those factories are not coming back.

We've installed machines like I talked about in the presentation, which reduced cycle time hugely. We've changed our design processes, again, reducing cycle time hugely, driving up the productivity. In fact, with the reduced level of activity that we're still seeing in 2021, we have underutilized assets, but those assets will be utilized when the growth comes back. And so the growth will be able to come back, as we said, with relatively small increment in terms of operating costs. I don't know if there's anything to add to that, really.

Panos Kakoullis

CFO & Executive Director

Yes, I think -- if I think about it from a quantitative perspective, as we look to 2022, there is going to be a load increase in the Civil business. And seeing how that load increase manifests itself, think around about 30% more load going through that business. And when we look at it from an operating cash cost perspective, it's around about 6%. So it's a disproportionate increase in load supported by that gearing that Warren's referred to already.

And if I just added, I guess, a little bit of experience from having now spent quite a bit of time in the business and wondering around the shop floor and talking to our people, and we've talked about it a little bit in the past around the mindset of our people, what we're able to do now and what I'm able to do now is link in some of those individual activities that I see on the shop floor, how they're thinking, what they're thinking around quality, safety and efficiency and how that starts manifesting itself in lower cost going forward.

David Warren Arthur East

CEO & Executive Director

Thank you.

Isabel Green

Head of Investor Relations

We're ready to take the next question, I think, from the phone lines, please.

Operator

Your first question comes from the line of Celine Fornaro from UBS.

Celine Fornaro

UBS Investment Bank, Research Division

It's Celine Fornaro. That was a nice one. Right. The first one would be actually on providing slightly more color, if you could, on the cash aerospace and the trading cash performance there and the dynamics that

are underlying, I would say, as you highlighted on the introductory remarks, and that are likely to stay in '22 and '23. And what I'm thinking here or interested in is if you assume some sort of a pickup in the shop visit, how do you think your estimated cost in the shop visits are trending compared to the real cash cost that you are incurring, and that's true for A350, 787 and A330.

And my second question is on the GBP 1 billion of cash savings that you have achieved, excluding CapEx. How should we think about the return of these costs, looking at '22, '23, please?

David Warren Arthur East

CEO & Executive Director

Okay. I'll -- thanks for the question. Kicking off more color on that cash. I mean, clearly, cash incoming depends on the rate of recovery of activity in the markets. We do anticipate the steep increase in activity, which we saw second half on second half in the '21 numbers to continue, albeit at a slightly sort of a slower rate because you're building on a larger base as we go through '22. So consensus forecast would be for approximately a 50% increase in flying hours.

Now you can see when we think about shop visits and our planned number of shop visits to deal with that, you can see from the answer that Panos gave a moment or two ago, we're anticipating roughly a 30% increase in load on our factories. And that's really driven by the component demand from those shop visits.

And the cost of those shop visits is clearly related to the cost reductions that we talked about a moment ago. And that sort of takes us into the second half of your question on the GBP 1 billion, and I'd sort of bring you back to Panos' answer a moment ago where we're sort of divorcing the load increase from the operational cost increase. You're probably going to go on and ask us about material cost increases and supply chain challenges and all those sorts of things as well. And of course, those are baked in, but I'd remind people of the long-term nature of this business, the long-term nature of the contracts that we have with suppliers and the escalation clauses that we have in there.

Operator

So your next question comes from the line of Robert Stallard from Vertical Research.

Robert Alan Stallard

Vertical Research Partners, LLC

This is probably a question for Panos. You highlighted the GBP 300 million positive benefit from concessions in '21, and it's a very sensitive topic. But what are your expectations for concession payments looking into the 2022 numbers and potentially to 2023 as Boeing eventually restart deliveries on the 787.

Panos Kakoullis

CFO & Executive Director

Thanks, Robert. Yes. Probably hard to predict because it does depend on some regulatory outcomes. The assumption we've made is that GBP 300 million slipped into '22 as you'll have seen. We do expect to see some unwind as we go through overall through the course of the year. It's going to typically depend on deliveries. Overall deliveries of new engines this year, we're expecting to be flat. But I'm seeing that go into 2022, it could potentially slip a little bit into '23. We will highlight it for you as and when we have greater clarity on it. And it's something we pull out, and you heard me talk about it earlier on in the presentation, it's an uncontrollable. So I'm not going to claim credit for it, if it doesn't happen. And if it happens earlier, then we'll highlight it.

Robert Alan Stallard

Vertical Research Partners, LLC

Yes. And as a quick follow-up -- I'm sorry. I can hear myself, sorry. And then maybe a question for Warren. On the fantastic name Vertical Aerospace, I was wondering what your thoughts are on potentially monetizing that stake at some point in the future? Or is this a long-term investment?

David Warren Arthur East*CEO & Executive Director*

Goodness me. This is, as far as we're concerned, a long-term investment. It's sort of cementing a partnership as it were. We're looking at that whole space, and as I say, huge growth opportunity. There are uncertainties around that. The market really doesn't exist today.

And so there's a big error on what that market is going to look like in, say, 2030. We're very confident when we look at our partners though that we're looking for a balance of partners like vertical aerospace, which are new companies tackling this market, and companies like EVE, the spinout from Embraer, where you have a more established player. We're interested in powering as many of them as possible because, as I just talked about a moment or two ago, we think we have real differentiation there. And as far as investments are concerned, we're not going to be making a habit of investing in everybody, but where we can do a little bit of catalyzing then we will.

Operator

So your next question comes from the line of George Zhao from Bernstein.

George Zhao*Sanford C. Bernstein & Co., LLC., Research Division*

I guess, first question, can you just talk more about the increased investments in '22, driving the flat margins for this year. How much higher? And how much of that is going to the new market? And I guess second question is more on those new markets. I mean you decided to give the GBP 5 billion revenue outlook by the early 2030s. I guess, why was now the time to give this figure when we're clearly in very much of an infancy of a stage for these new ventures? And I mean now that you've given us this GBP 5 billion number, could you give us some details on how you get there? And what are some of the investment requirements over the medium term to succeed here?

David Warren Arthur East*CEO & Executive Director*

Okay. I'm going to ask Panos to talk about the '22 investments, and I'll come back and add some color on the new businesses that we talked about this morning.

Panos Kakoullis*CFO & Executive Director*

So thanks, George. So -- and you'll have picked it up from both the release and how we presented. There is a sort of a pivot away into some of those growth opportunities over the course of the next few years, probably a little bit away from civil and where the civil business is. And the increased level of investment, you better see them effectively in 3 places. So Defence, where we've got some big bids coming up, and we're in that stage of ramping up around those bids now.

Power Systems, in particular, because that's -- you heard us talk about energy transition. That is where the big opportunities are sitting right in front of us at the moment. We've got 40,000 very, very sticky loyal customers who are coming to us now increasingly. In fact, we had a Board meeting earlier this week when we were looking at the ramp-up of that order book around that. So the investments there are around the technologies and the system solutions to help those customers. So you see it coming through there.

And as you've rightly said, around new markets. And we very deliberately for this year, trying to give you more clarity. We've pulled out those new market businesses into that segment, both SMR and Electrical, and we pulled out to show you how much R&D. Now the -- there's a big element of that ramp-up that does happen in '22 in those new markets. So -- and I think we've used sort of the word substantial, so you can think about that as a sort of near doubling of investment in that. That doesn't all come through in terms of cash. That will definitely be a P&L because those are businesses that we control and consolidate. But you saw from an SMR perspective, how much of that is coming from both government funding and third-party shareholders.

And as you go forward, that cash profile, particularly on SMR, is matched by customer orders and deposits coming in and matches off on that, how that spend happens. And I think we've talked about what we expect the rough spend over the next 5 years to be on new markets, which is around about GBP 1 billion mark, which about GBP 0.5 billion we will fund ourselves.

David Warren Arthur East

CEO & Executive Director

Yes. And I think Panos has sort of answered really the second part of the question there as well. We're talking about GBP 1 billion of investment. And we pulled it out because we want to demonstrate that this is investment not just sort of central R&D costs. Clearly, if we're -- I imagine it was a completely stand-alone start-up business. You have to paint to your investors a picture of the sort of return that you're going to make, and that's why we're talking about GBP 5 billion in the early 30s.

Now clearly, as I said in an answer to a question a moment ago, there is uncertainty around here. We're expecting these electrical aviation products to enter into service around about the middle of the decade, maybe between the middle of the decade and the next couple of years after that. The SMRs, we've talked about having orders in the next couple of years with revenue recognized in proportion to costs. But we're talking about getting these on the grid around about the end of the decade, maybe 2030 a little bit beyond. So there's uncertainty in it, but we're trying to paint a picture just to sort of scope out roughly the sort of size of contribution that is being made by those businesses in that time frame. It is very, very approximate.

I would just highlight, Panos referred to the investment that we're making in Power Systems, however. This is an established business with existing customers, with much shorter development cycles. And so we absolutely expect to see a revenue impact from the net zero investments in Power Systems well before the second half of this decade.

Operator

Sir, your next question comes from the line of Ben Heelan from Bank of America.

Benjamin Michael Heelan

BofA Securities, Research Division

I had a couple of questions around the guidance. I was quite surprised to see the low to mid-single-digit revenue guide at the group level. Is there any divisional breakdown that you can give us around that?

And then secondly, on the margin, you've talked about the operating margin being flat. Is there any color you can give around gross margin? Obviously, you've said R&D and investments are growing. So how should we think about the gross margin progress as we go through this year?

Panos Kakoullis

CFO & Executive Director

Yes. And you'd have seen we've done something different in how we talk about guidance going forward, and that was a very deliberate reflection on the shape of the business that we have now. It's a very different business to the one we had 2 years ago to a much more balanced. You had Warren talked about much more balanced and sustainable business. So 40% of it in Civil Aerospace; 60%, the majority now is Defence and Power Systems.

So when we thought about guidance, and you've heard me talk about a much more balanced view of the KPIs that we think about. So that's why we've talked about revenue growth. That's why we talked about margin in addition to what we've traditionally talked about around cash. And then there's in due course, start -- with that track record bill start thinking about what's the return that we can start demonstrating on that.

From a revenue perspective, that low to mid, how does that pan out across the businesses? So you've seen very strong order book. I think Warren referred to it record order book in Power Systems. That

turns into revenue over the course of this year. So you can see good growth coming through in the Power Systems business.

The defense business is a steady business. The big wins that we've talked about, they take time to come through. I think Warren talked about, that secures decades effectively for -- into the future. That doesn't come through immediately. So think of that as that's modest in terms of revenue. And then that leaves you effectively Civil Aerospace, which again is modest growth. And that's primarily determined by what happens around activity driving increased shop visits. You'll have seen in the release some of the factors that start affecting that. We had some long-term service agreement catch-ups, which went through revenue this year. So that's a factor that you have to think about from a headwind perspective on revenue.

And then as you look at those in terms of margin, if I go through the sort of 3 businesses. The Defence business, we had a good mix around margin this year, just go into 2021 around spare parts and spare engines. Those are typically higher margin. We get back to a more normal level of mix next year. So that has an impact on your gross margin. Similarly, when we think about Power Systems, again, there was quite a high element of service rather than -- that tends to be a little bit higher margin as well. So that's how that changes.

And then from a Civil Aerospace perspective, the margin mix of the business going forward is definitely changing. We're into the newer engine programs. Those are the programs that are flying more frequently now than they were in the past. They are earlier stage. We recognize less margin on those as they are less mature. There's a lot of margin left to come. And when I look at the balance sheet and I look at that long-term service agreement balance, that creditor that sits there, that is -- there are big chunks of that, that our potential margin as we work our way through, as Warren has talked about, how those cost savings come through, how we increase time on wing. That has a direct impact on margin as we go into the future.

Benjamin Michael Heelan

BofA Securities, Research Division

Okay. Great. Just a quick follow-up because I thought earlier in the call, you talked about expecting a roughly 30% increase in load for shop visits. So how do I tie the 30% increase in load to the kind of modest growth in Civil Aerospace? How significant is that revenue headwind from the catch-ups?

Panos Kakoullis

CFO & Executive Director

So Ben, the load was across the whole of the Civil business, including business aviation. So there's quite a big ramp-up in OE for business aviation as we go through this year. So it's OE ramp-up in business aviation and an increase in shop visits across the board. So that's how I think about it.

Operator

Sir, your next question comes from the line of Harry Breach from Stifel.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

Warren and Panos, can you hear me?

Panos Kakoullis

CFO & Executive Director

Hello. It's fine.

David Warren Arthur East

CEO & Executive Director

We can.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

Great. And forgive me because I missed the first half hour of this. Can I just -- first of all, can I just ask about time of material last year. I think sort of in the -- sort of first half of this year, T&M was about 16% of overall underlying revenue for Civil Aero. Can you -- and I might have missed this, so please forgive my ignorance. Can you give us a sense of where it was for full year 2021 and how you might see that trending in '22, if you can?

And then just thinking about major shop visits, I think in the presentation, you kindly gave us the number for Civil last year. What should we be expecting compared with that 208 base in 2021? What should we be expecting for this year and going forward? Because there is some discretion in the scheduling of those. I appreciate long-term trend will match EFH, but there may be some scheduling discretions. So any help would be gratefully appreciated.

Panos Kakoullis

CFO & Executive Director

Yes. So on -- we didn't talk about time materials, so you didn't miss that bit. Second half, first half, think about that as roughly the same. So there wasn't a significant disconnect between the two. In terms of shop visits, you are very right. It is driven by actual flying activity. And what Warren referred to what the market is anticipating around increase in engine flying hours, there is always a little bit of a lag in terms of how that comes through. But shop -- expect shop visits go up, probably a little bit less than flying hour activity given that lag that is typically there.

Operator

Sir, your next question comes from the line of David Perry from JPMorgan.

David Howard Perry

JPMorgan Chase & Co, Research Division

I'm sorry, I missed a fair amount of the speeches, so I apologize if I'm asking something you've covered. I've got 2 questions, both of you, I think, Panos, one is high level and one is more detailed. High level, you say you want to simplify how we report. I look at H1 '21 where you delivered a massive beat in Civil Aero EBIT. I look at H2, the full year where there's a huge miss and guidance, way below consensus. I think none of us on the sell side have accrued, frankly. What is it that you can change that makes this somehow more predictable and therefore, more investable? And so it's quite a high-level question.

The much more detailed one is, you've clearly guided to an EBIT number well below the sell-side consensus. Can you just walk me from this EBIT number to the cash flow in 2022? So what are you assuming out for working capital? What are you assuming on the LTSA time? That would be very helpful.

Panos Kakoullis

CFO & Executive Director

Sure. So let me take that up. So I think as we said at the half year, and you and I have had some good discussions, David, around simplification. When I look at how we simplify the way we communicate, the way we -- as you said, the way we help you understand the business and make it more investable, I think what we've done for this full year, we have started to give you some more clarity. So we've shown trading cash flow by business, which is something we hadn't done before. We've pulled out what we're doing on the investments within the new markets, again, to give some clarity on that.

And frankly, we started to use a little bit of nomenclature that is more common. So when I want -- because I want to have comparability, I think, across years in between the peers. And when I look at what our peer group do, I want to be -- us to be aspiring to that. There is still more to go, and you may have missed it when I was talking about it earlier on. This needs to be done ground up, right? I'm not going to put something over the top for a sort of veneer in how I present because it's fundamental to how we run the business on a day-to-day basis, making sure that the underlying value drivers that Warren and I spend time within the business as we push on those and as we start showing you what those value drivers

are and how we think about them, how they link up to the outside performance. And when you do that, budgeting, remuneration, how people get rewarded, the whole thing has to work in a robust way.

So things still to come, things that will help what you've asked for are what we do around foreign exchange and our hedging policy, which is different to what others do. And that will take time to put in place. And particularly, the last point you made there effectively is around contract accounting and having a much tighter link between what happens in the underlying contract and how that shows up from a profit and cash perspective. You will never get a direct link between cash and profit in any long-term contracting business. But how that trend can be much more easily seen. So we've done some, and there's more to go.

In terms of your effect for your comment on profit. We've never really given guidance around profit in the past. It's been -- it was more observation when I came in because it was a predominantly Civil Aerospace-driven business, there was a lot of focus around cash. It's a different shape business now. It is a much more balanced shape business. That's why we started talking about revenue. That's why we started talking about margin as well as cash and to come how we think about returns. So that's why that profit is there. I don't view it as missing guidance. I view it as helping you think about guidance and consensus going forward because it's nothing we've really talked about in the past, and that's been very evident when I look at the range of profit that the analyst community had in the past. It's never really been taught about. Now we want to put it in a much more understandable way.

In terms of the big movements around cash and how profitability comes back, let me come back to that in a few minutes. It is a detailed question. If we take the next one, then I'll come back to you.

Operator

Sir, your next question comes from the line of Andrew Humphrey from Morgan Stanley.

Andrew Edward Humphrey

Morgan Stanley, Research Division

Maybe a couple of bigger-picture questions. Warren, we talked a lot today about opportunities for the business and the kind of more balanced portfolio going forward. Could you maybe talk about how you would view the biggest challenges for your successor? And there's another kind of broader question, where does the departure of warrant purchased in terms of any potential mid-term target setting that we might see this year?

And then I also wanted to ask a bit about Power Systems. Clearly, we've seen a very strong performance there on orders. Clearly, that is also a shorter cycle business than the Civil Aero. So I wanted to ask about what additional challenges there may be in terms of supply chain management and protection around the margins that business is making over the next couple of years?

David Warren Arthur East

CEO & Executive Director

Okay. Well, I'll go with those, Andrew. Thanks very much. So I think the challenges over the next several years, the strategy is very clear. The challenge is there is a lot of opportunity out there, and it's making the investment calls and balancing that investment alongside looking after our existing business. So we talk about value creation from our installed fleet, for instance, in Civil Aerospace, extending the time on wing. That takes engineering effort resource investment and so on. But so do the opportunities in Net Zero that we talked about, both within Power Systems, actually within things like electrical aviation and even in defense addressing net zero opportunities. So the challenges of those. And we included a slide in Panos' presentation, the bit that Panos presented around how we think about investment and deploying capital. And I think therein lies the biggest challenges over the next several years.

As for target setting, medium-term target setting and so on, we'll come to that. When we talked about my moving on this morning, that is the end of this year. And so I'm -- after we do this results presentation, I'm back to running the business. And any target setting that we do around the middle of this year will be no change.

Supply chain challenges, particularly in Power Systems, we do expect the supply chain challenges that we've seen over the second half of 2021 persisting through quite a bit of 2022. Right now, if we compare what we anticipate those challenges to the impact that they might have on a sort of otherwise budget, think high tens of millions of pounds up towards GBP 100 million as an impact for 2022. So if miraculously, we're able to deal with those supply chain challenges and they go away, then there's some potential upside there. But we're not hugely optimistic about that happening anytime soon.

Panos Kakoullis*CFO & Executive Director*

Let me just come back to David's point. I sort of reflected on it. So -- and I think, David, you asked the sort of the detail point around the bridge between operating profit and free cash flow and what's sort of driving that. There's going to be a number of things going on the way. We're going to get to a more normal pattern of working capital within the business as engine flying hours start to increase, and we've talked about what that ramp-up would look like. Offset a little bit by the shop visits, but those tend to lag. There is some increased investment spend that we talked about, both from a CapEx and an R&D perspective going against that. There's the continuation of the hedge ongoing costs. That's going to be a little bit lower than we saw this year. Most of the other factors stay the same. So that's typically what you'll see going through.

At a macro level, if you just look one number to the other, the bridge isn't trying to bridge very much, but there are lots of ins and outs to get you from one to the other.

Operator

Sir, your next question comes from the line of Charles Armitage from Citi.

Charles J Armitage*Citigroup Inc., Research Division*

A couple of questions. I think David is doing a bit better than I am. I'm struggling to get to Ben's question. Low to mid-single-digit sales growth. So we've got a 30% increase in load in Aerospace and profit recognition and revenue recognition along with work done. We've got GBP 3.3 billion inflow in Power Systems versus GBP 2.7 billion of sales in orders, and that converts pretty quickly. We've got Defence stable. We got a negative GBP 200 million -- a headwind of GBP 200 million from CSA catch-ups. I'm struggling to get down to low to mid-single-digit growth, given lots of growth in Power Systems and seemingly Civil Aerospace. What am I missing?

Panos Kakoullis*CFO & Executive Director*

So Charles, that was on the revenue side.

Charles J Armitage*Citigroup Inc., Research Division*

Yes.

Panos Kakoullis*CFO & Executive Director*

Yes. So I think on Civil, we said -- when I answered earlier on, I said modest growth in Civil because that's determined by shop visits coming through and the recognition of revenue around those shop visits. They typically lag, as we've said, around what's happening on engine flying hours.

On Defence, we said broadly stable. There's a little bit of up, and there's good growth within Power Systems. When you take all of that mix together, that's how you end up with low to mid.

Charles J Armitage*Citigroup Inc., Research Division*

Okay. I fully think a bit harder on that. Next question. On SMR, what do you need to have -- what -- effectively what level do you need to have carbon cost to make -- to be able to be viable output for SAF production? Alternatively, what can you produce the fund of SAF?

David Warren Arthur East

CEO & Executive Director

Yes. I'll have a go at answering that, but I can't answer it explicitly to be honest. I mean, what we do know is that SAF requires a huge amount of energy, and the electrification of multiple sectors is putting a huge amount of demand on traditional generation. SAF is a sort of large increment on top of that. You have to use energy to create hydrogen. You then have to use energy to combine that hydrogen. You have to use energy to capture carbon dioxide as well and then put it together.

So the rationale is that it's a zero carbon effective way. We know that the levelized cost of electricity is comparable with wind. We know that, that includes the cost of decommissioning and waste management, and that the cost of wind and solar and the like doesn't include the cost of storage required to offset the intermittency. So I can't give you an answer in terms of carbon price, but I can give you an answer in terms of the large amount of demand, which is there, and the comparable competitive cost of electricity.

And then you get into the sizing and the logistics of arranging for large amounts of powerful things like SAF plants and significant hydrogen generation plants and the infrastructure that has to be put around it, and that's the economic argument for an off-grid application.

Operator

I'll now hand back to Isabel for question from the webcast.

Isabel Green

Head of Investor Relations

Thank you. And there's actually quite a lot of questions on the webcast, and we're not going to get through them all today. And in fact, quite a few of them, I think, have been covered by the answers given. But just to say if anybody feels that they need a direct answer, do come back to the Investor Relations team.

So the last question is actually from someone on the buy side. So we have [Tim Ashton] who Warren is asking you, how much do you think Rolls-Royce has changed in your tenure? I'm going to add so far on that because I know that you're not finished yet.

David Warren Arthur East

CEO & Executive Director

No, no, I'm certainly not finished yet. Yes, it's a difficult question and it's hard to quantify it exactly. I mean what I said this morning was that if I compare the company I walked into with the company we have now is chalk and cheese. From a cultural and behavioral point of view, it's a very different business. Some of the messaging I hope we've got across this morning is that from an operational point of view, it's also a very different business with strong operational gearing baked in so that as we lean towards growth in the future, that growth will have a big contribution to real value creation. So I think it is fit for the future.

I think, two, we have a very clear strategic direction, and it's very much a broad-based power group that we look at now and that gives us a much bigger opportunity set. The future of this business is not dependent on long-range, long-haul aviation. So that's a sort of summary, but it's probably time for a longer discussion rather than an answer in a Q&A like this. I'd also highlight a huge difference in the people, by the way, just for finishing on that. We have a much smaller organization. But if I look at things like the senior leadership group here, it's about 60% smaller. It's between 5 and 10 years younger. And I think these are some of the intangible things, which make a massive difference to the agility and the ability of the business to be competitive going forward.

Thank you. I think Isabel is busy telling me that, that is the last question. So thanks, everybody, for joining. We do appreciate that you've had a very busy day today, even before events that happened

in Ukraine. The messages we'd like you to take away. Improving financial performance in our result is evident here, the operational gearing that we've talked about. We are delivering on our commitments, and we're very focused on the future, both in terms of the opportunities for growth in our established businesses and in the new businesses. And we look forward to seeing you with an update on progress when we give you an update at the half year. Thank you.

Hello and welcome to the Rolls-Royce Trading Update Call. [Operator Instructions]

Just to remind you, this conference call is being recorded.

I'll now hand you over to Isabel Green, Head of Investor Relations. Please go ahead with your meeting.

Isabel Green

Head of Investor Relations

Thank you, Simon, and good morning, everyone. Welcome to our update conference call today. With me are Warren East, CEO; and Panos Kakoullis, CFO. We will begin with a few introductory remarks from Warren and then go on to Q&A.

But first, I am required to remind you we may make forward-looking statements and that actual results could differ from guidance. Thank you. Over to you, Warren.

Warren D.A. East

CEO & Executive Director

Thank you, Isabel, and thank you, everybody, for joining us today. So as the year draws to a close, I'm pleased to reflect this morning on the progress that's been made across the company this year as we definitely become a better quality and a more balanced business.

Now despite the ongoing uncertainties related to the COVID-19 pandemic, we continue to deliver on the elements that are within our control, and we're focused on the commitments that we made 12 to 14 months ago.

And now turning to those commitments to start with. Our restructuring program launched in May 2020 is now delivering sustainable savings. It's quicker than expected as we reduce costs and deliver a leaner and more efficient company. By the end of the full year this year, we expect to have removed more than 8,500 roles and saved more than GBP 1 billion. And this positions us well for the GBP 1.3 billion target by the end of 2022.

Also, trading performance is improving, and that's reflecting the gradual recovery in international flying combined with the market recovery in Power Systems and ongoing resilience in our Defence business. And a net cash inflow was achieved in the third quarter of 2021, reducing our second half outflow. And as a result, our full year free cash outflow is expected to be better than the GBP 2 billion previously guided. In addition, around GBP 300 million of original equipment concession outflows are now expected to fall in 2022 rather than 2021 due to the delayed delivery of aircraft for which we have already supplied engines.

We're also firmly on course to complete our disposal program with proceeds totaling around GBP 2 billion, and these disposals include Civil Nuclear Instrumentation & Control ITP Aero, Bergen Engines and AirTanker Holdings. We plan to use the proceeds from these disposals, together with underlying free cash flow, to reduce net debt.

Turning to our businesses now and what's been happening since we last updated you.

We're seeing overall better results and better order intake. In Civil Aerospace, large engine flying hours have continued to recover gradually as -- helped by certain key travel corridors reopening and, in particular, in early November, the transatlantic routes. Our large engine flying hours currently account for around -- are currently around about 50% of 2019 levels. And so if you put that with the 43% average in the first half of the year, that's approximately 46% year-to-date. Engine flying hours in business aviation remain above the 2019 level.

However, the pace of travel recovery remains uneven as countries are managing the ongoing challenges of the COVID-19 pandemic. And events over the last 10 days or so, bring that to mind.

Moving on to our Defence business. Current trading is in line with our expectations with a steady demand from customers. And in September, we were delighted to have been chosen for the B-52 replacement engine program, and that's an agreement to power the U.S. fleet of 76 8-engine aircraft for the next 30 years. It's a significant contract win for Rolls-Royce, and the initial phase of the contract for testing and development has a value of around \$500 million, and the total contract is valued at \$2.6 billion.

In Power Systems, the recovery of customer demand in many of our end markets is driving good growth in order intake. But as a shorter-cycle business with higher inventory turnover, Power Systems has more exposure to the current global supply chain disruption than either our Civil Aerospace or Defence business, and the significant near-term supply chain pressure that we're seeing right now looks set to continue for some time. Meanwhile, of course, we're focused on supply chain management and procurement practices that are helping to mitigate the impact in 2021. We're closely monitoring that as a business risk for 2022.

Elsewhere in the business, we're making good progress with new markets, successful funding for Rolls-Royce SMR and significant achievements in Rolls-Royce Electrical. Rolls-Royce SMR, small modular nuclear reactors, moved into its second phase with a special-purpose vehicle established, support from investors and from the U.K. government. The funds raised so far support the U.K. Generic Design Assessment process for new nuclear power plants and will help identify sites for the manufacture of the power plant modules.

And in Rolls-Royce Electrical, we're very proud to claim that our Spirit of Innovation aircraft is the world's fastest all-electric aircraft after it recently hit a top speed of 345 miles per hour, which was well over 100 miles per hour faster than the previous record over a prescribed 3-kilometer course. This achievement has also provided us with invaluable insights, though, into aerospace battery systems, which we will, of course, be applying in other new markets like urban air mobility.

These investments in net zero technologies and the solutions also help us to grasp the tremendous commercial opportunities of the global energy transition, and that sits behind driving our long-term value. It all underpins our strategy of creating a better quality and more balanced business, which can deliver significantly improved returns and cash flow into the future.

Now with that, then, enough of a summary. I'll hand back to the moderator, and Panos and I will take your questions. Thank you.

Question and Answer

Operator

[Operator Instructions] Our first question comes from Celine Fornaro with UBS.

Celine Fornaro

UBS Investment Bank, Research Division

I have two, if I may. The first one is if you could maybe elaborate a little bit more on the cash performance where you flagged some better trading dynamics leading to a slightly better cash flow for this year. So maybe you could provide a little bit more color on what happened there and what is going on and what could be sustainable for 2022. So stepping a little bit away from the concessions debate.

And my second question would be on the Power Systems performance, where it seems that the message for this year is that you seem to be making or landing where you wanted to land, but a bit of a degree of caution on 2022. Is that more on top line or on profitability?

Warren D.A. East

CEO & Executive Director

Okay, thanks. Panos, do you want to take that one?

Panos Kakoullis

CFO & Executive Director

Yes. Just -- thanks. In terms of free cash flow performance for '21, if you take out the concession point, as you've highlighted, so we had guided to GBP2 billion outflow originally. The GBP 300 million moves from this year to next year to make GBP 1.7 billion. And what we're saying, it's both a combination of trading performance and also the restructuring, the benefits of that coming through quicker than we had originally planned for. And that's a continuation of the theme that we highlighted in August when we set out the half year results. So it's a little bit better than GBP 1.7 billion is where I'd be looking at.

In terms of -- you asked what that means for FY '22. We see the flip from -- of the concessions from one side to the other side of the year-end. We'll give guidance on '22 when we get to our full year results.

And I think in terms of Power Systems, which was your second point, and I think you -- the -- we're not short of demand on Power Systems. There is a lot coming through. We've got a very strong order book. It is actually fulfilling that demand. Where there's -- effectively, if you look across supply chains across the world, there's just some indigestion as a result of bounce back in demand.

In terms of impact this year, think of it in terms of low tens of millions. There is definitely risk that we're highlighting as we go into next year. We'll update you on that as we go into next year, but it's something that we manage very, very carefully. It's not a demand point, it's more around fulfilling that demand.

Operator

Our next question comes from David Perry with JPMorgan.

David Howard Perry

JPMorgan Chase & Co, Research Division

Yes. One question for Panos, one for Warren, please.

Panos, back at the H1 results, you said one of your goals would be to set and achieve medium-term targets. We just had MTU and Safran in the last few weeks. You gave quite detailed guidance all the way through to '24, '25. So I just wondered, how far away or close do you feel rolls-Royce is in being able to help us with some guidance there?

And then the one for Warren, please. It's an ESG question. I'm just curious about the Civil Nuclear, the SMR opportunity, which looks exciting. I just wondered, is it completely tied to owning forever the nuclear submarine propulsion business? Can the two technologies ever be separated? Or do you have to keep ownership of the military piece to support the SMR opportunity?

Panos Kakoullis

CFO & Executive Director

Thanks, David. In terms of your question on medium-term targets, as you'd have seen from the update here, very focused on delivering on the commitments that we've already made and making sure that we crunch through those and on other promises. We will give guidance on '22 as we go into '22 with those results and then look at the nature of what that guidance might be you've -- I've highlighted before around getting broader than just free cash flow to make sure we got a more balanced view on guidance.

In terms of looking more at the medium term, we'll let that develop as we go through next year. We're going through sort of 5-year planning processes at the moment. As we go into next year, we'll look at how we roll those out.

Warren D.A. East

CEO & Executive Director

And on your specific one about the submarines, David, well, a couple of observations. We've set this up as a special-purpose vehicle. Rolls-Royce currently owns approximately 80% of that, and we probably will, as time progresses, get some additional third-party investments in there. But I think for the foreseeable future, you will see us continue to own a significant majority of that business.

Obviously, from a technology point of view, this is a low technology risk venture because we're taking six decades of experience in submarines and applying it to a new market space. And there's considerable strengths in that.

Also, from a technology point of view, these are very long development cycles. And one of the challenges we have is you have a bunch of engineers who are doing the development phase, and then you go into the sort of productization phase and then the support phase, and the design engineers that you have haven't gotten necessarily another program to work on. So it's quite handy to have a couple of different markets to be -- to keep that expertise in-house.

Having said that, SMRs, by the time we get into the early 2030s, if the -- particularly the off-grid opportunities that we've talked about to generate hydrogen, green -- proper zero-carbon hydrogen and proper zero-carbon synthetic fuel, if they materialize, then, of course, the size of this business could completely dwarf the size of Rolls-Royce today. And so that will be for another generation of management to work out how to structure that at the time.

Operator

Our next question comes from George Zhao with Bernstein.

George Zhao

Sanford C. Bernstein & Co., LLC., Research Division

I guess first question, how are you evaluating when China could reopen its borders to traffic because that's a huge part of what 2022 could look like?

And then second question is on the B-52 win. Can you talk about how that's going to impact the cash flow over the next few years?

Warren D.A. East

CEO & Executive Director

Okay. Well, let me start with China, where there are plenty of commentators out there. We listen to exactly the same intelligence that you do. We sometimes have meetings with ambassadors and those sorts of people. Frankly, we don't get a lot of extra intelligence that way.

China has been dealing with the pandemic in a very binary fashion, full on, full off. And we can see that behavior in the domestic routes that we power in China as well, where it's very volatile. One minute, the routes are completely open and we're back at 2019 levels of engine flying hours. The next minute, it's full off.

The international bit, our intelligence is that this will be a long way out, probably towards the end of 2022. But who knows? As I say, we've seen healthy recovery in our domestic position in China. Obviously, there's cargo, and China has continued to put on flights for cargo.

So our international-related China stuff is at around about 30% of our 2019 levels, while domestic has been much higher. So it's not completely on-off, but it's very much daily change from the Chinese authorities, and we don't really know when the international one is going to fully open up.

Sorry, on B-52 -- yes, sorry. Sorry, B-52. It's a development phase at the moment, and engine supply will happen, I believe, in the sort of period from about '28/'29 through to 2038 or so. And we have a contract at the moment for the development phase. I said that's about \$0.5 billion over that period. So you can do the arithmetic and lay that across the next 5 years.

Operator

Our next question comes from Nick Cunningham with Agency Partners.

Nick Cunningham

Agency Partners LLP

Yes, a couple of questions. On Defence, I think you're indicating sort of flattish, which is in line with what you said back in March, if I remember rightly. But you did a very strong first half. So that would obviously imply a weaker second half. Is there any significance to that? Or is that just some detailed timing issues that don't mean anything for going forward?

And then on the rebate question on 787. I think you said you expected GBP 300 million of rebates to be paid in the second half. I presume that was your expectation as of August. If we look at the total outstanding, if you like, total customer cash you're carrying that you expect to pay back to them, it involves a lot of supposition on our part to try and get to an estimate. I get to about GBP 1 billion. Is that in the right sort of ballpark? Or is it horribly wrong?

Warren D.A. East

CEO & Executive Director

Okay.

Panos Kakoullis

CFO & Executive Director

Sorry, effectively -- I think we -- you're right, Defence was stronger in the first half than we had originally anticipated, and it's purely a timing thing, Nick. So we had a higher proportion of sales of spares in the first half, and that tends to sort of happen more second half in other years. So it had a skew compared to our plan. So we end up, full year, where we expected to be. Just first half, second half switched a little bit in terms of phasing.

Warren D.A. East

CEO & Executive Director

And on the concessions, we're being pretty explicit about GBP 300 million worth of concessions slipping from one side to the other. And most of the concessions are related to the 787 program. And we've had a bit of concession flow this year on the final deliveries for 380s. But apart from that, it's now going forward pretty much all related to Boeing 787 deliveries. And obviously, we're somewhat at the mercy of Boeing's production plans.

Nick Cunningham

Agency Partners LLP

Just to sort of narrow down a bit, obviously, I think, roughly 105 that Boeing has in inventory. Is your portion of that sort of proportionate to your normal market share sort of 35% to 40%?

Warren D.A. East

CEO & Executive Director

Yes, I would take that as a good rule of thumb. I mean don't forget, a concession on an individual aircraft is not a sort of fixed price because we have a fixed price that is agreed, a list price with Boeing. But then, the actual concession for an individual aircraft that gets delivered will depend on the commercial arrangement that we reached with that airline.

So as long as you work with fairly sort of big numbers of aircraft, you are right. But as the numbers of aircraft get smaller, then I'm afraid you just have to listen to the numbers that we disclose.

Operator

[Operator Instructions] Our next question comes from Harry Breach with Stifel.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

Yes. Can you hear me?

Warren D.A. East

CEO & Executive Director

Yes.

Panos Kakoullis

CFO & Executive Director

Yes.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

Yes, great. Can I just ask maybe sort of a couple of slightly more technical ones? I guess first of all, you might remember about a year ago you guys gave us the sort of rule of thumb number of the GBP 30 million delta for every 1% change in engine flying hours versus the 2019 baseline. Is that still a sort of good working assumption for us to be using going forward?

And secondly, just thinking a bit about the time and materials side at civil. I suppose what I'd say is looking at the broad market, it looks as if shop visit activity sort of across all the air engine companies has been picking up fairly strongly in the third and fourth quarter. Can you give us some feeling about how T&M revenues activity are picking up for you in the second half of this year?

Warren D.A. East

CEO & Executive Director

Do you want to say the rule of thumb, Panos?

Panos Kakoullis

CFO & Executive Director

Yes. The rule of thumb, as you called it, that we talked about just over a year ago, it's an okay approximation, and it was done at a point in time given the engine programs and where they were at that particular point in time. But -- so going forward, it's not a bad thing to use. It's not one that I overly use within the business but not a bad thing to keep in mind.

Warren D.A. East

CEO & Executive Director

And on the shop visits and the time and materials, well, our proportion of time and materials activity hasn't sort of particularly changed. I think that what you really want to think about is the shop visit activity. And there has been, generally around the world, a pickup in shop visit activity as aviation generally has grown back. But of course, don't forget, a lot of that, as seen by our competitors and others in the sector, is around short-haul travel.

We're very focused on our fleet, which is primarily focused on long-haul travel. And right now, we can anticipate a significant pickup in shop visit activity. But this is one of the things that we have to manage in a fairly agile way because, as we said in the introductory remarks, the recovery is -- it's not linear. It will be bumpy. There are steps forwards and steps backwards. And emergence of variants and things is a step backwards, but the underlying trend is all forwards. So that underlying trend will drive shop visits that is driving an underlying significant step-up in the load on our factories to build components for next year.

But in the detail on a week-by-week basis, we'll be looking at the actual demand for components from shop visits, whether that's paid on a time and materials basis or on a long-term service agreement basis. As far as we're concerned, the difficult bit is managing that load on our factories as the shop visit ramp comes towards us. But ours is going to be behind the rest of the industry because we're not servicing short-haul aircraft.

Panos Kakoullis

CFO & Executive Director

And if I just sort of joined your 2 points together as well, when you think about the rule of thumb, it's not -- don't think of it as 100% because if I'm -- if we've got lower engine flying hours, which means there's lower cash inflow from that, that means most likely, and it's what we saw this year, shop visits get pushed out. So that cash outflow from shop visits moves out in addition to the inflow from lower engine flying hours.

Operator

Our next question comes from Christophe Menard with Deutsche Bank.

Christophe Menard

Deutsche Bank AG, Research Division

I had quick questions. The first one, on B-52, more specifically on free cash flow, should we expect a prepayment in the coming years? Or is it really we should think about it as the tranches and seeing prepayment in 2028 when you -- or 2027 when you -- or before the first deliveries of engines?

The -- on the SMR, did you actually dispose a 20% stake and received GBP 145 million in cash? Or is it me misunderstanding? And if you received -- I mean, if that was cash, did you receive it in 2021 or is it for 2022?

And the last point is on ITP. You haven't mention any retained cash that you could have. Could you give us a range of what you could retain when the transaction closes?

Warren D.A. East

CEO & Executive Director

Yes. Okay.

Panos Kakoullis

CFO & Executive Director

So on -- I'll pick up each of those. On B-52, on prepayments, clearly that's commercially sensitive. We will factor that into guidance as we go forward. But as Warren has said, that is likely to be in the more medium term, the impacts of that, than the shorter term.

SMR, the -- effectively, the way the transaction works, you are right, there is a disposal of 20%. But don't think of it as an M&A transaction because it's effectively disposal of 20% to bring in funding into that particular business. So it's not used for anything else other than going into that business. The profile of

that cash comes in over the next few years to match the actual funding requirements for the business as it develops the technology and starts to build out.

On ITP, the retained cash point, clearly that's something that we've not disclosed at this stage because it is commercially sensitive, and it is subject to negotiation, where we end up with. There is a floor to it, though, but I'm not going to disclose that now.

Operator

Our next question comes from Wasi Rizvi with Redburn.

Wasi Rizvi

Just a couple. One, if we could just think about free cash flow for next year because you talked about a GBP 300 million swing for next year. But then I guess restructuring is going better. And the engine fly hour recovery, who knows? But as we sit here today, are you thinking that we are probably still positive next year? And what -- when you think about in regards to what could change that?

And then a second one was just on Power Systems to better understand the supply chain issues you've talked about. If you could kind of pinpoint maybe what the pinch points are, whether it's more transport, whether it's more component availability, so we just know which -- or what to look at and what to look for and easing and to get more comfortable on Power Systems heading into next year.

Warren D.A. East

CEO & Executive Director

Yes. Okay. Let me take that then. On the free cash flow for next year, I mean, yes, we're clearly signaling this GBP 300 million of concession slipping from year to year, which means we've got a GBP 300 million headwind for next year. Also, we have a sort of lumpy recovery and -- in terms of gradual recovery. And I think engine flying hours, they'll be what they will be. But as we mentioned at the half year, the uptick that the industry looked for and hoped for in the first half of this year did not materialize for the Northern Hemisphere summer period. And so we're going into 2022 at a lower level than we previously expected. So those are all headwinds.

That said, we still expect to be and plan to be, and we're pushing with the things that we can control to be in positive cash territory for next year. When we get to our full year results in February, then we'll give exact guidance. But remember the context. Last year, GBP 4.2 billion of cash outflow. This year, it's going to be better than GBP 2 billion. It's going to be better than GBP 1.7 billion. And next year, it's going to be a positive territory. So there's a fairly well-defined trajectory there on free cash flow.

Now your second question was about specifics on Power Systems. Look, these are the sort of supply chain challenges that virtually every other company on the planet is seeing. Good examples in our business would be where we supply a system with a reciprocating engine and, say, a generator set and some control electronics, and the supplier for the control electronics just can't get the semiconductors. Semiconductors is a big part of those sorts of products. Meanwhile, we've got an engine and a generator that we've sourced, and we can't deliver the whole product. And so that's the type of supply chain challenge that we're seeing. It's not really a freight issue, it's more a component supply issue. And that's what we'll be managing closely as we go through next year.

Okay. All right, well, with that, apparently we have no further questions, so let me just sort of summarize with this morning's messages.

Our financial performance is improving. We're seeing healthy demand in our Power Systems business. The order book is strong and up. We're seeing a gradual recovery in aviation in our civil business. Business aviation is doing well, above 2019 levels. Gradual recovery in the commercial space. We're seeing new opportunities coming through on top of a continued resilient performance in our Defence business.

We're delivering on the commitments that we made around the time of the rights issue. We're ahead of plan with our restructuring program, which is obviously putting us -- giving us great operational gearing for when -- as the top line recovers with recovering markets. We are on plan in terms of our disposal plan

with transactions announced to generate around GBP 2 billion of cash, and we expect those to close during 2022. And we're seeing improving cash flow as well, as I just described.

We're concentrating on controlling the things that we can control, and that's enabling us to deal with volatility. And the pace of recovery in aviation is enabling us to deal with the supply chain issues that we face. And we're focusing our investments looking forward on the huge business opportunity in the energy transition, which will drive significant growth for the future.

So that's where we are now. We'll be back in 8 to 10 weeks, whenever it is, with our full year results and wish you a good, festive season. Thank you.

Operator

This now concludes our teleconference. Thank you all for participating. You may now disconnect your lines.

Presentation

Operator

Good day, and thank you for standing by. Welcome to the Rolls-Royce 2021 Half Year Results Conference Call. [Operator Instructions] Please be advised that today's conference is being recorded. I would now like to turn the conference over to your presenter today, Isabel Green, Head of Investor Relations. Please go ahead.

Isabel Green

Head of Investor Relations

Hello, and welcome, everyone, to our 2021 half year results presentation. With me here today are Warren East, CEO; and Panos Kakoullis, our recently appointed CFO. Warren will begin today's presentation with an overview of our first half performance before handing over to Panos for a more detailed review of our financial results. Warren will then conclude with an update as we look out to the future. In all, they should take less than 40 minutes, leaving time at the end for your questions.

Before we begin, please take note of the safe harbor statement on Slide 2. This results presentation contains forward-looking statements that involve risk and uncertainty, which may cause the actual results to differ materially. The full set of results materials can be downloaded from the Investor Relations section of our website.

Thank you, and over to you, Warren.

Warren D.A. East

CEO & Executive Director

Thank you, Isabel. Hello, everyone, and thank you for joining us for our virtual half year results presentation. As Isabel mentioned, I'm very pleased to be joined today by our new CFO, Panos Kakoullis. Panos joined us in May, bringing with him a wealth of financial experience from over 30 years at Deloitte, and we're delighted to have you on board, Panos.

Since our full year results, we've also appointed a new chair, Anita Frew, who joined the Board a month ago and will succeed Sir Ian Davis on the 1st of October. Anita is an experienced chair with in-depth experience from 2 decades of Board appointments, both in the U.K. and internationally, and we look forward to utilizing her skills for the benefit of the group.

I'd also like to take this opportunity to thank Sir Ian Davis for his outstanding contribution and dedication to Rolls-Royce and his stamina. We wish him the very best for the future.

This half, we also appointed Mike Manley as Non-Executive Director, and he joined the Board from the 1st of July. Mike has led businesses in the automotive sector in Europe, Asia and the U.S. and we value what his capability and experience will bring to us.

This half, however, has not only been busy in terms of Board appointments. It's also been a great chance to get out on the road again. So here, on the slide, are a couple of examples. In late May, we opened our new testbed in Darby. Testbed 80 is the world's largest and smartest indoor aerospace testbed and covers both production and experimental testing requirements.

And it was a major milestone for us. It's essentially a scientific instrument that's about the size of a cathedral with the most advanced testing technology we've ever used. We were delighted to have the right honorable Kwasi Kwarteng, Secretary of State for the Department of Business, Energy and Industrial Strategy to join us for the opening ceremony.

I also recently joined U.K. rail operator Chiltern Railways as they celebrated their 25th anniversary, and they chose that event for the first journey on the public rail network for their new hybrid flex train. That

was the result of a joint project that we've undertaken with Porterbrook, the U.K.'s largest owner of passenger rolling stock to bring hybrid trains to the U.K. network.

The hybrid flex uses our MTU Hybrid-PowerPack, and [Jens Gorcka] with me in the picture is our engineer who's been babysitting it through several months of final trials and testing. This is just one of many examples of how our technology is playing a pivotal role in the transition to net zero. And we were absolutely delighted to be part of the groundbreaking team alongside Chiltern Railway and Porterbrook. And that hybrid flex is due to begin regular services in September.

So now moving on and looking at our first half highlights. We've seen good progress and improvements in many areas across the group, and we're delivering on our commitments. Business performance is in line with our expectations and guidance, and we're moving forward with new business opportunities for future growth. In Civil Aerospace, we've made excellent progress with the restructuring program, and I'll go into that in a bit more depth in a moment.

Business Aviation had a strong performance with flying activity returning to levels that we last saw in 2019, and that's also been the case for our large engines that are operated on domestic routes in both the U.S. and China.

And in Defence, there has been demand for technology-led solutions with the U.S. Department of Defense and the U.K. and Ministry of Defense remaining completely committed to serious modernization and decarbonization of their fleets.

In Power Systems, we've seen a recovery in our order intake and book-to-bill ratio with orders up 19% year-on-year, led by demand improvements in all our markets, but particularly in marine, governmental and power generation.

In June, we went public with our net zero pathway, and we announced targets which set out our plan to develop new technologies, accelerate the take-up of sustainable fuels and drive step change improvements in fuel efficiency, and as well as decarbonizing our existing businesses. We're making disciplined investments in some exciting and potentially very significant new growth opportunities to lead the way to net zero power with our innovation and engineering excellence and grow the civil aero business into subsectors that are new for us.

Turning to the next slide. Let's have a quick update on the progress that we've made on the restructuring program we announced 15 months ago. That's been focused on our Civil Aerospace business. We committed to a reduction of at least 9,000 Rolls across the group. To date, we've removed around 8,000, and we remain confident of reaching our target. That will be a reduction in civil aero of about 1/3 of management roles with commensurate reductions across staff functions, engineering and manufacturing.

Our footprint rationalization is progressing well. We launched our large engine for assembly in Singapore as we consolidate that activity here in the U.K. We've moved equipment from Crosspointe in the U.S., and ahead of closing that facility, the machines were already up and running in Darby and contributing to improved productivity there.

And when complete, we will have consolidated 11 sites down to 6, delivering productivity and operational cost benefits. And that builds on our investments in efficiency that we made previously, and we continued to roll out during 2020. So all in all, we're now achieving significant reductions in cycle times and overall productivity improvements.

With CapEx reductions as well and operational cost improvements, we, therefore, remain on track to deliver cash cost savings of at least GBP 1 billion in 2021 and over GBP 1.3 billion of sustainable run rate savings by the end of 2022.

Moving on to the next slide to summarize what this means for our financial performance. We've had a solid start to the year with improving cash flows and profits as expected. Our business split is looking more evenly balanced.

Our underlying operating profit increased significantly at GBP 307 million. And our free cash flow, though still in negative territory, was also markedly improved to just under 1.1 -- GBP 1.2 billion of cash outflow for the half as we transition towards positive cash generation.

Our restructuring program is delivering results. And as I said a moment ago, we expect to achieve over GBP 1 billion in savings versus 2019 this year. This also makes us a leaner organization with a lower breakeven and much better operational gearing as growth resumes. And our disposal program is also progressing well towards our target of at least GBP 2 billion in proceeds.

With GBP 7.5 billion of liquidity and no maturities before 2024, we're confident our position is strong and not dependent on the pace of Civil Aerospace recovery. And in addition, of course, we expect to generate funds as we execute on our disposals activity.

So I'll now hand over to Panos for a more detailed review of our results.

Panos Kakoullis

CFO & Executive Director

Good morning, everybody, and thank you, Warren. I'm delighted to be here taking you all through my first set of results. I'm very excited to have joined Warren and the rest of the Rolls-Royce leadership team in helping the business achieve its true potential in the coming years.

And what attracted me most is the opportunity to help fulfill that potential by very clearly delivering on the commitments we have made; by building a balanced, profitable and cash-generative business; by getting the balance sheet back into good shape; and by helping capture the demand and upside created by the energy transition. So let's just move on to the numbers.

Our half year results, which we presented here on an underlying basis for the continuing businesses in the group, where they show a solid start to the year. Our restructuring program is very much on track and has helped to drive our return to profit in the period.

Underlying revenue, that stayed steady, only 2% lower than the first half of 2020. And we've seen a much more balanced contribution from across the business units. Last year, well, the first quarter was relatively unaffected by the emerging pandemic, and as you'd expect, provides a challenging comparative whilst the second quarter last year was severely impacted. In fact, April 2020 was the low point for industry flying hours. This half year has been much less volatile despite some continued uncertainty with gradual recovery across the period.

Operating profit was GBP 307 million. This reflected the significant cost savings from the restructuring program that was largely focused on Civil Aerospace. We've also benefited from some favorable timing and the mix of activity in both Defence and Power Systems. In addition, last year's underlying operating loss of GBP 1.6 billion included GBP 1.2 billion of one-off charges in Civil Aerospace, mostly related to the impact of COVID-19.

In the first half, we've incurred GBP 174 million of financing costs. This primarily reflects the interest charges and facility fees on the debt and facilities that we secure to underpin our robust GBP 7.5 billion liquidity position. That liquidity provides us with the confidence in our ability to withstand ongoing uncertainties around the pace of recovery in international travel. Financing costs in the prior period where they included a GBP 1.5 billion one-off charge on closing the overhedged position.

Turning now to Civil Aerospace. We've seen an overall improvement in performance driven by the significant cost actions we've taken. In addition, we're seeing a recovery in business aviation and domestic flying activity, where our engine flying hours have returned to 2019 levels during the period.

Large engine long-term service agreement flying hours were 43% of the 2019 level, up from 34% in the second half of 2020. And this gradual upwards trend is still constrained by ongoing international travel restrictions and the uneven progress of vaccination programs around the world.

During the period, we completed 284 large engine shop visits, 92 of which were major overhauls. Demand for new aircraft is expected to follow once existing fleets are well utilized. We delivered 100 large engines

and 48 business jet engines in the first half, broadly in line with expectations. Civil revenue is GBP 2.2 billion, some 13% lower than the comparative period. We've returned to operating profit at GBP 39 million.

We continue to focus very heavily on the areas within our control and have seen substantial sustainable cost benefits from our restructuring program. We are well on the way to reducing the size of our Civil Aerospace business cost base by around 1/3.

Our Defence business, which is set out on the next slide, continues to perform well. Revenue of GBP 1.7 billion is up 17% year-on-year. Operating profit is at GBP 269 million, up from GBP 210 million in the first half of 2020.

We've seen continued demand and improved operational performance. This is driven by the continued resilience of our submarines business, coupled with early delivery of spare engines and higher spare parts sales. That mix, which delivers better margins, has historically been more second-half weighted.

Now that favorable timing of mix in the first half is expected to result in a stronger first half versus second half performance. So our full year expectation is for broadly flat revenue and profit in Defence are unchanged. We have a strong order book, giving us confidence in that outlook with more than 70% cover for our expected sales in 2022.

In Power Systems, which we set out on the next slide, revenues were broadly stable in the first half with an increase in services offset by a reduction in OE deliveries. Operating profit was GBP 41 million, up from GBP 33 million in the first half of 2020. We've seen a rise in higher-margin aftermarket spare parts, partly offset by low factory utilization on OE manufacturing.

Now the other point of note here is that order intake was up 19% to GBP 1.4 billion. This is led by improved demand across all of our end markets with particular focus in marine, governmental and power generation. Most of that recovery in OE order intake is expected to be realized as revenue over the next 6 to 12 months. We're also seeing interest in lower carbon solutions growing, and we continue to wisely focus our R&D investment on these products.

Turning to the next slide. We've set out our funds flow. We saw a GBP 1.2 billion cash outflow in the period from our continuing operations, which is a significant improvement on the GBP 2.9 billion outflow last period. And just to help you understand it a little bit better, we've grouped this movement into 3 buckets.

Firstly, we saw a trading improvement of around GBP 1 billion. This looks through some of the noise of noncash items and was driven by a fundamental improvement in EBITDA, thanks in large part to our cost savings. Our capital expenditure was lower too, in line with planned spend as part of the restructuring.

Secondly, our working capital outflow was GBP 1.2 billion better than the first half of last year. This was mostly due to the non-repeat of the unwind of invoice factoring. Our concession balance fell by GBP 239 million, which was lower than we planned for due to third-party deliveries moving out. Our strong liquidity position means we are not sensitive to the precise timing of the unwinding of these delayed concessions.

Thirdly and finally, there are around GBP 500 million of other headwinds year-on-year. Payments relating to the cash cost of closing out the overhedged position in 2020 increased in line with our previous disclosures. And you can see the detail of that in our supplementary slides.

Interest and facility fees increased as guided with higher average debt and committed fees on facilities that strengthen our liquidity position. Pension cash costs were higher due to a one-off catch-up on a payment that was deferred from last year.

Our free cash flow is continuing to improve. The combination of restructuring and recovering end markets is putting us on track to get back to positive cash generation. We remain confident we can deliver on our guidance for around GBP 2 billion outflow for the current year.

Turning now to our balance sheet on the next slide. We ended the period with net debt before leases of GBP 3.1 billion, and we expect to end the year around GBP 4 billion. To rebuild our balance sheet and get back to an investment-grade credit profile in the medium term, we are very focused on executing on our

disposals program, together with tightly managed operational improvements in driving positive free cash generation from the business.

A strong balance sheet is important to us. We will balance the pace of that rebuild with the investment opportunities across our portfolio to make sure that we maximize long-term return for our shareholders. Our liquidity position is strong at GBP 7.5 billion. That is after repaying the EUR 750 million bond and the GBP 300 million COVID corporate finance facility in the period. And we've recently extended the 2022 GBP 1 billion unutilized loan facility to 2024. That means all of our debt maturities extend to at least 2024.

We're confident in our liquidity position. It's strong, and we're not dependent on the pace of Civil Aerospace recovery. The disposals program is progressing well and we continue to target proceeds of at least GBP 2 billion. We can't say much in detail here because of the ongoing processes, but we are having very constructive discussions and expect to achieve proceeds within the next 18 months.

Early this year, our announced agreement to sell Bergen Engines was interrupted. We're now back on track, and you'll have seen the agreement that was announced yesterday. We're focused on getting the right results for our shareholders, and we will continue to do so in a measured way with plenty of liquidity, and there are no near-term pressures as we rebuild the balance sheet. We will focus on making sure that we achieve the right value for our investors.

Moving on to outlook. We've made a good start to 2021, and our guidance for the full year is unchanged. We continue to expect to turn free cash flow positive sometime during the second half of this year. We also expect a full year free cash outflow of around GBP 2 billion, which would represent an improvement of over GBP 2 billion on 2020.

This outlook was supported by continued resilience in Defence, growth in order intake in Power Systems, a gradual recovery in Civil Aerospace and our actions to drive down costs. As previously highlighted in our full year results in March, our guidance does, of course, remain sensitive to the timing of OE concession outflows on already delivered wide-body engines.

Looking further ahead, we are confident that when border restrictions are lifted, the recovery of international travel will accelerate. The recovery we are already seeing in domestic aviation is encouraging. Free cash flow of at least GBP 750 million is still achievable in a 12-month period when engine flying hours exceed 80% of 2019 levels. However, given the uncertain pace of recovery in international travel and looking at industry forecasts, it is unlikely that this will occur in 2022.

We have a clear pathway back to a net cash position in the medium term. We have plenty of liquidity to manage the uncertain pace of the recovery in engine flying hours in the meantime. We're positive on the near-term opportunities in both Defence and Power Systems. The opportunities in our new areas of business, electricals and SMRs. We remain agile in our response to external factors and continue to deliver on our restructuring, rebuilding our balance sheet and investing in our future.

Before I hand back to Warren, let me just give you 2 minutes on what I'm very much focused on going forward. I very clearly heard 3 things in meeting our investors: One, make sure you deliver on the near-term commitments you've made; two, simplify financial reporting, make it easier for us to understand the business; and three, set achievable targets for the medium term and then achieve them or even beat them.

And here are my clear priorities, which I'm going to keep returning to and reporting against. We need to deliver on our commitments, and right now, the focus for me is to realize the sustainable savings from our restructuring program, making sure the costs go out and stay out. That gives us a clear route to rebuilding our financial position.

Last year, that was a very challenging one for Rolls-Royce, and we were well supported by our investors, lenders and the U.K. EF. As a result, we have around GBP 3 billion of net debt today. That is too high. We will reduce it over the coming years.

Secondly, we need to simplify. We need to break down the complexity in our financial communication. There is progress to be made in having a more straightforward way of explaining the finances in our business. I've taken some steps already to reduce the complexities and there is more to come.

And finally, as we look in setting those targets, we look to the future, we're going to continue to wisely invest in that future. We're at an exciting juncture with huge opportunity to lead our markets in the journey to net zero. We also have the opportunity to take our innovation and technology into new markets with incremental growth. And we won't stop investing in our current products. There are good near-term returns available from increasing durability and efficiency. So 3 things: deliver on the commitments, simplify how we report, and invest wisely.

With that, I'll hand back to Warren.

Warren D.A. East

CEO & Executive Director

Thank you, Panos, for the clarity there on our half year results, and thank you for the insight into the priorities that we've been discussing. I'm now going to turn to the future and the opportunities to further progress our business.

So as many of you know, in June, we launched our net zero pathway and its targets. And although we operate in some of the hardest areas of the global economy to decarbonize, we showed our commitment to playing a fundamental role in meeting the challenge of climate change.

Now that doesn't mean that we're stepping away from our traditional markets rather, that we're applying our engineering expertise and technology to find innovative and more sustainable solutions, which enable our customers to do things like continue flying without damaging the environment. At the same time, those solutions can generate additional growth opportunities for our business.

On the left-hand side, you can see how a focused range of our interrelated technologies is applicable to decarbonize the complex critical systems in which we operate within a broad categories of energy, transport and to the built environment. So there's not time today to discuss that part of the slide in depth.

The main graphic demonstrates our technology pathway to net zero in 3 broad categories with fuel efficiencies, new technologies and sustainable fuels, we can make a huge difference to Scope 3 greenhouse gas emissions by 2050.

On the right-hand side, you can see compatibility with sustainable fuels plays a central role as we outline some of our net zero targets and commitments. These are also reflected in our remuneration policy.

By 2023, we aim for all of our in-production commercial aero engines and our most popular diesel engines to be compatible with sustainable fuels. And by 2030, for all of our new products to be compatible with net zero operation. And in our Power Systems business, we aim to achieve a 35% reduction in lifetime emissions of new products sold. And by 2050, our ambition is for all of our products to be compatible with net zero operation. Now these are not simple goals. These will require collaboration across our businesses within Rolls-Royce as well as within a growing and evolving ecosystem.

So looking to the future. Looking to our future strategy, it is about enhancing profitability in our existing businesses and developing growth opportunities triggered and enabled by the energy transition. The foundation is our large installed base.

We're driving value in our existing portfolio through product enhancements that increase the efficiency of our products, so delivering more value to the customer, and also increasing durability in our civil business, for instance, leading to increased time on wing and therefore, increased profitability of our long-term service agreements.

In Civil Aerospace, we're now entering a lower investment phase as our engine programs mature. Now our focus is on further productivity and efficiency gains, for instance, with increased use of digital technology. Meanwhile, we're ensuring compatibility of our civil and business aviation engines with sustainable aviation

fuels, and our UltraFan architecture will deliver a further step change in efficiency, making it easier for our customers to adopt the more expensive SAFs in the long run.

In Power Systems, we have a loyal customer base with replacement cycles that are regular and relatively predictable. And that gives us a great opportunity to work with those customers as we convert together, driving penetration of greener technology based around hydrogen, hybrid, and pure electric solutions. We're also exploring ways to expand our network further into newer growth regions globally.

In Defence, our products have long life spans, which require us to provide upgrades and aftermarket services. We're also making investments in adjacent opportunities to expand our product portfolio further. And as mentioned at the full year results, we estimate over GBP 7 billion of lifetime value from tenders that are related to the B-52 re-engining program and the U.S. Department of Defense Future Vertical Lift program. We're also working with our Defence customers on compatibility with sustainable fuels and opportunities for new and greener solutions.

Now the energy transition also creates opportunity for new business. In Rolls-Royce Electrical, we're focused on the electrification of aviation. For us, that's about applying new technology to a market that we know very well indeed. For instance, safety and weight considerations, of which we have a thorough and deep understanding, are absolutely paramount.

This offers some of the most exciting and innovative areas for growth outside of our current portfolio. We now have over 300 engineers working in our aerospace electrical business, a fourfold increase over the last 2 years. And since we last updated you at the full year results, we've made excellent progress on the development of our all electric propulsion systems for smaller aircraft.

Now our commercial contract with vertical aerospace, left-hand picture on this slide, is progressing very well around the eVTOL vehicle, and they recently announced preorders for 1,000 aircraft with a potential value of over \$4 billion. Vertical also recently announced their intention to list on the New York Stock Exchange.

In another subsector, we announced a collaboration with Tecnam and Widerøe to cover the development and delivery of the zero-emissions P-Volt commuter aircraft, that's the middle picture on this slide, targeting an entry into service in the middle of the decade. We're also now testing a 2.5-megawatt power generation system used in hybrid electric propulsion. We saw a picture of that generator also on the front cover of this presentation.

We'll talk more about Rolls-Royce electrical and for that matter, SMRs, our full year results, reflecting the way that we create focus on these areas internally in line with normal requirements for segmental reporting.

Now it's not just about developing new technology for markets we know well. The energy transition is also an opportunity to take technology we know well and apply it to new markets in pursuit of growth, and that's what we're doing with SMRs. So turning to SMRs, or small modular reactors, it's not just about developing new technology for markets we know well. No, the energy transition is also an opportunity to take technology that we know very well and apply it to new markets in pursuit of growth, and that's what we're doing with SMRs.

Firstly, SMRs it's important to note that as with Rolls-Royce electrical, any SMR revenue generated will be additive to the current portfolio. And the reason why we see so much potential in SMRs is because they're affordable for both on-grid and off-grid applications, providing zero carbon nonintermittent electricity, but they're also scalable to create large quantities of zero carbon power in a reasonable time frame, and it's increasingly clear that the world needs large-scale practical solutions fast.

It's important to note that this isn't just about electricity for the grid. SMRs are ideal for the production of zero carbon hydrogen, synthetic aviation fuel, and other sustainable fuels so further enabling the production of clean energy for a range of different sectors and applications. And those countries around the world seek to comply with their legally binding carbon abatement targets, the stable supply of low-cost power becomes incredibly important. Our SMRs fit that need perfectly, creating a substantial global

opportunity, even though our initial efforts, highlighted here in the time line on the slide, are focused on a U.K. grid-based application.

We're particularly excited just now as we're in the process of forming a special purpose vehicle to take the program forward into the next stage of its development and we intend to enter the U.K. regulatory process this calendar year. And we'll step through the regulatory and policy processes in tandem, and we'll be targeting first power to the U.K. grid around 2030 with export orders following shortly thereafter.

So let's summarize. I'll reiterate some of the key points for a takeaway. First and foremost, we're delivering on our financial priorities. Our restructuring is on track and delivering the results that we expected. Our disposal program is also progressing well towards our target of at least GBP 2 billion in proceeds. Our cash flow and profitability are both showing significant improvement, and they're on track for our 2021 guidance. And we have the strong liquidity and clear pathway needed to get back to net positive cash and an investment-grade profile.

Furthermore, as we look forward towards a low-carbon future, we will play a leading role in the transition to net zero carbon emissions by 2050. And that is through both decarbonization of our existing businesses and through multiple exciting growth opportunities for incremental business. And with that, I'd like to...

Question and Answer

Operator

[Operator Instructions] And the first question comes from the line from Andrew Gollan from Berenberg.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

Welcome, Panos. 2 questions, please. First one is on the concession payments issue. So what is the expected benefit to free cash flow this year from the deferred payments on the Trent 1000? And compared to your assumption when you first guided to a free cash flow -- or free cash outflow of GBP 2 billion? And I guess, effectively, is it just an offset to the lowered hopes engine flying hours? So that's the first question.

Second question on the all fleet exposure. So pre-COVID, can you say what the percentage of engine flying hours were from Asia Pacific, ex-China? And given the slow progress of vaccinations there, what are your expectations for flight hours in that region in 2022, please?

Warren D.A. East

CEO & Executive Director

Yes. Okay. Panos...

Panos Kakoullis

CFO & Executive Director

I will do. Thank you. Thanks, Warren. Delighted to be here for my first set of results. And I guess, Andrew, what I would say when I look at full year guidance, and one of the things that struck me as I came into the business was this is a very broad-based group with 3 businesses in it. And there are a number of variables, both -- some in our control and some not in our control when we look at that full year guidance.

We've reiterated the GBP 2 billion outflow this year. There are definitely some ups and downs within that. You've mentioned concessions. There are some concessions that could go out and there are indeed some that could come back in. So there is some variability there. There is, I guess, a hedge within that around recovery in engine flying hours as well.

So when I look across the whole group, we're comfortable in reiterating that guidance for this year, when I look at each of the variables, particularly the ones that are in our control. We've sort of highlighted the benefits that we're getting from the cost measures and the restructuring that we've already taken within the group.

In terms of fleet exposure around those details. One thing I would highlight, and you've talked about China in particular, we have seen a recovery in domestic flying hours back to 2019 levels. And we know there is a significant part of that comes from Chinese domestic flight.

Warren D.A. East

CEO & Executive Director

Yes. I think the answer on the regional piece is that, yes, we do have an exposure in Asia and our big customers, Cathay and Singapore, clearly sort of facing reduction compared with where they were pre-COVID. As Panos said, we've been -- we can see the underlying demand in that region from the domestic travel in China.

And it is just a question of how quickly orders can open, and that's a question of how quickly vaccination rates can get to a level to have significant proportions of the population vaccinated. And clearly, that's one of the contributory factors to what we're seeing as a very slow and gradual improvement in our overall engine flying hours.

To answer specifically around the proportions, then it's approximately 20% of 2019 levels of engine flying hours that are exposed to international flights in that part of the world.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

If I could just follow up quickly on the concession payments answer. So if we simply break it down, I mean, at one point, we were talking around a target of GBP 750 million free cash flow at 80% engine flying hours. And if we assume a sensitivity of GBP 300 million or so for 10 points.

So if we take step down on the engine flying hours assumption of 10 or 20 points, say, and then adding a headwind from concession payments catching up, does that indicate a scenario that we could be closer to breakeven free cash flow in 2022? Or is that just too simplistic?

Warren D.A. East

CEO & Executive Director

I think it's a bit too granular. And no, we're on a clear trajectory. I mean, last year's cash outflow, we know was over GBP 4 billion. This year, we're sticking to a cash outflow of around GBP 2 billion. We are sticking with our comments sort of going through to reaching cash positive at some stage during the second half of this year.

And we'll be coming out with some specific guidance on cash for 2022 when we do our full year results. But we absolutely expect to be in positive cash territory by some margin.

Operator

The next question comes from the line from Robert Stallard from Vertical Research.

Robert Alan Stallard

Vertical Research Partners, LLC

A couple from me. First of all, obviously, been a lot of reports of older aircraft being retired and their engines being retired as well. I was wondering if you've seen any impact as a result of parting out of older wide-body aircraft in the first half that was any different from what you saw in the second half of last year? And then on the business jet side, the Gulfstream G700 with the Pearl engine, are you seeing any additional challenges in getting that engine certified?

Warren D.A. East

CEO & Executive Director

Well, no particular changes to the patterns that we've seen on retirements of older aircraft in the first half of this year versus what we saw in the sort of in the second half of last year, really. I mean, and as far as our fleet is concerned, obviously, this impacts things like the RB211s and the Trent 800s. We've got specifics around Trent 900s on 380s, where some of those much larger aircraft have been parked.

I think the thing looking forward for us is how quickly the A330s that have been parked return to service. And if we look there, we were coming into the pandemic, the sort of de facto market leader in terms of share. And that had been a relatively recent, i.e., sort of last 5 to 8 years phenomenon, and therefore, our engines are significantly newer.

And so we would expect that the younger engines on the Rolls-Royce-powered A330s are the ones that will be favored when those A330s go back into service. On the Gulfstream and the new program that we're doing there, there are no particular extra challenges with certifying that engine at the moment.

Operator

The next question comes from the line from Jeremy Bragg from Redburn.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

A couple of questions, please. First one on the breakeven rate for engine flight hours for free cash flow. So sorry, I'll put that a bit better. You're aiming to break even from a free cash flow perspective at some point in the second half of this year, and would you be able to state the engine flight hours required to do that, please?

Second question on engine flight hours again. When do you think you will return to 2019 levels roughly? And that's obviously the net of retirement and deliveries. But I guess where I'm going here is you've taken 1/3 of cost out structurally in civil. So I'm just kind of curious to sort of see your view of when that recovery point is, please?

And then the third question, if I may, please, around R&D. I note that you're spending 75% of gross R&D on sustainable technologies from now. Have you revised your assumptions on the self-funded R&D that you might spend over the next few years, please? And do you think -- do you still think there is a route to market for UltraFan given the lack of any new wide-body platforms?

Warren D.A. East

CEO & Executive Director

Yes. Righto, Panos is going to have the first question, and I'll...

Panos Kakoullis

CFO & Executive Director

Yes. Let me pick up on your first question around breakeven, Jeremy. I think as I mentioned earlier on, there are a number of ups and downs and variables that contribute to our results. Engine flight hours, as you rightly pointed out, is one of them. That's not one that's within our control.

When we reiterated the guidance for this year, that GBP 2 billion outflow and that positive at some point within the second half, we do look at all of those variables. The impact of the restructuring, some of the headwinds that we had in the first half of this year, which we've called out. When I put all of those in the mix, that's how we get confident that we will get through that breakeven rate this year.

In terms of the forecast going forward, when do we get to 2019 levels? There are a lot of industry forecasts out there as to -- we can look at -- you can look out and rather than us adding our own. I'd encourage everyone to look at what the wider industry forecasts are.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

On that though -- Panos, sorry to interrupt. I mean, we can look at the industry forecast, but you've always been quite assertive in the past that you've got a younger and better positioned fleet than the industry on average. So I'm guessing you must have your own separate view on that, please?

Panos Kakoullis

CFO & Executive Director

We do, and you can -- I think you can look historically how we have tracked against those industry forecasts. And I wouldn't expect us to be outlined with those industry forecasts.

Warren D.A. East

CEO & Executive Director

Yes. And again, industry forecasts are not very different from our own expectations of getting back to 2019 levels. And I think we've been fairly consistent that, that is some way off probably in the sort of 2024, maybe even 2025 time frame, we're going to see -- we will see a pickup when international travel opens.

The demand that we're seeing where it has opened is a good indicator that there's plenty of demand there. So we can't be any more clairvoyant than anyone else. It's a few years away before we get back to 2019 levels. And that's an indication of the changed behavior that everybody talks about around travel.

On R&D, then there's no big change to the absolute quantum that we've talked about before. I think what you are seeing in some of our commentary, though, is a tilt towards net zero and lower carbon, and an intention to push that up over the next several years to be 75% of our R&D investments and CapEx investments. And that is a process that we're going through at the moment, fairly disciplined capital allocation over the 5-year -- next 5-year period.

Well, I think that's about it really on the answer.

Operator

The next question comes from the line from Ben Heelan from the Bank of America.

Benjamin Michael Heelan

BofA Securities, Research Division

I had 2. The first one, you highlighted you're making good progress on the disposals, and you said there's not much incremental you can give on those processes. I was wondering if you could give any indication about how you think about the impact to that GBP 750 million of targeted free cash flow when you finally have disposed of those businesses? So that would be the first question.

And then the second question, back on the concessions point because at the very beginning of the year, we were expecting a massive outflow, in particular, from 787 concessions. And I think Panos, you mentioned about GBP 300 million outflow in H1. Are you expecting an outflow on 787 concessions in the second half of the year?

Panos Kakoullis

CFO & Executive Director

So I think your first question was around disposals and the impact of those disposal on free cash flow. It's not a significant impact. And you can see actually within our announcement where ITP is stripped out. So you can see that it's not a significant number.

In terms of the concession payments, we are dependent on airframe of deliveries. And as you know that there are some well-documented uncertainties around that. We do still expect to see an outflow. Some could move out, some could move earlier, but we took those into consideration when we looked at full year outturn on the GBP 2 billion outflow.

Operator

The next question comes from the line from David Perry from JPMorgan.

David Howard Perry

JPMorgan Chase & Co, Research Division

I have 2 questions for you, if that's okay. First one is sort of philosophical on the balance sheet, which you've mentioned you want to improve. And you mentioned specifically the GBP 3 billion of net debt is too high. But that's a very narrow definition of your net debt. It excludes operating leases and a lot of other financial liabilities that may or may not be treated as debt in your eyes.

So I'd just be interested in how you see the balance sheet in and around? And then the second part of that question, if the ITP disposal happens, what do you think the next steps are, whether they can be wholly organic or other external actions might be needed?

And then my second question, please, is you talked about wanting to simplify financial reporting. But I think your predecessors all had the same ambition as well. My view is probably the business model is just too complex. So the question for you is, are you comfortable with the LTSA business model? Or do you think Rolls needs to move away from that to achieve your goal of more simplified reporting?

Panos Kakoullis

CFO & Executive Director

I think on balance sheet, I think you heard in the comments that I made earlier on an ambition that we have in the medium term to get back to investment-grade credit profile. Lots of liquidity at present, so that GBP 7.5 billion of liquidity that we've got at the moment means that we can do that in a measured way and make sure that we invest wisely at the same time just to pick up on one of Warren's comments earlier on.

I recognize the point around other liabilities in the balance sheet. You consider all of those in and around when you're looking at getting back to that investment-grade credit profile. I think also it's going to be important as we look at the shape of the business going forward and as a more balanced business going forward. The gearing within the business may well look different to outlook in the past. So that's another consideration that you need to have.

I think in terms of your second point around ITP disposal. I'd reiterate the point around liquidity. Liquidity is there. There is plenty of liquidity. We're not dependent on engine flying hours recovering. So I don't see the need for any other nonorganic I think, measures.

In terms of financial reporting and your points around the business model, I'm comfortable with the business model. It's a smart business model. In fact, many businesses that I've been -- I've worked with in the past would love to have a business model where you have your customers being effectively so sticky and then you can work hard on making sure you deliver at a sensible cost.

Does that -- I think your comment there was does that contribute to the complexity of financial reporting? No. I think spending time, and I have spent a lot of time now understanding the underlying business drivers. The underlying business drivers are straightforward once I spend some time. It's now how we make sure we translate that into a way that the outside world can understand in a more straightforward way.

David Howard Perry

JPMorgan Chase & Co, Research Division

Well, good luck with it, and I look forward to meeting you next week.

Operator

The next question comes from the line from George Zhao from Bernstein.

George Zhao

Sanford C. Bernstein & Co., LLC., Research Division

We talked a lot about engine flying hours, so I want to focus on, I guess, on pricing. So on flight hour contracts, compared to the start of the year, have you seen any major changes in the trends around these prices when engines change hands or when new contracts are signed? And second question, a quick one. What proportion of the large engines are deployed on domestic routes today? And do you think that's sustainable?

Warren D.A. East

CEO & Executive Director

Yes. Engine -- or long-term service agreement pricing, our basic pricing model hasn't changed. Clearly, we have been engaged during this time where airlines have been restructuring, filing for bankruptcy and coming out of bankruptcy, restructuring, there's been new contracts to strike.

And I would say there's been a mix there where we have -- and I think we've mentioned this in the previous results, we have been working with customers to accommodate some of their short-term financial challenges in the normal way of a commercial negotiation that generally involves something on the other side.

And so that might manifest itself in terms of a period of lower per hour rate at given types of usage of an engine compensated by higher rates a little way down the road. And so sort of normal warp and weft of commercial negotiations have happened there. In terms of normally moving from one owner to a second

owner then the principle that we quite often secure higher rates on that transition, that's actually held up remarkably well during this period.

On your second question about domestic and large engines used on domestic. I mean, it's -- there's -- we have 2 areas. North America, we have some older engines that are used domestically. And in China, we see a lot of wide-bodies used domestically. And then case by case, different airlines have parts of their fleet with wide-body engines used domestically. And Japan is a good example of that with both ANA and JAL.

And all in all, domestic use was about 10% of our total pre-COVID 2019. And obviously, it's a bit greater now as the sort of traditional long-range international stuff has fallen away. But I would see upward pressure because regions like China, in particular, and in Japan, we can see large numbers of people traveling short distances and airlines are using large wide-body jets to do that. And so I think the 10% is probably a floor and the 20% to 25% that we're seeing today is probably a bit too high for long-term sustainable and the answer is somewhere in between.

Panos Kakoullis

CFO & Executive Director

And George, just something I'd probably add on the pricing point, and you can see it in the half year numbers where we've got some long-term contract catch-ups, which are the result of some of those commercial negotiations.

So I'm a big believer in us being rewarded for the value that we bring, and we recognize that within the long-term contracts when we've got that value. So you can see some of that upward gain around those commercial negotiations coming through there.

Operator

The next question comes from the line from Chris Hallam from Goldman Sachs.

Chris Hallam

Goldman Sachs Group, Inc., Research Division

So just 3 questions from me. Warren, perhaps first on strategy. There's no mention of hydrogen or absolute zero on your 2050 emission slide. And that's obviously a bit different to what some of the aircraft manufacturers are saying. So is that a different view of the future? Or do you expect to play a smaller role in propulsion if the industry does eventually partly transition to hydrogen?

Second, perhaps, Panos, on the EFH payments. Can you give us an idea just on how predictable those payments are because I think most of them are done annually in relation to the coming year. So how difficult is it to firm up the level of those payments given the uncertainty on the shape of the recovery? And are customers paying on time?

And then finally, just on free cash flow phasing. You've said you'll move to positive free cash flow at some point in H2. There's obviously a lot of seasonality in the business, but there's also the gradual EFH recovery and the savings benefits is kicking in. So should we sort of be assuming that H1 next year is better than H2 this year and then H2 '22 is better than H1 '22?

Warren D.A. East

CEO & Executive Director

Okay. Chris, let me just answer your first question. Also, have a go at that second one. So I think the simple answer is hydrogen is included in inverters new technologies on that slide. I did mention in the presentation that we haven't really got time this morning to discuss that slide in a lot of detail. And there is a huge amount of detail behind that slide.

Hydrogen will play its part in lots of different sectors. It's probably less likely to play a part in long distance international travel than there'll be shorter distance, smaller airplane place for hydrogen to play,

that's what we're currently believing. But it's very much part of our piece, and you should have a look at our net zero report that's on the internet that we launched a few weeks ago.

Panos Kakoullis*CFO & Executive Director*

And then in your other 2 questions, on engine flying hour payments, no particular concerns around the customers being able to pay. They're paying on time as we expect. In terms of the pattern of those, mostly the payments are based on hours flown. Occasionally, some pay based on shop visits. But again, that is relatively predictable, subject to engine flying hours actually being flown as we said earlier on.

In terms of your seasonality point, you're right. We maintain cash flow positive as we go through the second half of this year at some point. When you're looking at next year, think of that upward trend continuing for the course of the whole year. So the full year impact of the restructuring benefits coming through, the GBP 1.3 billion run rate we've talked about, the recovery in engine flying hours. Power Systems, we've called out the increase in the order book, that starts turning into revenue and then cash as you go through next year.

Defence remains resilient. And the underlying seasonality that you referred to that you've seen over past years, you should expect that to remain with the second half of the year being the more positive compared to the first half of the year.

Operator

The next question comes from the line from Andrew Humphrey from Morgan Stanley.

Andrew Edward Humphrey*Morgan Stanley, Research Division*

I've got a couple, if I may. One is on Civil Aerospace profitability in the first 6 months. Panos, you mentioned positive contract catch-ups in the period, but it also looked to me as though the underlying performance -- the clean performance on civil aero gross profit stability was stronger than maybe it was reflected in consensus. So I wanted to ask if there was anything specific in the mix either in terms of engines coming in for service or in terms of customers that would flatten that in this period?

Secondly, maybe one for Warren. We've obviously had confirmation of an A350 freighter entry into service 2025. I wanted to ask you about how you're assessing the opportunity there in terms of any additional capacity you may need to make available?

Panos Kakoullis*CFO & Executive Director*

Yes. So let me pick up on the Civil Aerospace profitability. So nothing specific in the mix to call out there around the underlying.

The other point I'm sort of curious about is around contract catch-ups. So sometimes when I see commentary on them, they're sort of viewed as something to ignore or to overlook. The reason those contract catch-ups are there, and they're positive contract catch-up is twofold. One, I've already mentioned. So when commercial negotiations, we've been robust, and we see that being baked in as a benefit. So it means the long-term contract as a whole is going to have a greater margin because of that, and this is the catch-up to recognize that.

And the other element that we've called out there is the cost savings that are now baked in. So we plan for cost savings, but we don't recognize them until we are sure of them and they start to flow through. And I think particularly within business aviation, those catch-ups are going through.

So I recognize that we're looking at a 6-month period, but I tend to look at long-term contracts as long-term contracts, and what's their -- what's happening to the margin of those contracts over their life, and those catch-ups represent an increase in margin over those.

Warren D.A. East

Copyright © 2021 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

CEO & Executive Director

And to your question on the A350 freighter. Obviously, that announcement for Airbus has been a little welcoming, and we're delighted with that. It's a very welcome pull forward as far as we're concerned of growth in demand for our engines.

We won't need to worry about any incremental capacity. I mean, don't forget, we have -- essentially have capacity for about 500 new large engines per annum, and that's the rate that we were delivering at in 2019.

Yes, we've been doing some consolidation of our facilities, but it's very much a consolidation activity. And we would expect to be able to scale up again later in the decade when demand returns without having to move on and open new factories and that sort of thing because of the huge productivity improvements that have been baked in. So we don't need to invest in any additional capacity. But the A350 freighter is a welcome sign.

Operator

Your next question comes from the line from Nick Cunningham from Agency Partners.

Nick Cunningham

Agency Partners LLP

Yes, I'm having dealt with a lot of detail, perhaps one could ask a more general question looking forward. And I think thinking past the crisis, you wanted to reduce your costs to the point that Rolls-Royce became -- Rolls-Royce civil aero engines became intrinsically adequately profitable, which it hasn't been in the past.

And so what I wanted to ask is, what would adequately profitable look like? And how would one measure that? And given what you know about your costs and future overhauls and so on, would -- when we get to, say, 2024, 2025, we get to 100% of 2019 EFH, would you then be adequately profitable on that basis?

And then a second longer-term question, slightly longer even than that, sustainable fuel, I think, is a sort of linchpin of your plan for zero carbon and clearly, very important and this enables you to stick with your existing technologies to a great extent. What's your assumption about how competitive SAF can be relative to fossil fuel costs? And do you have to assume some tax, if you like, concessions for SAF and a carbon tax on hydrocarbon fuels in order to make that work?

Warren D.A. East

CEO & Executive Director

Yes. Well, in terms of our ambition for profitability in civil, then -- so we've been working on improvements in productivity in civil and cost out in civil for a while. The restructuring that we've been through the process of implementing over the last 12 months. By the way, we have a little bit further to go yet because this consolidation from -- of 11 sites going down to 6, that's not actually complete until the back end of next year and possibly even a little into 2023 for some of those sites. So we're not quite done yet, but the heavy lifting has been done on that.

And then we will have -- and I've referred to it as -- in the presentation, as a better breakeven and better gearing as demand returns and that will, we believe, take us into a competitive zone in terms of profitability for our civil large engine business. And that would be certainly in the mid-teens.

As far as SAFs are concerned, looking forward to net zero, this isn't a Rolls-Royce thing. This is an industry thing. For long-distance international travel, the industry doesn't see a technology solution that's appropriate other than synthetic aviation fuel. For shorter distance, smaller aircraft, then full electrification, hybrids, hydrogen, all of these sorts of alternative technologies have their role to play. But in the long-distance wide-body space, then it's going to be SAF.

Now the good news is, of course, that things like our small modular nuclear reactors are very useful in terms of zero carbon electricity because large-scale SAF production requires large-scale green electricity. And that electricity can also be used for things like hydrogen, as I mentioned.

The cost of SAF at scale, we believe, will be approximately twice the fossil fuel equivalent that fossil fuel has at the moment. Now that's a little bit of a sort of industry guess. That isn't a Rolls-Royce guess. It's an industry expectation at the moment. And that's why it's important that we introduce things like the UltraFan new architecture to have a step function in efficiency to help our airline customers be able to adopt that. And you might have seen some of the airlines working on their cost projections and how they've been deeming that SAF will be affordable.

Panos Kakoullis

CFO & Executive Director

And Nick, I probably just to add on the first point around profitability. Again, coming in, I look across at a better balanced group now, and I look at Defence and Power Systems and the opportunities there, the resilience and opportunities from energy transition and push hard around what those margins should be to be competitive within the marketplace. So I don't just look at civil. I want to make sure that we are looking across the whole business and shining a light across each of the businesses.

Nick Cunningham

Agency Partners LLP

And very full answers for which I'm grateful. But just to clarify on the, if you like, adequate profitability, mid-teens would apply to civil and to the group? Or would you say a mix -- is there an intrinsic mix of margin across the different businesses?

Panos Kakoullis

CFO & Executive Director

There's going to be a mix.

Operator

The next question comes from the line from Harry Breach from Stifel.

Harry William Freeman Breach

Stifel, Nicolaus & Company, Incorporated, Research Division

It's Harry Breach here. Could I possibly just ask maybe 3 questions, if I could. Just back in March, I think you guys said you were expecting large engine shop visits. This year, I think, about 240 and then 400 next year. I guess over the last few years, those large engine shop visits have been a key indicator for us to try and model the business. So it's very helpful if we can have some sense of where they're heading. You've done 92 in the first half. I guess that leaves about 148 in the second. Is 240 still the expectation for this year and 400 next year?

And maybe secondly, guys, we almost don't talk about time and materials aftermarket revenue at civil anymore. But just trying to look at the financials, it looks as if looking at the analysis of aftermarket revenue is recognized at a point in time for civil and looks as if it was down really quite steeply.

I think GBP 193 million is the number, if I've read it correctly, for the first half of '21 versus GBP 746 million in the first half of last year. Can you help me -- maybe I've made another silly mistake, but could you help me to understand whether T&M has fallen significantly and what the sort of drivers are?

And then finally, Warren, I guess, again, in the past, pre-COVID, we used to talk about when across the portfolio, original equipment unit losses would get through breakeven. Obviously, last year was heavily disrupted with a lot of rescheduling of production plans, and it wasn't a meaningful number. But can you give us some idea, Warren, about when you think we'll get through breakeven in terms of original equipment unit losses?

Warren D.A. East

spglobal.com/marketintelligence

CEO & Executive Director

Okay. I think we're going to have to answer these questions quite quickly.

Panos Kakoullis

CFO & Executive Director

Yes, let me just rattle through the first couple. I think, shop visits. It's obviously dependent on what happens on engine flying hours. So one that's harder to predict, but a little bit of a shift to the right around that.

On timing materials, you're right, the fall is there, but there are again, lower -- less flying is going on, which means fewer of T&M type shop visits. Also, V2500 is a little bit lower around that.

Warren D.A. East

CEO & Executive Director

On the OEM breakeven point, yes, you're right. Disruption caused last year made it very difficult for us to continue sort of reporting that because obviously, there were large chunks of unrecovered cost. We will try to provide some guidance on that with the full year results. But certainly, our ambitions haven't changed and it's a question of volume. And of course, the restructuring will give us a significant tailwind in that regard.

Operator

The next question comes from the line from Charles Armitage from Citi.

Charles J Armitage

Citigroup Inc., Research Division

A couple of quick ones. First of all, going back to Jeremy's question, wide-body market flying hours will recover whenever it does. But if you look at -- compare Rolls-Royce to the overall market, you've got a younger fleet, you're delivering more engines than you have compared with your market share on the fleet, and you've got a few old engines to retire.

So that should grow faster. But on the other hand, you don't have the freighter exposure. So do you feel that Rolls wide -- large engine will grow -- will recover faster or slower than the widebody market as a whole? That's my first question.

Warren D.A. East

CEO & Executive Director

Yes. Well, it's a slightly loaded question. And the answer is the correlation that we saw last year between what's going on in the industry at large and recovery of usage of some of our engines, I think that holds going forward. It holds as far as things like our XWB are concerned, very pleasing utilization of some of those.

You're right in terms of freighters, older aircraft. We are now seeing freighter conversions, passenger freighter conversions going on with A330s and so on. And again, because our engines are the younger models of those aircraft, then I think there is a favorable tailwind for us. And obviously, as I said in answer to an earlier question, we're delighted with the Airbus freighter -- dedicated freighter announcement. So broadly correct, the -- we would expect to be on the positive side of a recovery trajectory.

Charles J Armitage

Citigroup Inc., Research Division

Great. Second question is EFH pricing. As I understand it, there's a matrix dependent on how far the routes are and whether they're hot and high, et cetera. Now as I understand that the stage length has come down, which would imply that the price per hour should be going up, yet we haven't heard anything about that. Is that a -- one of these long-term benefit in kinds or trading short term for the long term? Or is it not coming through? Or what's happening on that one?

Warren D.A. East*CEO & Executive Director*

Yes. I think intrinsically, you're absolutely correct. It's quite hard to see that coming through in the overall numbers. We'll take the point on and see if we can throw some color on that with our full year results. But you're absolutely correct in terms of the principles that you outlined there.

Charles J Armitage*Citigroup Inc., Research Division*

Okay. And the final question is, we were sort of agonizing over this in 2019 and it seems to be rather less important in the whole scheme of things. But the Trent 1000 10 HPT was due to be -- the fix was due to be certified around midyear '21. So a GBP 24 million increase in the provision. What's happening on that one?

Warren D.A. East*CEO & Executive Director*

Yes. I think -- well, as we sort of indicated at our full year results, that certification has been pushed out. We don't have that certification yet. We are expecting that certification before the end of this year. But in the detail, the FAA and their relationship with Boeing, they've had a lot of other things to do, basically.

And certifying our Trent 1000 blades is a bit lower down on their priorities than it was when we made our original estimate. We are confident in the parts and we're already making the new parts to fit when we do the overhauls just as soon as that certification happens and we're expecting it just before the end of this year, probably.

Charles J Armitage*Citigroup Inc., Research Division*

So from the Rolls-Royce perspective, it's the -- the technology work is done...

Warren D.A. East*CEO & Executive Director*

Yes. It's all complete and we're in the queue as it were.

Operator

And our last telephone question comes from the line -- from Celine Fornaro from UBS.

Celine Fornaro*UBS Investment Bank, Research Division*

I'll have 2, if I may. The first one would be trying to reconcile the second half of last year performance with the first half of this year performance. I'm trying to reconcile a little bit or maybe you could help me with that on the profit reach on the cash bridge because clearly, there is a strong improvement in the profit even if I put on the side, the GBP 166 million and TSA contract recognition. But we don't really see that from a cash point of view.

So maybe you could help us on the moving parts, understanding what is the restructuring contribution or the flying hours, or [indiscernible] and other things there? And then my second question would be regarding something you touched about. But yes, certainly encouraging H1 performance. But how do you think you compare yourself versus other industrial businesses who have had really strong H1 results. And so what could you change in Power Systems there? Or is it very heavy H2 [indiscernible]

Panos Kakoullis*CFO & Executive Director*

On the first one, I suggest we take that one off-line, and we can take you through that outside of the call.

Warren D.A. East

CEO & Executive Director

And on the second one around Power Systems and some of the Power Systems competitors, I think you have to look in -- at the power categories that -- where those competitors have seen a strong rebound in the first half, and we're not actually in those power categories, which is why we haven't seen it in Power Systems.

But what we have seen is a near 20% uptick in orders. And so we are seeing a rebound, but it's probably 6 months or so behind that -- some of those competitors you've seen.

Celine Fornaro

UBS Investment Bank, Research Division

But in terms of the profitability of 3.5%?

Warren D.A. East

CEO & Executive Director

Well, I mean, that is a result of a whole lot of factors. And it's basically less revenue actually going through with the same cost. And obviously, because of some of those competitors, as I said, have seen the impact some 6 months or so ahead, then that will be reflected in higher profitability.

Panos Kakoullis

CFO & Executive Director

And I think you have seen in the past, it's a second half-weighted business. So margins we're expecting for the year are in line with our previous expectations.

Isabel Green

Head of Investor Relations

Thank you, Celine. And Isabel here. I've got one question that came through on the webcast just to finish up with, which is for you, Panos, and it's from Rory Smith at Investec. He's asking if we can talk a little bit more about the steps you've already taken to simplify reporting and what you expect may change in terms of KPIs that we produce and how we're going to improve our reporting going forward?

Panos Kakoullis

CFO & Executive Director

I think early days at this stage. What we've tried to do with this half is trying to take a little bit out of the noise between statutory reporting and underlying reporting. So you can see that that's been simplified. Then looking at the underlying business drivers, how we get a better understanding of how those flow through the financials, and there is more to come, particularly as we look at hedging and foreign exchange going forward. But that's a bit more of a medium-term project.

Isabel Green

Head of Investor Relations

Thanks, Panos. And so back to Warren to close the call. Thank you, everyone, for their questions today.

Warren D.A. East

CEO & Executive Director

Yes. Thank you all. Just the quick summary to take away is that we're delivering on commitments made here. Restructuring is on track, the disposals program is going well, we are seeing significant improvements in profitability and our cash flow, and again, a continued position of strong liquidity and that journey to net cash in the medium term.

And that's enabling us to have some confidence around the disciplined investments that we're making in the future in our low-carbon businesses, which will be incremental around -- incremental to our business as it exists today. So with that, I'll finish, and we'll be back to tell you about our full year results in due course.

Operator

Thank you. And that does conclude the conference for today. Thank you all for participating. You may now disconnect.

Presentation

Operator

Hello, everyone, and welcome to the Net Zero Launch Investors and Analysts Panel. My name is Seth, and I will be your operator. [Operator Instructions] I will now hand the floor over to Isabel Green to begin. Please go ahead, Isabel.

Isabel Green

Head of Investor Relations

Thank you very much, Seth. And good morning, and good afternoon, everyone. So I'm Isabel Green, Head of Investor Relations, and thank you for joining our net zero pathway roundtable event today. Firstly, apologies for the late change for the conference call format. And for anybody who hasn't already accessed the slides, they are available on our website for you to download. And we will start with a short introduction by our CEO, Warren East, which we'll refer to those slides. We'll follow that with a Q&A session, and we have a panel of our senior managers from across our business with us today. So we very much look forward to receiving your questions at the end.

So now I'll hand over to Warren. Thank you very much.

Warren D.A. East

CEO & Executive Director

Great. Thanks, Isabel, and thank you, everybody.

And I think you can find the slides in the Results and events section on the Investors section of the website. And I am going to start -- I'm going to start on Slide 4 of the presentation there.

We're going to set out road map for achieving net zero by 2050. We're going to explain a little bit more about some of the technologies that will enable us to get there.

Global commitments to net zero have, we think, reached a tipping point. The chart -- the few pie charts in the middle of the chart there, pointing out that 68% of the global economy, 56% of the world's population are now covered by net zero targets. Achieving net zero is an imperative for our customers. It's imperative for our people and the communities in which we work. As well as being an imperative, for us as a business, it's also a great commercial opportunity, and we're very excited to be playing our part in this big change in society, but also addressing that opportunity.

So Slide 5. Demand for power is increasing and the industries that we serve are among the hardest to decarbonize. And because of this, our innovation to help our end markets reach net zero is essential to achieve the global transition. As we pivot away from fossil fuels, we'll be both expanding our business in traditional markets and migrating to net zero through the use of sustainable fuels and new technologies. And that will also mean that we'll be entering new areas, supporting further growth and technological development. The chart on the bottom of the slide looks like just a migration, but actually 100% at 2020 represents 300,000 gigawatt hours. 100% in 2050 represents 1.8 million gigawatt hours. So there's significant business growth in here as well as transition that we're talking about.

So moving on to Slide 6. We have, of course, many years experience in pioneering innovations that meet some of the world's really tough engineering challenges. In Civil Aerospace, the Trent XWB, that's top left of the picture there, is the world's most efficient large civil aero engine in service today. And efficient engines are absolutely vital because they will help stimulate and support the take-up of sustainable fuels.

Now we've been growing and expanding the reach of our business as we've aligned ourselves towards championing sustainable power for several years. And from testing of hybrid electric systems, like the rail picture in -- at the top of the slide and marine a few years ago, we now actually have real commercial products here. The microgrid that you can see on the top right is at our factory in Friedrichshafen. It's

been online since 2019. It's enabled us to go from demonstrating microgrids to actually selling them all around the world.

Last year, we acquired Kinolt, energy storage specialists. And that's now in -- left middle of the slide, that's now our Microgrid Competence Center. And the picture there is our battery container unit manufacturing plant in Ruhstorf in Bavaria.

In aviation, we took a significant step towards electrifying flight with the acquisition of the aircraft back in 2019, and that's the picture in the middle. And as far as engine testing is concerned, with sustainable aviation fuels, we've tested Trent 1000 engine with 100% sustainable aviation fuels in Darby and also the Pearl 700 business jet engine.

And finally, in the bottom right of the chart, our small modular reactor consortium is up and running, and it's aiming to be the first design to be assessed by U.K. regulators starting in the second half of this year.

Moving on to Slide 7. The pie chart shows our total emissions footprint. And you can see the emissions from our own manufacturing and production and office facilities, excluding product development and testing, make up a very small, but nevertheless, important proportion. We've actually halved those emissions over the past 5 years. And last year, we declared our target to get them to net zero by 2030.

But the chart shows clearly the vast, vast majority of our emissions, the scope 3 emissions associated with both the supply chain, but more importantly, the use of the products that we sell. So the abatement of the product-related emissions during their use is where we can have the most impact, and therefore, that is the primary focus for our decarbonization plan.

Now there is -- I'm flicking on to Slide 8. There's no one single solution to this. It's going to require multiple technology solutions and partnership across policymakers and across industry. Our pathway involves introducing new technologies, ensuring that our products are compatible with sustainable fuels and making our products more efficient to stimulate and assist in the take-up of those fuels. And this way, we believe we can take our emissions, bend that curve down to net zero by 2050. In fact, our business as a whole could be said to be there sooner as we introduce zero carbon technologies like SMRs into new areas that are outside the scope of our current business.

To emphasize just how significant we see this opportunity is, we're focusing our R&D investment on the necessary next-generation and lower carbon products. And we expect to spend 75% of our gross R&D in these areas by 2025, compared with approximately 50% in 2020.

So Slide 9. Today, we are committing to ensuring that our new products will be compatible with net zero by 2030. And all our in-use products will be compatible therefore with net zero by 2050. And a new engine that can use SAF is only part of the solution. We expect that our current products are going to be used for several decades. So today, we're pledging to have proven all our in production, commercial and business jet aero engines to be compatible with 100% SAFs by 2023. And that will mean that 2/3 of our Trent engine fleet and 3/5 of our business jet fleet currently in service will be SAF ready. We're also exploring the use of SAFs in defense application, including as part of our involvement in the [Tempus] program here in the U.K., and we've carried out extensive tests with our U.S. Defense products.

In our Power Systems business, we've defined a science-based interim target to reduce the lifetime emissions of new products by 35% by 2030. That's relative to 2019. And that, we believe, is an industry-leading ambition. We're also testing hydrogen fuel cells, in the middle of the slide there on the left. And we're putting 4 of those together into a new demonstrator that we hope to have up and running by this summer. And we are also targeting to have integrated many more modules to create a 2 megawatt solution in an operational microgrid for demonstration by 2030.

On the bottom of the slide, we're also planning to have approved the MTU Series 2000 and 4000 class engines that's extensively used in marine and power generation applications for use with sustainable fuels by 2023. These engines together represent the majority of the MTU engines that we make and sell today.

Moving to Slide 10. The transition to net zero represents a real opportunity for us. In aviation, we have opportunities for hybrid electric and all-electric applications across a host of completely new markets for

us, including urban air mobility, commuter and regional markets. We've learned a lot from our work on the Spirit of Innovation, all-electric plane, that's bottom left on the slide. The characteristics that air taxis require from batteries are very similar to what's being developed here. So we're powering the Vertical Aerospace urban air mobility aircraft, top left, which will be able to undertake zero emissions flights of over 100 miles on a single charge. And Vertical has already secured conditional preorders for 1,000 aircraft, and that's worth \$4 billion, with entry into service from as early as 2024.

And middle left, we're working with Tecnam and Widerøe to deliver an all-electric passenger commuter aircraft, which will be ready for service in Norway in 2026.

Further up the power scale, we recently started testing the first elements of a powerful hybrid electric power propulsion unit at a specially designed test bed in Bristol.

And back on the ground, we've developed a solution called [grid up] in Power Systems, which brings together renewables, grid power, hydrogen production, fuel cells and backup power into an uninterruptible CO2-neutral power supply system that can be used to provide power for data centers.

On the bottom right of the slide, our SMR technology. Our SMR technology will be able to create competitive zero carbon power for communities and for industrial processes. And it opens up a really significant export market opportunity for us. Another potential area for SMRs is to provide zero carbon power for things like direct air capture and sustainable fuels production.

So let me summarize what we're doing. We've pledged to achieve net zero carbon in our own operations by 2030, to be a net zero carbon business as a whole by 2050, and to take a crucial role in stimulating and enabling the sectors in which we operate to reach net zero by 2050. To help us achieve this, we've set a series of short-term targets. And yes, they're all connected to executive remuneration, to make many of our current products compatible with sustainable fuels.

Now at its heart, Rolls-Royce is really all about taking stored energy and turning it into useful power. We believe that, that must and it can be made compatible with net zero carbon emissions through the development of the technologies with which we operate.

In summary, we can see a clear pathway to net zero by 2050. With that, I'll hand back to Isabel to chair the Q&A.

Question and Answer

Isabel Green

Head of Investor Relations

Thank you, Warren. So I can start now by introducing the rest of our panel, and really keen to get questions for all of those who are volunteered their time today to help answer your questions. So with me today, we have Tom Bell, he is the President of Defence; Rachael Everard, Head of Sustainability; Andreas Schell is President of Power Systems; Paul Stein, our Chief Technology Officer; and Rob Watson, Director of Rolls-Royce Electrical.

So operator, can you please remind people how to register a question and then perhaps come back to me for the first question to give people a chance to put their hand up? Thank you.

Operator

[Operator Instructions]

Isabel Green

Head of Investor Relations

Thank you. I just wanted to wait for people to register their questions. Rachael, if we could start with a question for you, please?

How does the pathway we published today align with the other public and industry frameworks? And particularly, I'm thinking about things like sustainable aviation U.K. road map and ATAG Waypoint 2050.

Rachael Everard

Great. Thanks for the question, Isabel. So, broadly the pathways are aligned. The ultimate goal is to reach net zero carbon by 2050, as time tells us we must. There are some differentiating factors. Rolls-Royce is a technology-led company, has a technology-driven transition to net zero, and that's what we are setting out today. So many of the levers are the same: more efficient engines; increased use of sustainable fuels; and exciting new breakthrough technologies.

Of course, our pathway reflects the breadth of the group. And the diagram that Warren talked about showed the potential role of SMRs as an example to further bending the curve as well as negative emissions technologies like BECCS in accelerating our transition.

Isabel Green

Head of Investor Relations

Thank you, Rachael. We have got some questions online now. Operator, can I hand back to you to introduce and bring them on the call?

Operator

Of course. So the first question comes from the line of Robert Stallard of Vertical Research.

Robert Alan Stallard

Vertical Research Partners, LLC

I have a couple of questions. First of all, a lot of what you're talking about relies on SAF, sustainable aviation fuel, which at the moment is very, very expensive compared to kerosene. What can Rolls-Royce do to get the cost of SAF down and also expand its availability to your customers around the world?

And then secondly, realistically, at what point in the future do you think we'll be in a situation to replace a large civil aircraft engine with an alternative power source like all-electric or hydrogen?

Isabel Green

Head of Investor Relations

Thanks, Rob. Warren, can I ask you to have a few words on that and perhaps also we'll ask Paul Stein to add some comments there?

Warren D.A. East*CEO & Executive Director*

Yes. Well, let me just chip in to begin with then on SAFs and what we can do with the cost. First of all, one of the reasons for the costs being so high at the moment is that we're at very early stages in terms of proportion of SAF that is used. So around about 0.1% of the aviation fuel used in the world today is SAF. So scale is a key factor.

Another key factor is the cost of electricity that is used in the production process. And we do believe that there's a lot of SAF that's going to be required. That means a huge amount of energy is going to be required. And that's where off-grid zero carbon energy from things like our small modular reactors is going to come into play.

And then at the other -- on the other side of it, of course, we perhaps recognize that SAF for a long time are going to be somewhat more expensive than fossil fuels. And so we believe we have a part to play in stimulating the take-up of those by making it more economically possible by making progress in improving the efficiency of our engines.

Paul, you might want to answer the next bit, hopefully?

Paul Stein*Chief Technology Officer*

Yes. I might also suggest that, Tom, when I finish the next bit, you might want to say something about what's happening in the States to help stimulate the growth of SAFs under the States' net zero path.

On the question about powering large aircraft, before 2050, we firmly believed that large aircraft flying medium to long distances will continue to be powered by ever more efficient gas turbines fueled by sustainable aviation fuels. And that's because none of the technologies that we're exploring -- and as Warren had indicated earlier, we're exploring a number of very exciting technologies, electrification and hybrid electric and even hydrogen power. But none of them really are suitable for those very long-range flights or carrying large numbers of people. So we see the future of aviation really being ever more efficient engines, which is one of the reasons why we're investing in UltraFan, a rapid ramp-up of SAFs in the way that Warren just described, and then the investment in those novel technologies to really transform aviation, not just to achieve net zero, but to really redefine the way communities are connected.

But Tom, are you happy just to take up the question about some of the activities going on in the States to stimulate SAF?

Tom Bell*President of Defense*

Absolutely, Paul. Thank you. Tom Bell here again.

Yes. Here in the United States, in -- we know that the Biden administration has made climate change a focus of the new administration. And the Biden administration has committed over \$2 trillion to this problem in the next budgeting cycle. So it's a significant issue that is gaining a lot of momentum. And as a result of that, we see many legislatures in our House and in the Senate that are advancing bills to help the industry create SAF fuels to meet the emerging demand. As Warren spoke to very clearly, our job is to facilitate that emerging demand and make sure the engines are compatible with SAFs. We're partnered with companies to create the SAF. And our legislatures around the world are looking at ways that they can help lower the barrier to entry to make SAFs more economically viable for the producers, and therefore, put it at all the points where it will be required to make it a significant part of the Civil Aerospace market. So very exciting times that we're witnessing emerging all around us.

Operator

The next question comes from [Andy Jones] at [indiscernible].

Unknown Analyst

Firstly, congratulations on the new strategy, in particular, the science-based target for Power Systems. I'd imagine those are both a large amount of work, so well done. I just had 3 quick questions, if that's okay. The first one is just a clarification between net zero carbon and net zero, if you could explain that differentiation? And whether that's a question of data or materiality or something else? Second question, just, again, interested in the feasibility of science-based targets in civil aviation business before 2050. And how much that would depend on the changing goals at the value chain level to be able to do that? And thirdly, just interested in, I guess, how the company's reporting will evolve in regard to the alignment of capital allocation with the net zero goals?

Isabel Green

Head of Investor Relations

Thanks, [Andy]. And perhaps I'll ask Rachael to start it off with some answers on those?

Rachael Everard

Yes, [Andy], thanks for the question. So first up, on the net zero versus zero carbon. So the primary focus of the report is on carbon emissions, but we are kind of talking at a broader level around Rolls-Royce's impact on the climate and greenhouse gases more collectively. So we've been quite clear where we're talking specifically carbon or we're talking CO2 equivalent hopefully, if I'm not clear, throughout the report. But broadly, we are talking about our position of getting to net zero carbon by 2050.

And on your second question on Science Based Targets initiative. At the moment, I think it's fair to say we don't yet have clarity on the convergence of the breakthrough goals that we require to have -- get the whole of Rolls-Royce Group to be able to set a science-based target, particularly some of the more complex sectors that we're part of in terms of aviation and as well as the articulation of the role that new technologies that we are pursuing like SMRs, like electrification and also the negative technologies like BECCS won't be abating current Rolls-Royce scope 3 emissions, but can play a really important role in accelerating the global energy transition.

So we are working in partnership with the Science Based Targets initiative at the moment to understand how we can make sure we can set a verified group target through the net zero global standard consultation over the coming months. I'm really excited about that continued engagement with them. And we are continuing to talk to the Race to Zero coalition that we are really proud that Rolls-Royce is one of the founding members with them. Actually, Warren participated in a launch event about a year ago today to work with them on the sector breakthrough goals that they've identified as being the significant tipping points we need to reach by 2030 in order to reach net zero by 2050, such as the 10% SAF uptake goal for aviation.

And the third question?

Warren D.A. East

CEO & Executive Director

His question was about reporting and changing to reporting. So look, obviously, will be reflecting some of this in our external reporting in due course as and when it becomes appropriate. But FYI, internally, we are for the first time now adopting ambitious objectives for the medium term in terms of the proportions of our revenue that we expect to be at zero carbon by intermediate date. So we're not just planting a flag in 2050 and saying, we're going to go from here to there. We have a sort of a pathway with interim milestones. But we're not here today to discuss those interim milestones, but we will be prepared as and when it's appropriate to report externally.

Isabel Green

Head of Investor Relations

Sorry. Andy, did you have any follow-up on that or if not, we'll pass to the next question?

Operator

Our next question comes from Celine Fornaro at UBS.

Celine Fornaro

UBS Investment Bank, Research Division

I would have one which I would hope is more like food for thought. But I was wondering how should we think about evaluating management teams. And this comes to probably topics of variable remuneration or incentive plans to make sure that the decision that they take today are compelling and relevant for things that are actually going to influence 2035. And maybe the next management team is not going to turn back and say, actually, got that one wrong, we need to reinvest again. How are you thinking about that? You answered on the previous question about the reporting on the revenues. But also in terms of your own performance assessment, how do you think about that?

Isabel Green

Head of Investor Relations

Thanks, Celine. I think it's -- yes, that's a question that's going to be answered probably slightly differently by some of the executives of the business units because it does -- the actions and the targets. Whilst we have group level targets, there obviously individual achievements are being set at those levels as well. So again, sorry, Warren, would you like to kick off? But perhaps we could also ask to hear from Power Systems and Defence on things that have impacted them specifically.

Warren D.A. East

CEO & Executive Director

Yes. So while I'm talking, Andreas and Tom, please contemplate how you're going to add to this.

Actually, Celine, I think it's just a build on what I said in terms of -- we have some internal targets. We're not making many of those internal targets public today, but remuneration is connected. Some of the things we have said today, remuneration targets and the testing of our existing engine products by 2023. For instance, there's a very, very tight link there. And come March 2021, you'll probably be able to read about that in the remuneration report -- 2022, I mean, you'll be able to read that in the remuneration report.

Today, we talked about the proportion of our R&D expenditure that we are targeting at net zero products and activity, moving up from 50% in 2020 to 75% in 2025. Clearly, in order to achieve that, we'll reflect an objective like that in the internal objectives and that are tied to remuneration. So I don't think there's -- we're not going to be doing anything special with remuneration just because it's a different type of objective. It will be the same sorts of linkages that we apply to normal financial measures.

But Tom, Andreas, anything specific from Defence or Power Systems?

Andreas A. Schell

Chief Executive Officer - Rolls-Royce Power Systems AG

Yes, Warren. If you want me to -- Tom, you go first.

Tom Bell

President of Defense

I'm sorry. Okay. Yes, for us in Defence, obviously, we're going to be doing everything with our customers to help the existing suite of products run on synthetic fuels. And we are also in discussion with Warren and the Remuneration Committee about measuring that.

But the more exciting opportunity for Defence is actually helping our Defence customers become net carbon-neutral themselves. And so we're looking at it more as a growth opportunity for Defence, because what happens is, as governments turn their attention to net zero economies, and they want to lead the

way in showing that it's possible, they quickly realize, to the degree they haven't figured it out already, that their militaries represent the lion's share of their carbon footprint. Militaries around the world are always one of the dominant carbon emitters of any government.

And so the opportunity is there for us, uniquely positioned as Rolls-Royce is not only a gas turbine manufacturer, but also a power systems company and a company that has unique capabilities globally in the nuclear world to bring that together to go to militaries, to go to ministries of defense, to go to departments of defense and talk about our partnership with them to help them become net zero across the whole estate. And so for us, yes, remuneration is the net zero target of our business and our products, but it's also a growth opportunity for us in Defence.

Andreas, over to you.

Andreas A. Schell

Chief Executive Officer - Rolls-Royce Power Systems AG

Thank you, Tom.

Well, for Power Systems, you noticed in the announcement, there is a clear science-based target out there, which is for new products sold really to reduce carbon dioxide emissions by minus 35% on the basis of 2019 by 2030. So there is no mistake in the organization, it's very clear what needs to get done and those get flowed down.

Why is there a heightened sense of urgency in the Power Systems business? Because we are, in comparison to Civil Aerospace and Defence, in a much shorter business cycle. And actually, the demand on behalf of the customers is arriving a lot sooner there. And for that reason, we really kind of have that science-based target now to reduce. And in order to really kind of accelerate that, we did change our organization earlier in the year, and we created a business unit structure. And one of the 4 business units is totally dedicated to develop sustainable power solutions. So there is a team that comes to work where the 100% objective is to create the sustainable solutions in order to get to the carbon dioxide reduction.

Operator

Our next question comes from Chloe Lemarie from Exane BNP Paribas.

Chloe Lemarie

Exane BNP Paribas, Research Division

I had a couple. The first one would be on making your existing portfolio compatible with 100% sustainable aviation fuel. What would it look like from your customers' perspective? Would it be offered as a retrofit option or simply a matter of certifying the existing hardware?

And the second question, I noted the link you made while in between your small modular reactor solution, which could help make sustainable aviation fuel scalable and affordable. Are you currently seeking partnership that could make you involved in that part of the supply chain?

Isabel Green

Head of Investor Relations

Thanks, Chloe. I think give Warren rest at this point, maybe ask our Chief Technology Officer to address your questions, if that's okay. Paul, can you please speak to both of those for Chloe?

Paul Stein

Chief Technology Officer

Absolutely. And thanks for the question, Chloe.

So sustainable aviation fuels, you're probably aware, we can blend them up to 50% right now within the certification that is open to us. To move to 100%, we have to do a little bit of recalibration of the engines because sustainable aviation fuels have actually got a lot more energy density than fossil fuels. And secondly, we have to deal with a technical issue to do with the material we use in the seals of the engines.

So once we've taken our engines through certification, we've not actually come up with a specific formula, but I can imagine, we're simply -- at engine rotation time, when the engines come in for overhaul, we would simply upgrade the seals and recalibrate the control systems. We don't really see that as a major issue for us in making our engines compatible with 100% sustainable aviation fuels.

The second question was about can SMRs -- I think you're saying, can we use it as a pathway to hydrogen and sustainable aviation fuels? And the answer is a clear yes. And we've been working with some major oil and gas companies in looking to see how we can use the energy and residual heat of the small modular reactor in order to drive down the cost of what's called e-fuels. These are purely synthetic sustainable aviation fuels. And so far, the results look quite good, but these won't be available in quantity probably until the middle of the next decade. So we'd certainly see initially a ramp-up of waste to fuel and biofuel processes and then moving to e-fuels with time.

E-fuel is also being used in our Power Systems division. And perhaps I could just ask Andreas to come in on the non-aviation side. Andreas, do you want to add something?

Andreas A. Schell

Chief Executive Officer - Rolls-Royce Power Systems AG

Yes, absolutely. Thank you, Paul.

So in Power Systems, we really pursue a strategy that on -- in applications where today, we don't really see the physical capabilities of new technologies to be applicable, let's say, for instance, in high sea marine applications, that's the place where we then need to go for e-fuels. And of course, we need to kind of deliver complete solutions to our customers, and that in cases will evolve or will include also that we supply them with the equipment to generate synthetic fuels, of course, in smaller quantities. Wherever we can shift technologies where that's physically possible, we are going to kind of pursue technological changes.

And we are present in 13 different industries, and some of these industries are already in the process of converting right now. Examples are rail propulsion, where instead of a pure diesel propulsion system, we are offering a hybrid propulsion system with significant fuel reductions of up to -- fuel consumption reduction of up to 25%. Or another example is data centers, where the owners of data centers have declared that by the year 2025, they do not accept basically diesel-powered backup generators as a backup. So some of these industries, we really need to kind of convert sooner, but there, we will pursue technological changes.

Last, we are converting our major product lines, the Series 2000 and the Series 4000, to be 100% compatible by the year 2023 with e-fuels. And I think that's a very important milestone. And to be clear, I think that also kind of applies a bit pressure then to come up with the fuel in itself for usage.

Operator

Our next question comes from George Zhao at Bernstein.

George Zhao

Sanford C. Bernstein & Co., LLC., Research Division

My first question is, what is the pivot from 50% to 75% R&D expenditure on lower carbon means for aggregate spending? I mean is this -- does this represent incremental spending? Or is spending simply being redirected from legacy systems that naturally would have faded anyways?

And secondly, could you just talk about the technology overlap between what you're doing in the Civil Aerospace and the Power Systems side to help accelerate the development?

Warren D.A. East

CEO & Executive Director

Yes. I'll kick off on the R&D one. And I think then point towards Andreas and Robin between them possibly to talk about migration of Power Systems technology into the aerospace world.

On -- we're talking proportions of our R&D rather than absolute terms because we don't want to talk about absolute levels of R&D in 2025 today and effectively be issuing guidance for that sort of thing.

You're right. Some of the expenditure that we have been applying to our large gas turbines in Civil Aerospace, for instance, over recent years would have probably had a tendency to come off a bit, as a large number of new engine programs reach maturity, there's less work to do and so on. But it is more than that.

If I step back and think about the last -- the whole sort of COVID pandemic. And yes, I can observe there that the world of commercial aerospace is definitely contemplating a period where commercial aerospace is going to be a smaller proportion of the global economy than we would otherwise have expected it to be. And that's well known from other discussions that we're having with you guys and I'm sure we're having with everybody else in the sector.

And at the same time, probably a reflection of the last 18 months is that the general push around society for migration to a net zero world has gathered huge momentum. And I indicated that in probably the first or second slide that we presented this afternoon. And so if you take those 2 things together, it makes a lot of sense for a business like Rolls-Royce to tilt the balance a little bit of that R&D expenditure a little bit more than would naturally have occurred just because of engine programs reaching levels of maturity. And that's what's behind the, let's call it, a migration perhaps rather than a pivot from 50% in 2020 to 75% in 2025.

Andreas or Rob -- Andreas, why don't you go first?

Andreas A. Schell

Chief Executive Officer - Rolls-Royce Power Systems AG

Yes. Thank you, Warren.

Well, I -- when it comes to R&D, what I think, first, when I kind of think about us as a group is Rolls-Royce being a technology company. And within that company, Rolls-Royce Power Systems, really due to its shorter business cycle, is exposed sooner on to some of the required transformation due to customer requirements or legislative changes. And hence, we kind of really feel the need to also change over our product portfolio much sooner than, for instance, in some of the longer-cycle businesses. And in that regard, we benefit really from the central R&D capabilities that exist within the group, for instance, in Rob Watson's area when it comes to electrical. And in exchange, I think the group then gets the benefit from Power Systems really being first in experiencing what that means to deploy the technologies into applications and hand it over into the customer hands. And I think this is some of the benefit that we can deliver at Rolls-Royce because we're integrated as one group.

Robert Watson

Senior Vice President of Customer Business Asia-Pacific

I'd add from an electrical point of view. As Andreas said, we've been able to leverage some of the Power Systems capability certainly on batteries and microgrids. And the electrical systems architecture, the Power Systems are out in front developing. But at the same time, we have some great examples. For example, us in Singapore with our [electronics] team, where we're taking megawatt scale converts as we developed for the E-Fan X program for aerospace and using a lot of the topology software as the algorithms to then help develop megawatt scale converters for the Kinolt's battery solutions. So there's a really good 2-way flow of technology, both in hardware, software and in engineering skills.

Operator

Our next question comes from Liren Li at MFS. [Operator Instructions]

Liren Li

Okay. Great. And I just have 3 questions, please. The first one is just quickly, I wonder in the scope 3 emission disclosed today, could you just give some color on how that breaks down into your different segments of Power Systems and Civil and Defence?

And then I guess my second question comes back to Paul's comments on the long-term outlook for medium and long-range fuel aerospace aircraft still being gas turbine powered. So -- and I guess most estimates says SAF adoption will only be maybe 10% by 2030. So just curious, longer term beyond that and by 2050, sort of your thinking around what level of SAF is required to actually help the longer-range aviation segment to reach net zero. Are you expecting that to be 100% SAF? Or is it -- does it have to be offset by some kind of carbon capture or offset schemes?

And then my final question is just around -- your thinking around how your, I guess, R&D and CapEx is aligned with the rest of the supply chain, so Airbus and Boeing. Just sort of any color on whether you're kind of thinking along the same line. And so how you plan to kind of work with them and the entire sector?

Isabel Green

Head of Investor Relations

Thanks, Liren. I think it would require answers from a few different members of the panel there. And perhaps, Rachael, for the first question, would you mind talking about our scope 3?

Rachael Everard

Yes. Thanks for the question, Liren. I guess, a reminder that the nature of scope 3 emissions reporting means that the figure is always an estimation, of course, always someone else's scope 1 and 2. And actually, for that reason, we're not providing any further detail on the breakdown across the different businesses, particularly, we do consider that to be commercially sensitive and restricted, particularly in relation to our Defence business. But it wouldn't be inappropriate to assume that the breakdown of revenues across the group is broadly proportional.

Isabel Green

Head of Investor Relations

Thanks, Rachael. And then perhaps, Paul, over to you for the next question about the longer-term outlook for gas turbines and the -- looking at the SAF.

Paul Stein

Chief Technology Officer

Yes. And thanks, Liren. I think one thing that we all have to bear in mind is that we're at the start of the growth of a massive industry in SAF, Liren. And right now, we're only powering 0.1% in fleet [indiscernible] SAFs. And the world's energy companies, including our own pathway through SMR for SAF, are now gearing up for a huge global industrial scaling. IAG has already predicted that they'll have enough SAF to commit to 10% by 2030, and they made a statement of that recently. The EU is going through the refuel initiative, which is likely to commit to a much higher figure by 2035. And we believe there is a pathway to get to 500 million tonnes of SAF per year by 2050, which is what we need to completely decarbonize aviation.

Isabel Green

Head of Investor Relations

Thank you. And then finally, Warren, would you mind picking up the question about the R&D and the alignment with the supply chain?

Warren D.A. East

CEO & Executive Director

Yes. Supply chain and -- and with customers. And I think there's 2 parts to this answer. The first is that there is a natural alignment. Whatever the topic, whether we're talking about journey to net zero or whatever, we as a business have to be aligned with our customers. If our customers are applying a lot of R&D on net zero technologies, whether that be ships or airplanes, it doesn't matter. We have to be aligned with them. Otherwise, we're not going to sell any products to them. So I think from that point of view, from our existing customer base, we're pretty aligned. And the same is true with our supply chain,

because if our suppliers didn't align their businesses with ours, as you sort of move along the value chain, then it just wouldn't work.

But just one thing I should bring out here is -- one of the things we've been talking about today is the opportunity that's in the net zero report and then the energy transition, and that is to -- for us as a business to be working in other areas. And we've highlighted a couple of examples today. We've talked about electric aviation, and how electric aviation brings us to urban air mobility, brings us to small commuter aircraft, smaller regional aircraft and so on, where we're just not present today. And so yes, we do have to spend some R&D there, and we're aligning there with future customers.

What we're doing with Rolls-Royce Electrical is taking new technology, but we're applying it very much into a field that we understand, in a market that we understand. But surely, there are going to be different customers in that market.

And then with SMRs, we're taking some technology that we're quite familiar with, the underlying nuclear technology there, and we're applying it to a completely new market.

And so in those 2 areas, where we're really creating completely pure growth opportunities, obviously, we have to get our R&D out a bit ahead of our customers.

Isabel Green

Head of Investor Relations

Thank you. I think we have run over time slightly, but perhaps you could just squeeze in one last question, please, operator. If you've got one more that we could add?

Operator

Of course. So we'll take the last question from Mouchumi Bhuyan from Spinecap.

Mouchumi Bhuyan

And congratulations on setting up science-based target. I just have one question. So are these targets only internally verified, or these are also verified and certified by SBTi already?

Isabel Green

Head of Investor Relations

Great question. So as I said earlier, we are engaging with the Science Based Targets initiative. The target itself that we're setting for Power Systems that Andreas has described is not yet verified. As you might be aware, it's quite a lengthy process to go through, but it is fully aligned with their methodology for new products lifetime -- life cycle emissions reduction, and does align with an emission trajectory to maintain global warming well below a 2-degree emissions trajectory. So we are just in the process of having that target verified.

Warren D.A. East

CEO & Executive Director

Maybe If I could add. We're working with SBTi to kind of get this set up, and we will communicate about the specifics behind the 35% reduction for Power Systems later in the year.

Isabel Green

Head of Investor Relations

Thank you. Thank you. And I'm very sorry for everyone that had a question that didn't get answer today. It has been a popular call. Unfortunately, [indiscernible] we have time for. So if you do have more questions that you want to come back to me or my team with, obviously, there's a lot of information also available on the website. So please do continue to engage with us as we proceed along this journey. But thank you for joining the call, and thank you to our panel for providing all the answers.

Warren D.A. East

CEO & Executive Director

Yes. Okay. Thank you for joining us. Thank you for your support.

Isabel Green

Head of Investor Relations

Bye-bye.

Warren D.A. East

CEO & Executive Director

Bye.

Operator

This concludes today's conference call. Thank you all for dialing in. You may now disconnect your lines.

Presentation

Operator

Thank you for standing by, and welcome to the Rolls-Royce 2020 Full Year Results. [Operator Instructions] I must advise you that your conference is being recorded today, Thursday, the 11th of March 2021. I would now like to hand over to the speaker for today, Isabel Green, Head of Investor Relations. Please go ahead.

Isabel Green

Head of Investor Relations

Welcome, everyone, to our 2020 full year results presentation. With me today are Warren East, CEO; and for his final results with us, Stephen Daintith, CFO. Also with us today is our Deputy CFO, Ben Fidler. We'll start the presentation shortly with an introduction from Warren, followed by a more detailed review of results by Stephen; and lastly, returning to Warren for an update on our outlook and strategy. In all, this should take about 40 minutes, leaving plenty of time at the end for Q&A.

Before I hand over to Warren, please take note of the safe harbor statement on Slide 2. This results presentation contains forward-looking statements that involve risks and uncertainty that may cause actual results or developments to differ materially. A full set of results materials can be downloaded from our website. Thank you, and over to you, Warren.

Warren D.A. East

CEO & Executive Director

Good morning, everyone, and thank you for joining us. Now before we look at our performance in detail, I'm going to reflect for a moment on the extraordinary and unprecedented year in 2020. And you can see from the images on the top of the slide there about just how devastating it was for our sector. It was also devastating for many people. It was a year where our colleagues made many personal sacrifices. And despite all the challenges, they still managed to dig deep to find the solutions to help keep our company strong for the future. And I'm very mindful of the fact that around 7,000 of our colleagues, some of whom have worked with Rolls-Royce for many years, have left us as we took actions to restructure and protect our business. And I thank all of those colleagues, both past and present, for their contributions, their diligence and their hard work.

Looking at the images on this slide, I'm particularly proud of the practical support that our people have given to the communities in which we work, doing things such as making face shields and volunteering to help those in need. As a company, we also endeavored to give back to our community. We launched the Emergent Alliance, and that's now growing to more than 140 members. And we've worked together there with the community using data analytics to assist economic recovery. Here in the U.K., we also joined the ventilator program, and we've been providing home learning and STEM materials to encourage online learning for young engineers and inventors of the future.

Finally, of course, I must thank our investors and our lenders who helped us and gave us additional liquidity to weather this crisis. So as we move forward, preparing for the recovery and investing for the future, we're very aware of the responsibility that we now have to honor the support we've received from all of our stakeholders by delivering on commitments that we've made and achieving those goals.

So now moving on to group performance. I'm on Slide 5. When COVID arrived early in 2020, it had an immediate and very material impact on our business. You remember, we came into 2020 with great positive momentum, and that momentum that we had at the start of the year was overtaken. And in response, we took decisive and effective actions to protect our people and protect our business. We introduced new ways of working to protect our colleagues, and that enabled us to maintain operations throughout with minimal disruption. We took mitigating actions that save more than GBP 1 billion in cash. We secured more than GBP 7 billion of additional liquidity and to secure the future. And we embarked on a very large restructuring, the largest restructuring in our history, to fundamentally change the economics

of our Civil Aerospace business, and that's going to save more than GBP 1.3 billion of annual costs on an ongoing basis.

We've also committed to rebuild our balance sheet, which is supported by a disposal program, where we're targeting more than GBP 2 billion from disposal by 2022. And despite the enormous pressure on cash and the cost reductions, however, we managed to continue to investment in sustainable, low-carbon solutions for the future. And I'm going to come back and say much more about that later in this presentation.

We're now looking at the business highlights for 2020. I mean the impact of COVID on our business, you can see on the right-hand side of the chart different businesses affected in different ways. The impact of COVID was most acutely felt in our Civil Aerospace business with engine flying hours reducing sharply in April to less than 20% of 2019 levels. And as the year progressed, those flying hours gradually recovered. Now while the rollout of vaccines and testing gives us good reason to look forward to the recovery, the impact on our industry is severe, and OE demand is expected to remain low for several years.

On large engines on wide-body aircraft, that's where we're most exposed to the downturn. International and business travel particularly was affected, and that's likely to recover slowly. Regional and narrow-body flights have been marginally less impacted with fewer cross-border routes. Business aviation was relatively resilient, and that was helped initially by repatriation flights at the start of lockdowns and, of course, much less exposed customer base.

How -- we've made good progress on our fundamental restructuring program in civil, around 5,500 of the roles removed so far from our business from the Civil Aerospace and that will, of course, give us permanent cost efficiencies and help reshape the economics of our business for the longer term. And I'll talk more about that later in this presentation. Despite the challenges, we've managed to continue to serve our customers, we've managed to design and manufacture solutions and invest in new technology. We've achieved our target of eliminating aircraft on ground due to the Trent 1000 durability fixes. And we've now got enough parts and MRO capacity there on Trent 1000 to avoid a recurrence of any customer inconvenience, even if miraculously all travel restrictions were lifted today.

In ITP Aero, we've seen, of course, similar market dynamics because Civil Aviation accounts for about 70% of ITP revenues and Defence activities in ITP contributing the rest. That performed relatively resiliently. Power Systems was less affected than our Civil Aerospace, but still quite affected by what happened, but it has a number of end markets, each with its own dynamics and that has helped to balance the business performance in Power Systems. Government end markets, for instance, were the most resilient, whereas industrial and marine suffered from the impact of lower economic activity and lockdown restrictions. Our strategy in Power Systems to grow in China also helped the overall performance of that business with structural growth and market share gains continuing. And our solutions to support and enable the transition to lower-carbon power have had a good year driven by investments in batteries, hydrogen fuel cells and hybrid systems.

And moving to the bottom of the slide, Defence. Defence had a good year because our government customers remained committed to the programs that we're delivering, and our order book remains strong. And this year has -- or 2020 has been a real reminder of why the Defence business is an important one for our group, delivering profit growth even in what turned out to be the most challenging of years across the rest of our business.

Now I'll hand over to Stephen to talk more about our financial performance.

Stephen Wayne Daintith
CFO & Executive Director

Thanks, Warren, and good morning, everybody. So our full year 2020 results were severely impacted by COVID, as Warren has just outlined. In addition to the trading impact, there were a number of large onetime charges in our underlying and reported results. Now they're shown here on this particular slide, Slide 8. These charges were mostly incurred in the first half of the year when the outlook suddenly deteriorated. Group revenues declined by more than 20%. This reflected the drop in activity in Civil Aerospace, ITP Aero and Power Systems but also the impact of a GBP 1.1 billion negative catch-up charge

on our Civil Aerospace long-term service agreements. This related to changes in the outlook on our long-term contracts as a result of COVID, which led to the derecognition of some of the revenue that has been booked in prior years.

Now we had a gross loss of GBP 512 million in 2020. This included GBP 1.3 billion of onetime charges, most notably the impact of the contract catch-ups that I've just talked about, although the gross profit charge was slightly lower than the revenue impact after taking risk and revenue share partners into account. In addition, we took a GBP 213 million charge related to onerous or loss-making contracts. Now we don't have many of these, and they are mostly related to the Trent 900 engines on the Airbus A380s. As the largest passenger plane in service, these have been particularly affected by the fall in passenger demand.

It's been a very tough year for everyone in our industry. A number of our customers have had challenges with their liquidity and financial stability. We have responded commercially with relaxations of certain terms and conditions, and we're keeping a close watch on the customer credit risk. Prudence requires that in some cases we provide for specific customer credit risk, which is why we have taken an GBP 86 million charge in this respect. The final large charge on our underlying results is the GBP 1.7 billion financing cost charge related to our hedge book. Our U.S. dollar hedge book provides cover for transactional currency risk because our dollar receipts usually exceed our dollar costs. The impact of COVID on our future forecast left us significantly overhedged and so in 2020 and early 2021, reduced the hedge book at a cost of GBP 1.7 billion spread over the next 6 years.

Now you can see on this slide the business unit performance in more detail. As Warren has already talked about the market drivers of our performance, so I won't need to cover those again. What you can see here is the scale of the impact of the drop in performance in Civil Aerospace has had on the group as well as the impact of the COVID-related onetime charges, which make up most of the loss. Power Systems, Defence and ITP Aero all contributed positively to operating performance, albeit only Defence achieved year-on-year growth, up 8% on 2019.

Now this next slide details the successful mitigating actions we took this year to help protect our financial and liquidity position. We've had a laser-like focus on cash costs, culminating in year savings of more than GBP 1 billion compared to our plan at the start of the year. The largest savings of around GBP 500 million came from a reduction in pay and benefits. Now this was a result of 3 key things: Number one, a pay cut for senior managers during the 9 months between April and December; secondly, support from government furlough schemes; and thirdly, savings starting to come through from the reduction in roles in the second half of the year. Furthermore, we reduced our capital expenditure by around GBP 300 million. We stopped all nonessential spend and rephased some of our projects. About 2/3 of our savings were in Civil Aerospace, where earlier plans to increase capacity were shelved as we now expect to meet the forecast load within our existing facilities. We've reduced the pace of investment in spare engines, and we've also challenged capital plans across the group.

Engineering spend was also reduced as industry-wide delays have allowed us to slow down our R&D spend without jeopardizing our commercial objectives. We've also saved on third-party costs and travel and absorbed the additional investment needed to make our workspaces COVID-secure. Now most of our mitigations were onetime or temporary. However, some of the savings are expected to roll into our fundamental restructuring program, helping to deliver the GBP 1.3 billion of annualized savings by the end of 2022. Achieving more than GBP 1 billion of savings so swiftly is testament to the collaboration, dedication and focus from everyone in the business. Not only have personal sacrifices been made, but we have pulled together to find savings, no matter how small, to contribute to the group-wide effort to protect our business. I'd like to thank everyone at Rolls-Royce for the part that they have played delivering this extraordinary response to the COVID crisis.

Now on this next slide, we had a GBP 4.2 billion group free cash outflow in 2020 compared to a GBP 900 million inflow in 2019. This GBP 5.1 billion year-on-year movement can be divided into 3 broad categories. Firstly, compared to 2019, there was a GBP 3 billion impact from operational factors, but this is mostly due to the lower engine flying hour receipts from the long-term service agreements, but also includes lower time and material receipts and the impact of under-recovery of fixed costs, particularly on civil OE, original

equipment, volumes. Although Power Systems and ITP Aero contributed positively to group cash, they were down year-on-year, which was only partly offset by growth in Defence.

Secondly, we had a GBP 2.1 billion swing in working capital, moving from a GBP 0.4 billion inflow in 2019 to a GBP 1.7 billion outflow in 2020, and this was mostly due to our decision to stop invoice factoring, which resulted in a GBP 1.1 billion adverse one-off timing impact to cash. The rest was a reflection of the underlying reduction in working capital as our activity levels diminished significantly in 2020. This compares to the previous trend of cash inflow from working capital as we grew the business. Now finally, there were a range of other smaller factors moving in both directions, which largely net each other out. Included within these are the costs of closing out the hedges in 2020 as well as the positive swing of around GBP 400 million from the lower capital spending due to our cash mitigations.

This next slide shows how these 3 movements show up in our summary funds flow in more detail. The Civil Aerospace net LTSA balance grew by GBP 479 million in 2020, which may feel a little counterintuitive given the significant fall in flying hours. Now this is the result, though, of the GBP 1.1 billion contract catch-up to revenues that I outlined a little while ago. Typically, we expect to see an increase in the LTSA balance as we grow the fleet. However, this year, if we adjusted out the catch-up effect, we had a reduction in the LTSA balance as revenues, which, as you know, are driven by shop visits, were larger than the flying hour receipts. The GBP 138 million movement in provisions is the net result of new provisions for onerous contracts, offset by the reduction in provisions related to the Trent 1000 in service costs. You can also see here the GBP 202 million cash impacts of closing out unutilized hedges.

Although the cash headwinds from the hedge book and Trent 1000 fixes are substantial and multiyear, they are not permanent elements of our cash flow. In 2020, the cash impact of these combined was around GBP 700 million. Moving on to '21 and '22, they are expected to be around GBP 800 million and GBP 500 million, respectively. But beyond 2023, importantly, the headwind from Trent 1000 is expected to be de minimis. The last of the hedge cost will be in 2026. Now further details of these are included in the appendix slides.

Moving on to the next slide. We strengthened our liquidity in 2020 to cope with the uncertain outlook and near-term cash impact of the COVID crisis. At the start of 2020, we had GBP 6.9 billion of liquidity and a net funds position of GBP 1.4 billion. Our GBP 3.1 billion of debt included EUR 750 million of bonds maturing in 2020 and \$500 million maturing in 2021. Now we had expected to cover these maturities with the cash generated by the business. With the arrival of COVID, we took the precaution of drawing down on our GBP 2.5 billion revolving credit facility, which had a duration out to 2024. As the extent of the pandemic became apparent, we took the necessary actions to ensure that we would have enough liquidity and a sufficiently long maturity profile to manage even in a severe but plausible downside scenario.

We agreed new loan facilities, GBP 1 billion with a 2-year term and GBP 2 billion with a 5-year term, and we lengthened the GBP 2.5 billion revolving credit facility to 2025. We were supported by the U.K. credit export agency with an 80% guarantee on the 5-year term loan. In the fourth quarter, we added to this with a GBP 2 billion bond issue and a GBP 2 billion rights issue, which were both well supported by our investors. This leaves us all in a strong liquidity position with around GBP 9 billion at the start of 2021, and most of our debt does not mature until at least 2025. This gives us the strength to weather the near-term cash outflows and we expect to return to generating cash from operations in 2022. Today, we have GBP 5.5 billion of undrawn facilities. And additionally, we have just agreed a GBP 1 billion extension to the 5-year term loan with the UK. Export Finance and our syndicate of banks. We do not expect to draw on this extension even in a downside scenario, but it provides an important safety net.

Moving on to the next slide. Our strong liquidity will, therefore, see us through this crisis, but afterwards, we will need to rebuild our balance sheet. We do not intend to remain in a net debt position. We're in a cyclical industry and need a strong balance sheet to be able to weather the storms without jeopardizing our commercial position or our through-cycle investments. The first step on the road to financial recovery came from the support of our shareholders, with the GBP 2 billion proceeds from the rights issue in 2020. We expect to at least match this with proceeds from disposals, which I'll say more about in a moment. The remainder of the bridge comes from cash generated organically from operations, the actions we are taking to restructure the business. And the expected recovery in engine flying hours should enable us to

get back to a healthy cash generation by 2022. This underpins our ambition to reach a net cash position in the medium term, consistent with an investment-grade credit rating.

Now on this next slide, and before I hand back to Warren, I promise to say a bit more on our plans for asset sales. We got off to a good start with 2 disposals all really agreed and due to complete later this year. Firstly, we agreed the sale of our Civil Nuclear instrumentation and control business to Framatome. Secondly, we agreed to sell Bergen Engines to TMH International. Now this transaction has been temporarily paused at the request of the Norwegian government to be further reviewed by them. It is not for us to speculate on the outcome of the government's review. However, it should be noted that the sale of Bergen is only one part of our disposal program. Although both of these are good businesses, neither of them were central to our future strategy, and they did not generate any material profit or cash flows. Between them, they generated about GBP 300 million in annual revenues.

The largest of our planned asset sales is ITP Aero. We've started the disposal process with the proposed transfer of our Hucknall facility and some of the work from Barnoldswick into ITP. We are holding talks with a number of interested buyers. No one is being ruled out, and we are working closely with all the key stakeholders to find the right path forward. We've got a number of other assets under consideration too, not just in Civil Aerospace but across the group. We're not in a position to name these yet as they are at a relatively -- still in their early stages. But we expect to see further progress by the end of 2021 on all processes.

Now I'll now pass back to Warren to discuss our outlook and our strategy.

Warren D.A. East

CEO & Executive Director

Thank you, Stephen. Okay. Let's move on. Now, as I said before, this has been an unprecedented time. We have faced up to the challenges with decisive and effective actions to take control of the things we can control and manage the things that we can't control. And within that framework, we have 3 clear priorities as we look forward. First of all, restoring our financial performance, then thinking about how we maximize value from our existing capabilities for the medium term and, looking further forward, how we deliver the science-led innovation in sustainable power that's going to take us forward into the longer term, and I'm going to take each one of these in turn.

So let's start with our financial performance and how that changes. The -- we'll step back for a moment and look at the global economy. The impact of COVID on the global economy has been greater than any other event in recent history. You can see from the chart on the top right here. Nonetheless, there is cause to be optimistic about a V-shaped recovery, and that's underpinned by the efficacy of vaccines and the decline of infections in locations where vaccinations and testing have been rolled out. The data is -- initial data is very encouraging. The pace and timing for opening up borders, however, remains uncertain today, but it's clear from our airline customers that there is significant pent-up demand from consumers for flights just as soon as they're able to resume. And this could be accelerated by vaccine passports, air bridges or other risk-based approaches between countries with low levels of infection.

Now in Civil Aerospace, there is, as you know, a historic correlation between GDP and flying with growth in passenger miles increasing at around 1.5x the pace of economic growth. And there's also a strong link between the development of the country's economy and the penetration of flights per person. And as a result, fast-growing economies with low levels of air travel fuel the long-term expected growth trends for our industry in the coming decades. And this makes it hugely important that we develop the right low-carbon solutions that will support these economies to develop cleanly and sustainably, and I'm going to elaborate more on that in future.

Now Power Systems is also a GDP-plus business. But unlike Aerospace, it doesn't have particular issues around opening up of travel corridors and government-to-government agreements. And so we expect the V-shaped recovery in GDP to result in a faster recovery of revenues and profits. Defence, as I said earlier, has been less impacted by the crisis. It's also less impacted on an ongoing basis by fluctuations in GDP because government allocations are driven more by the need for investment based on geopolitical risk. And actually, we don't see that geopolitical risk changing anytime in the near future. But of course, there

will be pressure or likely to be pressure at any rate on total government budgets in coming years as they seek to repair the economic and social damage that has been caused by COVID.

So moving on to Slide 19, talking about Defence and Power Systems. I'll start there with a little more detail. Power Systems and Defence have been the bedrock of support for us this year, and they've contributed over half our revenues and generated both profit and cash for the group. Power Systems provides the power for industrial and agricultural growth as well as travel and infrastructure, and reliable power is critical for continuity of services, and our microgrids and backup power solutions can provide that. And as we see economies reopen and get back to business, so we expect our customers' capital expenditure cycle to accelerate, and that will drive a sharp recovery in demand for our OE and for aftermarket services.

And so we see our Power Systems business returning to 2019 revenue levels by 2022, along with a margin recovery back to double-digit levels. And that is helped by structural growth in China, that I've mentioned before, and increased pace of development of low-carbon solutions as well as the general recovery from COVID. In Defence, we have a stable outlook. We have a strong order book. We're working continuously in that business to offset inflation and pricing pressure with savings and operational efficiencies. And we think that we're in a good position to benefit from future program opportunities as they emerge.

So now let's look at Civil Aerospace on Slide 20. Clearly, the pace and timing of recovery in engine flying hours remains uncertain, but the progress on vaccines and testing is encouraging. At the start of the year, in January, we updated our expectations for 2021 to reflect the challenges that the world is seeing from new virus variants and new national lockdowns, and our view of a recovery in 2021, we modified, and this is particularly about the Rolls-Royce fleet, by the way, that we modified to an average of around 55% of 2019 levels, and that remains unchanged as we sit here today. Today, activity is actually below that level. But based on third-party projections and conversations with our own customers, we expect the recovery to pick up in the second half of the year as flights fill up and the airlines open more routes. And this recovery is likely, of course, to be led by short-haul leisure demand, and that will be followed by business trips and long-haul journeys.

Now turning to our expectations for engine flying hours in 2022. We're now expecting around 80% average flying hours in 2022 compared to 2019, and that's different from the 90% we talked about previously. The impact of this downward revision on our GBP 750 million cash target has been mitigated by additional management actions and our latest view on certain cash movements. We've also refreshed our plausible and severe downside scenario to make sure we're well prepared should the recovery take a little longer. Full details of our scenarios are included in the press release. But in summary, we see a reasonable worst-case of around 45% of 2019 levels in 2021, that's flat on 2020, but it's a bit higher than the levels we're seeing today, and approximately 70% of 2019 in 2022.

So we continue to see a disparity between the different engine programs, the chart on the top right-hand side slide, and you can see that shows that the newer, more efficient aircraft and engines are the ones that are recovering faster than the more mature ones. And that's, of course, driven by the economics for airlines as they look to minimize their operating costs. And it's also driven as well by the geographic mix and customer concentrations of our fleet. You can see our Trent XWB engines have been the fastest to recover. They've already reached around 60% of prior year flying hours by the end of 2020, and that's followed closely by the fleet of Trent 1000.

One of the bright spots for the whole industry last year was the winning combination of our Trent XWB engine on the Airbus A350. This is the most fuel-efficient wide-body aircraft in the world and it has versatility to serve both long-haul and short-haul routes. Now we're already exclusive on the A350-1000 variant of the aircraft, and we are extending our position, our exclusive position, on the A350-900 variant, and that accounts for the bulk of the A350 fleet, and that extension has agreed with Airbus out to 2030. Now that's in line with the development time line for our next-generation UltraFan engine program. And just to remind you, by the way, that we're also the exclusive engine provider for the A330neo with the Trent 7000.

So Slide 21. I talked so far about recovery factors that we can't control, engine flying hours, behavior of airlines and the like. Now I'm going to talk about things that we can control. We were quick to recognize

the need to self-help actions to control our cost base and position our business for the future last year. And in May, we announced a fundamental restructuring program, the largest we've ever undertaken. The impact on our people of a change program at this scale cannot be underestimated, and we didn't -- certainly did not take this decision lightly. We're consulting with colleagues on the proposed actions. We're working with unions and employee representatives to try to limit the number of compulsory redundancies and protect as many livelihoods as we can. We've increased support for mental health and well-being, and we're helping those that are affected by redundancy to find alternative roles, sometimes elsewhere in Rolls-Royce, sometimes outside of the company.

But the outcome we're targeting is clear. We need to restructure our cost base and eliminate the under-recoveries and set up the framework that will enable us to recover strongly when activity levels return. So we've set the target to achieve annualized pretax savings of more than GBP 1.3 billion by the end of 2022. And our plan for this includes the removal of more than 9,000 roles, and most of those are in our Civil Aerospace business. It includes consolidation of our operational footprint and cost discipline right across the business. And we're also looking to keep our capital expenditure low, and we're aiming to be at the better end of our peer group range of 3% to 4% of revenues in that respect.

Now we made a strong start in 2020. In 2020, around 7,000 roles were removed across the business, mostly through our voluntary severance programs, but also as a result of hiring freezes via contractors, some compulsory redundancies. We also began consultations to consolidate the major Civil Aerospace operating sites, consolidating 11 sites down to 5, with activities being moved to the most productive cost-effective hubs and a reduction in the duplication of work in multiple locations. We're engaging with all the stakeholders to make sure that our actions are both fair and effective.

Now let's have a look at the economics. Changes are fundamentally altering the economics of our Civil Aerospace business, and that's shown here on Slide 22. The majority of our cost savings are targeting fixed costs in our Civil Aerospace business. We're reducing headcount by approximately 1/3, and we're looking to lock in substantial savings from those site consolidations and efficiency improvements. And on top of that, most of the planned group capital expenditure savings are also in Civil Aerospace. And there, we have a reduction of more than 50% versus the 2019 levels. And that's, of course, helped by the growing maturity of our newest engine program, so some of that CapEx was going to reduce anyway.

At the same time, we're seeing our variable costs reduce with load, but we're also pushing those variable costs even further. We're challenging ourselves to achieve better pricing and engineer greater efficiency to reduce per-unit cost and waste. It really is a fundamental transformation of the Civil Aerospace cost base. It's a program of self-help, and that will enable us to create a stronger business with more sustainable cash generation and a permanently lower fixed cost base, regardless of whatever the pace of recovery happens to be.

And as the next slide shows, it sets us up well to benefit from huge operating leverage as the market recovers. So let's look and see what that means for our future cash flows, on Slide 23. We can't control the pace and timing of recovery, which, in turn, is the main driver of recovery in both the aftermarket and the OE receipts part of our business. So those are the blocks above of the axis. But what we can control are the blocks below the axis, which I've just talked about on the previous slide. But here, you can see spread out in time. We can influence the rate of cash burn during the downturn. And also, consequently, the operational leverage that we enjoy as the flying hours improve.

In 2020, large engine flying hours were 43% of 2019 levels, and we delivered around half as many of new large engines. Business jets and regional did show more resilience, but still, the fall in receipts was quite significant. And you can see our response in the reduction of the turquoise bars below the line, representing the operating cost and capital spend. And that begins in 2020 with the cash mitigation that I talked about. But it continues in 2021 and 2022 as the restructuring program makes those savings permanent and expands them even further.

However, due to supplier lead times and working capital movements, in 2020, it simply wasn't possible to reduce our total costs at the same pace that we saw in the fall in receipts. And that's what drove the Civil Aerospace trading cash outflow of GBP 4.6 billion. In 2021, this does begin to improve because that purchasing reduces with lower volumes and as we're able to turn off those taps, we still have a working

capital headwind to contend with, and that is driven primarily by the OE concession payments that we talked about shortly before Christmas as a backlog of 787 aircraft are delivered by Boeing, and that triggers payments from us to airlines. The timing of this is completely outside of our control. And while we expect significant concession outflow in the first half of 2021, we may slip a little bit to the right.

Nevertheless, you can see the cash flow as a whole begins to improve in 2021. Once the market recovers more fully, you can see Civil Aerospace returning to positive cash flow. And assuming flying hours reach approximately 80% of 2019 levels, on average, in 2022, we will see the Civil Aerospace business delivering cash flows that support our group ambition of at least GBP 750 million of free cash flow. Looking longer term, the actions that we've taken to change our cost base and position for the recovery mean we're confident we'll be able to keep those costs low as volumes increase and that will deliver better cash margins in the future than we have achieved in the past.

So that brings me back now to the group outlook for the near term, on Slide 24. We're expecting free cash outflow of around about GBP 2 billion in 2021. The first half will see the worst of the outflows, mostly due to the shape of expected flying hour recovery and the timing of those concession payments. In the second half, there should be benefits as the vaccine and testing allows more routes to reopen and working capital pressure begins to ease on those concession payments. Both halves are expected to see cash outflow overall. But at some point during the second half of the year, we expect net cash outflow to become net cash inflow, marking the inflection point in our recovery. Now as we move into 2022, we expect those improvements to continue and drive sustainable positive cash inflow and that could total as much as GBP 750 million in the year as a whole in 2022.

And that's not adjusted for any disposals that may have completed by then but it does remain contingent on the recovery in flying hours to at least about 80% of 2019 levels. Now despite the uncertainties of the exact timing of that, we're confident that over a 12-month period, starting at some point in 2022, we're going to achieve that target. Looking further ahead, our ambition to get back to at least GBP 750 million as early as 2022 includes up to GBP 500 million of temporary headwinds from the Trent 1000 fixes and the closure of our overhedged positions. So our projected future cash flows will benefit as these diminish in the years going forward.

So Slide 25, now that we've -- that's effectively covered how we are restoring our financial performance. I'm going to move on to how we're positioning ourselves for the recovery and creating a sustainable future. And that's 2 things: first, by maximizing the value from our existing capabilities in civil, in Power Systems and Defence; and secondly, through the science-led innovation in sustainable power that we talk about quite a bit. And that includes exploring opportunities with things like sustainable aviation fuels, exploring opportunities around hydrogen, and I'll come on to talk about that in a moment.

So on Slide 26, maximizing the value from our existing capabilities, it's all about what we can do in each of our business units to really capitalize on our position. We've invested heavily in Civil Aerospace over recent years, but that major investment cycle is now largely complete and our fleets are amongst the youngest in their respective markets. So the focus now is on extracting aftermarket value from that installed base with more than 5,000 large engines and 7,000 business jet engines, and we can do that by improving time on wing and continuing to reduce the cost of components. Similarly, in Power Systems, we've got an installed base, more than 150,000 large engines, which gives us a great foundation to build upon. We're also exploring how we can really grow our strategic position in China, which is a fast-growing market for Power Systems, as well as commercialize our electrical, hybrid and hydrogen solutions. In Defence, there are 2 particularly notable engine programs, and we're awaiting decisions on those in the next 2 years or so. These are the B52 re-engine program and the future Vertical lift program. And together, they have an estimated lifetime value of more than GBP 7 billion. And we're also continuing to work on through-life upgrades to engines in service.

Slide 27 shows what this means for our capital allocation. On the left-hand side of the slide, you can see how we're pivoting our midterm investments away from civil towards Power Systems and Defence because, as mentioned, the major investment cycle in civil is now largely complete. And in 2019 and 2020, we spent more than 70% on Civil Aerospace and ITP Aero. But looking into the medium term, we're going to see that decline, and it will be more like 50%. Now if we look at the chart on the right, we can

look at that capital allocation through a different lens. This is a lens where we are accelerating our focus on carbon -- on low-carbon technologies and sort of self-funded and disciplined R&D.

And as we move towards the midterm, the proportion of our investments in low-carbon and next-generation engines will really be the lion's share. The current investment in current technology falls from around 2/3 in 2019 to around 1/4 in several years' time. And that rapid shift in investment spend reflects our net-zero ambitions. If we are to become a carbon-neutral business by 2050, and that means enabling the markets that we serve to be net zero by 2050, then it's vitally important that we take the steps now that will enable us to create more sustainable power in the future.

Slide 28, so I'm going to take each of these in turn and start with low carbon. Firstly, UltraFan, our next-generation aero engine. As many of you will know, this new engine architecture is forming an exciting part of our sustainability journey. For starters, it's 25% more fuel-efficient than the first generation of Trent family engines. It's also 100% SAF compatible, sustainable aviation fuel compatible. Now that efficiency is very important as SAF will inevitably be more expensive than fossil fuel to begin with. Now I mentioned SAF a moment ago, and there's a lot of interest in this area recently. So just touching on that for a moment. For journeys over 1,000 nautical miles, alternatives like electric solutions and hydrogen solutions become very challenging or even impossible.

So for Rolls-Royce, we see the use of SAF, or sustainable aviations fuel, as being vital. And they require little change to our existing engine architecture and what we're working on with partners in the industry is SAF that can be simply dropped into the engine. They also have higher energy density and fewer impurities. And additionally, they can be created synthetically using captured carbon, using a zero-carbon energy source and that's what gives us our net zero. You may have read the announcements we've made recently about successful tests on our wide-body business jet engines. We've also been testing SAF in our Defence engines, and all the results have been extremely promising.

However, it's not just aviation that can benefit from more sustainable fuels. Our Power Systems business also has a separate unit called Power Lab, and that's dedicated to our sustainable future. And there, we're exploring the use of synthetic fuels in our Power Systems portfolio. Our hybrid electric solutions reduce further our CO2 impact, and we're embracing hybrid solutions in many different areas across the group. You've seen pictures of hybrid trains before from Power Systems. In Power Systems here, on the bottom of the slide, we have a picture of a hybrid electric engine based on the Series 2000 engines, ideally suited for yachts and provides increased power and lower noise pollution.

Now let's turn to Slide 29 and talk about enabling net zero. Now remember, an UltraFan engine running 100% synthetic aviation fuel generated from net-zero electricity is indeed net zero, but we're doing more. As with SAF, there's been a lot of interest and excitement in the aviation sector around the use of hydrogen. And just like others in the industry, of course, we're exploring the fundamentals of hydrogen in aviation. It's a very exciting area and one that really pushes the boundaries and uses our existing engine technology. Our existing engine technologies could be adapted relatively easily to utilize hydrogen. There are large challenges for the industry that are -- industry more broadly, however, to overcome. But it's exciting to see the effort building around hydrogen. I'm confident that we have the technical capability to support our aviation customers if that is indeed the direction in which the industry moves.

Aside from the use of hydrogen in aviation, there are also many opportunities for hydrogen in our Power Systems business. We're cooperating, for instance, with Daimler truck on stationary hydrogen-powered fuel cell generators, and that would act as a CO2-neutral emergency power generator for critical facilities like data centers. And we're also working on ways to make energy storage more carbon-neutral. We recently made a majority stake in the acquisition of Qinous, which is central to our microgrid solutions, enabling renewable power and energy storage. I would also like to talk about SMRs, or small modular reactors. You've heard us talk about that before.

Rolls-Royce has unique expertise in high-density nuclear technology from decades of experience in Defence. SMRs are small nuclear power stations which are factory built, which have the ability to deliver electricity in a net-zero way. In turn, this electricity could further contribute towards our net-zero ambition as, of course, it could be used to power the synthetic production of SAFs or indeed of hydrogen. And we

have U.K. government support for SMRs, and we're targeting the first power by 2030. They have much lower CapEx requirements, much smaller footprint per gigawatt.

Now turning to Slide 30. I'm going to come back to aviation. And the progress we're making in electric aviation is particularly important for small- and medium-distance journeys and is an area where we're seeing a huge amount of interest and growth. Now you may have noticed on Tuesday that we announced our first commercial deal in the urban air mobility market. It's a very significant step towards commercializing our technology. The deal with Vertical Aerospace uses a Rolls-Royce electrical power system, which will be integrated into the piloted eVTOL vehicle. It's also particularly exciting as it has the potential to transform the way that people and freight move from city to city. In the commuter and regional space, we've got a partnership with Italian airframer Tecnam to jointly develop the P-Volt. That's an 11-seater aircraft in an all-electric battery and fuel-cell configuration.

And today, I'm announcing that we are expanding the successful research program between Rolls-Royce and Widerøe to cover all elements of developing and delivering the zero ambitions, people commuter aircraft that could be used in the Norwegian market from 2026. And in the small propeller space, you might have read our announcement earlier this month that the Spirit of Innovation aircraft, part of the ACCEL program, achieved another major milestone. It's on track to be the world's fastest electric airplane. It successfully did its taxiing trial propelled by its 50-horsepower or 400-kilowatt electric powertrain, and we are hoping to see the first flight of that aircraft in the spring.

So let me summarize. Before we end our presentation today, just a reminder of what we've been talking about, the decisive and effective actions we've taken to address the challenging market conditions we faced in 2020. We made in-year cash savings of more than GBP 1 billion from one-off mitigating actions with the support of our stakeholders. We've strengthened our liquidity position to increase the resilience and support our long-term strategy. We've also made strong progress on our fundamental restructuring program and we've commenced our disposal program to raise over GBP 2 billion in proceeds.

If we look forward, ahead to the recovery, then we're confident that those restructuring actions that we've taken in 2020 will enable us to have permanent cost efficiencies. We remain committed to supporting the decarbonization of our end markets by pivoting our R&D and CapEx towards lower carbon solutions. And I'm confident we'll be able to offer -- continue to offer growing low-carbon technology for a more sustainable future.

Now before I hand back to the operator now for Q&A, as I mentioned, or in fact, as Isabel mentioned at the start of this call, this is Stephen's final full year results with us. And I'd obviously like to thank Stephen for all his hard work and support, particularly during the recapitalization efforts of the last year. I want to thank him for his friendship over the last 4 years as well and help with putting this business back where it belongs. So thank you, Stephen. I think Ocado is very lucky to have you. And now as the rest of you know, Ben Fidler, who's here with us today, is stepping up to the role of interim CFO for a few months until our new CFO, Panos Kakoullis, joins us in May. And with that, I'd like to thank you all for listening and hand over to the moderator for Q&A.

Question and Answer

Operator

[Operator Instructions] We have the first questions coming from the line of Andrew Humphrey from Morgan Stanley.

Andrew Edward Humphrey
Morgan Stanley, Research Division

I've got a couple, if I may. One is on flying hours. I mean I think on -- over January and February, Rolls-Royce flying hours, as far as we can tell, were around 36% of 2019 levels. Assuming they stay at a similar level over the rest of the first half, are we effectively saying we need to be at 75% of 2019 levels in the second half to meet the cash guidance for this year?

And my second question is sort of a bit longer-term around XWB. You've obviously secured the exclusive position on the 900 until 2030. I was curious about the reason for specifying that variant. I mean I assume that the 800 and the 1000 would not be sufficiently large-volume opportunities in themselves for a competitor to make significant inroads in there. I'd be interested in your view on that. And also, does the kind of specification of sort of 2030 as an end date for that exclusivity mean, effectively, that could be dual-source from 1st of January 2031?

Warren D.A. East
CEO & Executive Director

Right. Thanks very much, Andrew. Well, let me take both of those. I mean the engine flying hours, undoubtedly, we can see what's happened in the first couple of months. And there is a huge amount of uncertainty still in the timing of the recovery. And yes, our base case does expect a recovery to resume in the summer. Things like vaccine rollouts and the efficacy of vaccines are important to that. But also airport testing or health passports or whatever the solution is going to be will also require government to government interactions and lastly, public confidence, people have to actually get on the airplanes. So yes, there's a lot of uncertainty.

And yes, the arithmetic that you suggest about overall percentage of engine flying hours is there. Of course, don't forget, engine flying hours, there isn't a literal connection of engine flying hours to our cash performance this year, but there's definitely a directional relationship. And our base case does depend on that recovery. So we'll just have to wait and see. And we're going to concentrate and continue to concentrate on the things that we can control and manage the things that we can't control, like timing and pace of recovery.

On XWB 900, you'll recall, 12 months or so ago, there was a huge amount of speculation about our competitive position on A350 and GE having conversations with Airbus and so on. A huge amount of speculation and uncertainty in the community. And so we're delighted to put that speculation to bed for the remainder of this decade. And you're right, the 900 variant is the volume variant. It's a hugely successful airplane. And technically, yes, when a period of exclusivity finishes at the end of 2030, then it could be dual-sourced at the end of 2031. But as I pointed out in the presentation a moment ago, the 2030 date does coincide pretty much with the timing of likely UltraFan and next-generation aircraft and those sorts of things. It's a useful round date as well. To say exclusivity to the middle of March 2031 or something like that doesn't seem like a very -- seems spuriously accurate date. So we'll see. But for now, we're delighted with confirming the exclusive position across all the variants of the A350.

Operator

We have the next questions coming from the line of Celine Fornaro from UBS.

Celine Fornaro
UBS Investment Bank, Research Division

If I may, I would have 2 questions, please. The first one is regarding your GBP 750 million free cash guidance for 2022. So if we try and work it backwards a little bit in terms of the businesses, we know that roughly the non-Aerospace part of the business would generate approximately GBP 700 million of cash and then you would have GBP 600 million of headwinds coming from the tax, interest and the hedge book. So that would imply that Aerospace basically needs to generate roughly GBP 600 million in 2022 with a scenario of 80% flying hours. I just -- this is way above the 2019 level, which was in the high 400s. Maybe you could just explain to us the path towards that and if this logic seems accurate based on the headwinds on aftermarket and the rebased volume offset somewhat by restructuring.

And then my second question would be I've just seen this morning an appointment, a new appointment with a new effect on the Board by Mr. Paul Adams. So maybe you could share a few words on his background and what he would bring to the business given his operational focus. You are midway through a restructuring and a potential portfolio sale of some assets.

Stephen Wayne Daintith
CFO & Executive Director

Celine, it's Stephen here. So let me start with bridge to the GBP 750 million free cash flow as early as 2022 that you referenced. And you're absolutely right, the key driver here will be the recovery and turnaround in Civil Aerospace. Let me just take you through -- if I just work, let's say, from the outflow of GBP 4.2 billion that we saw in 2020 and take you through to 2022 and what are the key drivers of that material improvement in free cash flow over those 2 years. So first of all, the single-biggest driver is of course the improvement in the engine flying hours that we see, close to GBP 1.2 billion of cash flow improvement. And that's essentially driven by engine flying hours rising from the 43% of 2019 levels that we saw in 2020, particularly in the final 9 months of 2020, improving to the guidance that we're giving today of our expectation of around 8% of 2019 levels in 2021 -- sorry, in '22. And every 1%, as a rough rule of thumb, equals GBP 30 million. So there's a -- that is your first key item really in that bridge.

We're then also expecting to see about GBP 900 million of improvement in Civil Aerospace just in market impacts, and this will be around the regional engines, the V2500 and just generally, wide-body time and material improvement. That's going to be a big driver of that. We're also going to see higher spare-engine volumes in 2022 that we saw in 2020, which was a pretty subdued year for spare-engine demand, as you might expect. And finally, a key thing that we shouldn't forget about in Civil Aerospace is we're going to see around GBP 300 million lower Trent 1000 costs. We're about GBP 520 million this year. That will reduce to around GBP 200 million or so in 2022, so that's another key driver.

When we look at Power Systems and ITP, put those 2 businesses together, we're probably going to see around GBP 200 million of improved cash flow out of those 2 businesses in 2022. Another key item that we're working through and, in fact, this is an item that we've made good progress on during 2020 is our group restructuring program. We're expecting a GBP 500 million contribution from that compared to our 2020 numbers. Those are reductions in operating costs and capital expenditure. Just as a reminder on that, the cash mitigations of the GBP 1 billion of savings that we delivered in 2020 were against our pre-COVID budget, whereas the GBP 1.3 billion of restructuring savings that we first indicated on the 20th of May, when we announced our 9,000-headcount reduction, they're measured against our 2019 cost base. So in short, this difference means that despite the 2020 mitigations, there's still GBP 500 million of benefit to come across '21 and '22 and not just the headline GBP 300 million.

Another key point here is to bear in mind that we actually see a reduction in the 2020 temporary headwinds as well that we saw, and these are 2 key areas, really. Number one is in the fixed cost under-recoveries, particularly in Civil Aerospace, to the drop, sharp drop in volumes that we saw in 2020 as COVID really kicked in and that we've talked about the OE volumes just now. And then we've also got a one-off FX impact in 2020 as well as our U.S. dollar costs exceeded our revenues. And in that scenario then, we translate rather the achieved rate at the prevailing spot rates at the time, closer to sort of GBP 130 million-or-so rather than the GBP 150 million-or-so in the hedge book. And given that our costs exceeded our revenues in 2020, that has a material around GBP 400 million FX headwind to 2020 that won't be repeated in 2022 as our revenues and costs get closer aligned in U.S. dollars.

Finally, we had a GBP 200 million increase in pension, interest and tax, pension cost swings in 2020 due to a deferral of the 2020 cash costs into '21. So that's another item in that respect as well. So that gets you to the GBP 750 million as early as 2022. And I would put some qualification around that, very much dependent on the 80% of engine flying hours that we've highlighted today and also very much dependent on the pace of our restructuring program and the delivery of the savings as well. I think we've made very good progress during 2020. There's still much to do, particularly as we get into the discussions around the potential site implications in Civil Aerospace. But we're pleased with the progress that we're making and pretty confident about delivering those full savings from our restructuring program.

That's it really on the GBP 750 million. Warren?

Warren D.A. East

CEO & Executive Director

Great. Thanks, Stephen. And on Paul Adams, well, we're very pleased to welcome Paul Adams to the Board. I'd point out that we also highlight that 3 of our directors are leaving the Board. They're timing out. And so this is part of the normal succession process. Now Paul was Head of Engineering at Pratt & Whitney for some years, and so he clearly has some very relevant industrial experience. And that compensates for some of the industrial experience that we are losing with the timing out of those 3 directors. But it's also very relevant industry experience. And I think his technical background is going to be particularly useful as we go through the next decade with next-generation engines to bring on and transition to new technologies.

Operator

We have the next questions coming from the line of Chloe Lemarie from Exane BNP Paribas.

Chloe Lemarie

Exane BNP Paribas, Research Division

I have 2 as well. The first one would actually be building on Celine's question on 2022 free cash flow. If we keep all things equal and add back we're missing 20% flight hours to go back to 2019 level, I would assume you could deliver about GBP 1 billion from civil and even possibly GBP 1.5 billion once the hedge book and Trent 1000 headwinds have gone. So could you say whether this is broadly your ambition for the division or would there be elements that would cap that performance going forward?

And the second is on your R&D and technology road map. Would you see the need to return to past R&D peak by, let's say, the middle of the decade as you help fund that innovation to move towards the decarbonization goals? Or are these technologies actually less R&D-intensive than prior programs, having quite a lot of commonality with your existing portfolio?

Stephen Wayne Daintith

CFO & Executive Director

So thank you. I'll do the first question, Warren, and I guess, you'll do the second.

Warren D.A. East

CEO & Executive Director

Yes, that's fine.

Stephen Wayne Daintith

CFO & Executive Director

So yes, it's a good point actually, the GBP 750 million as early as 2022, that actually includes Trent 1000 costs. We're guiding those costs in that year of between GBP 100 million to GBP 200 million in Trent 1000 costs. That's pretty much the final year of material Trent 1000 cash costs. And then we've also got within that number, the cash cost of closing out those FX forward contracts in respect to 2022 as well, and that's around GBP 300 million. So you put those 2 numbers together, neither of which will be permanent, the

Trent 1000 costs will stop earlier than the FX cash costs, and you'll see in the appendix the timing for those total cash costs.

And just as a reminder, on a profit basis, we took all of the profit impact, about GBP 1.7 billion, in underlying costs as part of our financing costs in 2020. So the P&L impact of that has already rippled through, but the cash profile rippled through across from 2020 through to 2027. So your interpretation is correct that one could see a route to free cash flows greater than GBP 1 billion in the absence of those 2 headwinds. Warren?

Warren D.A. East
CEO & Executive Director

Yes. And the question on R&D. Well, I mean, clearly, we are talking about being -- having an organization that is a science-led innovation. And so we could spend almost anything on R&D. But our challenge is to make sure that we can do this in a profitable and effective way. And we've made -- if you push COVID to one side for a moment, we've made lots of investments over recent years to enhance the productivity and efficiency of our engineering efforts. And so yes, we remain absolutely confident that we can maintain R&D within the sort of envelope that we've now established, which is significantly less than it has been over the last several years.

But don't forget, 2 factors driving that, the improvement in efficiency and productivity, but also the fact that we're coming to the end of the investment -- the big investment cycle in new engines in our Civil Aerospace business. And that's why we're able to make a massive change, like I showed on the slide a moment ago, in terms of how much we're spending on Civil Aerospace, tilting the investments that we are making into the other divisions and also into the newer technologies. So you'll see the absolute level of R&D remain roughly flat. You'll see the shape change significantly.

Operator

We have the next questions coming from the line of Chris Hallam from Goldman Sachs.

Chris Hallam
Goldman Sachs Group, Inc., Research Division

Yes, so 3 quick questions. First, on Slide 14. Are you able to put any time frame around the GBP 2 billion of cumulative organic free cash flow that you've highlighted after 2022? And should we assume that, that's net of a 2.5x dividend cover ratio, i.e., that you're paying out 40% of free cash flow and dividends over that period?

Second, back in February 2019, you withdrew from the NMA due to the tight schedules associated with the program. If it comes, it seems like the EIS date for that program has been pushed out to 2027 or so. And obviously, you've continued to make progress on UltraFan in the past 2 years. So is there a chance that you're interested in that program once again?

And then finally, if the U.K. were to significantly reduce the number of F-35s it plans to operate, would that have a meaningful impact on your Defence business? Or should we think about that being driven more by the global fleet number than by the U.K. fleet number?

Stephen Wayne Daintith
CFO & Executive Director

So we're really talking in the midterm sort of 3, 4 years is the time frame that we're referencing there. I mean clearly, a lot of uncertainty ahead still, a lot of restructuring to do and a lot of engine flying hour recovery to happen. But that's a sort of rough guide on the timing.

And I -- sorry, Chris, I missed the second part of the question there. I was writing down the first part of the question. So what was the second part of the question again? I missed that one.

Chris Hallam
Goldman Sachs Group, Inc., Research Division

Yes, sorry. So precrisis, you used to operate on a 2.5x dividend cover ratio, right? So you used to pay out 40% of your free cash flow in dividends. So as you try and get to net cash, are you assuming within that net cash position that you will have paid out around 40% of free cash flow in dividends?

Stephen Wayne Daintith

CFO & Executive Director

No. That is not part of the -- of that modeling right now. I mean it is something that we clearly will be considering. As we get into sort of 2023, I would imagine will be the earliest that start considering the dividend coming back. I mean we clearly want to be in a world whereby we've come out of COVID the other side. We're confident in our cash flow profile. We are very keen to get back to a -- that net-cash position that you just described. And we can see a route there, as I said, over the next sort of 3, 4 years or so. And at that point, I think, we'll be ready to have the debate about dividends.

But right now, we're laser-focused on our disposals program, generating the at least GBP 2 billion from that program and very focused on the restructuring program and getting this business back to the sort of economics that make sense for Rolls-Royce. That GBP 750 million as early as '22, that's the first gating point and then taking it beyond there, particularly as the Trent 1000 FX headwinds disappear as well. But I think it's going to be around, at the earliest, '23, '24 debate around the dividend pick-up again.

Warren D.A. East

CEO & Executive Director

Okay. And so your second question, Chris, was around UltraFan and NMA, I suppose. And yes, you're right. We were very explicit about the reason why we withdrew from that proposed program a couple of years ago and that was around the timing of our UltraFan program. Our UltraFan development has gone well since then. And we're sort of gearing up for a demonstration early next year. So then it will depend -- whether we go ahead with it at that stage or whether we pause at that stage, it will depend on the timing of new aircraft programs. And the product is -- or the product will be scalable. It will go across single-aisle and dual-aisle applications. It will be applicable for new aircraft, compatible with 100% SAF and so on. So yes, it's quite applicable. But we'll have to see if programs actually materialize and when they do.

On the F-35s and the U.K. government's cancellation, then actually, obviously we're more geared to the whole sort of global F-35 program than just the U.K. program. But I would also note that the U.K. is talking about channeling that investment into the Tempest program, where we are obviously playing a crucial role.

Operator

We have the next questions coming from the line of Andrew Gollan from Berenberg.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

So 2 questions for me, please. One on new engine volumes and one on shop visits. So on the new engine volumes, you've lowered the outlook slightly to, I think, GBP 200 million to GBP 250 million, which is understandable, I suppose. So firstly, can you give us an update on the engine unit losses in 2020? And with that kind of lower-for-longer-volume outlook, what's the trajectory you're expecting now for reducing that number going forward? And I guess I'm referring here to the pre-COVID target of GBP 0.4 billion per engine?

And then second question on shop visits. Can you break out the volumes in 2020 as you have done before? So in terms of major refits and check and repair. And what is assumed within the cash guidance over the next couple of years, in particular, please?

Stephen Wayne Daintith

CFO & Executive Director

Right. Yes, let me start on the OE volumes. I mean of course, on our OE volumes, we are completely dependent on the airframe build rates. And I think in 2020, we demonstrated a certain amount of

flexibility being able to respond to that and manage our supply chain accordingly. So we will just respond to those build rates. As far as the losses are concerned, in 2020, whilst we can respond to build-rate changes, in 2020, the change was rapid. And so actually, OE losses as we came into the year at full throttle, we had no chance whatsoever of being able to respond and scale down our operation quite as fast as the volume disappeared. So lots of under-recovery in 2020.

And so in a way, the 2020 number was pretty meaningless as far as our forward-looking ambitions are concerned. Now to those forward-looking ambitions, however, we're -- that is precisely why we are resizing our business with this restructuring, that is to deal with the anticipated OE volumes and also the anticipated volumes of spare parts for the aftermarket. And so I think we'll be back with more news about OE loss ambitions. But hopefully, we're resizing our operation accordingly to meet those lower volumes.

Warren D.A. East

CEO & Executive Director

Okay. So shop visit volumes. We actually have quite a bit of this detail already on Page 12 in the first half of the release, but I'll go through it in any event. In 2020, we had 278 -- sorry, 272 large engine major shop visits, as you described in those -- major refurbs. In 2021, that number is going to be closer to 240. So a slightly lower level. But that's going to start to -- it rises then quite sharply as we're talking around 2022 to around 400 in 2022. So that's the broad trajectory of major shop visits over the course of the next couple of years compared to our 2020 levels.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

That's helpful. And all the best, Stephen, in your next challenge.

Stephen Wayne Daintith

CFO & Executive Director

Thank you very much.

Operator

We have the next questions from the line of Ben Heelan from Bank of America.

Benjamin Michael Heelan

BofA Securities, Research Division

One on retirement because we haven't really touched on that in great detail. You do still have a relatively large exposure to four-engined aircraft and retirements should be picking up as we go through 2021. So how do you think about the impact of retirements of 380s, 340, 747s on that flight hour recovery?

Stephen Wayne Daintith

CFO & Executive Director

Yes. Well, we're not guiding specifically on retirement today. But when we look at our engine flying hour forecasts, which are -- what the guidance is or what's really the driver for aftermarket revenue, then we're effectively taking into account that retirement risk. I mean we know that airlines are preferring the newer aircraft. We showed that in the presentation. And we do have exposure to some of these older aircraft. And undoubtedly, airlines are going to retire the less efficient aircraft more quickly and in preference to the others. So yes, we're taking that into account. And in fact, in the data appendices to the presentation, then I -- we've got the data about those older aircraft and what happened in 2020, and that's probably an indicator of what airlines are doing.

Operator

We have the next questions coming from the line of Robert Stallard from Vertical Research.

Robert Alan Stallard

Vertical Research Partners, LLC

I have a similar question to Ben, actually. Looking in the back in the appendices, roughly 1/4 of your civil revenues in 2020 came from time and material and other, and that actually held in pretty well compared to long-term service agreements. So I was wondering if you could explain what was going on there. And also looking forward into '21 and beyond, how do you expect T&M to track from here?

Stephen Wayne Daintith

CFO & Executive Director

Yes. Well, basically, we expect T&M to track with activity. The long-term service agreement actual numbers were hit by the catch-ups. And so if you want to look at sort of activity, then look at shop visits and how those are developing. And time and materials is more of a reflection of activity, whereas long-term service agreements are wrapped up in accounting as well as what's actually going on in the field. So that's the difference. And we would expect time and materials for those engines where we have time and material contracts, that will just reflect flying activity as we go forward. And therefore, the recovery.

Robert Alan Stallard

Vertical Research Partners, LLC

Can I just follow-up on that? Because down 9% year-on-year would seem a very good performance given the prevailing activity we saw in 2020. So I was wondering if there was any offsets in that number.

Stephen Wayne Daintith

CFO & Executive Director

Yes. Well, I think 2020, we have to regard as an unusual year, and that's the way I'd sort of look at it. I mean don't forget, we came into the year with a bit of a backlog of airplanes needing shop visits. We did take the opportunity of 2020 to burn down those queues and that also meant burning down some of the time and materials demand as well.

Operator

Your next questions come from the line of Jeremy Bragg from Redburn.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

I wanted to ask, please, again, on the GBP 750 million guide for 2022. So you're achieving it despite lower engine flight hours. So I wondered if you could elaborate, please, on what the mitigating factors were and whether the cost cutting is just happening a bit sooner or whether there's a potential for it to actually wind up being bigger than the GBP 1.3 billion. That was the first question, please.

And then the second question was on the IAE royalties, which I wonder if you could quantify them for 2020 and give a kind of view of what's baked into the 2022 guidance because that's, again, rather like the FX, something which doesn't last forever.

Stephen Wayne Daintith

CFO & Executive Director

Okay. So thank you for that. I'll start off with the GBP 750 million. Yes, you're quite right, back in October with the rights issue, we highlighted a GBP 750 million number as early as 2022, but based on engine flying hours being at 90% of 2019 levels. And we're now reconfirming that GBP 750 million, but obviously with a lower 80% of 2019 levels. I think the key driver of this is we actually made really good progress in 2020 in our restructuring program. We got further than we thought we would and which means that we're delivering those savings earlier than we thought. And in 2022, the GBP 1.3 billion of savings that we've quoted is the exit run rate at the end 2022, so clearly, we're getting that earlier. We're going to get it earlier in 2022 as well, and that's one of the key drivers.

I think another aspect here is that there have been some benefits from COVID. We now have a 13-week rolling cash flow forecast by business that's given us more granularity than we've ever had, I think, into the operations of our individual businesses. We've been working hard on our budget for '21 and '22 since

October with the rights issue, and that's identified, I think, some further opportunities for improvement, particularly around our capital allocation and operating costs to help us reconfirm that GBP 750 million. And we've got a pretty robust plan, I think, for the next couple of years now. There are some timing items that have impacted 2021, that GBP 2 billion cash outflow in 2021 that may benefit 2022. So there's an item there just to bear in mind as well. I think as it stands, though, we are pretty comfortable with the GBP 750 million as early as '22, but very much dependent on that 80% of engine flying hour level in 2022 compared to 2019 levels.

And again, that in itself is very much dependent on the recovery in the second half of the year, as Warren talked about once the vaccination programs globally kick in. I mean it's become apparent, talking to other countries and our customers in the aerospace sector generally, that the rollout of the vaccination program will be a really key gating item. And I think most countries looking for a majority of their population to have been vaccinated before global travel restrictions start to get lifted in a meaningful way. So that is probably the one key indicator for us to watch out for.

Warren D.A. East

CEO & Executive Director

I'll pick up the second half of the question. Just as I start on that, I'd also point out that the U.K. government is hosting the G7 this year. And this getting flying going again is a sort of multi-government thing that has to happen. And so our government relations team are very much spending time and effort lobbying the U.K. government to play a leading role in getting this risk-based approach to opening up flying again.

Now IAE royalties. IAE royalties simply pretty good reflection of the flying hours for that V2500 engine. And so in 2020, very roughly, 50% down. We expect to be recovered quite a bit in 2022. Don't forget that this is effectively a single-aisle. It's a short-haul aircraft. Short-haul recovers before long-haul. And so we would expect that to come back a bit more substantially than most of our activity, which is wide-body long-haul, by 2022. But also, don't forget that this royalty stream is going to disappear in 2020 and -- or in 2027, anyway. So it's one to note, but it's not really the major driving factor of our business.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

A follow-on, please. What were the timing items that might benefit 2022 -- 2021 -- sorry, what were the timing items that might benefit 2022, please? You mentioned that, but I wasn't really...

Stephen Wayne Daintith

CFO & Executive Director

The item here, and we talked about this before, is credit notes that we've issued in respect to the Trent 1000 customer disruption. I think in the main, that's one of the items that we -- no surprise, our airlines' using their credit notes earlier. And we're working actually pretty well with our airlines to help them through their cash pressures to the extent that it's appropriate for us to do so and not to damage ourselves. But I think it's the early use of credit notes is the one thing that I would point to that are in the '21 numbers and therefore benefit 2022.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

Got you. Okay. And good luck, Stephen.

Stephen Wayne Daintith

CFO & Executive Director

Thanks very much.

Operator

We have the next questions coming from the line of Sean Stewart from JPMorgan.

Sean A. Stewart*JPMorgan Chase & Co, Research Division*

I have 4, please. Firstly, and similar to Ben's question, your base case is for engine flying hours to be 80% of 2019 levels in 2022. But what is your assumption on the size of the fleet in 2022 versus 2019?

And then secondly, your guidance on free cash flow to greater than GBP 750 million as early as 2022, which essentially has a lot of flexibility as far as guidance goes. Are you able to provide us with the minimum guide on free cash flow actually in 2022 on the current perimeter?

And thirdly, Warren, you provided some color on some of your near-term margin expectations for your Power Systems business. Given that you retained Civil Aero as somewhat tied to shop visit activity and engine deliveries, 2 things that you have guided on and which are perhaps not as volatile as the outlook for engine flying hours in the near term, please, can you provide us with like your margin expectations in the Civil Aero business in 2021 and 2022?

And then finally, you subjected some assets into ITP to make it perhaps more attractive to a potential buyer. Are you able to please quantify what the sales and EBITA -- what sales and EBITA have been injected into that business, please?

Stephen Wayne Daintith*CFO & Executive Director*

Yes. Right. There's quite a lot there, and I have to say I didn't hear all of it completely accurately. But let's have a go at some of them. So size of the fleet in 2022. Look, we're guiding -- or we're not guiding. We're making assumptions about the engine flying hours that we expect in 2022. And that's the -- that's a reflection of activity. It's a reflection of airline schedules and their current plans, combined with top-down forecast. Now in those current plans, we're not taking particular -- it's about airline schedules and their expectations. Exactly how many airplanes they're going to have servicing those routes is not something that is of particular relevance to us. And so yes, we're taking retirements into account, things like A340s retiring and four-engine aircraft generally retiring more than the ones that are current...

[Technical Difficulty]

Operator

We have the last questions coming from the line of Harry Breach.

Harry William Freeman Breach*Stifel Europe, Research Division*

Yes. Can you hear me, Warren and Stephen? Can you hear me?

Operator

Please bear with us. One moment, please.

[Technical Difficulty]

Stephen Wayne Daintith*CFO & Executive Director*

So we're not giving -- sorry, I've just been told here the line's -- shall I carry on? Okay. I'll carry on with my answer. We're not giving minimum -- 2022 free cash flow guidance. But to help you, what I would say, all things being equal, engine flying hours is the key thing to watch out for. So 1% equals around GBP 30 million and GBP 750 million, we've said 80%. So variation around that 80% number of 2019 levels, 1% equal to GBP 30 million. That's probably as best as I can give you in terms of a minimum number for 2022.

On your other questions, we're not guiding on civil profits. We haven't done previously and nor do we intend to. It's a level of detail that we're not going to go into. I think even now it is less likely, more than

ever, given the general uncertainty generally as we're still in the thick of COVID and we have all the recovery ahead of us to go through and the restructuring program to go through as well. So I think that's probably going to be something to say, but for this time next year.

Isabel Green

Head of Investor Relations

I think there may be a small interruption on the line there. If anybody did miss part of Stephen's answer and wants to come back to Investor Relations later, we can run through that again. Apologies, but I think some of you may have lost sound for a short period. Back to you, operator. Sorry, is there any more questions online? If not, I've got a -- just 1 on the webcast. I'm going to -- actually, sorry, 2 on the webcast, I'm going to turn to.

Firstly, Nick Cunningham here from Agency Partners wanting to know more about the longer-term pattern for the major overhauls and wanting to know the impact that has as those visits start to ramp up in the later years. So if you've got any further commentary on the cash growth skyline of the overhaul scenarios, that would be welcomed by Nick.

Stephen Wayne Daintith

CFO & Executive Director

Yes. I mean, Nick, the shop visit volumes will start to increase. I mean you all have seen that from the big orders that came through over the last 3, 4, 5 years, those first shop visits start to flow through, and that is built into our plans. They will grow but so, at the same time, do engine flying hours. At the same time, we see the nonappearance of the FX costs that I talked about earlier, and we also will have seen the back of the Trent 1000 cost by then as well. So despite that growing shop visit volume and therefore, the cost headwind that goes with it, there are some very significant tailwinds as well ahead for us. So that's how we compensate that.

Isabel Green

Head of Investor Relations

Just asking one last question, and apologies for anybody who didn't get their question answered. Obviously, we will come back to you individually if you weren't able to get a response online. There's a question here about SMRs for Warren. Just saying are you confident in sort of a 2030 target for SMRs given the pressures on R&D spend and how we're making those priorities. So if you have any comments you'd like to make on the SMR outlook, that'd be appreciated.

Warren D.A. East

CEO & Executive Director

Yes. And so the answer is we're confident in the program at the moment. I mean this is very early stages at the moment. Just had the government go ahead and we'll be fleshing out the detail on that, I think, over the next 18 months to 2 years. But suffice to say, we think it's a very exciting program. Rolls-Royce has absolutely unique expertise in this area. And we see it as an essential piece of net zero for the U.K. but also excitingly, as I pointed out in the presentation, for other applications like SAF and hydrogen. So we'll flesh that out over the next couple of years.

Isabel Green

Head of Investor Relations

Okay. Thank you. That's -- I'm afraid that's all we've got time for on the webcast questions. We have run out of time. Just to say, for anyone who missed that period of answers, we will make sure there is content in there in this transcript, which will be out later today or if not, maybe tomorrow on our website. So sorry if anyone missed that, the answer will be published.

Back to you, Warren.

Warren D.A. East

CEO & Executive Director

Great. Well, thank you very much, everybody. The messages that we need you to take away are that the worst is behind us as far as COVID is concerned. I'm very pleased with the progress we're making on the fundamental restructuring, particularly of our civil business to reset the economics of our civil business and give us great operational leverage as the recovery happens. And that's going to mean that we can tilt the balance of our capital allocation going forward so we're well positioned for this future recovery and a net-zero world in the future. Thanks very much.

Operator

Ladies and gentlemen, that does conclude our conference for today. Thank you for your participation. You may now disconnect your lines. Thank you.

Presentation

Operator

Hello and welcome to the Rolls-Royce Trading Update Call. [Operator Instructions] And just to remind you, this conference call is being recorded.

I'll now hand you over to Isabel Green, Head of Investor Relations. Please go ahead with your meeting.

Isabel Green

Head of Investor Relations

Thank you, and good morning, everyone. With me on the call today are Warren East, CEO; and Stephen Daintith, CFO. We expect the call to last for around 0.5 hour, including the prepared remarks, which will take 10 to 15 minutes.

Before I hand over to Warren, I'm required to remind you that on the call, we may make forward-looking statements and actual results could differ, as per Page 4 on our press release.

Thank you, and over to you, Warren.

D. Warren A. East

CEO & Executive Director

Thanks very much, Isabel. Thanks very much, everybody, for joining us. I'll make a few opening remarks as usual.

We're coming to the end of 2020 now. It's been a year that's completely unprecedented, unprecedented challenges. I think it's right to just have a quick reflect on our performance and some of the commitments that we've made for the years ahead.

Going all the way back to the beginning of the year, we came in with good momentum, having turned a bit of a corner as we emerged from a period of -- extended period, actually, of investments in new large civil engine programs to be looking forward to a period where we would see higher returns, reaping the returns from that investment on our large installed base and increased market share that has been achieved. We were also on a position of solid growth in Power Systems and Defence with a particularly strong order book there.

Then COVID, and an exogenous issue, nothing we could do about COVID. Our focus had to be on the things that we could control. And when the first wave of COVID hit, we took quick decisive actions to conserve cash, restructure our Civil Aerospace business. By the time of our interim results, we've already achieved approximately GBP 350 million of in-year cash savings. And now we are confident that we will deliver our target of more than GBP 1 billion for the full year.

We've also made good progress with a more fundamental restructuring. In May, we announced at least 9,000 roles will be removed by the end of 2022. In October, we launched our GBP 5 billion refinancing package. That was necessary to increase resilience to see us through this crisis and strengthen our balance sheet as well as support our long-term strategy. And we're very pleased to have concluded that process.

We're also very grateful for the support that our investors showed us at that time, both with the equity raise and with the debt that it serves to unlock. This means that we can now look forward with confidence that we have sufficient liquidity to get through this crisis no matter how extended it is.

Turning to what's happening in the business since we last gave you an update. In Civil Aerospace, our year-to-date large engine invoiced flying hours were at 42% of 2019 levels. We've been seeing a gradual tick-up in flying activity every month since April. October and November combined were at 33% of 2019 levels, and that was a trend up from 29% in Q3 and 24% in Q2. Meanwhile, our business jets have continued to perform relatively well, with demand much less affected by the pandemic.

Now while the second wave of COVID-19 has delayed near-term recovery in air travel, it's very good to see the recent progress on vaccination. That's encouraging welcome news. Flying looks likely to exit 2020 at a lower level than we expected, and that is likely to recover more slowly in the first half of 2021. But we still expect recovery then to accelerate in the second half as borders start reopening and economies pick up.

We've continued to see the disparity in the pace of recovery for different routes and different aircraft. And in particular, we've seen improvement in flying hours in areas like China where infection rates have been kept very low after the first wave passed and travel restrictions have been reduced. We've also seen the fastest recovery on the younger aircraft, those programs that have the newer planes, things like the Trent XWB-97 on the A350-1000. That's already back to 2019 levels. Now that's only a relatively small part of our installed base, but it's an indicator of the -- of what happens with our younger fleet.

To preempt any later questions, by the way, on in-service issues on some of our Trent 1000 and Trent XWB engines, just a quick update there. We've completed our inspections of all high-cycle Trent XWB engines. We found early signs of wear on the first stage of the IPC blade in around 20% of cases, which is exactly the same as we reported in August. Most of these were already being refurbished, returned to the customers, and we have ample spares in place. The root cause investigation and testing is still proceeding, but it has progressed as planned.

[One of] the Trent 1000 in-service issues, we remain -- we first achieved the ambition about 0 aircraft on ground, clearly helped a little bit by the pandemic. But we have continued with the development work on the final fix for the HPT blade on the Trent 1000 TEN, and we remain on track to start installing that by the middle of next year. During the year, we have built sufficient spare engine capacity such that even if all those Dreamliners took to the air again tomorrow, we would be fine to maintain that 0 aircraft on ground position.

Our Defence business has been largely unaffected by COVID-19 throughout. We've been able to keep all our facilities operational throughout, and demand has remained intact. We benefited from very good support from our government customers. And 2021 revenue cover in our backlog is around 90% at the moment for Defence.

The recently announced multiyear defense budget increases in the U.K., very encouraging. They're supporting the investment in next-generation capabilities, including the Tempest program, and we're a core partner there. We've recently received an order from the German Air Force for 56 new Eurofighter engines, and that has benefited our Defence business. It's also benefited ITP Aero.

Our Power Systems business has been impacted by the pandemic but much less so than our Civil Aerospace business. Some sectors and regions are holding up better than others. Again, a bright spot for us is China where we have been growing market share, as you know, in recent years, and strategic relationships there have helped us increase our market presence. At a recent China International Import Expo, we announced provisional agreements with 6 Chinese companies, almost 1,000 MTU engines and systems, for instance. And our book-to-bill in Power Systems as a whole this year is getting to about 1. Demand from government customers in Power Systems has been resilient throughout, and we're starting to see early signs of recovery in some of the other end markets.

Now whilst the current year is important and the impact of COVID is important, it's also important that we keep an eye on the future and look ahead. And despite everything that has happened this year, we've been able to keep focused on our ambition to deliver more sustainable power. We know that society at large is at a pivotal moment in the drive towards a net 0 carbon economy, and we think that Rolls-Royce has a key role to play. We're a leading British industrial technology company. And our key role is not only to do the right thing for ourselves but to drive change through innovation in our products and services.

We already make some of the world's most efficient jet engines, things like the XWB on the A350. That's the most efficient wide-body plane available in the market today. But as we look ahead to the future, we are investing in hybrid and electrical alternatives. In November, we ran ground tests to demonstrate that our Trent engines can operate with 100% sustainable aviation fuel, and that's an important piece of groundwork for industry-wide certification.

To achieve net zero, society needs a huge step-up in power generated from alternative sources like nuclear power. The U.K. government has committed GBP 215 million for a 4-year development program for our small modular reactor consortium. This investment in our nuclear energy solution will support the decarbonization of power generation in the U.K. But we've also signed strategic agreements with Exelon Generation and CEZ, highlighting the international appeal of our small modular nuclear reactors.

Back inside the business, our key focus, as I said at the start, is being on controlling what we can control and the restructuring that we announced in May, for instance. We've had to adapt to very challenging new reality as we look forward. And that has presented the difficult choices about consolidating our global production footprint. We've had to make some very tough proposals after the last few months, but we can't afford to retain capacity where demand in the medium term has been so dramatically reduced.

We announced a number of proposed changes for our Civil Aerospace business as we focus on reducing costs and positioning the business for recovery. Last week, we announced the proposal to transfer some of our structures and products manufacturing to ITP Aero and further changes at some of our civil manufacturing sites to make them more competitive and reduce costs. These changes are in addition to the proposals that we'd announced previously about bringing assembly and testing of our wide-body engines back and consolidating in the U.K. and consolidating our fan blade manufacturing into Singapore. It includes the -- we'd already announced the closure of a manufacturing site in the U.S. and a reduction to workforce in Germany.

Now this makes it a very difficult time for some of our people. We have removed more than 5,500 roles this year, but that has mostly been achieved through voluntary severance and early retirement. And that's helped us move ahead much more quickly with less uncertainty for our people. We're actively engaging with the trade unions, and those discussions are very constructive but remain ongoing.

So now moving on to our financial priorities. Rebuilding our balance sheet, increasing our resilience, these are absolutely key to positioning the company for the future. When we launched our GBP 5 billion recapitalization in October, we made a number of commitments. And I'm very aware of the responsibility that, that means we now have to deliver on those commitments over the coming years.

Firstly, we're targeting more than GBP 2 billion in proceeds from disposals. On Monday, we announced the agreement to sell our civil nuclear instrumentation and controls business to Framatome. This business, by the way, doesn't include any of our nuclear submarines activity or any of our SMR, small modular nuclear reactor, activity. It generated around EUR 100 million in revenue last year. It has a workforce of about 550 people across sites in France and the Czech Republic and in China.

There are other assets under consideration for disposal. And we've talked before about ITP Aero. And we've also [since] mention, and it's true, medium speed gas and diesel engines business, Bergen Engines, we're also looking to divest. We'll say more about these as and when it's appropriate to talk about them.

So moving on to operational cash flows. We do expect to see free cash outflow in the region of GBP 4.2 billion this year. It's an approximate guidance. The actual outturn is heavily influenced by timing of significant working capital cash flows around the year-end, so we can't be more than approximate at the moment. And in particular, there are some issues around OE concession payments, which depend on the timing of new aircraft deliveries to airlines and either outside of our control.

This guidance, however, I'll remind you, does include GBP 1 billion of the negative impact from the cessation of invoice discounting that we talked about with our half year results. It also reflects the huge effort group-wide to save more than GBP 1 billion of in-year cash costs. As a result, we expect overall our year-end net debt position to be around GBP 1.5 billion with liquidity of around GBP 9 billion, which is enough to see us through the crisis even in reasonable worst-case scenario.

Our primary goal from a financial standpoint is to get the business away from consuming cash as soon as possible. We are targeting reaching breakeven at some stage during the second half of 2021, primarily driven by our reorganization program. Now the timing, the exact timing, will also be a little bit impacted

by the pace of recovery in engine flying hours. If the recovery is slow, it might be a bit later in the second half. But we're going to do our best to get there as soon as possible.

The other key financial objective is to generate at least GBP 750 million of free cash flow as early as 2022. And of course, that is linked to the pace of market recovery. But it does include headwinds like Trent 1000 remediation costs, foreign currency exchange, rightsizing on the hedge book costs that we talked about earlier this year. And obviously, as we look forward into the future, those one-offs will disappear. So GBP 750 million remains firmly within our sights in that time period. In the medium term, our restructuring will enable us to be a leaner, healthier business, stronger operational gearing than we would otherwise have been and well positioned for a recovery in revenue.

2020 has been a very tough year, indeed. There's still a lot of work to be done in '21, but we think the fundamental drivers behind our business remain intact, and we can see structural and strategic growth opportunities across all our core businesses.

I've talked long enough, so I pause now, and we'll answer your questions.

Question and Answer

Operator

[Operator Instructions] Our first question comes from the line of George Zhao from Bernstein.

George Zhao

Sanford C. Bernstein & Co., LLC., Research Division

Warren, you said in the past there has not been discounts on the flight hour contract prices. So when operators are under the service agreements with you, it may be more difficult for them to cut back the cash outlay. But how do you think about the downside of that, right? I mean, where elsewhere do you envision potential pressure either now or in the future as operators are still very much under pressure to cut that maintenance? And we've seen that where they have flexibility under Time & Materials model elsewhere. They have been doing exactly that to cut maintenance.

D. Warren A. East

CEO & Executive Director

Well, look, I think what we've said before is that as far as invoicing during 2020 is concerned, then the contracts are in place. And we've tried to be reasonable with our airline customers in terms of rescheduling payments and the like. And we've tried to be reasonable.

On a forward-looking basis, as airlines seek to resize their fleets, and there'll be some airplanes that get retired and other airplanes that get flown, we'll do our best to maintain our flying hour rates. But where it's necessary to have a trade-off between offering temporary discounts on flying hour rates in order to keep our airplanes flying rather than somebody else's, then we'll work with airlines and with leasing companies to come up with sensible commercial win-win packages.

And our flying hour rates are a portion of the costs, but they're by no means the only costs for an airline. There's the financing costs and many other operational costs. So hour rates are a very small part, actually, of airline operating costs, but we recognize we've got a part to play in that.

Operator

And the next question comes from the line of Andrew Gollan from Berenberg.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

A couple really for me. Firstly, on the engine flying hours, you indicated 70% down in Q4 roughly. You mentioned, Warren, within your prepared remarks about utilization of the XWB. Can you give an indication of what's going on in terms of utilization for the other models? So particularly, the Trent 700 I'm interested in and Trent 100 -- sorry, Trent 1000. That's the first question.

D. Warren A. East

CEO & Executive Director

Yes. So I think Trent 700 -- the older you get, the less utilized you are. That's the basic rule of thumb. And it's really quite difficult to generalize much more than that.

Very, very approximately, Trent 700 is about half the utilization rate of XWB at the moment. XWB and Trent 1000 on A350 and the 787, these are the aircraft that are getting used most in the wide-body space at the moment. And then when you get into A330s, used less. When you get into the older aircraft, then it's used even less. And that's all of them. But we've got a bunch of different airline customers that all have just different approaches.

Very approximately, utilization of aircraft, whether an aircraft is being flown or not is just one measure. And how much it is being flown is another measure. So XWB and Trent 1000, they're getting used a lot. So

XWB-97k is back to the levels that it was in 2019. But that is a very small part of our fleet. When you get into higher -- bigger volumes and so on, then they use a bit less.

And then during an individual day, whether an aircraft is used, maybe it used to be used 2 or 3 times a day, and now it's being used once a day. On average, XWB is about 12 hours a day at the moment for those that are getting used, which is significantly less than it would normally be used.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

Sure. Okay. And then the second question is around free cash flow and the various guidance you've given for '21 and '22. So can you confirm what you've -- what you're guiding is premised broadly around the base case scenario of a recovery to 70% in '21 and 90% in '22? And what gives you confidence that this is still realistic given the trends we're seeing today? Is it maybe availability of vaccines that's just going to free up everything in that time frame? Is that what you're assuming? Or any comments around that would be helpful.

D. Warren A. East

CEO & Executive Director

Yes. So I think we're going to give a bit more specifics about this when we do our full year results. I mean there's a huge amount of uncertainty around what's going to happen in 2021. And there's less uncertainty, obviously, about what's going to happen in 2022 because we do see a picture of vaccines helping, vaccines being a significant factor. But it's all about government-to-government relationships and opening up of air corridors and routes. That is we see a 2021 -- second half 2021 phenomenon. And that's why we can be a bit more certain about 2022 than we can be about 2021, which is giving us confidence.

That's giving us some confidence in underpinning our GBP 750 million target for 2022. What's giving us most confidence, however, is, as I said in the remarks a moment or two ago, the things that we can control. We know we are removing fixed costs from -- out of our business and improving the operational leverage. And that's the primary factor. Engine flying hours are going to -- and the rate at which engine flying hours come back is going to affect timing. And that's why we're a bit more uncertain about 2021. We remain confident we can get into positive cash generation territory in the second half of 2021. Whether that's at the beginning or the end of the second half, that depends a bit on engine flying hours and how they perform.

And don't forget, we do have the other half of our business, which isn't Civil Aerospace large engines. Business Aviation, holding up very well. Defence, holding up very well. Power Systems, responding a bit like Civil Aerospace but much less so, and it's a shorter-cycle business. And if we look, for instance, at the rate of recovery in Power Systems in China, we saw that come back quite swiftly. So just remind people that there's another half to our business as well.

Operator

And the next question comes from the line of Ben Heelan from Bank of America.

Benjamin Michael Heelan

BofA Merrill Lynch, Research Division

One, I guess just back on what Andrew was asking there. I guess another way to ask it was you said that the recovery to positive free cash flow is going to be dependent on that recovery in engine flying hours. Is there a way to gauge what level of engine flying hours need to be back relative to 2019 in a given month for you to be free cash flow positive? Is there a way to frame it around that? That would be the first question.

And then the second question, could you talk a little bit, has there been interest in ITP and Bergen? And are there any other facilities that you're considering putting into ITP to make it more attractive to bidder?

Stephen Wayne Daintith

CFO & Executive Director

Thanks. I'll take that -- those 2 questions, Ben. So yes, we're not going to go into specifics at this stage around the shape of flying hour recovery in '21 and moving to cash positive. We'll share more of that with our full year results in March. I think what I would say, though, is that we've been tracking our cash flows very carefully over the last 9 months. We've seen a good trajectory and a good -- we've got good confidence around that ability to turn cash positive sometime during the second half of next year.

On ITP, we are already engaging with the potential buy universe on this. There are several interested parties. And we expect that there'll be a pickup in activity in the first half of next year as we really get into the sale process and we go through the management presentations and all that usual sort of malarkey that goes on with a disposal process. And we'll keep you updated on the progress as we go along.

Operator

And the next question comes from the line of Nick Cunningham from Agency Partners.

Nick Cunningham

Agency Partners LLP

Yes. A couple of perhaps slightly longer-term questions. Obviously, there's been a lot of learning in the last year also for everybody. And I was wondering what the experience has said to you about what's a prudent capital structure is to aim for at the end of all this process. [Does it also sort of] have to be net cash, if you like? And would that be before or after the lease liabilities, to be more precise?

And then the second question, GBP 1.3 billion cost reductions. To what extent are those just aligned with the anticipated lower revenue base? Or is some of it going to result in a lower unit cost? And if so, is there any indication as to what proportion we might see contributing to a lower cost base going forward?

D. Warren A. East

CEO & Executive Director

In terms of our view on ideal balance sheet, that hasn't really changed. We're looking for a net cash positive of circa GBP 2 billion in the medium term. I think we had that view coming into this crisis, and we were on a good trajectory to get there during 2020 actually. We were confident of getting there in 2020, coming into the year at GBP 1.3 billion to GBP 1.4 billion net positive. And I think that's still a sensible goal. It's driven by requirements to keep R&D going and that sort of thing.

I'm terribly sorry, the second half of the question has completely slipped my mind.

Nick Cunningham

Agency Partners LLP

Sorry. It's the cost reduction, to what extent is that...

D. Warren A. East

CEO & Executive Director

Yes. No, I mean, of course, there's costs coming out through loads coming out. But no, the GBP 1.3 billion is structural.

Nick Cunningham

Agency Partners LLP

So in other words, that would entirely stick if revenue came back up to 2019 levels, GBP 1.3 billion lower cost that...

D. Warren A. East

CEO & Executive Director

Yes, yes, absolutely. Yes, yes, yes. I mean you only have to talk to some of the unfortunate people who are losing their jobs, and it's sticking as far as our cost reduction is concerned.

Operator

And the next question comes from the line of Timm Schulze-Melander from Redburn.

Timm Nikolaus Schulze-Melander

Redburn (Europe) Limited, Research Division

I'm standing for Jeremy Bragg. I have a 2-part question, if I can, just thinking about the Trent 1000 and aircraft on ground being a sort of unexpected beneficiary of this COVID crisis. First part of question is, could you just tell us what will happen to the Trent 1000 provisioning flows in '21 and '22?

And then just, again, on those Trent 1000 sort of expected cash flows in 2021, what are you expecting now compared to what you would have expected, let's say, a year ago?

D. Warren A. East

CEO & Executive Director

Yes. So I think with our half year results, we talked about a reversal of provision on Trent 1000. And that was based on the fact that disruption that we had previously anticipated to be continuing to accumulate during 2020, we're now not seeing. And because of the ability to generate spare engines, we're now not anticipating. Even if they all started flying tomorrow, we wouldn't anticipate accumulating any more disruption costs. And that's why we were able to reverse that provision.

And then in terms of the impact on cash flow in 2021 and 2022, then the -- we're still anticipating the already accumulated disruption costs and things like credit notes being utilized as before. I mean do you have any rephrasing...

Stephen Wayne Daintith

CFO & Executive Director

Yes, no change in previous guidance on that one. And as a reminder, '21 and '22 will be the last 2 years of any material cash outflow on the Trent 1000. So '23 will be an [income] by those cash flows. And that GBP 750 million number that we guide to as well for '22 includes the final year of Trent 1000 cash costs of around GBP 250 million in that year.

Timm Nikolaus Schulze-Melander

Redburn (Europe) Limited, Research Division

Great. Very clear. If I could just sneak in one follow-up, and that's, Stephen, on your replacement. So Warren, could you maybe give us an update on where the company stands on the CFO search?

D. Warren A. East

CEO & Executive Director

Yes. Well, it's still ongoing, but we expect to be able to -- we will have an announcement in due course. And obviously, you can't announce these things until everything is signed and filled. We want to choose the right person to replace Stephen. And I'm sure by the time we get to our full year results, we'll probably have some news.

Operator

The next question comes from the line of Sean Stewart from JPMorgan.

Sean A. Stewart

JPMorgan Chase & Co, Research Division

I just have one quick question, please. You've reiterated your guidance this morning for at least GBP 750 million in free cash flow in 2022 pre the disposal. Are you able to give us any EBITDA guidance behind that free cash flow guidance, please?

Stephen Wayne Daintith

CFO & Executive Director

No, we're not, actually. We may say something with our full year results next year, but no. And I would just flag -- just a wording point here. Just to be specific, we said GBP 750 million as early as 2022, so just to qualify that somewhat. But as it stands today, that's very much in our plans. But no, we're not giving any EBITDA guidance at this stage.

Operator

The next question comes from the line of Harry Breach from Stifel.

Harry William Freeman Breach

Stifel Europe, Research Division

Just a couple, if I can. Can you give us any sense about how Time & Materials revenues are trending? Have we gone through the bottom there specifically? Or are we still seeing sort of deteriorating trend?

And then slightly different note, just thinking about receivables collection rates, can you give us a feeling about how those are going? Stephen, this is probably pushing it far too far. But in terms of payment deferrals and delays you granted to customers, can you give us any sense about whether those are sort of reducing now to schedule the holding, customers aren't asking for payment deferrals? Any sense would be really helpful.

Stephen Wayne Daintith

CFO & Executive Director

Yes. I'll do the second question first. As you might expect, we're seeing a number of dynamics right now. We're seeing airlines saying that they are just not able to pay minimum flying hour per contractual terms right now, and we understand that. But we are building up a debtor's balance that you'll see at the year-end, therefore, of overdue debt.

What we're also seeing and that we expect to see in '21 is increasing credit note utilization as well. So we're seeing airlines using credit notes to avoid the cash outflow. Again, no surprise there. I'm not going to go into details of numbers at this stage, but these dynamics are certainly out there.

Beyond that, we -- at the same time, though, we have many customers who are paying cash for their minimum flying hours as well, and they're in the majority. So it's just worth highlighting that side of it as well. And so I think those are probably all I would say at this stage on the cash flow dynamics around our customers this year.

D. Warren A. East

CEO & Executive Director

Yes. And on the long-term service agreement versus Time & Materials, then it's broadly similar. And just a couple of comments. In the long run, of course, Time & Materials is more prevalent on the older programs than it is on the newer programs. And so you would expect to see in the long run Time & Materials declining slightly as a proportion. It's never going to disappear because as we've said before, part of our long-term service agreement includes an element of Time & Materials for parts that mutually we agree with airlines and not covered by those long-term service agreements. So broadly similar is the picture at the moment.

Harry William Freeman Breach

Stifel Europe, Research Division

And if I can just -- to clarify my understanding, Stephen. So when you take a credit note from a customer, is there any security you have for payment of that credit note?

Stephen Wayne Daintith

CFO & Executive Director

No. These are customer credit notes that they have that they can use against our flying hours. So that is...

D. Warren A. East

CEO & Executive Director

So for instance, when we agreed a compensation payment for disruption on Trent 1000, instead of actually paying over pound notes to an airline, we gave them a credit note that they could then cash in at some stage in the future.

And each contract is a bit different. Sometimes, we talk about proportions of those that you're allowed to use and so on, and it's all individual commercial negotiations. But there is a picture, general picture of credit note utilization in this period as airlines are struck for cash. And that's going to continue in '21 and '22.

Stephen Wayne Daintith

CFO & Executive Director

They each have their own timing terms but also a degree of magnitude terms as well.

Operator

And we have one more question from the line of Andrew Humphrey from Morgan Stanley.

Andrew Edward Humphrey

Morgan Stanley, Research Division

I know we're not talking in too much detail about 2021, but I wanted to make sure we understand some specific components of it if we're trying to kind of build models that bridge from 2020 on cash flow. You've obviously been quite clear about the nonrecurrence of the invoice discounting effect. I think we can probably do our own arithmetic on the flying hour impact based on an assumed level and the sensitivity that you've given around that. But I wanted to ask about other specific effects on free cash in 2021, specifically the first half of 2021 versus 2020, that you can quantify versus -- so for instance, the benefit of restructuring or any other components that you'd care to highlight versus this year as we're building bridges.

Stephen Wayne Daintith

CFO & Executive Director

I'll highlight 2 or 3. First of all, the savings from the restructuring, the full savings, full run rate savings to be delivered by 2022 is GBP 1.3 billion. Now that will more than replace the GBP 1 billion of cash mitigation actions that we've taken in 2020. That's a key component. Another important component is capital expenditure. I won't go into specific numbers at this stage, but we are expecting a further downwards revision of capital expenditure in '21 versus the 2020 number. So that's important as well.

I think the third area I'd point to is our operating costs generally and the work that we've done there during 2020 to really identify those nonessential items of spend where we can operate with a lower cost base. And I think we all -- probably all experienced that during COVID-19, caused us to have a new lens of a way of working generally, and that has -- we see opportunity in our operating costs as well. So those are the 3 key areas sort of outside of those assumptions that you just highlighted.

Operator

And we have one more question from the line of Andrew Gollan from Berenberg.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

One more for me, please. Working capital question and cash again, I suppose. So can you give some idea of the quantum of risk around the customer concessions issue? Or maybe answer this way, what is the scale of payables that built up on delayed buying 787 deliveries?

Stephen Wayne Daintith

CFO & Executive Director

I actually -- I'm not going to go into specifics around it. They can be material. You have seen that in recent years, but I won't go beyond that. And it's very much down to, as we've said in our trading update, the timing of aircraft deliveries, whether it's before the year-end or after the year-end. But beyond that, I wouldn't really want to add any more.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

So to be clear, it's -- the risk is over and above the GBP 4.2 billion guide.

Stephen Wayne Daintith

CFO & Executive Director

Yes, that's correct, yes.

D. Warren A. East

CEO & Executive Director

I think that's as far as questions are concerned. So let me just sort of summarize the messages we want you to take away.

We're concentrating on controlling the things that we can control. We're very pleased with our progress on that, particularly around the restructuring and the operating costs, as Stephen just discussed, and that means there's essentially no change to our forward-looking guidance. We remain confident of achieving positive cash flow, going through that breakeven point in the second half of 2021 and generating GBP 750 million of free cash flow as early as 2022.

And with that, well, thank you very much, and we'll be back to report on the full year properly in the first quarter.

Operator

This now concludes the conference call. Thank you all for attending. You may now disconnect your lines.

D. Warren A. East
CEO & Executive Director

Isabel Green
Head of Investor Relations

Presentation

Operator

Hello, and welcome to the Rolls-Royce conference call. [Operator Instructions] Just to remind you, this conference call is being recorded.

Today, I am pleased to present Warren East, Chief Executive; Stephen Daintith, Chief Financial Officer; and Isabel Green, Head of Investor Relations.

I will now hand over to Isabel to begin the call. Please go ahead with your meeting.

Isabel Green

Head of Investor Relations

Thank you, Keith, and good morning, everyone, and thank you for joining our call at short notice. As introduced by Keith, I've got with me this morning Warren East and Stephen Daintith. In a moment, I'm going to hand over to Warren for some introductory remarks before we open the lines for your questions.

A little disclaimer here. I mean on the call today, we may refer to the investor presentation that was published today. It's available to download on our website.

I also need to remind you that we may not be able to respond to certain questions relating to rights issue or bond offering details, and that's for regulatory reasons. And we will not be able to discuss specifics of the rights issue or the bond offering themselves.

We will direct you now to our announcement this morning for those answers and the prospectus for those details.

Thank you, and over to Warren.

D. Warren A. East

CEO & Executive Director

Thank you, Isabel. Good morning, everybody, and thanks for joining us.

I'm pleased to be in a position now to update you on the plans we have to improve our liquidity headroom and reduce our level of balance sheet leverage to safeguard our business as we return to generating strong positive cash flows. For those of you looking at the slides, I am going to refer to some of the slides. And so we'll start on Page 5, which shows the package of solutions that we're proposing and that package coming together to increase our resilience through a combination of complementary self-help and external measures.

Now the impact of the COVID-19 pandemic on our business and our industry has been unprecedented, we've said that before. And despite entering this year with excellent momentum in our operating and financial performance and despite the rapid measures we've put in place to deliver GBP 1 billion of cash savings in 2020, we still expect to experience a free cash outflow this year of approximately GBP 4 billion.

Now we acted quickly to address the impact of the pandemic because alongside that GBP 1 billion of one-off in-year cost savings for 2020, we launched a fundamental restructuring, predominantly of our Civil Aerospace business, in order to deliver annual pretax cash savings of GBP 1.3 billion by the end of 2022. And we believe this restructuring program, together with an anticipated recovery in the end markets, will help us to restore financial performance. And we aim to be delivering free cash flow generation of at least GBP 750 million excluding any impact of disposals as early as 2022.

However, the pathway to that sustainable, positive cash flow remains dependent on the recovery from COVID-19 particularly with regard to long-haul air travel. And there is significant uncertainty about the precise timing and the shape of this recovery, and so the possibility of delay in that does remain. And we

consider it prudent, therefore, to prioritize resilience and flexibility, in particular, taking into account our reasonable worst-case scenario.

And as a result, today, we're announcing plans to increase our resilience through the uncertainty with the recapitalization package. We're commencing a GBP 2 billion rights issue and intend to launch a bond offering of at least GBP 1 billion in the near future. In addition, we have agreed commitments for a new GBP 1 billion 2-year term loan, and we have an indication of support in principle from UK Export Finance Bank for extension of their partial guarantee of our existing 5-year term loan to support an increase in that term loan of a further GBP 1 billion. So these additional potential loans are subject to various conditions including, importantly, completion of the rights issue. So this is an integrated package.

We believe that these actions, coupled with targeted gross proceeds of more than GBP 2 billion from a number of potential disposals which we announced at our half year results in August, would enable us to navigate the uncertain macroeconomic environment. It's not been an easy decision to get here. We've already put in place more than GBP 4 billion of additional borrowing facilities since the start of this crisis, but there is a limit to the amount that we can reasonably expect solely from our banks and the bond market without addressing the leverage as well.

We have approximately GBP 3.2 billion of debt and credit facilities due to mature over the next 13 months. And that includes the undrawn GBP 1.9 billion revolving credit facility, which will be canceled on completion of the rights issue. The GBP 3 billion cumulative proceeds from the rights issue and the intended bond offering announced today will largely cover those maturities and allow us to deliver disposals in a manner that ensures enhanced value for shareholders.

So now let's move on to Slide 8. We've spoken a lot about the uncertainty in the timing and the shape of recovery. We believe that the base case shown here is the most probable outcome, and our large engine flying hours data over July and August has tracked slightly ahead of expectations. However, uncertainties remain around the timing and the shape of recovery, in particular, given the inspection rates are rising again especially when you think about Europe.

Our reasonable worst-case scenario assumes a significant delay in recovery with engine flying hours in 2021 at only about 45% of 2019 levels. And in that event, in addition to lower large engine flying hour receipts, we would expect adverse trading conditions across the rest of our business too, probably with the exception of Defence, which we expect to remain resilient. So there's more detail on the reasonable worst-case scenario included in the working capital statement on Page 31 of the presentation and also in the full rights issue prospectus, which should be read prior to making an investment decision.

It's our responsibility to prepare for the reasonable worst case. And in consideration of the outcome alongside continued global and macroeconomic uncertainty, we've determined that it is in the best interest of shareholders to take the actions that we set out today.

Slide 10 sets out the reasons why we need to rebuild our balance sheet and what our ambitions are in the medium term. We aim to restore the company to a net cash position in the coming years through a combination of GBP 2 billion gross disposal proceeds, as we announced in our half year results, and an expected return to positive free cash flow during the second half of 2021 and a GBP 2 billion rights issue announced today.

This is important commercially, competitively and financially. A strong financial position does matter to our customers. In Civil Aerospace, airline customers signed multiyear service contracts with us. They want to know that we can be relied on as a long-term partner, and we'll live up to our side of the contract. Similarly, in Civil Aerospace and Defence, we're committed to long-term investment cycles in order to win positions on new programs. Our customers need to know that we are resilient enough to be able to invest in those products through the cycle. And that's why we remain committed to our ambition to return to an investment-grade credit rating in the medium term, and we think that we need to act now to prevent further deterioration and start the journey back to where we need to be.

So Slide 14 now, moving on to Slide 14. This shows our sort of recovery path back to free cash flow generation of GBP 750 million as early as 2022, premised on our base case recovery assumptions before

adjustment for any potential disposals. And we spoke about this at our interim results, so I'm not going to go through it all in detail again today but just a little bit more color on how we expect that improvement in cash generation to unfold.

First, cash flow recovery is not dependent on any large working capital inflows, only on the nonrepeat of the working capital outflows that we're experiencing in 2020. And that includes the impact of our -- the onetime impact of our decision to cease the invoice discounting.

Secondly, we expect an improvement of around GBP 2 billion in cash from Civil Aerospace business with engine flying hours expected to return in our base case to 90% of 2019 levels by the end of 2022 as well as improvements in time and materials work and, importantly, significantly lower Trent 1000 in-service costs and lower losses on installed wide-body OE deliveries.

Thirdly, the actions we're taking to resize our fixed cost base and reduce our capital intensity. We've reduced our head count already by over 4,000 since we announced the cost reduction program in May. And we're confident that by 2022, we will have delivered the approximately GBP 1.3 billion of annual cost benefits that we've identified.

While timing and shape of the recovery is uncertain, we think that these actions, which aren't or in our control, will enable us to adapt and thrive whatever the future holds.

Finally, we can see continued resilience in Defence and a recovery in Power Systems, and that's expected to contribute an additional GBP 200 million to '22 cash flows compared to 2020 cash flows. So remember, the GBP 750 million cash flow ambition still includes nonpermanent costs. Nonpermanent costs of approximately GBP 300 million related to reducing the size of our FX hedge book, and it includes GBP 200 million to GBP 300 million related to Trent 1000 disruption and in-service costs. And so those nonrepeat items will still be there in that GBP 750 million in 2022. We expect our target free cash flow to grow further in the future as those temporary negative outflows diminish over time.

Moving forward a little, Slide 16 and 17 are a reminder of our strong foundation in Civil Aerospace established over decades of investments in engineering and design. We've recently completed a multiyear investment cycle. We've got 4 wide-body engine programs that have been launched since 2010, which have taken our market share of in-service wide-body passenger planes up from 26% 10 years ago to 38% by December '19. Our share of the order book is even stronger at 55% in December 2019. And our investment overall in our Civil Aerospace fleet means that by the end of 2019, we had more than 5,000 installed wide-body engines with an average age of less than 9 years. And so most of the planes that we power are the newer, more-economic, lower-carbon-footprint planes than our customers and their passengers want to use.

As our engine programs mature, the investment needs to reduce, of course, manufacturing efficiency improves, pricing increases, and the risk of in-service issues diminishes. And all of that creates a significant inflection in the financial performance. We think that we were already actually reaching that pivot point before COVID-19. But despite the current disruption, these underlying value drivers will continue to have a positive impact on our business performance.

Now we tend to focus a lot on wide-body. Our business aviation has been less impacted by COVID-19 than the commercial aviation. For those people that can afford it, business jets enable passengers to mix less with other travelers and have more control over their flight plans. And we've got over 7,000 engines installed on business jets, and our strong product positions mean that, that gives us 30% -- more than 30% of the market by value. And this is an area of Civil Aerospace that's often overlooked when we talk about our performance, but it's a key pillar of our strategy, an area where we've seen more resilience through the COVID-19 pandemic.

On Slide 18, we sent out the ambition for the future beyond 2022. In addition to the embedded value in Civil Aerospace, we can see potential for underlying growth in both Defence and Power Systems.

In Defence, we had a record order intake in 2019. It's actually the fifth -- the 5 years of very strong order intake in Defence. And in addition, we're competing for new business to drive growth in Defence into the longer term on programs that will be running for several decades into the future.

And in Power Systems, we're well positioned in key growth areas such as mission-critical backup power. And we're also driving market share in high-growth markets through our expansion in China and India. And as a result, we think Power Systems can grow at a 5% to 10% underlying revenue CAGR from 2021.

Underpinning all of that growth beyond 2022, the world is shifting ever more towards a net zero carbon economy. And the breadth of our engineering expertise and our established access to a range of end markets means that we're well positioned to play a crucial role in the transition through increasingly efficient gas turbine engines in Aerospace, through innovating with hybrid products in Power Systems, and that's actually paving the way for sustainable aviation as well through hybrid technology and aviation. And also, we're working on sustainable aviation fuels.

So once we achieve our aim of restoring financial returns and a more appropriate balance sheet, we'll be accelerating these aspects of our strategy, and you'll see substantial growth in that starting to happen by 2025.

So to sum up, over the last 6 months, we've taken swift actions to minimize our cash outflow, restructure our business and position it for the future in response to both the short-term and medium-term impact of the pandemic. We believe that the restructuring program, alongside an anticipated recovery in our end markets, will help us to restore financial performance. But there is significant uncertainty around the precise timing and the shape of the recovery from COVID-19. And as a result, we do consider it prudent to prioritize resilience and flexibility.

We thought carefully about the capital needs that we'll have over the next few years, and raising additional capital at this time will provide us with 3 key things: improved financial resilience and more liquidity headroom across 2021 in order to weather the macroeconomic risks before we return to strong cash generation, which is expected as early as 2022; an improved level of balance sheet leverage supporting disciplined execution and investment to ensure that we can maximize value from our existing capabilities; and thirdly, flexibility to allow us to pursue disposals in a manner that delivers value for shareholders as we position the group for the long term to benefit from the new technologies that we have focused on sustainable power.

We thought carefully about the size and the shape of this integrated package to ensure that this is sufficient to secure us against the downside risk and also that it supports our deleveraging towards a net cash position over an acceptable time horizon. And as a result, we see this as a final major step in our balance sheet repair. The focus is now on executing our turnaround and securing the disposal proceeds.

Presentation

Operator

Ladies and gentlemen, thank you for standing by and welcome to the Rolls-Royce plc 2020 Half Year Results Conference call. [Operator Instructions] I must advise that this conference is being recorded today, Thursday, 27th of August 2020.

And without any further delay, I would now like to hand the conference over to your first speaker today, Isabel Green, Head of Investor Relations. Thank you. Please go ahead.

Isabel Green

Head of Investor Relations

Welcome, everyone, to our 2020 half year results presentation. With me today are Warren East, CEO; and Stephen Daintith, CFO.

We will start the slide presentation shortly with an introduction from Warren, followed by a more detailed review of results by Stephen and an update on our plans for the future from both Warren and Stephen. In all, this should take about 50 minutes, leaving time at the end for Q&A.

Before I hand over to Warren, please take note of the safe harbor statement on Slide 2. This results presentation contains forward-looking statements that involve risks and uncertainties that may cause the actual results or developments to differ materially.

Thank you. And over to you, Warren.

D. Warren A. East

CEO & Executive Director

Thank you, Isabel. Well, it feels as if this year has been all about COVID. Although we came into the year, and indeed, started with good momentum, COVID-19 arrived in Q1 and has had a material impact on the whole of the civil aviation sector, and it significantly affected our first half performance and our outlook for the future. Lower activity in civil aerospace drove a 24% reduction in group revenue, and that led us to a GBP 1.7 billion operating loss in the period.

When COVID hit, we acted quickly. We acted quickly to keep our people safe to minimize operational disruption, and we provided practical assistance in the countries and communities in which we work. We acted quickly to strengthen our liquidity position with new borrowing facilities established. Also, we rapidly responded on costs, driving immediate short-term reductions in discretionary spend and CapEx with GBP 350 million delivered in the first half of the year, and we're on track to achieve our target of GBP 1 billion of savings for the full year.

Looking a little bit further ahead. In May, we announced the largest restructuring of Civil Aerospace we've ever undertaken, fundamentally resizing to align our capacity with expected future demand and save at least GBP 1.3 billion of ongoing costs across the group.

We also want to take steps to rebuild our balance sheet in the medium term. And today, we've announced planned disposals to generate more than GBP 2 billion of proceeds. We will come back to that later on.

Turning to Slide 5. This is an outline of what we're going to cover this morning. As you know, we're in the middle of an unprecedented shock to the civil aviation sector and that's going to take a number of years to recover from. We have a clear strategy however to lead Rolls-Royce through these difficulties. And we're creating a leaner and a more balanced company for the future on the other side.

So today's presentation is split into 4 sections. Stephen will talk through the interim results in some detail and our plans to strengthen our balance sheet. And I will cover our extensive restructuring program for Civil and the wider strategic priorities.

So with that introduction, over to Stephen.

Stephen Wayne Daintith

CFO & Executive Director

Thanks, Warren, and good morning, everybody. So as Warren said just now, although we started the year with positive momentum from a strong 2019, COVID-19 has severely impacted our business. The worst impact was very clearly in Civil Aerospace with large engine deliveries and flying hours each down around 50% in the first half of the year. ITP in the Civil Aerospace sector was similarly affected. Power Systems has been less severely impacted with industrial markets suffering the most. And Defence has remained resilient with good support from ongoing government programs. You'll see that in the slide attached.

So Slide 7. You can see on Slide 7 the impacts of COVID in our divisions in more detail. In Civil Aerospace, looking at that chart there on the top left, flights were grounded around the world from around the middle of March with April the worst month when large engine flying hours were down around 80% compared to 2019. For the second quarter as a whole, flying hours were down around 75%. The data since then has shown modest recovery, but remained weak as governments tried to find a balance between containing the virus and protecting their own economies. Business jets and regional flights have been less impacted with fewer cross-border routes.

Now we've been working closely with our airframe customers, particularly Airbus and Boeing, to reschedule engine deliveries to match their reductions in build rates. We expect to remain at lower levels until at least 2022.

Power Systems was less impacted. Industrial end markets were hit by economic disruption, but Marine and Power Gen have actually held up relatively well.

Now as you might expect, our Defence business was resilient with no material impact from COVID and delivered a strong profit growth in the first half of the year.

Moving on to the next slide. So here are the group underlying numbers. First of all, revenue was down in the first half mostly due to the significant reduction in the contribution from Civil, as you can see from the chart. Our underlying gross loss of GBP 967 million included GBP 1.2 billion of COVID-related one-off charges. So what are these? Well, these results include significant negative contract catch-ups, GBP 866 million in revenues and GBP 814 million in gross profit. And as a reminder, a catch-up happens when there is a change in projections that results in a recalculation of the future value of our long-term service agreements. Now in this case, it was negative because of a decrease in the forecast of engine flying hours over the term of the contracts. And these are due to revised assumptions around things like utilization levels, parkings and retirements. On average, there's been a modest negative impact on expected contract margins as a consequence of these revisions.

Also in Civil, and in addition to the catch-ups, we incurred a GBP 309 million charge for estimated future losses on a small number of contracts. Most of these related to Trent 900 engines. And there's also a GBP 95 million charge for specific customer provisions and customer credit rating changes.

As a reminder, when we have a contract that moves into a loss-making position, we recognize all expected future losses upfront. And unfortunately, this period, we have a small number of contracts which have either become loss-making or where expected future losses have actually increased.

Our underlying loss before tax of GBP 3.2 billion also included a GBP 1.46 billion underlying finance charge to reduce our U.S. dollar hedge book. We took the necessary decision to reduce our hedge book because the industry downturn left us over-hedged by around \$10 billion. Now had we not done so, there is a risk that a further weakening in sterling would leave us in a more -- much more impacted position. In addition, we were net purchasers of U.S. dollars in the first half of this year and unable to utilize our hedge book in the period. Now this means that our underlying results are presented at an effective rate of \$1.24 to the pound in the first half of 2020. That's pretty much the spot rate in the first half of the year. This compared to the hedge rate achieved in the first half of 2019 of \$1.53 to the pound.

Next slide. So a quick run-through of our underlying business results now starting with Civil Aerospace. Revenue was down 37%, as you can see from the chart, with steep declines in both original equipment, OE, and aftermarket services. We reported an operating loss of GBP 1.8 billion and that includes that GBP 1.2 billion that I referenced earlier of one-off charges that mostly came as a result of COVID-19.

Total shop visits were up marginally on the prior year. We eliminated aircraft on ground due to Trent 1000 durability issues and performed scheduled overhauls and check-and-repair visits on high-cycle engines that were mostly booked in before flights were grounded. We continue to expect the final Trent 1000 fix to be certified and ready to fit to the fleet by the end of the first half 2021.

Moving on to time and material profits. Now this includes the V2500 flying hour payment, that's reduced with the lower aircraft utilization. The benefit to profit from fewer loss-making large engine in-store deliveries is more than offset by lower business jet and large spare engine sales and under-recovery of fixed costs.

Now you recall, as announced in early August, we have found some signs of wear to IPC blades in some Trent XWB-84 engines at the first shop visit. Now this was identified during proactive checks we had in place. None of the engines have suffered in-flight shutdowns, and none of our customers have been significantly inconvenienced as a result. We've put in place a process now to check all engines, over 2,300 cycles, on a regular basis. And until a permanent solution is found, we'll now replace this part as standard at the first shop visit.

The annual financial impact is not actually considered to be material. Notwithstanding this matter, the Trent XWB remains the most successful engine launch we have ever had. And the early performance of this program has been successful both operationally and financially.

Now some of you will have noticed that we've not reported our usual operating metrics today: average OE loss per engine, for example, or the aftermarket margin. Now we're still tracking these internally and striving to deliver fundamental improvements, but the extraordinary circumstances that we're facing have affected the usefulness of reporting them. For example, the benefit of lower losses on a single engine are offset by lower plant utilization.

Now let's move into the second half of the year. Shop visit activity will start to reflect the drop in fleet utilization as engines reach service milestones more slowly. Also, the actions we took in the first half to slow down procurement, eliminate noncritical spend and reduced pay will start to offset some of the performance declines. So an important trajectory in the second half of the year.

Moving on to the next slide in Power Systems. So looking at the Power Systems numbers. Revenue was down 11% to just under GBP 1.3 billion with similar falls in revenue for both OE and services.

On the OE side, our customers in industrial markets were the most impacted by lower activity levels, particularly with exposure to oil and gas and mining. We experienced a reduction in demand for smaller yacht engines. Some marine yards closed for much of the second quarter. But on the government side, our Marine business performed relatively robustly. Power Gen activity started the year well, but did experience a slowdown in the second quarter, most notably, in fact, in the U.S.

Order intake included 40 MTU engines and generator sets. These were used for a main propulsion and onboard power generation for 5 new Type 31 general-purpose frigates for the Royal Navy. We've also celebrated a sale success with Irish Rail, ordering 41 Hybrid-ready PowerPacks during the second quarter, and there's potential there for a further order of around 30 Hybrid-PowerPacks per year starting in 2023. So good momentum there.

Services revenues were negatively impacted by lower fleet utilization, particularly in transport and oil and gas markets.

So for Power Systems, operating profit was down 79% to GBP 22 million, showing the underutilization of the fixed cost base, which was unable to react to the speed of the downturn in demand. It also included in that number an inventory write-down of around GBP 20 million on the back of weakness in commodity market demand.

Now despite the challenges of the current market condition, we're still focused on benefiting from structural trends and increasing our share in fast-growing markets. We've added 2 bolt-on acquisitions to enhance our Power Systems offering with the addition of Qinous in January and Kinolt in July. Qinous brings electricity storage solutions to enhance our microgrid offering, and Kinolt provides uninterruptible power supply systems that are great addition to help us grow our share of the mission-critical backup power generation market.

Our push to expand into China remains high in our agenda, and we've expanded our partnership with VPower Group, enhancing our relationships to include distribution of our MTU products in China.

Moving on to our Defence business now on the next slide. So our Defence business saw limited impact from COVID-19 and performed well into -- in the first half, delivering another strong set of results. Demand remained resilient and our government customers remained supportive in both our key markets, the U.K. and the U.S.

Revenue of just over GBP 1.5 billion was marginally higher than the prior year with increased service revenues relating to a growth in naval repairs and higher spare part sales. OE revenue was also up, helped by favorable phasing of deliveries. Operating profit was 19% higher, driven largely by mix and benefit of group-wide efforts to cut costs, including salary reductions and lower travel costs. Mitigating actions to manage the supply chain risk and operational disruption from COVID-19 were successful with no material impact to us or our customers.

Our Defence business is steadily growing, and we're investing for the future with investment in facilities and people. We completed the revitalization of our operations facilities in Indianapolis over the summer, and this will be one of the most productive sites enabled by digitalization and technology.

And finally, moving on to ITP. ITP has faced the same challenging market conditions unsurprisingly as our Civil Aerospace business. Demand for OEM services were severely impacted by the grounding of fleets and the reduction in build rates for our OE customers, particularly for wide-body engines. In Defence, ITP saw lower OE volumes on the TP400 and adverse phasing on the EJ200 activity.

Operating profit of GBP 10 million was down 70% despite significant management efforts and actions to cut costs.

So returning to the group results and looking at our cash flow, the summary funds flow in the first half of the year, which is a really important slide, this one. There are 5 key drivers that reconcile the underlying operating profit of a loss of GBP 1.669 billion to the group free cash flow, again, an outflow of GBP 2.801 billion.

There are 5 key drivers that reconcile those 2 numbers, and let me go through these one by one. First of all, starting with the Civil Aerospace net long-term service agreement balance. Well, that grew by GBP 788 million in the first half of the year. Now this may seem counterintuitive given the significant fall in flying hours that we're highlighting today. But this is the result of the GBP 866 million contract catch-up to revenues that I referenced a little earlier. Typically, we do see an increase in the LTSA balance. However, if we adjusted out the catch-up effect, we would have seen a reduction in the LTSA balance as revenues, which are driven by shop visit costs, but larger than the reduced level of flying hour receipts. So I hope that makes sense.

Secondly, CapEx on property, plant and equipment was over GBP 100 million lower, in fact, to be precise, GBP 127 million lower than last year, as we immediately stopped all noncommitted spend in March to save more than GBP 1 billion of in-year cash costs, that's in total, across all of our efforts to mitigate the impacts of COVID.

Similarly, on the third point, CapEx on intangible assets was down by around GBP 100 million with lower capitalization of new civil engine programs as we reassessed our near-term investment priorities.

The fourth bucket, working capital. Now there's a lot going on here, so we've got a separate slide on that coming up and I'll go through this in detail shortly.

And finally, the movements in provisions. The growth in the provision balance is the net result of just over GBP 300 million of new provisions for onerous contracts, my earlier comments, offset by approximately GBP 500 million due to a reduction in provisions related to the Trent 1000 in service costs. The lower flying hours this year and in our forecast means that more of our Trent 1000 engines will be able to have the final fix installed at the next shop visit, reducing forecast shop visits and customer disruption costs and saving around GBP 300 million. The other savings come from an improvement in onerous contracts with reduced losses as a result of lower engine utilization.

Now moving on to the next slide and a deep dive on working capital. So starting with inventory build of around GBP 300 million, that's the top half of this chart. We acted quickly to control our supply chain to mitigate the impacts of COVID-19 on our operations. We secured access to all the parts we needed while minimizing the buildup of any excess parts. However, some items, as you know, are ordered many months in advance and so a build in inventory was unavoidable. We also saw an increase in finished, but undelivered engines as our customers adjusted their build schedules. We expect a significant inventory unwind to take place during the second half of the year as we settle down to the new lower normal pace.

The change in net receivables and payables includes GBP 1.1 billion from our decision to stop invoice discounting. Previously, we had used this to pull forward cash due from airframers who have fairly long payment terms. This provided us with short-term liquidity. Now this year, in light of our drive to cut all unnecessary spend and our strong liquidity position, we decided to stop doing this. The remaining GBP 400 million deterioration in working capital comes about almost mathematically -- mechanically, sorry. In our Civil Aerospace business, it works with a negative working capital pattern. We're collecting the money owed to us from our customers ahead of carrying out the work. However, if business shrinks, we see an outflow of cash as the situation unwinds. The good news is that this will stabilize when the market starts to recover and reverse when we return to growth.

Okay. And moving on to the next slide and our expectations for the recovery. We've based our forecast on a thorough review of all the data. We've included current airframer build rates, industry and macroeconomic forecast, together with the bottom-up analysis of our own fleet. And we believe the worst is actually behind us in terms of the severity of the impacts on wide-body engine flying hours. They dropped 80% to the low point in April before recovering to between 70% and 75% down in May, June and July.

Now based on our base case scenario, we expect our large engine flying hours in the full year 2020 to be 45% of the 2019 levels, and you can see that in the table there up at the top, before recovering to approximately 70% of 2019 levels in 2021 and 90% of 2019 levels in 2022. We don't expect a full recovery until 2024.

Now why do we believe that this will be the shape and timing of our recovery? A few things here. According to the latest IATA forecast, global revenue passenger kilometers, RPKs, are expected to recover to 64% of 2019 levels in 2021 and then to fully recover by 2024 with domestic travel expected to be stronger than international travel. During the first half, Rolls-Royce large engine flying hours were down 46% and they outperformed those revenue passenger kilometers that were actually down around 58%.

There are several explanations for this. First of all, it reflects the impacts of falling airline load factors. Now we're not exposed to how full planes are. It's the flight that matters to us. Secondly, we've seen resilient demand in freight and domestic travel, which account for approximately 20% of our flying hours. And thirdly, we have a greater exposure to China and the Far East, which have seen the fastest recovery to date. And finally, worth reminding ourselves, we have one of the youngest fleets with an average age of around 9 years, younger, more efficient and more versatile wide-body planes like the A350, where we are the sole engine supplier with our Trent XWB engines, and we're seeing much higher utilization levels there.

Now we expect that these factors will continue to benefit our installed base, leading to accelerated market share gains with lower retirements of Rolls-Royce wide-body aircraft in the coming years.

Now of course, we will recognize that the pace and shape of the recovery is uncertain, and no one has a crystal ball. Therefore, in addition to our base case, we've considered a plausible and severe downside scenario to make sure we are ready to take the necessary further actions. Now as a guide, we estimate

that each percentage point movement in large engine flying hours are worth about GBP 30 million in flying hour cash receipts, and I'll come back to this point later. And you can see on the table there how we've highlighted what the downside scenario looks like in respect of engine flying hours.

So on the next slide. We're expecting to see around GBP 4 billion of free cash outflow in 2020. Now that implies around GBP 1 billion outflow in the second half of the year. Now it's a significant improvement from the GBP 2.8 billion outflow we're reporting today in the first half numbers with a relative benefit from inventory unwinding and an increase in spare engine sales.

The GBP 1.1 billion impact from invoice discounting was a onetime hit in the first half and won't reoccur.

Our cost mitigations delivered around GBP 350 million in the first half of the year. We're confident in achieving at least GBP 1 billion in total. So that implies at least GBP 600 million of mitigations in the second half of the year. Headwinds in the second half, however, include lower engine flying hours and a further expected reduction in income from Time & Materials.

Now in addition to the free cash flow, we expect to incur in the region of GBP 400 million or so of costs related to our restructuring program. This compares to GBP 87 million in the first half, which mostly related to the tail end of the 2018 program.

Now based on this guidance, we're forecasting therefore around -- net debt of around GBP 3.5 billion at the end of 2020, a deterioration of around GBP 5 billion over the year.

We do expect further free cash outflow overall as we look across 2021, but at a significantly reduced level compared to 2020. Helped by a little seasonality, we are targeting a return to positive free cash flow during the second half of next year. Warren will come back to this point later.

We aim to restore annual free cash flow to around GBP 750 million as early as 2022 as we look beyond 2020, driven primarily by our expectations for market recovery, restructuring savings and the nonrecurrence of the working capital headwinds that we have in 2020.

Now both of these targets are before the impacts of any potential disposals and they also exclude costs related to the restructuring program. However, both targets do, as a reminder, include around GBP 300 million in each year of costs related to the reduction of our over-hedged U.S. dollar position that I referenced a little earlier.

So our 2021 and 2022 targets are stepping stones in our recovery, and they do rest on the base case assumptions we have made, if, as is entirely possible, the world takes a little longer to get back to normal, then these targets could take a little longer to achieve. But we are confident that the self-help actions we are taking will get us there in the end.

So I'll pass back to Warren now to talk about the steps we've taken to restore our financial performance. Warren, over to you.

D. Warren A. East
CEO & Executive Director

Thank you, Stephen. Now I've said before, this crisis is not of our making, but it's what we do about it that matters, and that's what we're focused on. And that's why we took the decisive actions early on to strengthen our liquidity. And that's why we acted quickly to begin the restructure of our Civil Aerospace business. I'm going to talk about that soon.

I'll start with this slide, however. The phrase cash is king has never been more apt than it has been for us this year. Now those of you looking for some precise cash flow guidance here, please put your rulers away. This is not a calibrated chart. It's an illustration of our monthly free cash flow based on what we've seen so far and our expectations for recovery.

Our target is for a sustained return to positive cash flow at some stage during the second half of 2021 and it's based on the drivers that are shown on this slide: first of all, a gradual recovery in engine flying hours; secondly, a stabilization of the rate of procurement as we adjust from previously higher levels

of production and output to expected lower levels; and thirdly, achieving our planned savings from our restructuring program. Of course, it's also helped by the usual positive second half seasonality that we see in our business. But nevertheless, we expect, overall, this recovery to be sustained as we go through into 2022. And this slide illustrates how we expect this to play out over time.

So let's move on. This slide shows the cash bridge from 2020 to 2022, and it shows clearly the 3 steps in our plan for sustainable recovery. We expect a recovery of our Civil Aerospace aftermarket. We expect to see savings from our restructuring plans materialize. And we expect recovery in Power Systems to combine with ongoing resilience in our Defence business. Stephen has already spoken about the GBP 1.8 billion working capital outflow this year in the first half and why we don't expect that to recur in 2021 and beyond. And similarly, we don't expect a repeat of the in-year mitigating actions to save costs in 2020 with most of these only delivering a onetime benefit. The restructuring benefits will replace that onetime effect.

So now I'll talk about these 3 things in more detail. Firstly, the recovery of the Civil aftermarket. We expect our large engine flying hours to recover to 90% of the 2019 levels by 2022 as Stephen mentioned a minute or 2 ago as global travel once again becomes a normal part of people's everyday lives, and that's supported as well by ongoing fleet growth.

The chart on the top half of this slide, which I showed with our full year results in February, reminds us of the relative use of our fleet, which Stephen referred to a moment ago, and consequently, our expectations of market share growth as airlines shrink their fleets through retirement. And as flying hours recover generally, this market share is what really matters to Rolls-Royce flying hours, and therefore, our aftermarket revenue.

However, I should stress the timing and shape of recovery remains uncertain. And if the flying hours take longer to pick up, then our journey back to GBP 750 million will be slower.

We're assisted a little by the diminishing annual cash costs related to the durability issues that we've had on the Trent 1000 and that diminishing cash cost is a helpful tailwind. These costs are projected to fall as we roll out the fixes. And by 2022, we expect the headwind from this to be between GBP 200 million and GBP 300 million, which is GBP 250 million less than what we're seeing in 2020.

Next slide shows the second driver and this is about our restructuring program. As you know, the world around us has changed and so we're changing, too. We're undertaking the largest reorganization of Civil Aerospace in our history. Net-net, we're shrinking our capacity by about 1/3. We remain committed to retaining our expertise and our capability, and we will continue to focus on the high-value manufacturing and services that differentiate us.

Now a severe downturn has caused us to take some difficult decisions, and that results in an unfortunate but absolutely necessary reduction in roles. In total, we're proposing the removal of about 8,000 roles from Civil Aerospace and a further 1,000 mainly from central functions. Nobody likes to make compulsory redundancies, but we are therefore doing what we can to help support our people as we make these very necessary changes to our business. More than 2,500 voluntary severance and early retirements have been agreed in the U.K. And we've moved some of those people who've been working in at-risk roles successfully over to our Defence business, which has continued to see strength on the back of its large installed base and high levels of order intake that we've seen recently. And so as of today, with more than 4,000 departures this year globally with another 1,000 expected by the year-end.

The cash cost of restructuring is expected to be about GBP 800 million with -- in total with GBP 400 million this year, GBP 300 million in 2021 and the remainder in 2022 and that roughly mirrors the pace of these departures. We don't expect to see OE demand recover for several years, so a consolidation of our manufacturing facilities is inevitable.

As part of our detailed analysis to establish the right balance, we're moving certain activities to fewer sites in order to optimize utilization and that will help us be more efficient and productive. The first phase of the proposals includes consolidations shown on this slide: from 3 sites to 1 for wide-body engine assembly and tests, from 2 sites to 1 for fan blade production, from 2 sites to 1 for advanced turbine blade machining

and from 3 sites to 2 for blisk production. Now not all of the sites losing work will close completely, some will continue with other activities. But by the end of 2022, we expect to save a total of GBP 1.3 billion in costs from our restructuring program, GBP 700 million from head count reductions and the rest from lower indirect costs and CapEx.

Moving on. Our restructuring is not just about job losses and consolidation. A lot of our parts are made in-house and we get most benefit from owning the supply chain where our engineering and experience is a differentiating factor, especially where we have design and manufacture that are closely related. And we're reviewing our manufacturing activities to explore further outsourcing opportunity. And that would lower our capital intensity and increase the flexibility of our cost base.

And it's not just in OE that we're making changes. In our maintenance, repair and overhaul, or MRO, shops, we're driving efficiencies to adapt to the post-COVID world. We have a growing fleet of young engines. So despite the near-term shock to flying, we will actually need to grow our MRO capacity over the coming years. And we plan to maintain that capability consolidated into fewer locations and meet the future growth by enlarging our external network.

As well as overhauling engines, an important part of our TotalCare package for airline customers is the provision of spare engines, and we typically spend between GBP 50 million and GBP 100 million each year on spare engines, which support our customers when their engines are off wing.

And we're looking at a number of possible ways to reduce the number of engines that we hold on our balance sheet and therefore reduce our capital intensity. All of these actions are supporting a more flexible cost base with lower capital intensity, better returns for our shareholders. Historically, our investment in CapEx in proportion to sales has underperformed that of our peers. And through these changes, we believe that we can narrow the gap.

So stepping away now from Civil Aerospace to the third key driver of the recovery on Slide 23. Diversity in our business has helped us to weather this crisis, and that continues to be a key pillar of our strategy for overall group resilience.

Our Power Systems business, on the top of the slide -- our Power Systems business is exposed to a broad range of sectors. And whilst it also has suffered from the impact of COVID-19, that is, to a lesser degree, than in our Civil business, and we're forecasting a faster recovery. In Power Systems, we expect most of our end markets to recover by the end of 2021 and we're targeting a full recovery to 2019 revenue levels by 2022.

Switching to Defence. Defence has been a resilient sector throughout the whole COVID-19 disruption so far and shows every indication of continuing that way. We're benefiting from strong order intake over the last 5 years. And we've got an installed base of more than 16,000 engines and still growing that we have to maintain.

Now I'll be back to talk about our strategy expectations for the future in a moment. But before I do, Stephen is going to lead you through our plans to strengthen the balance sheet. Stephen?

Stephen Wayne Daintith
CFO & Executive Director

Thanks, Warren. So let's get back to the numbers. So as Warren said earlier, cash is king, and we have an important journey ahead of us to make sure we maintain our strong liquidity and to restore our balance sheet.

Now this slide shows our sources of and uses of cash and the actions we've taken to ensure we have enough liquidity.

We started the year with GBP 6.9 billion of liquidity, and we used about GBP 3 billion of this in the first half of the year. We preemptively drew on our GBP 2.5 billion revolving credit facility, and we added a new revolving credit facility for GBP 1.9 billion that remains undrawn. We also used the government's COVID commercial financing facility scheme to draw GBP 300 million of loan notes. And we're thankful again for

the government's support, not just on that facility, but also as they partly guaranteed our new undrawn GBP 2 billion term loan facility.

So taking all that into account, we had GBP 6.1 billion of liquidity at the end of June plus the new GBP 2 billion term loan, so near-term liquidity is strong.

Now looking ahead for the next 18 or so months, let me take you through the key factors influencing our liquidity. So taking our starting point of just over GBP 8 billion, over the next 18 months, we have GBP 3.2 billion of debt maturities. You can see those in the chart below. We have an aggregate GBP 800 million of restructuring costs that's mostly Civil Aerospace related. And we have the last of our Deferred Prosecution Agreement payments, as well as our expected free cash outflows in 2020 and 2021 that I outlined a little earlier.

Now as you might expect, both in our base case and downside scenarios, we're taking several actions so that we can maintain appropriate headroom. Now these include: a program of potential disposals to generate at least GBP 2 billion; the reassessment of Civil Aerospace's make-versus-buy strategy, which will reduce our capital intensity that Warren talked about a little earlier; we're exploring new forms of industrial collaboration; and finally, we continue to review a range of additional options to further strengthen our balance sheet and liquidity and this includes the refinancing, of course, of the debt and RCF maturities that are on the horizon.

We'll come out of this downturn with considerably more debt than we started with. And as such, it won't surprise you to know we're pursuing a number of potential actions to strengthen our balance sheet.

Now moving on to my last slide, Slide 26. A strong balance sheet is essential in our line of work, and strengthening is one of our top priorities. This is why we remain committed to our ambition of an investment-grade credit profile in the medium term and are considering a number of options to help us return to a net cash position.

Further to the self-help that is behind our free cash flow recovery and going back to my earlier comments, we've identified more than GBP 2 billion of proceeds from potential disposals that could be achieved within the next 18 months. One of the potential disposals we're considering that we're announcing today is ITP Aero. As part of this process, we're exploring options that would enlarge the scope of ITP's capabilities, increasing its value prior to disposal. Now whether or not a sale takes place, ITP Aero is a key partner and we will retain a long-term relationship with it across our Civil and Defence programs.

Now as you'll recognize, I can't go into too much detail at this stage on this or indeed any other potential disposals as we're still in the early stages and I wouldn't want to impede the consultation that will be needed before we reach any certainties. And of course, all disposals are subject to finding the right buyer, and most importantly, the right price. But I'm confident we can achieve substantial proceeds and at the appropriate value.

And with that, I'll hand back to Warren. Thank you.

D. Warren A. East
CEO & Executive Director

Thank you, Stephen. Now just a few more slides on our strategy before we open up the call for your questions.

So starting on Slide 28. We know COVID has changed the shape and the future of the civil aerospace market. And some of the changes are obvious today and plain to see and others will only become apparent over the years as the world begins to recover. But we have to make some fundamental changes, too. So we've taken this crisis as an opportunity to really rethink and accelerate some of the ways in which we do business from manufacturing to what we outsource, to the facilities we need and how we collaborate with partners for the long term to reduce our future capital costs and risks. Taken together, these measures should mean much improved operational gearing as the market recovers and we return to growth. It will be a very different Civil business in future.

Looking forward, we see a lower carbon technology as being essential. If anything, the changes over the last few months have accelerated the drive towards better, cleaner power solutions. The world is demanding cleaner energy, and we need to find the right approach that enables us to continue to lead the way in our markets without taking on unacceptable costs and risks.

Slide 29 shows the strategic areas to improve returns in Civil Aerospace. To really benefit from the large installed base we've built and growing market share as we continue to build it, firstly, we need to improve our manufacturing efficiency. Post COVID, our consolidated footprint and smaller fixed cost base will do just that.

Secondly, we see a substantial opportunity for improvement in our aftermarket returns by extending the time on wing and working with MRO partners as our base of over 5,000 installed large engines grows. And that's where we have real alignment with the needs of our airline customers, and it's key for us to benefit from the annuity-like characteristics of our model.

Thirdly, we're looking to reduce the amounts that we need to invest to get new technology to market. We already have a number of risk- and revenue-sharing partners in manufacturing. But as technology develops, we need to think more broadly and work with more industrial partners to accelerate those developments and to share the upfront investments.

Moving on to Slide 30. There are, of course, exciting opportunities in Power Systems and Defence as well. In Power Systems, we have structural growth opportunities as we increase our share in growing regional markets like China and India and right across all the sectors in which we operate. We look to build on the large installed base we have and increase our services penetration with long-term service agreements similar to those that we've successfully deployed in our Civil business. We have the right products, too, for mission-critical power generation market. And we're leading the energy transition with our hybrid and microgrid solutions. Power Systems also has the potential for even better margins as we shift manufacturing to some lower-cost locations.

Moving to Defence. In Defence, we've been well supported through this period by our government customers, and we've seen commitment from them on new programs. In the U.K., we've welcomed new partners to Team Tempest, where we continue to make good progress. In the U.S., there are 2 very exciting opportunities on the horizon with a combined estimated lifetime value of GBP 7 billion. We submitted our proposal for the B-52 re-engining to the Department of Defense this year. And we look forward to submitting our future vertical lift proposal with Bell in 2021.

Longer term, being pioneers of lower carbon power remains at the heart of our long-term strategy. And earlier this year, you will have seen us join the UN's Race to Zero campaign. Our breadth of activities uniquely positions us to develop and deliver solutions that will change the way people travel and access power. We believe our work on sustainable aviation fuels, which is developing momentum, is the fastest way to achieve net zero long-haul travel. It can be adopted without any change to the existing engine architecture and infrastructure. And we're also looking at hybrid and electric solutions with an ambition to pave the way for regional hybrid aircraft by the 2030s.

In Power Systems, we aim to be the leader in hybrid power solutions. We were the first to market with our hybrid rail packs and with the yacht system under development. Our environmentally friendly mobile gas engines entered service this year, powering a passenger ferry. And the second ferry is currently under construction and scheduled to enter service at the end of the year.

Our small modular reactors are gaining traction. Now these are really game-changing and could materially accelerate the transition away from fossil fuels for both grid power and stand-alone applications. We also see a significant opportunity for SMRs to generate carbon-free electricity and create sustainable aviation fuels. Combined with the appropriate carbon capture, this, which would be a truly net zero carbon solution, potentially producing SAFs on a scale and cost that will accelerate their adoption.

So slide to summarize. We started 2020 with good momentum, but external events quickly overtook us in Q1 and placed us on a very much more difficult path. However, we've taken some fast, decisive actions strengthening our liquidity, launching our largest ever restructuring of Civil Aerospace to step change our

performance and we believe that the worst is behind us in terms of the severity of the impact on wide-body engine flying hours. We're now looking at a range of options to repair our balance sheet led by self-help, with potential disposals already identified. And we're absolutely unwavering in our commitment to improve returns. We're well placed in each of our markets where each remain attractive over the long term. And we're looking forward to continuing the path to becoming a broad power group, leading the way to a lower carbon future.

And with that, I will stop and hand over to Q&A.

Question and Answer

Operator

[Operator Instructions] Your first question comes from the line of Chloe Lemarie from Exane BNP Paribas.

Chloe Lemarie

Exane BNP Paribas, Research Division

I had a couple. The first one is on the ambition to resume to investment-grade over the midterm. Can you give more color on the timing? I mean when you'd feel you absolutely need to return to investment-grade. And would that mean that you need to return to a net cash position or is it actually more driven by EBIT performance?

And the second set of question is related to Civil operating profit. So if we exclude the COVID-19 one-offs, you recorded about GBP 300 million loss in H1. And that was about the same the level of cash losses you recorded last year just on the large engine OE. So how should we think of the H1 '20 OE losses and the rest of the business? Should we think stable OE losses and the rest was just a 0 due to lower volumes? Or any color on this would be really helpful.

Stephen Wayne Daintith

CFO & Executive Director

Okay. Thank you. So Stephen here. I'll cover the first question around return to investment-grade. Return to investment-grade is important to us given the industry that we're in. Our customers are committing to us when they place orders, making long-term commitments around engine programs that will be on their aircraft. So that's an important commitment that we're giving them, and our credit rating is an indication of the health of Rolls-Royce. So returning to that investment-grade is important.

I think right now, it's not as important as perhaps it has been given that we're unlikely to see big new engine program orders over the next 2 or 3 years given the markets, but also given where we are in our engine program development at the moment. So it's a priority, but not as important a priority as it has been.

On the question around what is it about? Well, I think returning to net cash is important to us. We referenced that today. We'd like to get there over the next 2 or 3, 4 years. Similarly, growing profitability and cash flows is an important lever as well. And of those two, the second one of those is the most important one. We've highlighted today that we are targeting to return to free cash flows of around GBP 750 million as early as 2022. That will be driven really by the pace of the restructuring program that we're driving today -- that we're going through at the moment, sorry. And it will also be driven by the pace and shape of the recovery in engine flying hours over the next 12, 24 months.

So both of those factors will be important for us as we look to get back to investment-grade status. Warren?

D. Warren A. East

CEO & Executive Director

Okay. And the other question was about Civil operating margin or operating profit in the half. I mean there are fundamentally 3 reasons here. We've got lower activity and that lower activity is driving things like lower V2500 payments, lower Time & Materials and so on. There's a little bit of lower spare engine sales to sit alongside that lower levels of activity. And then because we've been unable to rightsize our fixed cost base as quickly as the change in activity levels, then we have got some underutilization as well in our facilities, which has pulled things down. So under-recovery of those fixed costs. And I think that just about summarizes it.

Operator

Your next question comes from the line of George Zhao from Bernstein.

Copyright © 2020 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

George Zhao*Sanford C. Bernstein & Co., LLC., Research Division*

Stephen, you talked about getting to 70% of the 2019 engine flying hours by '21 partially based on the outperformance of the IATA projection. The 64% recovery forecast from IATA you cited refers to total passenger traffic, not just international. So how much contribution of your fleet is intra-China that gives you confidence that despite the all wide-body fleet with 80% exposure to commercial traffic that you can still outperform the total passenger trends?

And second question related to that. You talked a lot about the trend of the flying hours, but the other side of the equation is the dollar-per-hour rate. And given the airlines may be flying the aircraft but at much lower load factors, have they tried to negotiate for lower rate on existing contracts or looking to pay lower rates on the newer contracts?

Stephen Wayne Daintith*CFO & Executive Director*

Okay. Thank you for your question. Yes, so on flying hours, I'm glad you pointed this out. The geographical mix of our engine flying hours is really important. When we look at our sort of top 5 markets, we have China, Japan and South Korea are all in our top 5 markets. The other 2 are the U.S.A. and the U.K. So we are well placed there given the shape and stage of recovery in those markets. China in itself is around 20% of our coverage and around 6% of that. So in other words, 6% out of the 20%, that is, is domestic China. So that's helpful for us, and this goes to my earlier comments during the presentation just now around it's important to look at the granularity of engine flying hours for us: the engine programs that we're in, the geographies that we're in, the routes that we're flying, the age of our fleet. All of those are important factors. So it may be misleading to look at an average across an IATA statistic on revenue passenger kilometers. And it's perhaps better, we believe, to look at engine program by engine program and route by route and so on. So that's how we'd arrived at our numbers today.

D. Warren A. East*CEO & Executive Director*

Yes. And your second question was a little bit about, well, are people trying to ask us to compensate them for lower load factors effectively? I mean, of course, we recognize the fact that some of our customers are under severe pressure and there is an ongoing commercial discussion. But to balance that sort of thing, in many of these contracts, we have minimum utilizations and so on. And so I don't think there's been any material impact whatsoever from actual renegotiations. We're trying to support our customers through this phase as much as we can, but we've also got our own business to run.

Operator

Our next question is from the line of Celine Fornaro from UBS.

Celine Fornaro*UBS Investment Bank, Research Division*

I'll have 3 questions, if I may. The first one is regarding your 2022 cash outlook, which is now guided for GBP 750 million, whereas before, probably it was more at least GBP 750 million. But in this number, you're now benefiting from a GBP 330 million cash tailwind, I would say, on the 787 lower costs incurred. So what has gone worse? Or do you already know early July that you would have lower 787 costs? That's the first question.

The second question is regarding the sizing of your disposal, approximately GBP 2 billion-plus. I know Stephen addressed it, some of it, in the presentation. However, I'm not really sure how I understand how you get to that number given the slump in performance in ITP. So how do we think about how would we get to GBP 2 billion? And is it a lot of small divestments or a big large chunk? So maybe you can help us. And if you think of selling any MRO participations in your JV?

My final question would be regarding the shape or the timing of the shop visit costs and the timing of those, I guess, beyond 2020. So in 2021, do you expect more shop visits than in 2020? So if you could compare that, that would be great in your assumed scenario.

Stephen Wayne Daintith

CFO & Executive Director

Thanks, Celine. Okay. Well, I'll kick off with the GBP 750 million. And just as a reminder, we've said as early as 2022. Very much still significant uncertainty around the shape and pace of the engine flying hour recovery. So just to put that qualification around it.

So if I just sort of go through the sort of key building blocks to how we get to that number. Well, first of all, in 2020, we'll have seen that GBP 1.1 billion one-off impacts from ceasing invoice discounting. So there's a benefit there in 2022 that won't be repeated. We're also going to see the benefit of the GBP 1 billion large working capital outflow that we're going to see in 2020 across inventory, but also receivables and payables movements. Rolls-Royce Civil Aerospace, in particular, is a negative working capital flow business given that we often receive cash from our customers in advance of activity. Now when activity starts to wind down and reduce, that impact goes the other way. So we've seen a headwind from that this year, which we don't expect to see in 2022. At the same time, we're expecting, and this is the single biggest driver, an improvement in the civil aftermarket driven by engine flying hour recovery largely in excess of GBP 2 billion. We also are going to see, to your question, lower Trent 1000 costs. We're going to see Time & Materials improvements as well. We're expecting to see our Trent 1000 costs around GBP 300 million lower than 2020 numbers, which is about GBP 100 million lower in '22 versus the old guidance.

By the way, when we gave our GBP 750 million number in July, we already knew the impact of the Trent 1000. That was actually implicit within that number that we -- when we gave you that number in July as well, just to explain that one.

We're going to see a modest benefit in Civil OE as average losses continue to recover, that's another part of the bridge. And we're going to see higher profits in each of Power Systems, Defence and ITP, particularly Power Systems and ITP versus the 2020 numbers that we're highlighting today and then it will be there for the full year as well. And then at the same time, we're going to see an improvement in the year in the cost base as well, the restructuring that we're doing in Civil Aerospace, the pace that we can get through that. We're highlighting today 4,000 head count reduction already this year, with a further 1,000 to follow before the end of the year. And certainly, I think by the middle of next year, we'll be well way -- well through that restructuring program in Civil Aerospace to give us good confidence about that GBP 1.3 billion of restructuring savings that we're expecting for 2022.

So those are the key drivers that get us to that GBP 750 million. Just flagging again, there still remains uncertainty around how flying hours profile over the next couple of years.

Warren, do you want to take the next question?

D. Warren A. East

CEO & Executive Director

Okay. So the next question was around the GBP 2 billion. I think the first thing to note is that, actually, the price at which we bought in -- or bought back the share of ITP that we didn't own was actually quite a good price. And so I think the difference -- although the valuation might be down a little as a result of COVID is where you start from is quite important. But of course, our target of GBP 2 billion comes from a series of potential disposals here. There are other assets involved. We're not being specific this morning and we can't be specific this morning about other assets. But I draw your attention to track record. And as an example, the disposal of L'Orange a couple of years ago where we weren't talking about a whole chunk of activity that we regularly report on. We were talking about an asset that sits within one of our businesses where we thought it was time to do an intelligent recycling of capital. And that's the sort of thing that we're looking at.

So there isn't a small list here. There's a list of several potential assets that we're looking at, at the moment. And as and when we're in a position to talk about something specifically, we will. But the

statement we made this morning is that we're confident of more than GBP 2 billion over the next 18 months or so.

I think the third question about shop visits and shop visit timing and what happens over the next couple of years with shop visits. Yes, we do expect this to grow beyond 2020 because our fleet that is continuing to fly is growing and it is maturing. So shop visits have slowed in 2020 simply because of the depressed levels of flying activity, but we will see that recovering. And of course, we will see the engine flying hours recover as well. So the actual aftermarket margin will grow as well.

I think that's it, the third question. Yes.

Isabel Green

Head of Investor Relations

I've got a couple of questions coming in online now, which I shall read out for management.

So Jeremy Bragg is asking for a little bit more detail on the timing of when we're looking to restore the balance sheet by, and in particular, if or when a rights issue might be needed. Is it better to wait for things to get better or risk that they get worse?

Stephen Wayne Daintith

CFO & Executive Director

Okay. Well, I'm not going to be drawn on any speculation about a rights issue. So on the balance sheet, so are we waiting for it to get better? First of all, key message: we have strong and adequate liquidity today. More than adequate, in fact, when we look at our base case scenario as you'll see this highlighted in there. Long term, we have an ambition to return to a net cash position, going back to my comments just now a question from Celine.

The drivers of returning to a net cash position, what are the key things they're going to get us there? Well, first of all, the self-help stuff that we're doing on costs: the GBP 1 billion of cost mitigations this year that we announced as early as April; the GBP 1.3 billion of restructuring savings that we've announced in May -- on May 20. There will be an unwind of some of the cash mitigants in 2020, of course, around sort of paid deferrals and so on. Some of those items will unwind going forward and pay cuts and so on. At the same time, we're anticipating a significant recovery in the aftermarket that will help our net cash position. The disposals that Warren just talked about, at least GBP 2 billion. We have good confidence and conviction around those and delivering proceeds there over the next 18 months. And we continue to assess a range of other options as well. So that's how we're thinking about balance sheet at the moment.

Isabel Green

Head of Investor Relations

And another question we've also got on the webcast here from Ben Heelan. He would like to ask if we can give some more information on the industrial partnerships we talked about.

D. Warren A. East

CEO & Executive Director

Yes. I don't think there's anything specific that we can give about that. Of course, if you look at our history, we've always done a certain amount of partnering. We have a handful of risk- and revenue-sharing partners that are part of our existing Civil programs. But as we look forward, these new products that we contemplate, things like UltraFan and beyond, have a greater range of new technologies within them. And developing those technologies to make them all ready to put into engines is a lengthy exercise and it's a risky exercise. And so we'll be continuing to look for new partnerships, perhaps a little bit more at the development end around new technologies to share some of that risk. And also, frankly, accelerate some of those technology developments so that we can get the benefit of them sooner rather than later. And that's the direction of travel that we're talking about.

So nobody specific, but probably a wider range of players than we've historically been involved with.

Operator

Your next question comes from the line of Chris Hallam from Goldman Sachs.

Chris Hallam

Goldman Sachs Group, Inc., Research Division

Just 2 quick questions for me. So first, on the 2022 free cash flow guidance. You sort of already answered my question with your earlier response to Celine. But is it fair to say that the only working capital assumption you're including in that GBP 750 million number is no working capital outflow, i.e., a nonrepeat of the big 2020 outflow? But given your negative working capital business, wouldn't you expect to be seeing some degree of inflow in 2022 as activity improves? So that's my first point.

And then secondly, on disposals. Again, you've already covered some of the ground on this topic. But given the outsourcing comments, I suppose it's fair to say the revenue number for ITP is going to look different. So how should we think about the push and pull between higher revenues at ITP due to more outsourcing from Rolls-Royce versus lower revenues due to lower overall activity in the Civil world? And where would you expect the net to shake out relative to 2019?

Stephen Wayne Daintith

CFO & Executive Director

Okay. Thanks. Thanks for your question. So on working capital assumptions for '22, the assumption that you stated, the answer is broadly yes. We could see a modest positive contribution from working capital in 2022. It is a very modest assumption though in our modeling. It's not a material number.

One item that I should have referenced whilst I've got the opportunity to talk about '22 as well that's within our GBP 750 million model that I just ran through. There is also the headwind of the GBP 300 million or so of hedge cost as we settle those -- that over-hedged position for that particular year and that's the spot rate. And that's around the -- sorry, through the FX forward contracts that we've taken, and that's about a GBP 300 million hit. So that GBP 750 million number is after that exposure. So that's a good way of looking and thinking about it.

And the question next, Warren, view on ITP?

D. Warren A. East

CEO & Executive Director

Yes. I mean, I don't think we can be specific, I'm afraid, on a revenue number for ITP in 2022. I mean, I think the question is basically correct in terms of pushes and pulls when you look at ITP and call ITP a partner. But what matters to us is overall profitability. And we talked about make versus buy. It's a constant question that we're asking about make versus buy. We have to recognize that you can't just make snap changes and have them effective within a matter of months because lots of these parts have to be -- go through a qualification cycle when they move from one manufacturing location to another. So it's far too complex really for us to be, frankly, misleading people with guidance on specific numbers. But your question is right. There'll be a little bit of a balance there, and the number will be what it be. I just can't give you the answer right now.

Operator

Next question comes from the line of Nick Cunningham from Agency Partners.

Nick Cunningham

Agency Partners LLP

[indiscernible] sort of famously W shaped with an outflow in between the reporting dates. Presumably, with the factoring gone and Civil smaller, it will be less [indiscernible]. What I wanted to ask was if we could remove the overlay [period], how much you need to -- liquidity you need to have at the beginning or end of a period to be comfortable to get through that normal seasonality? What is it? How much headroom do you need to [indiscernible]

I think less important question, but presumably, you've [indiscernible] visits during the first half because you've been doing the shop visits, but the flight hours haven't been undertaken. So that's some cash that should come back. Is that relatively near term and therefore built in [indiscernible] the sort of beyond '22 period?

Stephen Wayne Daintith

CFO & Executive Director

Okay. Thank you. Thank you for your questions. You're cutting out quite a bit, but I think that we heard enough of the first question to answer it. And I might to have another go at the second question, but I'll do the first question to begin with.

So the W shape. No. I mean I for one will be quite pleased to see the back of this, that W shape. I think the cessation of invoice discounting means that it should go away. I mean there should not be material seasonality in our business and so that will be a consequence of that.

Your question was then around sort of the cash flows and the -- I'm trying to recall the second bit of it. No. Sorry, the headroom area. I think you should be thinking about sort of low single digits of billions of pounds for what is meant by comfortable headroom. And that's what we've used in all of our statements and modeling. So it's not a 0 case. It's very much a low single digit, so GBP 1 billion to GBP 2 billion or so of comfortable headroom. That's the sort of number that we've used in our modeling. Warren?

D. Warren A. East

CEO & Executive Director

I'm afraid on the second question you just broke up too much. So can we have another go at the second question?

Nick Cunningham

Agency Partners LLP

Yes. I apologize. If you can't understand me, stop me. The question is, have you been effectively banking [indiscernible] of and so there [indiscernible] one place for [overhauls] anyway. And so therefore, that's effectively cash to come back in at some future date? And is that already in the near-term cash flow forecast or is that to come back later?

D. Warren A. East

CEO & Executive Director

Yes. No. I think we're still slightly struggling. It's -- we've -- well, I think the point is -- I'm struggling to hear the question really, but I think the question is around is there a big benefit from the lower number of shop visits, and I think that's what it is in terms of cost. The answer is not really in that we have fixed costs that are part of our MRO network that don't go away and so there's a cost in that in itself in any event. So I don't -- I shouldn't -- it shouldn't be regarded as being a material benefit. I think that's a just good question. Sorry, I'm not answering your question. It was just very difficult to hear it that's all.

Stephen Wayne Daintith

CFO & Executive Director

I think another point, just to reinforce this, the shop visit, the volumes have not fallen materially in the first half in any event. So the -- although the mix has changed, the volume has remained pretty much flat year-on-year.

D. Warren A. East

CEO & Executive Director

If you've still got a question, then maybe take that as a call with our Investor Relations team off-line after the event.

Operator

Your next question comes from the line of Mr. Khan from Societe Generale.

Zafar Khan

Societe Generale Cross Asset Research

I have 3 questions, please. The first one is just on the JV and associates contribution, which is quite encouraging. Could you just tell me where that's coming from, presumably MRO and leasing? Or is there something else there? That's the first question.

Second one is just on the tax charge and the cash-out on tax this year and perhaps next year because of the mix of profits and losses is geographically quite skewed towards Germany and U.S. So just want some idea on that.

And then the old topic, I'm sorry to come back to this. But the long-term service agreement contract balance change, I've been looking at this for a couple of years now, but I still cannot get my head around this. And I would have imagined in the first half of this year, that would have been a big negative number yet it's a very big positive number. Is that just backing out the losses that are in the line above, in the underlying operating profit so it's kind of canceling that? How does it actually work? I know, Stephen, you touched on this in your presentation, but you were going quite fast for my brain to process. So if you could just please help me and tell us what that looks like for the full year. And you've said in the past that as an ongoing number, that should be around about GBP 300 million positive per annum. But that's not been the case.

Stephen Wayne Daintith

CFO & Executive Director

Right. Well, why don't I do the LTSA balance first? And sorry if I went too quickly in the presentation. So this actually grew by GBP 780 million in the first half of the year. So that's a credit to that balance in the year. Now just as a reminder though, the contract catch-ups that have taken place or when they do take place, they are a revenue adjustment. And the double entry in the case of a sort of negative contract catch-up is a debit to revenues and a credit to the LTSA balance. And that number that we're highlighting today in the first half is GBP 866 million, and that's down to that sort of reassessment of engine flying hours around our engine programs. And I should also point out at this stage that 700 and the 900 were the 2 biggest contributors to that GBP 866 million. And that makes sense given the, number one, for the 700, the amount of revenues that have already flowed through that mature engine program, the materiality there. And number two, Trent 900, which is the most impacted engine program when we think about future engine flying hours, and you'll have read all the press around the Trent 900 retirements and so on.

So when you take off that GBP 866 million, you're then into a reduction in the LTSA balance from that GBP 788 million that I referenced there, that's an GBP 80 million-or-so reduction. Now one might have expected it to be larger than that, but I just think it's worthwhile just highlighting the difference between invoiced engine flying hour receipts and -- but also the cash receipts that come in as well and there can be a disconnect between the two. And I think that's just another factor to take into account. So hopefully, I've given you some of an explanation there around that one.

We don't expect more catch-ups in the second half. And in fact, they could actually shrink in the second half as well so I think that's an important factor to bear in mind.

I'll very quickly cover the cash tax item as well. Just as a reminder, we don't pay cash tax in the U.K. where we have, number one, sufficient accumulated losses to offset any future profits. And at the moment, our U.K. business remains an unprofitable loss-making business. We pay cash tax in the U.S. and Germany. We're expecting that it will be -- well, in 2019, it was about GBP 175 million; first half of this year, GBP 34 million, and that's largely driven by the reduced profits in our Power Systems business that we've highlighted today. And then going forward, I think for 2020, across '21 and '22, as the U.S. and German businesses grow, I think you should be thinking about GBP 250 million or so as a good guide of cash tax in each of those 2 years.

And then, Warren, do you want to cover the first question that was asked in this one? Sorry, this is about sort of the JVs.

D. Warren A. East

CEO & Executive Director

JV. Yes. I mean I think the -- our MRO networks have sort of continued to operate in spite of the depressed environment. As we said a moment ago, shop visits have essentially been flat in the first half of the year and that's really a driver of the performance from those JVs.

Zafar Khan

Societe Generale Cross Asset Research

Okay. And Stephen, just on the tax rate that we should be looking at for '21, '22. Any kind of an underlying rate that you can guide us to?

Stephen Wayne Daintith

CFO & Executive Director

Yes. That's a -- it's a really tricky question because it's very much driven by the sort of the mix of profits across territories, so it's hard to be precise. I would think of the tax rate as being a low negative number. But there's no deferred tax assets, so there's no credit on the U.K. loss that we have seen in previous years. Because you'll recall, last year, we stopped adding to the deferred tax asset. And this year, in fact, we derecognized some of the deferred tax asset in light of a revised view of when U.K. profits are likely to flow through. So for your modeling on effective tax rate, I would assume a low negative percentage number.

Zafar Khan

Societe Generale Cross Asset Research

Sorry. A low negative percentage number means a tax credit?

Stephen Wayne Daintith

CFO & Executive Director

Sorry. So for the full year, 20%, same as in the first half. I think that's the -- yes.

Operator

Our last question comes from the line of Andrew Humphrey from Morgan Stanley.

Andrew Edward Humphrey

Morgan Stanley, Research Division

Just a couple from me. Wanting to ask about the kind of make-versus-buy decisions that you're making. And specifically, what benchmarking exercises you've done versus peers to work out what the optimum level might be on that. And secondly, you've given us some benchmarking versus peers on tangible CapEx. I wonder if you could give us a bit more detail on, say, overall investment levels, including intangible and R&D. I mean I know that's an area you focused on in recent years. So if you could give us an idea of where overall investment ratios might turn out in the medium term compared to some of the peer group.

Stephen Wayne Daintith

CFO & Executive Director

Yes. Okay. Well, look, on the make versus buy, I can't go into specifics at the moment. This is a constant exercise. I think all we're highlighting is the changes we're making, the restructuring that we're doing in terms of site consolidation that we announced this morning in terms of overall head count reduction creates a catalyst for looking at that make versus buy again and saying, are we really doing what's right for us?

Now what's right for our peers might be completely different. We're seeking to look at make versus buy from a point of view of profitability and deployment of our capital. And we'll come out with the answer,

Copyright © 2020 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

which is right for us. I expect that, that will probably mean some -- a little bit more buy and a little bit less make, which is essentially being less capital intensive transferring more of, essentially, our fixed costs into variable costs, giving us a bit greater flexibility.

The comment we made on the slide a little while ago in the presentation about making our capital intensity a bit closer to the range of our peers was simply meant to illustrate the fact that if you see us move in that direction, this is a healthy direction. It makes us more competitive. But I think you can see from the first part my answer, obviously, it's making our business more competitive.

And then on the investment question. So you'll recall that over the last few years, we've actually ramped up investment levels across both R&D and CapEx, number one, as we brought several new engine programs to the market; and number two, as we've increased our capacity for the volume we were anticipating, particularly OE volume in Civil Aerospace. Coming out of that, for natural reasons around the engine program development, but also COVID related, R&D cash spend, GBP 1.1 billion cash spend in 2019. I think you can expect to see that decline modestly as we get towards 2022. I think maybe declines, maybe GBP 100 million, GBP 200 million reduction in R&D cash spend.

I think, CapEx, I think that's where you're more likely to see a material change in profile. We spent around GBP 750 million in 2019. That number for 2020 is more likely to be about GBP 600 million, so quite a material reduction. And then, again, I think if you're thinking around 2022, you're probably looking at a number of somewhere between GBP 400 million to GBP 500 million in 2022. I think that's a decent guide on capital expenditure where, having built the capacity, we think we can manage at those lower capital expenditure levels that I've just highlighted.

D. Warren A. East

CEO & Executive Director

Yes. I think what's important, just to sort of add a little bit of context on that capital expenditure. Stephen's talked about the quantum there on R&D and CapEx. One of the things we are doing is thinking about the shape of that CapEx over the next several years. And if I look at the shape by business, we are emerging from a period where we've spent a huge amount of investment on our Civil Aerospace business, created a portfolio of relatively new and new engines. Now is the time to capitalize on those new engines. And over the next several years, you will see us going a bit less capital-intensive in Civil. But now is the time we can free up then some of that investment to target these zero carbon areas, which are showing up in our Power Systems business initially, in some of the electrical activity that we're doing for future in Aerospace and for some of the new exciting opportunities that we've got ahead of us in Defence. So -- as well as the quantum, it's important to think about the shape of the R&D and CapEx.

With that, I think that was actually, I'm being told, the last question. So we'll thank you all for your questions.

And before we disappear, I just want to take this opportunity to quickly summarize. And I'll start by talking about our other announcement this morning. So Stephen will be leaving us. So I want to say thank you very much to Stephen for being a great colleague and a great influence on our business over the last several years. He's overseen great change to our finance team and built a very strong finance team over the last few years and injected some rigor there. The executive team will miss him and wish him well. He has overseen or helped us drive very significant changes in our business. And that has actually manifested itself in, if you look over the last several years, a big improvement in free cash flow generation, coming from negative through to getting on for GBP 1 billion of free cash flow last year. So thank you very much, Stephen.

And actually, I'll start my summary then with that point. That was a great position to come into 2020 with some good momentum. Unfortunately, the COVID crisis struck fairly fast in the first quarter. So we have acted quickly to secure liquidity. We've acted quickly with our very significant spend mitigations for 2020. We've recognized the market outlook and undertaken the largest restructuring of our Civil Aerospace business to date. We do think that, that is going to deliver a step change in performance for our Civil Aerospace business so that we can really capitalize with great operational gearing on that installed base that I talked about just a moment ago.

And looking a bit further forward, we have the self-help actions underway to make our -- repair our balance sheet after this crisis as we look beyond the crisis so that we can really maximize value from those existing positions and secure our long-term ambitions.

So I think that's the summary. And thank you all very much for your interest.

Operator

That does conclude our conference for today. Thank you for participating. You may all disconnect.

D. Warren A. East
CEO & Executive Director

Ian Edward Lamert Davis
Independent Chairman

Presentation

Ian Edward Lamert Davis*Independent Chairman*

Hello, everyone, and thank you for joining us today. My name is Ian Davis. I'm Chairman of the Board of Rolls-Royce. Due to the social-distancing measures all of us are being asked to take in the U.K. to protect ourselves and others from COVID-19, we've taken the unprecedented step of not meeting with you face-to-face today. That is one of several changes we've had to make to the Annual General Meeting in order to comply with health guidance and changes required by the stay-at-home measures introduced in the U.K. As the situation becomes clearer over the coming months, we will explore ways in which we can offer you an opportunity to engage in person with your Board. But I hope you will see that we have endeavored to do what we can to give you, our shareholders, an opportunity to engage with us today in what are exceptionally challenging times.

I'm joined in the room by Warren East, our Chief Executive, at the required 2 meters distance, of course, who will provide a review of 2019. He'll then talk more about what we are doing to ensure the wellbeing of all our employees and to assist the communities in which we operate to combat COVID. He will also talk about the important and critical steps we are taking to strengthen the operational and financial resilience of our business.

In the notice of meeting, we ask you to submit questions in advance and thank you to those who took the time to do that. A number of questions will be covered by both my address and Warren's. And in addition, we have several questions, which we'll address at the end of our presentation. If you have any further questions as a result of this meeting, please do contact the company's registrar, and we will be glad to answer. You can find the relevant details on the Investor Relations page of our website.

As I said, we've had to make other changes to the way we conduct the business of the AGM today. And immediately before this broadcast, we held a closed meeting in order to consider the business set out in the notice of meeting. I'm pleased to say that together with all your votes that were received in advance, all resolutions were passed, and the results will be available on our website later today.

Immediately after the conclusion of this meeting, we'll hold a general meeting on a single resolution recommending an increase of our borrowing limits in order to give us greater flexibility at this time. We do not have plans to borrow out of this limit. But in a time of uncertainty, we believe it is prudent to create headroom to give management flexibility to act as necessary. Your Board believes that the resolution being proposed at this general meeting is in the best interest of the company and its shareholders as a whole. And the Directors have voted in favor of this resolution. Details of the outcome of that meeting, which will also be closed, will be posted on our website later today as well.

Traditionally at this point, I'd introduce you to your Board, but for obvious reasons, they are not physically with me today. I'd like to welcome Dame Angela Strank to your Board. She joined us at the start of this month and will be a member of the Nominations and Governance Committee, the Safety, Ethics and Sustainability Committee and The Science and Technology Committee. Dame Angela is currently Chief Scientist and Head of Downstream Technology at BP and a member of their executive management team, although she will be retiring from BP by the end of this year.

During 2019, we announced the appointment of George Culmer as a Nonexecutive Director. He joined at the start of 2020 and is a member of the Nominations and Governance Committee, the Audit Committee and the Safety, Ethics and Sustainability Committee. A Chartered Accountant, George, was until recently Chief Financial Officer at Lloyds Banking Group, and is also the Senior Independent Director at Aviva.

During 2019, we were starting to see the departure of Ruth Cairnie as a Nonexecutive Director, following her appointment as Chair of Babcock International Group. Ruth made extraordinary contributions to the Board and to the group, not least in her role as Chairman of the Remuneration Committee.

Also in 2019, Brad Singer, a Partner and Chief Operating Officer of ValueAct Capital stepped down as a Nonexecutive Director. Since joining us in 2016, Brad had been an active member of the Board, offering a valued external perspective and helping us to drive progress in our efforts to transform Rolls-Royce. I'm sure all of you will join me in thanking both Ruth and Brad for their contributions over the years. They were also terrific colleagues and friends at the Rolls-Royce.

Lewis Booth will have completed 9 years on the Board this month and is stepping down as Chairman of the Audit Committee. However, the Board has approved that he will remain as an independent Nonexecutive Director and as an Audit Committee member, to provide continuity of support to Nick Luff as Nick takes over as Chairman of the Audit Committee.

The Board also approved the time extension for Sir Frank Chapman to remain as an independent Nonexecutive Director and as Chairman of The Safety, Ethics and Sustainability Committee, recognizing his significant support for our safety, ethics and sustainability agenda. Sir Frank Chapman would have completed his 9 years on the Board in November this year. I'm pleased to report to you that both Lewis Booth and Sir Frank Chapman will be remaining with us until next year's AGM at the latest.

I'll hand over to Warren in a moment, but first, I'd like to make a few introductory remarks. As I said earlier, these are exceptionally challenging times. The COVID pandemic has created a global shock, the full scale of which is still unfolding, especially the longer-term economic consequences on all countries, notably on government, finances and uneconomic growth. All our stakeholders are feeling the effects from customers, partners and suppliers to governments, employees, their families and you, our shareholders.

Your Board is receiving regular updates on the measures being taken by management to deal with the impact of the pandemic on Rolls-Royce. The primary impact has, of course, been on our civil aerospace business, which accounts for approximately half of the company. Anyone who raises their eye skywards will see the result of the grounding of airline fleets across the world. In April, the International Air Transport Association warned that global air traffic for 2020 could be 48% below 2019 levels. And as half the revenues we make in civil aerospace comes from engine-flying hours, fewer flights means less cash coming into our business.

We, like many executives in the broader aerospace sector, will be working with partners to ensure a successful and orderly restart of the industry. We must mitigate this impact whilst positioning ourselves to the future that will come. We have commenced a number of contingency measures in order to mitigate the impact on our 2020 financial performance, ensuring we can deal with a sudden short-term repercussions of the virus on our business. Warren will outline these measures in further detail in a moment.

We appreciate the swift action taken by governments across the world to support businesses, but we must also take difficult decisions ourselves to ensure that we endure this period and emerge strongly on the other side. And that will require support and sacrifices from all our stakeholders.

Given the rising level of uncertainty as to how the COVID situation will develop, your Board has decided not to recommend or make final payment to shareholders in respect of the 2019 final year. Your Board believes that in light of the uncertain macroeconomic outlook this is an appropriate and precautionary measure to take at this point as the group seeks to ensure an appropriate level of liquidity in the event of a prolonged reduction in trading activity. I'd like to thank all our shareholders for understanding why this is a prudent step to take at this time.

In order to bolster our financial resilience, our employees are seeing a 10% reduction in salaries. While senior management, including the executive team, have accepted a 20% reduction, which is being mirrored by your Board. The remuneration committee meanwhile will make full use of its discretion to amend any future executive awards under the group's long-term incentive plans to avoid any windfall gains caused by general stock market recovery, which is something I think all of us are hoping we will eventually see.

The exact shape of the future and to which we will emerge is still the subject of much debate and conjecture. However, it seems likely that this virus and its effect on the global economy will have a lasting

impact. The civil aerospace market will need to evolve and adapt in the years to come. And with the support of our stakeholders, we are confident that we can recover and continue to lead the way.

During this time, we've derived strength in the diversity of our business units. Our Power Systems business has been less significantly impacted and defence operations have proven resilient to the disruption.

You all heard me talk before about culture, about how making sure every employee can be at their best. It's so important to the success of the business. I can honestly say that the behaviors and dedication I have seen exhibited across Rolls-Royce during the last few weeks have made me feel very proud. All of us on the Board would like to thank our people for their dedication, support and effort at all times, but particularly in the current environment.

I will now hand over to Warren.

D. Warren A. East

CEO & Executive Director

Thank you, Ian. So as Ian has said and all of us joining online and not in person can see, these are exceptionally challenging times, not just for our business and the industries in which we operate, but for everyone. In this unprecedented period of uncertainty, we have rapidly adapted our business to safeguard its future for all of our stakeholders. We've implemented heightened safety procedures to protect our people who need to be in the workplace, whilst many others are working from home. We're also providing practical assistance to combat the impact of COVID-19 on the countries in which we operate.

In the U.K., for instance, we've put some of our manufacturing and supply chain expertise to use in the drive to increase the supply of ventilators for hospitals. In parallel, we have strengthened the financial resilience of the group to ensure that we are well positioned to weather them pandemic. We're working hard to mitigate the near-term disruption caused by COVID. We're making stronger progress than expected on our mitigating actions, giving us confidence that we can now deliver up to GBP 1 billion of savings this year. However, we must also take difficult but necessary decisions to ensure that the group emerges from this period with an appropriate cost base for what will be a smaller commercial aerospace market, which may take several years to recover.

I'm proud of the dedication and commitment of all of my colleagues and thankful for the continuing support of our shareholders and other stakeholders during this challenging time. But before we return to COVID-19, the first part of the business of this meeting for me is to report back to you, our shareholders, on the progress of Rolls-Royce in 2019. For those of you on the phone, the slides for my presentation are available on the website, and you can now follow this review of the year on Slides 4 to 8.

Starting on Slide 4. We ended 2019 with positive momentum, showing solid progress right across the group, thanks to a good finish to the year following a tough first half. We reported 25% growth in full year underlying operating profit and an encouraging level of free cash flow, over GBP 900 million, driven by higher profits, improved efficiency, and a reduction in inventory as the year progressed.

On to Slide 5. In 2019, we delivered a robust trading performance across all the divisions. Civil Aerospace improved its underlying profit significantly with record engine deliveries, good aftermarket performance and improved OE unit losses. In Power Systems, we saw revenues increase despite some tough end markets, with growth in power generation and market share gains in Asia. During the year, we also increased our services penetration, further capitalizing on more than 140,000 MTU engines that we have in use worldwide.

Defence performed well throughout the year despite a headwind from the adverse OE mix, another year with a very strong book-to-bill ratio meant another record order intake in Defence of GBP 5.3 billion. Alongside good operational performance, this produced a healthy cash flow.

2019 was a pivotal year for the resolution of our Trent 1000 engine durability challenges. We have made significant progress and have now achieved fixes for 8 out of the 9 issues. However, the engine's durability issues weighed heavily on 2019 in terms of financial cost of returning the fleet to the levels of service

that our customers expect and dealing with the unacceptable disruption that we've been causing them. As the year drew to a close, we carried out a detailed technical reevaluation of our progress on the final fix, a new high-pressure turbine blade for the Trent 1000 TEN. Based on this reevaluation and on our test activity, we reset the financial and operational expectations for the engine last November with a revised estimate of the final durability of the engine's high-pressure turbine blades. And this allowed us to provide certainty for our customers and greater clarity for investors. As a result of the Trent 1000 issues, and as announced in November, we recognized a net exceptional charge of the GBP 1.36 billion within our 2019 financial results, contributing to a reported loss of GBP 852 million for the year.

We're progressing well with the final new HP Turbine blade and have now started engine testing. Despite everything else that is currently happening, we continue to expect certification of this component in the first half of 2021. We've also now overhauled enough and spare engines and have spare engines such that once fitted, our aircraft on the ground reduces to about 10. And we remain on target to achieve single digits by the end of the second quarter of this year.

On to Slide 7. Our restructuring efforts gained momentum in 2019 with run rate cost savings of GBP 269 million, indirect headcount reduction followed the introduction of new processes, taking the cumulative net indirect headcount reduction to almost 3,000 of the 4,600 goal we set back in 2018 for 2020. I was very heartened by the performance and the behaviors that I saw within the business, particularly in the second half of last year. And that gave me increased confidence coming into 2020 that the changes we've been implementing over the past 2 years are indeed creating a tangible and sustainable cultural performance shift within our business.

Strategically, we've bolstered our ambitions to be a leader in low-carbon technologies during 2019. We acquired eAircraft, the electric and hybrid electric aerospace propulsion activities of Siemens. And that added new products and a team of specialist electrical designers and engineers to our portfolio as well as a handful of design wins. Late last year, we also unveiled the plane which will seek to break the speed record for an all-electric aircraft as part of our ACCEL program. Power Systems is, of course, already well advanced in the provision of low-carbon energy, such as hybrid propulsion systems for applications, including trains and yachts. During 2019, we signed customer contracts and framework agreements for hybrid solutions for both those markets. We're increasingly taking our expertise in power generation and integrating it with power management systems, renewable energy sources and battery technology. This will create microgrids that can deliver cleaner decentralized energy. Since October, we've been operating our own micro grid at Friedrichshafen. And during 2019, we received the first customer orders.

Early in 2020, we further enhanced our capabilities in this area with the acquisition of a majority holding in power storage specialist, Qinous. We also completed the sale of Commercial Marine and agreed the sale of our North America Civil Nuclear business in 2019.

For those of you on the phone now, I'm moving on to Slide 9. And at the time of our full year results at the end of February, the impact of COVID-19 was still evident predominantly in China. And we said it was a macro risk to our business but took the decision to provide guidance excluding COVID for 2020. This would provide a benchmark for the year ahead, upon which investors could build their models before considering their own assumptions of the impact of the disease. Since then, as we all know, there is almost no part of the world that has not been impacted. And the scale of the measures being brought in by governments to slow the spread of the virus is unprecedented. By the time we reported our results, we had a detail of the impact on flying hours into and out of and within China.

In March, however, we started to see flight restrictions being implemented in many more countries. And come April, airlines were grounding large proportions of their fleets. As a result, in early April, we withdrew our financial guidance for 2020. Due to the unprecedented reduction in air traffic caused by COVID, we're anticipating a significant net cash outflow during the second quarter, and it remains too early to guide on the likely outcome for the full year.

Slide 10. In terms of the impact seen so far, Civil Aerospace widebody engine-flying hours were approximately 40% lower in the first 4 months of the year. This reflected a fall of 90% in April as airlines right around the world have temporarily grounded large proportions of their fleets. As a result of this lower level of activity, we're now enacting a significant reduction in the volume of service visits in our

maintenance, repair and overhaul shops compared with our original plans. And consequently, now we expect MRO volumes in 2020 to be moderately below 2019 levels. Additionally, our airframer customers have reduced aircraft production rates. And as a result, we now expect to deliver about 250 engines in 2020, down from our previous guidance of 450 announced in February.

During this time, we do derive strength from the diversity of our business units, with almost half our sales coming from non-Civil Aerospace place end markets. Our Defence business continues to perform robustly. However, the impact of social distancing and elevated absence levels is presenting some operational challenges, particularly for some of our suppliers. We're closely monitoring our supply chain. We're taking actions, where possible, to mitigate the impact on our own productivity. Since our trading update in April, Power Systems has experienced a deterioration in demand due to the impact of COVID-19 on economic activity in our end markets. And in particular, we've seen our industrial end markets heavily impacted, especially mining and oil and gas. Service activity is also lower and several yacht production facilities have temporarily closed. Delays to construction projects has affected PowerGen demand also. However, as we look ahead, we anticipate a trend for higher data traffic to result in increased demand for mission-critical backup power for data centers. As a result, Power Systems' financial performance for 2020 is likely to be materially lower than it was in 2019, although we do still expect it to contribute positively to group profit and cash flows for the full year.

Slide 19 for -- Slide 11, sorry, for those of you on the phone. Throughout this outbreak, our top priority has been to do everything we can do to safeguard the lives and livelihoods of our people and to play our part in helping our customers, partners and communities. Proactive measures remain in place at all our facilities to help keep our people safe and minimize operational disruption, and they're aligned with local and national guidelines. These include remote working practices alongside workplace measures such as social distancing, enhanced hygiene procedures and modified shift patterns in our manufacturing facilities. This enables us to continue to serve our customers in these difficult times.

We're supporting our communities with whatever practical help we can offer. In the U.K., we're very proud to be a member of the VentilatorChallengeUK consortium, which is producing additional ventilators for the NHS. Our role is to lead the development and execution of a parallel supply chain to feed assembly lines for the Smiths paraPAC300 ventilator. In a little more than 1 month, we've established a new supply chain to deliver over 3.5 million parts with a team that includes project managers, manufacturing engineers, buyers, quality controllers, who've worked right around the clock. These parts are being delivered to production lines in the U.K. who are ramping up production of ventilators and will soon be producing at least 1,500 units a week.

Across Rolls-Royce, teams are using their skills in manufacturing techniques, including things like 3D printing to produce personal protective equipment, including over 10,000 face shields to help protect the local health care staff. One team in the U.K., working with medics and engineers at the technology manufacturing center, developed, tested and put into operation a shield to protect frontline staff from frequent exposure to aerosolized COVID-19, all in just 1 week. And these fast-make prototype activities were supported with funding from Innovate UK.

As a leading promoter of science, technology, engineering and mathematics, or STEM, activities designed to inspire the future generation, we are also playing our part in helping the many people who need to keep children excited and learning during these trying times. We've made a wide range of materials available on our website. These include things like lesson plans linked to the U.K.'s national curriculum on flight, electricity, recycling and green energy. These materials all use our all-electric ACCEL aircraft program as their starting point. We also have indoor learning activities available through our partnership with the Scout Association. Just last week, we published content from our digital academy offering our world-class digital training program to help people and businesses around the world learn new digital skills. Of course, it's available on our website range from bite-sized, hour-long sessions to fully certify training programs. Our R2 Data Labs team, meanwhile, has assembled a group of leading companies to collaborate on the Emergent Alliance. A selection of data analytics experts will combine traditional economic, business, travel and retail data sets with behavior and sentiment data and so as to provide insights that will support the global recovery from the pandemic.

Turning now to Slide 12. COVID-19 has caused significant disruption to the global aerospace industry with an unprecedented reduction in air traffic. And in order to mitigate the impact on our 2020 financial performance, we immediately implemented a number of contingency measures. In response to the change in outlook resulting from the global spread of COVID-19 and to ensure cash headroom in the event of a prolonged reduction in trading activity, we took a precautionary decision in March to draw fully on our GBP 2.5 billion revolving credit facility. An additional revolving credit facility of GBP 1.5 billion was also secured in April to bolster the group's liquidity position. This has now been increased to GBP 1.9 billion following the completion of discussions with a larger group of banks.

Notwithstanding our financial and liquidity position, as Ian said earlier, the Board decided that in the light of uncertain macro outlook, it would no longer recommend a final shareholder payment of 7.1p per share in respect to 2019. Now I understand this will be a disappointment to many of you, but it is the prudent thing to do. We've made better-than-anticipated progress with our self-help specific mitigation activities to further reduce our cash expenditure. We now expect to generate a cash flow benefit of up to GBP 1 billion this year. We're achieving this by minimizing discretionary costs, such as noncritical capital and expense capital projects, consulting and professional fees, ceasing all nonessential travel and postponing external recruitment. We've also introduced reduced working hours and removed overtime. We're reducing salary costs across our global workforce by 10% this year, subject to local legal requirements. Our senior managers, including the executive team, have taken an additional 10% pay cut. There has also been a corresponding reduction in fees for Nonexecutive Directors of the Board.

We've taken a number of immediate actions to adapt to the current market conditions, and we've reduced volume expectations, both original equipment production and maintenance, repair and overhaul activity. These include working with our supply chain to reduce direct procurement as well as placing over 4,000 of our own employees in the U.K. on furlough. We've pledged to ensure that they receive no less than 80% of their salary. And we will make up any difference beyond the government caps.

Looking ahead, the severity of the disruption caused by COVID is expected to lead to a smaller commercial aerospace market, which may take several years to recover. And as a result, we're actively pursuing changes to our business, particularly in Civil Aerospace, to better align to the medium-term market conditions. We're committed to working with our trade union and the employee representatives as well as our customers and suppliers as we adjust to the new outlook and establish a more appropriate cost base in order to secure our future for all stakeholders. We've promised to give our people further details of the impact of the current situation, on the size of our workforce before the end of the month, and we'll consult with affected employees in due course.

Finally, on Slide 13 now. Our strategic choices over the last few years, including streamlining our portfolio, investing in our management systems and building a culture of agility have helped us to respond quickly to COVID with the actions to mitigate the immediate impact. There's a lot of speculation about the exact shape of this recovery from the pandemic. And obviously, we've worked through a number of scenarios, but I firmly believe that flying is a societal good and will be one of the drivers of any global economic recovery. And once that recovery begins, the shape of our portfolio, the synergies between our different divisions will leave us well placed to capitalize on the long-term potential of our markets.

I firmly believe that the world on the other side of this pandemic will be even more focused on the provision of lower carbon, more sustainable power. And this plays very well to our strengths and our strategy. The transition to low-carbon power was always going to be an opportunity that we could seize through increasingly efficient engines and our world-class innovation, becoming a disruptor in new markets. Now those opportunities may come even sooner than we originally anticipated. We must, and we will emerge from this period ready to pioneer the power that matters.

Thank you. I'll now hand back to Ian.

Ian Edward Lamert Davis
Independent Chairman

Well, thanks, Warren. Traditionally, at this point, I would ask the questions from the floor. But this time, we requested that shareholders send us their questions in advance. And thank you to those of you that did.

I'll now read out those questions for the benefits of everyone watching and listening in, and Warren or I will address them. The first question is from Mr. [Ablaster]. It is, the current severe decline in civil aircraft utilization helps emphasize the importance of the B-52 reengineering program for the U.S. Air Force. Mr. East mentions this in his strategic report review on Page 8 of the annual report. Does he yet have any further news on this very important opportunity for the group? Warren?

Question and Answer

D. Warren A. East*CEO & Executive Director*

Yes, of course. So the U.S. Air Force is continuing to progress the reengineering of its fleet of B-52s with a new in-production commercial off-the-shelf engine. And we anticipate that a request for proposal will be issued very shortly in the coming weeks and a selection decision made by early 2021. And we will compete with our F130 engine, a variant of the commercial BR725 engine. Should we win, we will manufacture, assemble and test the F130 engines in our newly modernized facilities at Indianapolis. We consider the F130 to be a perfect fit for B-52. It's the right size, the right thrust and fuel efficiency, and it's a modern design with high reliability and a proven service record. Thanks, Ian.

Ian Edward Lamert Davis*Independent Chairman*

The next question is from Mr. [Neil,] who ask, to what extent does the Adour T-45, powering the Goshawk U.S. Navy pilot training aircraft figure in the company's accounts today?

In the 1970s to 1980s, I worked on the T-45 program in Darby, Bristol and Long Beach, ending up as Project Program Manager. I believe that T-45 is still going strong and contributing to Rolls-Royce's income, is this so?

D. Warren A. East*CEO & Executive Director*

Firstly, I'd like to thank you, Mr. [Neil,] and all your colleagues for the work put into the program. The enduring returns that we see from military programs over an extended period of time are one of the core characteristics of our Defence business. We continue to service and support the Adour engines, known as the F405 in the U.S., that power the U.S. Navy T-45 training fleet based at 2 military training sites in the Southern U.S., and this does indeed continue to provide us with a steady flow of service revenue into our Defence business. So thank you again.

Ian Edward Lamert Davis*Independent Chairman*

Turning to a question from Mr. Atkinson. When UltraFan engine goes into service, do you anticipate that it will be a niche product? Or will it have such a wide application that it will threaten the continued existence of other manufacturers? Again, Warren.

D. Warren A. East*CEO & Executive Director*

Yes, of course. UltraFan, as many of you know, is a demonstrator program for a whole suite of new technologies. It's not simply one single new engine. Those individual technologies will give us competitive advantages as well as options. Exactly how we use them and when we use them is not something, for obvious competitive reasons, that I'm going to talk about today. I'd also add that UltraFan is an important step towards lower carbon power. The architecture behind it is even more efficient than the Trent XWB, which, as I'm sure many of you know, is the world's most efficient, civil, large gas turbine engine in service today. Thank you.

Ian Edward Lamert Davis*Independent Chairman*

I have 3 questions from Hermes Investment Management. The first is when will Rolls-Royce publish company-specific metrics and targets for its key product areas that reflect the longer-term ambition for its role in the low-carbon transition and against which stakeholders can evaluate progress and impact? Warren, you want to take this one?

D. Warren A. East*CEO & Executive Director*

Sure. As part of our broader review of our sustainability strategy, we're reviewing sustainability targets this year with a particular view to replace those which expire at the end of 2020. We're proud to already have a leading target to reach net 0 emissions from our own operations and facilities by 2030. We're also committed to playing a leading role in enabling the vital sectors in which we operate to get to net 0 emissions by 2050. One of our key tasks is to articulate more clearly what this means, what the potential pathway, where we will -- the potential pathway that we'll take to reach net 0 emissions by 2050, including considering potential future targets. And we will provide more on this when we've completed the work.

Ian Edward Lamert Davis*Independent Chairman*

The second question is, will the company commit to advance climate disclosures over the next 2 reporting cycles with the aim that by 2022, it achieves material alignment with the intention of the TCFD and as per the 5-year implementation aim of the task force's recommendations. Warren?

D. Warren A. East*CEO & Executive Director*

Yes. We've taken steps to enhance our climate-related reporting over the past few years and to bring it in line with TCFD recommendations. This includes strengthening our related governance, including climate scenarios into our strategic planning processes and reviewing our treatment of climate-related risk. A further step in strengthening our reporting will be the consideration of product-related climate targets in relation to the above. Thank you for that question.

Ian Edward Lamert Davis*Independent Chairman*

Thanks, Warren. And I'd like to add a comment that it is reassuring to see that the desire for demonstrable action on climate change remains high on the agenda despite the immediate pressures of COVID-19 today. I was pleased to receive the statement from Hermes accompanying these questions submitted on behalf of the Climate Action 100+ investor coalition. This recognized the continued commitment Rolls-Royce has demonstrated in building the company's position and the school of thought on the necessary transition to a low-carbon economy. This is a topic I believe to be of the utmost importance.

And so the last of 3 questions from Hermes is, will the Remuneration Committee seek to include a climate metric or metrics in the variable pay plans of executive team. If so, what would the metrics be? And by when would the committee seek for these to be included?

Let me answer this one. The remuneration policy is being left deliberately open for the addition of further targets, with a particular expectation that we may introduce ESG-related targets in the future, particularly ones related to climate, in line with the sustainability review mentioned earlier.

Our next question is from Ms. [Nazari.] What is the time line on which the company is planning to convert all its aircraft into all-electric aircraft, given that a similar situation to the COVID-19 pandemic is bound to happen again if we do not take action quickly enough regarding the climate crisis. Warren, would you like to take this?

D. Warren A. East*CEO & Executive Director*

Yes, of course. Despite the immediate pressures of the COVID-19 crisis, the climate emergency hasn't waned. And we remain committed to playing a leading role in enabling the vital sectors in which we operate to get to net 0 emissions by 2050. There's no doubt that this must be a core part of the post-COVID recovery of aviation, in particular, but there won't be one single solution that will get us there. We must have a combination of technologies, including further improving engine efficiency and other

measures such as the increased use of sustainable lower carbon fuels to achieve that. Electrification will play an important part, particularly in the smaller end of the market. And here we expect to attempt to break the world's speed record with a fully electric single seater plane this year, and we expect to introduce our first certified propulsion unit for 2- to 4-seater aircraft to the market by 2023, the technologies that we're developing for these smaller aircraft and then we scaled up and applied over time into larger aircraft, particularly regional. And at the larger end of the market, particularly for widebody long-haul flights, we don't yet see a viable technological pathway for fully electric flight. But we do anticipate there will be more electric planes, perhaps with some form of hybrid technology, but more likely using fuel sources that are not fossil fuel based. And these technologies will take time to bring to market and must be supported by the right policy environment that ensures that they really are sustainable and don't compromise product safety. We remain confident in our ultimate goals that aviation can be compatible with a net 0 carbon future by 2050. Thank you for that question.

Ian Edward Lamert Davis

Independent Chairman

Now to a question from Ms. [Brand] from CCLA Investment Management on behalf of the coalition of investors with assets under management of approximately GBP 2.2 trillion. While we fully appreciate the extraordinary pressures that you are under at present, we would urge you to address the threat posed by COVID-19 to the mental health of your workforce and the risk it poses to the overall sustainability of your business. We are encouraging businesses to develop a specific mental health action plan during COVID-19 for all your employees and would welcome hearing your approach.

Thank you for this question. I'll take this on myself. I think all of us have, to some extent, been feeling the strain that these unprecedented times. It's particularly hard to those while self isolating or spending an extensive amount of time within their homes and away from colleagues, friends and family. This is a very necessary precaution, but it does not make it any easier. Your Board is acutely aware of the impact of the virus on people's mental health. We've been regularly updating

[Audio Gap]

by management on the advice and resources being offered through internal communications to our people. We also have mechanisms in place, which enable us to keep in touch with our people on furlough. Ultimately, however, it is a job of all our managers to make sure they remain close to their teams, that they emphasize with those who are feeling anxious right now and that for one of a better phrase, they keep everyone's morale up. As just one example, I know Warren has been made a personal video every week to make sure he can connect with as many people as possible and provide as much reassurance as he can.

The next question is from Mr. Hamilton, who asks, in view of the fact that inequality is widely recognized as one of the greatest evils in the U.K., is it not time that the remuneration of directors and senior staff is substantially reduced?

Well, Mr. Hamilton, the remuneration committee maintains a very close watch on levels of executive pay in order to ensure that we can attract and retain the people that we need. You'll see on pages 14 and 15 of the annual report, the very clear links between our key performance indicators and remuneration. As you will also see in the report of the committee from Page 85, we've always taken a careful approach to executive reward. After the third year running, the committee has not proposed any changes in quantum for existing Executive Directors.

I'll return to this topic with the next question, which comes from Mr. [Shepherd], who asked, the company has recently said it is anticipating losing a lot of orders in the face of possible reduction in travel and, therefore, a reduction in the need for aircraft. As a consequence, it has been -- it has warned as likely to be redundancies. Presumably, the members of the Board will be reduced pro rata, and all of them will be very happy considering their need to receive the full amount of our remuneration expenses. Perhaps already, they are only taking 80% of their remuneration and expenses to show sympathy with those who have been furloughed.

Thank you for the question. As we said in the trading update in April, we have already reduced the salaries of our senior management, including the executive team by 20%. There's been a corresponding reduction in fees for Nonexecutive Directors.

The penultimate question comes from Mr. [Cunningham,] who says, you will not need me to tell you that the impact of COVID-19 on the airline industry is devastating. All areas will have to take their share of the pain. But what concerns me is that the capability of the company to design, develop and certificate a comprehensive large engine will be lost forever. It must already be diminished. It is this engineering competence that is only possessed by the 3 large aero engine companies. However, what concerns me is that there is no one on the Board who really understands how the commercial airline industry works. So I urge you to find somebody who can fulfill that role on the Board and not only listen to them, but be mindful that for the long term, engineering capability will be key to a successful future, not just technology.

Thank you for the question. Your Board is very mindful of understanding the needs of the airline industry, and we receive regular insights from the leadership within our Civil Aerospace business, which retains incredibly close size not only with the airframers, but within the airline industry as a whole. As to your broader point, we're also very mindful of the need to protect Rolls-Royce's ability to innovate. And the Board has extensive experience of engineering as well as technology and indeed as well in the aerospace sector as well, contrary to what you claim. Several of our members on the Board are chartered engineers. And together, we collectively have many decades of experience, perhaps more than some of us who care to admit, within companies engaged in high-value manufacturing, advanced engineering, safety critical technology as well as airlines. I believe your Board is very well-qualified and versed in both engineering and technology.

Last question comes from Mr. Barton. As it's been very impressive how skills and capabilities are being used to benefit society with ventilators, face masks and the like, given this ability to step up and do something different successfully in a crisis, what are your thoughts around repurposing some of our people and facilities currently involved in this civil aero work to enter a new line of business for Rolls-Royce in an area of post-COVID that will have a demand. Perhaps medical equipment or electrical power. This could be a temporary venture to bridge a slump in air travel. And if it proves really successful, it could be continued with also. Warren, do you want to take those on?

D. Warren A. East
CEO & Executive Director

Yes, with pleasure. Interestingly, a few weeks ago, I visited the team working in Darby to support our work on ventilators. And obviously, I was maintaining the appropriate social distance, but I was particularly impressed by the entrepreneurial spirit shown by the team. It's very unlikely that on the other side of the pandemic, Rolls-Royce will be going into the medical devices business. However, the behaviors that I saw on display, the agile way in which the people were problem-solving and the collaboration with multiple teams are exactly what we've been driving for across the company and are exactly what will help us get through this challenging period.

This isn't a crisis of our making, but it's a crisis that we do face, and I've been very impressed with the way that colleagues across the group are tackling it. In reality, it's almost certainly the darkest hour for our whole company since the 1970s. Thanks to much hard work from all of our people, including some of the difficult changes we've made over the last few years, we are a much stronger company today than we were then.

COVID-19 pandemic has shown that we derive strength from the diversity of our group. Rolls-Royce stands upon 3 legs, not just one. Our Defence and Power Systems businesses have always had close links with our Civil Aerospace business. Defence has benefited from civil's work in gas turbines and has civil products in use with defence customers, such as the MT30 naval gas turbine engine. Power Systems has learned a lot from civil about data collection and creating aftermarket services. And civil and defence have both been able to learn from Power Systems' experience in hybrid electrical systems. Power Systems has hybrid electrical products in service with customers right now and is learning valuable lessons that can be drawn upon that from -- for the rest of the group.

On the other side of this pandemic, the world will have the need for vital power that we produce. And I firmly believe that the call for that vital power to be lower carbon will be strong. And this plays to our strengths and strategy. And we've emerged from troubled times before to achieve incredible things, and we will definitely do so again. Thank you.

Ian Edward Lamert Davis

Independent Chairman

Thanks, Warren. There are no more questions to address. So I'd like to draw this meeting to a close. Thank you all for joining us today. All of us on your Board are sorry that we've not been able to meet in person as we usually do at this time of year. As I said earlier, as the situation becomes clearer over the coming months, we will explore ways in which we can offer you an opportunity to engage in person with us, perhaps in the autumn. In the meantime, thank you for your continued support and stay safe in these unprecedented times.

Presentation

Peter Lapthorn; Investor Relations Manager

Hey, good morning, everyone, and thank you for joining us here at the London Stock Exchange, and for those of you joining online. My name is Peter Lapthorn. I work in the Investor Relations team here at Rolls-Royce, and it's my pleasure to welcome you to our 2019 results.

The agenda for today's presentation is that our CEO, Warren East, will give an overview of the year's performance and some of the strategic highlights. And then our CFO, Stephen Daintith, will take you through some of the more detailed financials. Warren will then wrap up and give his view for the year ahead as well as the longer-term outlook.

Our presentation is expected to take around 50 minutes, and then we'll have time for Q&A, both from the audience and here online -- and online. You can do online questions through the webcast services.

Finally, can I ask you to switch off mobile phones? We are not expecting any drills today. So if you do hear an alarm, please exit in an orderly manner.

I think that's all of the safe harbor and the boring stuff out of the way. So with that, I will hand over to Warren East.

D. Warren A. East *CEO & Executive Director*

Thank you, Peter. Good morning, everybody. Thank you for coming along. I hope you enjoyed the video rolling while you're having coffee and pastries out there, a little bit of subliminal messaging. And the picture of the electric plane on the front cover of the little handouts we've got there, we're just 1 quarter away from flying that now. So some exciting highlights to come in the year ahead. But before we get there, I'm going to talk about 2019 to start with.

So here's a summary, and we're very pleased that we ended up with very strong progress across the group. We ended up with a strong finish to the year. It was a tough first half in 2019, but we saw very encouraging behavior changes around the group. And we could really see the effects of the transformation that has been ongoing within the company in some of the behaviors, which were necessary to drive that performance into the end of the year. So very pleasing to have an underlying operating profit strongly up, and that is really what's underpinning the quality of that cash flow number that's delivered as well. We have as a Board held payments to shareholders. There are some environmental risks out there, which I'll be talking about in a little while. But in summary, a strong set of results.

Because 2019 was a year of delivery. In 2019, we delivered strong trading performance. We delivered significant progress on the Trent 1000. Trent 1000 has dominated a lot of the conversation about Rolls-Royce for the last 18 months. But actually, underneath that, and I'll show you a slide in a few moments, we've had some excellent progress on that. Restructuring has been going on for a little while. But again, we've continued with the progress on that. We've continued with delivering on portfolio simplification, and we've delivered on our forward-looking strategy to capitalize on the upcoming energy transition and the journey to low carbon for the world at large. I'm very pleased with the momentum that we established, particularly in the second half of the year, particularly in Q4, particularly around the behaviors of our people. And that momentum has carried forward into 2020, and that underpins our confidence in 2020.

Stepping back and looking at the market environments, I'm just going to go around the 3 key areas of our business. So in civil aerospace, which is half of our business, we continue to build our installed base. It's now over 5,000 large wide-body engines. Passenger air traffic demand has settled back to a steady state rate. We have had a few years of some quite superior growth, but it is, in 2019, more of a steady state, long-term trend. Build rates from airframers were adjusted during 2019, and as a consequence, our forward-looking projections of build rates for large wide-body engines has changed. In some ways, I think this build rate adjustment from the airframers has alleviated somewhat the concerns which were growing

in the industry about oversupply. And so that's actually quite a positive thing from a market environment point of view, and of course, it's led by what's effectively been slower-than-anticipated retirements over recent years of older aircraft. And I've got a little picture later showing pictures about retirements and so on.

In our Power Systems business and the sector there, we have had a cyclical downturn in the markets served by our Power Systems business, particularly following a pull forward a year or so ago from some of the traditional markets. However, from our point of view, we've seen encouraging growth opportunities in new applications and new geographic regions.

Defence, in our Defence business, after several years of pause, we're now seeing new programs coming through from the key Defence customers, particularly the U.S. Department of Defense and here in Europe with the U.K. Ministry of Defence as well. And so the new programs are getting closer in the Defence environment.

Down at the bottom of the slide here, we're on our journey towards 0 net carbon. And across all of our markets, our customers, we found in 2019, getting much, much more receptive to our thoughts on this. And we're pleased to have, I think, established in 2019 a position of thought leadership.

Before I go into detail of the business, I'll just build on that last point. Thought leadership in terms of leading a trend within our industry towards 0 carbon, taking the responsibility that we need to take for this, and that's in products that face up to the market. It's in the underlying technologies which feed those products, where we've seen great acceleration in our capabilities around electrification, for instance. We've seen progress on nuclear reactors with small modular nuclear reactors, a great source of 0 carbon electrical power. And we've seen a lot more industry engagement in the reality that the world needs to solve the synthetic, sustainable fuel challenge ahead.

Little bit of practicing what we preach on the bottom of the slide here for our own operations. This is a picture of our site in Friedrichshafen, where we have installed a microgrid. We're starting to sell microgrids, but we've installed our own microgrid, and this solar-powered microgrid is generating about 30% of the energy requirements for our plant in Friedrichshafen. Enough of the future for the time being.

I'll now have a quick update on what's been going on in the business. So in our Civil Aerospace business, we've seen a year of sustaining improvement in underlying operating profit. If you look, that's been happening over the last several years, and 2019 was no exception, a significant increase in underlying operating profit in our Civil business driven by the usual drivers that we've been tracking for the last several years. Customer confidence is pretty good as well. So from a forward-looking point of view, from orders coming in through the door, approximately nearly, they're [using] 2/3 of widebody new orders in 2019 coming to Rolls-Royce. From an operational point of view, our operations are getting into much better shape. We're improving performance there, improving stability, improving cycle times, and generally improving performance. It's not just about our wide-body engines in civil aerospace. We do have some exciting programs in business aviation as well. And in 2018, we launched the Pearl family of engines. The first Pearl family engine entered into service in 2019, and the second Pearl family engine was launched in 2019. That's going to power the new Gulfstream aircraft.

In Power Systems, I mentioned from a market point of view, there's a bit of a downturn in the sector served by our Power Systems business. And so we were encouraged to be able to grow our business into that environment, grow our business at the top line and grow the profitability of our business. And how do we do that? Well, we did that through targeting new applications, the newer applications, particularly strong in mission-critical power, backup power, and also by pushing hard on developing our business in what's new geographic regions for us and particularly in China. And it was great on some of the new technologies as well, to see progress on things like microgrids and hybrids. And that hybrid, I'll probably come back to a bit later in the presentation. But in the space of 2.5 years, we've gone from concept to proposal to MOU to order to, in the next several months, delivery of Hybrid Rail PowerPacks. So very solid progress from our Power Systems business.

Defence. Defence, the standouts for 2019 in Defence was about orders, another year of record book-to-bill, taking our order book to a record level as well. And it was another good year for delivery of cash. In

the background, I mentioned we're getting closer to those new programs. So actually, our R&D is going up a bit. So you will see the margins coming off a bit over the next couple of years in Defence, but we're capping off a period of 4 to 5 years of building the order book. And over the last 5 years, book-to-bill has been above 1x. And so our future in Defence, particularly driven by some of the service contracts, is in -- looking like very good shape.

Now I know that everybody wants to hear a bit more about Civil than they do about Defence and Power Systems, so we're going to have a couple of deep dives on Civil. I can't stand here and not talk about Trent 1000. Obviously, we did a little bit of an update in November. And in the results announcement this morning, you will see no change from what we announced in December. No change in terms of projected return of AOGs to single digits, no change in exceptional costs and so on.

During the year, we made some pretty good progress, good progress in actively managing the situation, continuing to extend our MRO capability and our MRO capacity. And we are confident that, that GBP 578 million of cash cost in 2019 is the peak year of cash costs for Trent 1000. So we are beyond that peak. As we look forward in 2020 to single-digit position around the midyear, then we'll be underpinning that with more spare engines as we announced in November.

On the histogram here on the bottom of the chart is about just that reduction in aircraft on ground. And you'll see in 2019, we had to take a step back, and we took a step back proactively by -- because we needed to pull forward a replacement of intermediate pressure turbine blades on one of the variants of the engine. And having originally generated indigestion in our MRO network and having been eating off some of the indigestion, we then generated [the load] more and so pushed the AOGs down again, and that effectively pushed out the period when we'd get back to single digits. But there has been no further deterioration on that since we announced that in Q4 last year, so we're currently sitting around the mid-30s in terms of disruption.

This slide is an update of the slide that we showed in November, which summarizes the 3 engine [marks] for Trent 1000 and the 3 key issues, and we are now in a position of 8 out of 9 of the design changes are done. We've got one there, the Pack B IP compressor waiting to be certified. There's no change to that design. We're totally confident that, that will get certified. It's simply a question of priorities in terms of the fact that that's the last one. Other than the final box over there, where, as we said in November, the design work for the high-pressure turbine blade on the TEN, that's still underway. As I stand here this morning, I'm a lot more confident than I was last November about that design work. It's progressing well. And in the coming weeks, we will be running an engine with that new design. We'll be going to type test, and hopefully, then on to certification.

The chart has been updated, though with these little pies to show that it isn't just about doing the designs, it's about rolling those designs into the fleet. That's what minimizes the disruption and ensures a healthy fleet. And the pies on the left in each box, a snapshot of where we were 12 months ago, and the pies on the right in each box represent where we are today in terms of rolling those fixes into the fleet. So I hope you get a sense of momentum here of how the fleet is getting healthier as we go.

So moving on, it isn't all about Trent 1000. Trent XWB has now reached 5 years in service. And the leading engines are surpassing our expectations in terms of durability, in terms of performance. It's our most reliable engine, and its efficiency holds up very well in service. So the airlines love it. And actually, the customers love flying on the airplane as well. The 350 is a great airplane.

Points on the XWB. It's today just over 10% of our installed fleet, but it's approximately half of our wide-body deliveries. And it's on a journey to be around 1/3 of our fleet in the mid-term. So this is a very important engine for us. So it's very important that it has an outstanding record of performance.

There are other programs as well. I've already talked about the Trent 1000. Trent 700 is still our largest volume. It's 1/3 of our fleet nearly. It's the major workhorse of the Trent fleet. We've seen great progress over the years in extending the time on wing for the Trent 700, and so it's a little bit of a benchmark and barometer for the newer engines that are coming along behind. And it's an auspicious day today because it's 25 years to the day that the first Trent engine went into service. It was a Trent 700 25 years ago on the 28th of February, and it's still going strong after 25 years.

At the newer end of the spectrum, Trent 7000, and we put this up because the Trent 700 powers the A330, the Trent 7000 powers the A30 -- A330neo. And we're putting all the lessons we've learned from the Trent 1000 into that engine. It is based on the same architecture as the Trent 1000 TEN. But putting all the lessons in, then we are confident in the performance of that engine.

Looking a little bit further forward at our installed base because it's the size of our installed base that underpins the medium-term business confidence. And the size of our installed base is about new airplanes going in, it's about older airplanes retiring. And this chart shows that actually, if you look at the older airplanes that are going to retire, i.e., the ones on the left-hand side of the slide at the bottom, it's dominated by our competitors. And at the right-hand side of the slide, the present day, you see our market share. And you recall, our market share in terms of orders, approximately 2/3 of the orders in the last 12 months, for instance. So we think we are well positioned through this retirement cycle that is going to be coming up over the next several years, well positioned to continue to grow our market share, and that underpins the installed base.

Enough of deep dive on civil. By the way, the clock in the bottom -- in the back of the room, guys, has stopped working at 9:07. So I've just realized that it's actually 20 past 9. So sorry about that. We're now going to move on to -- I thought, blimey, it's going slowly. Change and transformation. Change and transformation is at the heart of creating a higher performance business, which is capable of delivering quality results. And over the last 18 months or so, we've seen great change in the management. We've seen change in pace. We've seen change in process and the development of a forward-looking strategy. So we now have a very different business than we had a few years ago to face the challenges that are around today.

Just recapping some of what we talked about on the Capital Markets Day in 2018. We talked about simplifying our organization structure, streamlining processes and investing in automation to enable our people. So during '18, we sorted out the structure. During '19, we made great strides in terms of reducing process, removing duplication and installing automation to enable our people. And that's carrying on in 2020. So A&M are continuing to help us to actually deliver the benefits of this transformation. But basically, we are on track for what we set out at the Capital Markets Day, delivering what we said we were going to deliver, and that's measured in some ways by achieving run rate savings. And if I look, for instance, some specifics, product change process and end-to-end digital design, that sort of reduction in engineering hours, that sort of improvement in productivity is baked into our plans. And that frees up resource to concentrate on the future. And I talked about improvements in our operations earlier. There's a focus area there, and I think other good indications are the change in trajectory of that inventory that we saw halfway through the year, demonstrating a sharpening up in our operations. And in our service business, we've had to grow our MRO capacity. But the good news is we're growing our MRO capacity faster than our investment in MRO because we're getting better and smarter at doing it.

So improved productivity across all these 3 areas, and these are the fundamental 3 areas that make our business tick, we're either developing this stuff or we're building this stuff or we're looking after it when it's in service. And why are we doing all that? Well, we're doing it to position our business for the future. At the Capital Markets Day, we talked about bending the cost curve, and this is a focus on R&D, for instance, but bending the cost curve, reducing the cost as a percentage of sales. So in the R&D domain, that means effectively keeping our R&D flat as the sales grows. And within that fixed envelope, you can see here how we're tilting the amount of money spent towards future-looking technologies. So that's why we're doing this transformation so that we can position the business -- we can deliver the business performance and position ourselves for the future.

So with that, I'm going to hand over to Stephen to talk about our 2019 numbers in a bit more depth.

Stephen Wayne Daintith

CFO & Executive Director

Thank you, Warren. Good morning, everybody. So I'm going to take you through the full year results, give an update on the key drivers that we first highlighted back in the middle of 2018 at our Capital Markets Day, then we'll go through a quick review of each business, and then we'll go into guidance for 2020. So just running through these.

So at a glance. We gave ourselves a lot to do in the second half, but with the -- we're pleased to be reporting today a strong underlying operating profit growth of 25%. And what's most encouraging about this, this is the core driver of the growth in our free cash flow, and we'll see that again in 2020.

Moving on to free cash flow, GBP 911 million. So driven by that growth in profits. And especially strong performance in the Civil Aerospace aftermarket. We're going to see shortly the Civil aftermarket cash margin and how that's developed over the last couple of years. We also received, very late in the year, some insurance receipts in respect of insurance that we had in respect of grounding of our wide-body engine fleet, and we could claim against that on the Trent 1000. At the -- we have been negotiating these for well over 12 months, this particular insurance arrangement. And we reached the conclusion of those negotiations towards the end of the year. And hence, the receipts, which arrived in right at the very end of the year as well. So at the halfway through the year, limited visibility around that and not much certainty.

Civil Aerospace. We saw a strong improvement in operating profit in Civil Aerospace as well. It's the first time that we've seen profit in Civil under IFRS 15. As a reminder, that came in at the start of 2018, we no longer capitalize the losses on the OE sales. And so very encouraged to move to operating profit in civil aerospace.

And finally, gross debt reduction. We reduced our gross debt by GBP 1.1 billion. Reporting today a net cash position, this improved to GBP 1.4 billion. An important priority for us. We'll come into the details a little later, to strengthen our balance sheet and return to a single A rating.

Let's go to the revenue slide. Revenue business by business. Our delivery in 2019 was in line or better than guidance for every business. I won't go through the exact numbers, but you can see there in the blue just to the right of center, what we guided a year ago. And then the middle there, the growth for each business. Really solid growth in Civil Aerospace, 10% growth driven by both OE and aftermarket. Strong growth in Power Systems, and we'll go into the detail, in a challenging market. Defence growth, in line with guidance. And good growth in ITP, which we'll go through shortly when we go through the business reviews, but largely driven by increase in Civil Aerospace volumes.

Moving on to profit, and there's the profit profile for each business in 2019. And again, margin guidance that we gave a year ago met or exceeded in every business. A relatively modest margin in Civil Aerospace, but moving into profitability. Power Systems back into double-digit territory. Defence, increased investments in R&D, as Warren mentioned, causing that drag. And ITP, good improvements in margin in ITP, largely around our simplifying of the contractual relationship between ITP and Civil Aerospace, with ITP very much now as a full-fledged member of the group and very much a traditional parts supplier to Rolls-Royce. And we simplified those contracts there. So good performance in operating profit and a strong performance in particular into the year-end, especially in Power Systems that delivered on much of the projects that have been built up during the course of 2019.

Moving on to free cash flow. So we had a strong end to 2019 following a challenging first half, and just 3 or 4 items here to just call out that helped us deliver this good free cash flow. Inventory reduction. We'll go through the detail very shortly, but a very significant inventory reduction in the final quarter. Disciplined spend control as well. You'll see that today we're reporting C&A costs down 4% year-on-year. That was another good achievement, largely around discipline around discretionary spend. Capital expenditure was also down year-on-year, and good discipline there as well, but driven largely by some large projects coming to their conclusion during the course of the year, and I'll go through that detail. And as I just mentioned, the Trent 1000, we secured those insurance receipts. What's not included in this list is a strong Civil aftermarket performance as well in the second half, and we'll see that when we go into the details of the long-term contract creditor and how that moved year-on-year. We also saw in our cash flow an improved quality as well. There's a materially lower contribution from net receivables/payables, still a large contribution, but materially lower than last year, and I'll talk about that in a second.

Cash return on invested capital was stable at 12% and that's despite our R&D investment being at the highest levels of cash spend of GBP 1.1 billion per annum. And the chart down the bottom shows a material free cash flow improvement from the low base of 2016 when we were generating just GBP 100 million of free cash flow. So bear that GBP 800 million improvement in mind, which I'm going to come to as we go through the cash drivers of performance that we first highlighted in the middle of 2018.

So when we look at those drivers of cash flow, and we break them down, looking at our summary funds flow statement, looking at the balance sheet movements, tying that in with operating profit, here is the composition of our free cash flow improvement of GBP 305 million. And what's most encouraging is that GBP 507 million of that was driven by operational cash flow improvement: increased operating profit; the growth in the Civil deferred revenue balance, that long-term service agreement creditor on the balance sheet represents deferred revenue cash receipts that haven't been traded through the P&L account; and then lower CapEx as certain large projects have come to a conclusion. R&D cash spend is stable, so it's not through any reduction in R&D that these numbers are being delivered.

A lower working capital contribution of GBP 50 million is a headwind. And the peak year for the Trent 1000 costs of GBP 152 million is also a headwind, and that includes the insurance receipts as well. So you put all that together, you get to your GBP 305 million. And it's color-coded there, which matches this next table, which goes through the summary funds flow statement itself to show you how we've allocated the individual lines to deliver those numbers. So that's how the maths all works.

Working capital improvements. Now just on this one as well because it does attract a lot of attention, and often it's regarded as always bad, which is far from the case. First of all, in the second half, we saw a GBP 390 million reduction in inventory. That was the task that we had ahead of us at the half year after that big build of inventory in the first half of the year. Civil Aerospace and Power Systems had particularly strong fourth quarters. There's been a tight focus on supply chain management that will continue through 2020. The buffer inventory that we built up on the Series 1600 in Power Systems, as that production moves to India, that will start to unwind. The sales and operations planning process in Civil Aerospace. I think I've mentioned previously, a lot of room for improvement there. We're starting to see the signs of improvement, it's taking place more regularly with a smaller number of people perversely working a lot better than all the various committees that often cause complications there, but that's a lot more efficient as well, and that's helping drive that inventory improvement. We expect to see the vast majority of working capital contribution in 2020 from further inventory reductions.

We have just over GBP 4 billion of inventory on our balance sheet, about half of that is in finished goods, which ought to flow through quite quickly. There was a GBP 574 million increase in net receivables and payables. Our Defence business had a very good year for cash flow generation, driven by that strong order book intake of just over GBP 5 billion and GBP 200 million contribution towards that GBP 574 million. And then another example here of what I regard as good working capital management, a more disciplined collection of overdue debts, reducing those from 20% to 15% of trade debtors. And driving that GBP 130 million contribution. So don't be surprised that there's more of this in future years. There should be. This is good, healthy discipline. And these are what I would regard as durable working capital improvements.

So putting this together, we have a significantly improved cash position at the year-end. We have year-end net cash of GBP 1.4 billion. That's led by that group free cash flow number of GBP 873 million. Of course, we received the Commercial Marine and Power Development proceeds in aggregate of GBP 453 million. There was a GBP 1.1 billion reduction in gross debt as we repaid the GBP 500 million bond and then the EIB loan as well. We have one maturity in 2020 of \$500 million bond in the second half of the year, and we'll consider whether to refinance or retire that bond in due course. That gives us, together with the cash that we have in our revolving facility of GBP 2.5 billion, that gives us almost GBP 7 billion of liquidity. We do, though, have a credit rating challenge right now, given where we are, and we have a strong ambition to return to a single A rating. We highlighted this as a strategic priority for us in 2018, and it remains, and we are very much determined and focused to get back to that rating. It will be around operational delivery and delivering the Trent 1000 fixes and demonstrating that we've retired that risk.

So the progress on the key levers. These are the 3 key levers of cash flow growth that we first highlighted in 2018 at our Capital Markets Day, and they remain as true today as they were then, and they will be for the next 5 years as well. So what are they? First of all, reducing the loss on our OE wide-body deliveries. There was a further improvement in the year of around GBP 200,000 per engine in the reduction of the loss. The XWB-84 leads the average loss reduction. There's been a GBP 400,000 improvement per engine since 2017, which was the base year that we're comparing against from when we first unveiled these drivers in 2018. So let's just use 500 engines, GBP 400,000 improvement per engine, that's around a GBP 200 million improvement from this particular initiative.

The wide-body aftermarket cash margin delivered a further GBP 300 million improvement, moving from GBP 1.6 billion to GBP 1.9 billion aftermarket cash margin. That's a GBP 500 million increase since the -- over the 2017 base. It's worth reminding ourselves as well that in 2018, our 2022 goal for the aftermarket cash margin was GBP 2 billion. And we're already at GBP 1.9 billion. This should grow further as aftermarket flying hours grow, but also as we extend time on wing and the gaps between shop visits as well, a core priority for us in Civil Aerospace.

And then finally, bending the fixed cost curve on the right-hand side there, and this is the aggregate of commercial and admin costs, R&D and CapEx put together. Right now, we are 280 basis points lower as sales reduction during the course of the year, which in aggregate brings us to around 400 basis points lower since the 2017 base.

So put all that together, that's about GBP 100 million contribution there. So it's not -- the maths isn't quite exactly the same. But the point is if you add up the GBP 200 million, the GBP 500 million and the GBP 100 million from those 3 key drivers, you get to an GBP 800 million improvement over the last 2 years, which happens to conveniently be the free cash flow improvement as well, although they are -- there is a mixing of drinks a little bit here, but it gives you an idea of the direction and the contribution from these 3 key drivers.

Here's a bit more detail on the wide-body engine deliveries, 510 in 2019, a record year for deliveries. That's how the profile of losses has improved over the last 3 years in the top right there. Worth pointing out as well on the deliveries, the big pickup in volumes of the Trent 7000 in 2019 versus 2018. So very small, just 2% of the pie down there, Trent 7000. And on the right-hand side, 21% Trent 7000 deliveries. Just calling out on the left-hand side here, the Trent XWB-84, we saw a 22% reduction in OE losses. And by the end of next year, we expect the XWB-84 to be a breakeven engine.

The aftermarket cash margin has now moved from GBP 1.6 billion to GBP 1.9 billion. This is driven by -- on the -- above the horizontal line there is the cash coming in. That's just wide-body, 15.3 million engine flying hours, and then -- from the 5,000 installed engine base. And then down at the bottom there, are the costs that go out during the course of the year in respect of the major refurbishments. That's the scheduled every 5 years-or-so shop visits. The check and repair visits are the sort of more the case is sort of ad hoc depending on specific instances. And this one, for example, is where most of the Trent 1000 check and repair visits in respect of the issues that Warren ran through is going through that line in there, and then there's various other costs as well. So delivering ahead of our Capital Markets Day ambition, at GBP 1.9 billion, and within touching distance of the 2022 goal.

On the right-hand side there, the key drivers of growth, 7% engine flying hour growth in the year. Strong time and material growth as well. We'll see this shortly in the Civil Aerospace Profit and loss account, 14% growth. Yield improvements as well. And growth in pay at shop visits events. Now this is important. There are many of our customers who prefer to be paid at the shop visit rather than through the flying hour process. That has a higher yield per flying hour than had they just paid as the hours were generated, but it's an important dynamic.

This is an important slide, and it's a reminder of the trajectory that Rolls-Royce is on to become increasingly a services business. It's a reminder of our installed base. When you add up the Civil Aerospace installed base of 14,000 engines, the Power Systems installed base of 146,000 and then 16,000 in Defence, the 176,000 engines driving this service revenue. And you can see the makeup there of long-term service agreements, GBP 3.8 billion and other services of GBP 4.1 billion, growing at 13% and 8%, respectively. So now representing 52% of our revenues and a growing source of revenues with recurring, visible, higher-margin business. And so a lot more certainty around these revenues from this large installed base.

Key initiatives for us to drive higher returns: extending the time on wing in civil and defence aerospace, the point that I mentioned earlier, which will only help improve the aftermarket cash margin; optimizing repair technologies; and increasing use of digital capabilities, better predictability about the health of the engines and when they're going to be required to be serviced and how quickly to turn them around.

Bending the fixed cost curve. C&A costs were down 4% year-over-year. Capital expenditure was down GBP 158 million year-over-year, beating the guidance that we gave as those large projects came to completion. C&A costs, I've mentioned. You can see the charts there. Just as a reminder though, R&D is at its highest levels at just over GBP 1.1 billion of cash spend. And then you can see the progress that we've made as a percent of sales for each of those lines of the cost curve.

Trent 1000 in-service cash costs. 2019 is the peak year of those cash costs, gross cash costs of GBP 578 million before the benefit of that GBP 173 million of insurance receipts, and you can see the profile that we're expecting and guiding to over the next 3 or 4 years.

So a quick run through our businesses. Operating profit of GBP 44 million in Civil Aerospace, driven by wide-body OE -- sorry, driven by OE revenue growth of 4%, services growth of 14% in equal measure across LTSA and time and materials, still a very healthy source of high-margin business for us, delivering that 10% overall, driving gross profit improvement and subsequently the operating profit that we're reporting today.

Our Power Systems business. Good revenue growth in what are challenging markets. You'll see some of the others in this sector having -- reporting less -- much lower revenue growth than Power Systems has experienced. Good growth in Power Systems in power generation and good opportunity in China, where we see good progression there as well.

Our Defence business, pretty much as we guided. Underlying revenue broadly stable at just 1% growth, a little bit of a margin decline given that increased investments in research and development, but some good opportunities for that business in its pipeline. And we're hopeful for even more big order wins in 2020 for Defence, but a really knockout year for our Defence business. And I should call out here the very high cash conversion in our Defence business driven by those big order wins and a big contributor to the cash flow performance for the group. So an outstanding year for our Defence business.

And then finally, ITP. ITP is a business now full -- fully-fledged member of the group, reported very good revenue growth of 21%, largely driven by aerospace volumes. As a reminder, ITP is a risk and revenue sharing partner on certain Rolls-Royce engines but also on Pratt & Whitney and GE engines as well. So it's a partner to various players in the aerospace sector. The operating profit growth was partly driven by a GBP 25 million one-off benefit in respect of the adjustment of those trading terms between Civil Aerospace and ITP to better simplify arrangements between the 2 companies.

So moving on to the guidance for 2020. Underlying revenue. We're looking at Civil Aerospace revenue being stable to low single-digit growth, very much driven by that revision to OE volumes, 450 to 500-or-so engines in 2020. Power Systems, low single-digit growth anticipated there. Defence, stable to low single-digit growth. ITP -- and ITP stable at GBP 936 million.

And on operating profit. Civil, growing by 50 to 100 basis points improvement in margin in Civil Aerospace. But as a reminder, we're guiding today that our R&D -- capitalized R&D will be between GBP 100 million to GBP 150 million lower in 2020 than in '19, and that will mostly be in Civil Aerospace. So one might think that, that's a slightly low-margin improvement in civil, but we should bear that into mind. Power Systems, further margin improvement there of another 100 basis points. Defence business, stable. And then ITP, a small margin improvement there as well.

Operating profit growth. Putting all this together of at least 15%, and that gets you to around GBP 1 billion of operating profit in 2020.

Core free cash flow of at least GBP 1 billion, and I should call out that this guidance excludes any material impact from COVID-19 in 2020.

How does that bridge to cash flow, profit and -- oops. So how does that bridge from profit to cash? So here are the big moving parts. GBP 1 billion of operating profit, the core driver of the free cash flow growth. The LTSA deferred revenue, we think, will be broadly stable year-on-year at around GBP 750 million. Capital spend above depreciation and amortization, again, broadly stable at GBP 600 million. Working capital contribution of GBP 600 million in 2020, but reinforcing my earlier point that, that will be led by inventory unwind, and I think around sort of 3 quarters or so of that GBP 600 million being in

inventory unwind. The movement in provisions, around GBP 500 million. That's largely the Trent 1000 that you would expect. And then other, tax, interest, pension, broadly stable at around GBP 250 million. And that's how we get to our GBP 1 billion of free cash flow, at least GBP 1 billion of free cash flow in 2020.

With that -- I should add one more thing. There's other more detailed guidance, by the way, in the appendix of the slides that you've got here around various other drivers.

With that, I'll hand over to Warren. Thank you.

D. Warren A. East

CEO & Executive Director

Thanks, Stephen. Okay. Right. I'm going to look forward a little bit more. Earlier, I talked about momentum, and I talked about momentum around changed behavior and changed levels of performance. That continuing momentum coming in from the second half of 2019 is what gives us the confidence in 2020. As Stephen said, little footnote here on the left-hand side of the slide, and the guidance that he just stepped through, and in fact, all the guidance that we have in our earnings release, is subject to the fact that it excludes material impact from COVID-19 in 2020. But that said, we would expect our operating profit growth to be around 15%. The number that Stephen mentioned and at least GBP 1 billion of free cash flow in 2020.

Importantly, we look through COVID, because we see the fundamental drivers of the business, and that's what's driving our confidence in GBP 1 of free cash flow per share in the midterm.

Now I'm not going to ignore the COVID situation at all. We're taking it very seriously. And what's important is what we're doing to manage the situation as far as our business is concerned. So our priority is, of course, our own people, and we have daily monitoring of the situation in all of our locations, and that's coordinated and comes into our Chief Medical Officer, who reviews that situation every day. We're also doing daily monitoring of the business risks, and the business risks break down into what's happening potentially to our revenue and importantly, although we're not a business that is subject to lots of just-in-time deliveries and that sort of thing. It's important that we keep a daily track on our supply chain. And that is -- that's what we're doing at the moment through our supply chain leadership. This is clearly 1 of those known unknown situations. The things we don't know are how long the disruption is going to go on for and to what extent the disruption is going to spread around the world. So here on the bottom of the slide, we've got a few data points so that you can scope out some of the potential impact to our business. I say potential impact because, of course, the third unknown is the extent to which we're able to mitigate the damage should there be material damage. Here are some parameters. Chinese airline customers, it's about 10% of our backlog today. Flights touching China is about 20% of our engine flying hours. How much of that should we take into account. I can't tell you. But what I can tell you is that year-to-date flights touching China are down by approximately 15% between the 15-ish percent in January and 50% in February. So I can also tell you from our daily monitoring of the supply chain and our daily interaction with customers through our Power Systems business that operations in China are getting back to normal. Our key suppliers. We have a handful of key suppliers in China. These suppliers are all back at work, and we have had actually no interruptions in our Civil Aerospace supply chain as a result of the shutdown there. So that's kind of the scope of the situation. The monitoring of the situation that we are doing. And in terms of contingencies and how we can mitigate against that. Well, we're the same as any other business. So we look at the financial impacts, and what can we do about deferring expenditure, what can we do about deferring investment, what can we do about deferring or freezing hiring, and what can we do about the actual staff costs that we take on a day-to-day basis. And like any other business, we're pulling on all of those levers. So that's the situation as far as COVID is concerned for our business. COVID is a reality, and we have to manage through that. And I say manage through that because though it is a reality. And I mentioned earlier, I think we're in better shape than we ever have been to deal with that reality. We must look beyond and looking beyond, takes us to our priorities for 2020. Customer priorities are very clear about meeting our commitments and about getting the Trent 1000 AOGs down.

From an operations point of view, we need to continue the improvements that we've made over the last 18 months or so, particularly driving towards achieving the GBP 400 million of run rate savings. Having successfully changed the trajectory on inventory. We need to continue driving that forward. From

a financial point of view, obviously, the emphasis is on quality of cash and strength of operating profit. And from a people and culture point of view, we need to build on the fantastic changes that we've seen, embedding those behavioral changes, building on the encouraging momentum that we have seen.

So that, in the longer term, we can be a leader. We can be a leader in terms of behaviors. We can be a leader in terms of business performance. And we can play a leading role that we want to play in the energy transition over the coming decades in all of the sectors in which we operate, because we see that as a fantastic business opportunity.

And with that, I'll stop, and we'll hand over to Q&A. So who wants to go first?
We got one, we got one over there. That side.

Question and Answer

Robert Alan Stallard

Vertical Research Partners, LLC

Rob Stallard from Vertical Research. A couple of questions, if I may. First one, easy 1 for Stephen. 2020 guidance, what sort of embedded commercial aerospace aftermarket growth rate have you built into your forecast and if you could break it down by long-term service and the time and material, that would be great. And then perhaps 1 for Warren and a longer-term question. You have cut your forecast for wide-body engine deliveries going forward. So you're coming down from roughly 500 last year to potentially 400 in the out-years. What sort of impact does that have, particularly in terms of your targets for reducing the loss per engine on OE?

Stephen Wayne Daintith

CFO & Executive Director

Okay. So the Civil drivers. Well, we talked about 450 or so 450 to 500 engine deliveries. That's a key driver. The average loss per wide-body engine. We'd hope to get that to around GBP 1 million per engine. So for the GBP 200,000 improvement. That's the goal for us there. XWB, clearly on the road to breakeven by the end of the year. So average on that number will be sort of 0.2, 0.3 I would expect that sort of -- that's what we're looking for. Engine flying hour growth, you should be thinking high single digits, 8%, 9% engine flying hour growth is a key driver for us. And then in number of shop visits, we did just short of 1,000 shop visits in 2019. And I would suggest that using something around 1,100, 1,200 shop visits is a good guide. Major refurbishes roughly as it was in 2019 of between anywhere of 300 to 350-or-so, and then about 800-or-so check and repair visits is the rough composition of the -- so those are the key drivers of the Civil profits and cash flow in 2020.

D. Warren A. East

CEO & Executive Director

And coming on to the wide-body deliveries. Yes, the wide-body deliveries that we would expect to make over the next several years is lower than perhaps the estimates we had a year or 2 ago. But what drives our business is actually the size of that installed base. And so we will still be at north of 6,000 wide-body engines in a few years. Because the size of the installed base is about the retirements and the rate of retirement as well as the rate of new aeroplanes going into the market. And the -- so that's the sort of key point.

The other point to bring out, of course, as you saw in Stephen's presentation, our midterm ambition is underpinned by that aftermarket margin growth, the total aftermarket margin contribution, which we estimated at GBP 2 billion in 2022. And as Stephen just showed, we're at GBP 1.9 billion in 2019. So we're an awful long way through that process already. And in fact, we're probably going to exceed our assumptions, and it's those assumptions, which underpin our midterm ambition. And as for the volume and its impact on that trajectory of OE loss reduction, I don't actually see a material impact by the difference in volume. This is not a hugely sort of high-volume activity anyway. And the costs are dominated by the costs of those components and the cost of the components is dominated by the design of those components. We continue to spend engineering effort on modifying designs to take cost out, we take cost out on an annual basis. And those plans are proceeding according -- just unaffected by volume. You saw in the numbers that Stephen talked about. It's led by XWB. I said XWB is half of the total volume. We will ship our first breakeven XWB in the fourth quarter of this year, which takes us to the average that Stephen mentioned. And we are confident of achieving that.

Stephen Wayne Daintith

CFO & Executive Director

I can just -- I didn't answer your question about the LTSA split and the time and material split. I'd say, time and material. I mean, great performance in 2019, probably sort of high single digits-or-so in 2020. And the LTSA, the number of -- volume of shop visits, clearly is a key driver there. But 1 thing to watch

out for is that -- and again, this is true in 2019 where we have Trent 1000 shop visits, check and repair visits that are related to the exceptional cost activity. We trade those costs through the provision that -- and it won't therefore, hit the LTC, the long-term creditor balance. So the deferred revenue is not reduced. The LTC balance is not reduced by those shop visits. If you see my point, which is a slightly accounting point, but -- and that partly explains the growth in the long-term creditor this year.

Celine Fornaro

UBS Investment Bank, Research Division

Celine Fornaro from UBS. I was just wondering if you could explain the mechanics through the Civil trading cash, which saw a nice improvement this year to GBP 400 million. And so how do we think about that for 2020 because potentially could be slightly worse. Depending on all the dynamics you've assumed? And then my second question would be on the 787 overall market share. And in terms of the recent announcement from ANA to go with GE and thoughts there on your assumption on potential volume on the TEN?

D. Warren A. East

CEO & Executive Director

Okay, do you want to have a go at the mechanics or shall I -- shall I do the ANA one while you're just [indiscernible]

So on 787, we look at it from a sort of fairly macro position. And it isn't just about share on 787, it's about share of wide-body orders, I think, approximately 2/3 of the wide-body orders in 2019 is a reasonable result. We are taking orders on Trent 1000 as well. Obviously, we are disappointed with the decision from ANA. We're disappointed, but realistic. ANA already, 83 of their aircraft are powered, of their 787s, are powered by Rolls-Royce. And to be 100% dependent on Rolls-Royce when you have the choice is perhaps an unrealistic assumption when you get to a fleet that is growing at that sort of size. And so to have 15 aircraft and a few options going to GE is not something that particularly surprises us but, of course, we're disappointed. We retain a very close relationship with ANA. And I think if you talk with them, you'll find that they're very pleased with the way in which we've handled the situation for their fleet, the importance of their fleet notwithstanding COVID for the Japanese Olympics this year. And in fact, in the next several weeks, all of their Trent 1000 powered aircraft will be in the air rather than on the ground.

Stephen Wayne Daintith

CFO & Executive Director

Sorry, and on the improvements in the Civil Aerospace, trading cash flow. Well, again, going back to those drivers of cash flow growth generally across the group. Our original equipment losses coming down and lower volumes at the same time as well. There's going to be a contribution there. The aftermarket cash margin will continue to grow. Maybe I think a couple of GBP 100 million or so, there may be GBP 100 million or so from the first 1 that I mentioned. I haven't yet mentioned business jets as well. Business jets had a very strong 2019 and is well placed for 2020. So we're going to see some further improvements in the business jet contribution.

Trent 1000 costs coming down as gross cost, but of course, we don't have the benefit of the insurance receipts. So that is a headwind there. And we are expecting further improvements in C&A costs generally across the group in 2020, building on the momentum that we developed in the second half of 2019.

Most of the headcount reductions in that we're announcing today, the cumulative reduction of 2,900. I think 2,000 of those are Civil Aerospace. And you're going to start to see that full year benefit of that 2,000 headcount reduction flowing through in Civil Aerospace. So putting all of those together, gives us confidence around further improvement in trading cash flow in Civil Aerospace.

Nick Cunningham

Agency Partners LLP

Nick Cunningham, Agency Partners. I apologize in advance because this is in grave danger of being nerdy. Both of my questions in fact. Thank you for the disclosure on factoring, which is really interesting. And

I just wanted to try and understand it better in terms of how it moves across the year. And what the rationale of using it is, does it reduce the cost of capital and so on? And then second, I think probably equally nerdy, but possibly more generally interesting. If we look at the decarbonization, if you like, road map, how do you see that playing out in sort of very broad time scales and route to market? And what kind of mode of power source do you see developing?

Stephen Wayne Daintith

CFO & Executive Director

Okay. So let me cover factoring. And we are as you know, we've been very keen over the last few years to add transparency to our numbers and our guidance is pretty detailed, and we kind of explain our numbers at length as well. And an extra piece of transparency that we're bringing today is our details of around invoice discounting or factoring as it's otherwise known. And let me just explain where we are on this. It's -- factoring is a common place activity in the aerospace sector. We've been doing it for over a decade now. I would say 2016, though, was the first time that we materially got into invoice discounting, and that was largely around the time when the airframers changed their own settlement terms. And we introduced it to normalize the cash flows with physical delivery of engine volumes. So you've got a symmetry around those cash flows.

The last 3 years, it's averaged at the year-end, it's just over GBP 1 billion, as it does in this year. The way to think about it is that if we haven't done any invoice discounting this year. Our cash flows will be GBP 95 million lower, which is the delta between this year's activity and last year's activity. But the average over the last 3 years has been, as I said, just -- I think it's GBP 1,037 million over the last 3 years. That's the rationale for why we do it. It works well for us. And you're right, there is a cost of capital attached to it, but it's pretty modest, and it's only for a short period of time as well because really, you're just advancing November, December invoices into current year rather than waiting until January and February. So it's only in place for a very short time.

D. Warren A. East

CEO & Executive Director

Okay. And the other 1 around the decarbonization road map.

I mean, obviously, I'm not going to be too specific on dates here and basic principle is that the smaller the aircraft, the more electric. And so we see an opportunity in the sort of helicopter size market disruption, new products for all-electric to hybrid. And then in the regional space, we see an opportunity for hybrid coming sooner than we do into the narrow-body space. So you have hybrid designs in the mid- to late 20s moving through to larger aeroplanes in the early to mid-30s. And then in the larger space, we don't see an alternative to kerosene in terms of energy storage, but we do see opportunities for sustainable synthetic fuels. And there the decarbonization bit is all about the source of the electricity that's used in the synthesis process. So clearly, it's not very sustainable if the electricity comes from a carbon rich source. But as the world electrifies in a cleaner way, then there will be opportunities for clean electricity to generate synthetic fuel. We do see a potential role for hydrogen in that mix, and we are spending effort with some of our partners on exploring the opportunities for hydrogen, but it is going to be about the challenge of storing that hydrogen and again, about the clean source of electricity to produce the hydrogen in the first place.

Synthetic fuel is going to be limited by the ecosystem and the rate at which the ecosystem can develop and the faster it develops, the faster the cost will come down. The more the cost is up there, the more delay there is in that. And I suspect, as with any new technology, there will be a bit of a hysteresis, a tipping point, and then we'll get there. And it's important that we do things like UltraFan and more efficient gas turbines because whether we're burning hydrogen or whether we're burning synthetic fuel, there's still a cost associated with producing that. And so the less of it that we can use, the better. And so we see a very firm role for UltraFan and more efficient gas turbines, whether they used directly for the UltraFan propulsion or whether the core out of UltraFan, the more efficient core is used in a hybrid application in a smaller aircraft. The project is absolutely vital.

Harry William Freeman Breach

MainFirst Bank AG, Research Division

It's Harry Breach here from MainFirst. Could I just ask you, Warren, you touched on coronavirus in the slide earlier on. Can you just say -- have you had any deferrals of delivery dates for on wing or spare engines that have been cited to be coronavirus capacity related? Secondly, if I remember well, and I probably don't. Back in July at the interims. If I remember, you were saying that the breakeven date across the large engine deliveries, including spares, if I remember, was to 2023. Firstly, have I got that number right? And secondly, is there any change given your lower wide-body delivery expectations. And then just final one, maybe for Stephen. Stephen, just in 2019, for the civil aero LTSA revenue stream. Is it possible for you to just give us an idea of the pay at shop visit versus the sort of pay per flying hour monthly settlement?

D. Warren A. East

CEO & Executive Director

Yes. Let me kick off. We haven't seen any deferrals attributed to the impact of COVID yet. But of course, that is a phenomenon, which is in the realm of our sort of planning and our sort of scoping the size of the potential impact from COVID, but as of today, we haven't seen any of that. The breakeven point and the volumes. I mean, first of all, the volumes don't make any difference as the answer to the previous question. Do you -- you're jumping in on something?

Stephen Wayne Daintith

CFO & Executive Director

Yes, I'll happily go along this one. There's a GBP 400,000 average loss per engine by 2022.

So I'm sorry, what was the number? you seem -- [quoting] 2023?

Harry William Freeman Breach

MainFirst Bank AG, Research Division

[Those are -- it was] across the portfolio for installed engine deliveries. [Integrate] even in [indiscernible] remember that date well.

D. Warren A. East

CEO & Executive Director

We haven't actually -- I mean, I think I remember a little bit the conversation where there was a slight bit of miscommunication from the presentation. You know, As Stephen says, the line that we are sticking to is just under GBP 500,000 across the portfolio by 2022. And the other data point that we're sticking with is breakeven on XWB 84k by the end of 2020. And as I said, we will achieve that second one. It's close we're going to get there in 2020.

Stephen Wayne Daintith

CFO & Executive Director

Okay. And on the -- sorry, the mix of shop visits as well. And I'm talking here around the sort of the major refurb shop visits.

Harry William Freeman Breach

MainFirst Bank AG, Research Division

[Let's just say] revenues by pay at shop visit versus...

So I think my question has been just -- I was trying to get at the for civil aero LTSA revenues, what the mix there was between the pay at shop visit part and the...?

Stephen Wayne Daintith

CFO & Executive Director

I would -- okay, I'd hope for at least 20% pay at shop visit. Perhaps sort of the mid-high teens. And then the rest would be with flying hour. It's a relatively -- the important point -- dynamic in 2019, we have 3x

Copyright © 2020 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

the number of pay at shop visits in the second half of the year than we had in the first half of the year, which somewhat explains the strong second half performance from cash generation on the long-term creditor that we're seeing in the numbers today. That's an important dynamic.

D. Warren A. East

CEO & Executive Director

Thank you. One -- just pass it along, I think, is the best answer.

Unknown Analyst

A couple of questions. First of all, presumably, the 97k is 1 of the big lose -- big loss makers at the moment. Is there any reason why it shouldn't get to breakeven like the 84?

D. Warren A. East

CEO & Executive Director

The -- you're right, the 97k is 2 years younger than 84 in terms of entry into service. And so that is 1 of the loss-making contributors. It will follow the trajectory. We -- I can't commit today that will actually get to 0. I mean, what you've seen because it depends how far out you take these things, and we put a lot of effort into extending the time on wing. It's possible that we don't want that to get to breakeven because it's possible that we actually want to spend the money and have the components that improve the durability and the time on wing for service of and -- a given engine because we actually make more profit out of that, than we make from trying to squeeze a technical profit on the OE. So generally, it's a good idea to make as little loss as possible on the OE, but when you get in the detail and you get to the smaller numbers, then it might actually be better not to do that economically for the [program] and for the -- for our overall profit.

Unknown Analyst

The next question is a group of questions is, you've tripled the number of spare engines on the Trent 1000. How come it was so low?

D. Warren A. East

CEO & Executive Director

Capacity and capital. Simple as that. I mean, we -- it's a new engine. It's obviously had issues. And the reason that we were able to improve the spare engines a little bit last year, and we're going to take another big step forward this year is because we now have the capacity to do that.

Unknown Analyst

[indiscernible] related to that, the -- it must be a pretty tough job being the Trent 1000 salesman at the moment. Why on earth would any airline sign up to buy 1 right now, [indiscernible] [serious] question? Is there enough in your backlog to see you through to H1? Is there any chance of us seeing a Trent 1000 order this year?

D. Warren A. East

CEO & Executive Director

Yes. Well, I mean, there are Trent 1000 opportunities for us this year. And we do hope to take orders this year. Why would anybody do it? Well, because of the overall performance of the engine, the overall actual reliability of the engine. And the fact that actually, our competitor while having spare engines to protect against the disruption that we've seen, when you get in the detail, there are issues with our competitors' engine as well. Now I'm not going to stand on the platform and talk about that. You can talk to Boeing, you can talk to airlines about their experiences of the engines on 787. But the answer is, we wouldn't be taking the orders we're taking now, if our engine was so bad that it was such a tough job being the salesman.

Unknown Analyst

And the final 1 is bit of a philosophical one. A couple of years ago, you said that you typically had 4 in-service problems at any one time. It would take a couple years to sort out each and [one would solve them] [indiscernible] So there's probably GBP 200 million-ish of cost underlying. With the Trent 1000, you've had 3 problems and it cost you GBP 2.5 billion. There will be undoubtedly in-service problems with your other [indiscernible] engines at some stage. How can you give us any reassurance that it's going to be a GBP 100 million problem, not a GBP 2.5 billion problem?

D. Warren A. East

CEO & Executive Director

Well, and the answer, of course, is that we can't give any guarantees but we can give assurances based on the very data that generated that original assumption in the first place. It wasn't based on thin air. It was based on our experience of 25 years of the Trent engines. And that is the experience we've had and some of it does come of our own making when we're trying to actually sort of extend the life of time on wing of the engine, and we've made great progress on Trent 700, over 25 years in doing that, but it hasn't all been linear.

And sometimes, we end up with a great idea to extend the life or reduce the cost. And then 2 years later, in in-service, we find some issue. And those are the sorts of issues that I'm talking about that crop up regularly.

The Trent 1000 has been absolutely unprecedented in our history. That's what everybody tells me. And we are grinding through it. Obviously, we've spent a lot of time and effort learning from those lessons. So we can take steps to minimize the probability of that happening again. I think if you look at the later engines, XWB is our example of the later engine, then, as I said, we're fleet leaders at 5 years now achieving the number of cycles that they set out to achieve. And the airlines seeing excellent reliability during that process and excellent hanging on to the engine performance as well as it goes through time.

Peter Laphorn;Investor Relations Manager

[indiscernible] quickly here with a couple from the webcast. We've had 2 on the LTSA creditor inflow from David Perry and Zafar Khan both asking it was an encouraging inflow in 2019, we're guiding to a similar level in 2020, what might 2021 look like? And what are the drivers around that being a bit higher than previously thought. And then secondly, a quick -- a second 1 from David on delivery guidance and whether we think 400 to 450 is the floor for wide-body deliveries?

Stephen Wayne Daintith

CFO & Executive Director

Okay.

D. Warren A. East

CEO & Executive Director

Do you want to do the first 1 or should I do the second one?

Stephen Wayne Daintith

CFO & Executive Director

I'll do the first one. I'll get the long-term creditor out of the way. So as a reminder, this is the balance on our balance sheet, the credit balance it's the deferred revenue from flying hour cash going in there and then revenue gets traded through as the shop visits take place. We had a very strong second half, GBP 500 million better than the first half. In fact, there's 3 or 4 key drivers of it. So first of all, engine flying hour receipts, good flying hour growth, but we also, as you know, we reconcile at the end of each quarter. The actual engine flying hours compared to the invoiced engine flying hours, and we do often see upside there. It's not so straightforward as just number of flying hours flown. And it's the type of flying hours as well. There are different prices around different parts of the flight experience. So that -- it's a pretty complicated reconciliation. We run that through, and we saw some good upside from that activity in the second half.

Pay at shop visits. We had 3x the volume of shop visits in the second half as we had in the first half. I talked a little bit about the high yield. That was a driver of growth as well, particularly strong business jet performance in the second half, which gives us encouragement for 2020.

And then finally, the -- well, penultimate point, the GBP 100 million revenue catch-up that we had, that suppresses the drag -- the [pullout] of revenue as well that we reported. And then the final piece is the number of Trent 1000 check and repair visits in the second half that goes through the provision, again, which isn't hitting the creditor, but you're still getting cash generated from those flying hours flowing through in any event. So those are the 4 or 5 key drivers. 2020, you'll be thinking about the same sort of drivers. I think it's too early to talk about 2021. What I would say though is that flying hour growth high single-digit sort of approaching double-digit flying hour growth is -- it remains the fundamental principal driver of cash flow generation in 2021.

D. Warren A. East

CEO & Executive Director

And on the question of build rate and is our current estimate, the floor. Well, what I can say is that the current run rate supports the demand, the final demand, we have seen the demand fall to what appears to be more of a long-term run rate growth in demand. And I think if I go back 6, 12, 18 months, even. There was a lot more noise about overcapacity in the industry. And that overcapacity being ahead of that underlying demand, and therefore, there's been a little bit of an overhang. And I think the build rate adjustments have been pretty, pretty well sort of expected.

Obviously, short term, we don't know the impact in 2020 of the virus outbreak and the disruption that results from that, and what -- to what extent that might spill over into some deferrals, I already answered that question. And so technically, there might be a little bit of deferral there. But actually, I can see more indicators to increase that demand for build rates. The underlying demand is going to carry on growing along with economic growth. And I think with the changes in sort of public opinion around flying, airlines are going to want to deploy cleaner, more efficient airplanes as and when they can afford to do so. So if anything, I can see a little bit of a sort of demand increase signal, but we're not going to call that just yet.

I think we've got one -- we've got the microphone over there. So we'll come back to you. We've got about 4 minutes.

Unknown Analyst

Yes, this is really, really [specific. Just standing.] If I've paid you for a flying hour, is there any way I can get the money back from you?

Stephen Wayne Daintith

CFO & Executive Director

No. Not typically. [Seeing] around the back of the bike shed. I mean, it's a very good point because I know what you're getting at here with the question because there is some commentary that the -- we should regard the credit balance as debt. Will that -- the cash is contractually ours and remains ours. Even if the airline stopped flying the planes forever. The cash is still our cash contractually. So that's the way we should regard it.

Unknown Analyst

[indiscernible] creditor, [let alone] debt?

D. Warren A. East

CEO & Executive Director

It's deferred revenue, it's on the balance sheet as deferred income. Yes.

Benjamin Michael Heelan

BofA Merrill Lynch, Research Division

Yes. It's Ben from Bank of America. Just one on the credit rating, you said you want to get back to A rating, what sort of metrics do you think we should be looking at in terms of that path, and what you think you need to get to A?

Stephen Wayne Daintith

CFO & Executive Director

We've had a lot of dialogue as you might imagine with the rating agencies, with both Standard & Poor's and Moody's on this one. I mean, [what] is very clear and their priorities align with our priorities. Operational performance improvement, delivering a high-quality operating profit growth and cash flow generation. If you're looking for a metric, Standard & Poor's, in particular, are looking for a 14%, 15% EBITDA margin. So that to get us to sort of move us into that single A rating category.

What I can say is that when we look at our plans, and then we look at the numbers that we're talking around in the mid-term, we can see good progress over the course of the next 2 years on that ambition. And what is critical, though, is clearly derisking the Trent 1000. Warren talked about delivering that final fix on the high-pressure turbine blade on the TEN, getting it the design through in 2019 and certified in early 2021, and then we can start installing those blades, and we get the Trent 1000 back to a healthy engine. So that's very much how the rating agencies are looking at it, and we know what we need to do, and we're absolutely focused on it.

George Zhao

Bernstein Ag

George Zhao from Bernstein. Could you talk about the CapEx spend needed in 2020 to build the spare lease pool engines to support the Trent 1000. And given that not all the fixes will be done by 2020. Is there concerns that you may need to continue to build more spares beyond next year?

Stephen Wayne Daintith

CFO & Executive Director

So our CapEx was around GBP 750 million in 2019, and that includes an element, about GBP 100 million in round numbers of investment in Trent, in spare engines, a large proportion of which is Trent 1000. In 2020, we're going to be maintaining the underlying spend, that's before the Trent 1000 build, but we're going to be increasing overall capital expenditure by GBP 100 million, GBP 150 million or so in respect of that additional engine build for the Trent 1000. And the way to think about this is that let's use a proxy of GBP 4 million, GBP 5 million per engine, that's about sort of 20 engines or so that we're building in addition, in 2020. In addition to the 20-or-so that we built in 2019, if that makes sense.

D. Warren A. East

CEO & Executive Director

To answer, is there a danger that we're going to have to build some more. What we're effectively doing is pulling forward spares that we would otherwise have built anyway, as the size of the fleet grows. And so I don't think we're going to need to do an extraordinary number of spare engines. I mean, certainly, from an operational point of view, if we do the spares that we plan to do in 2020, then we should be able to protect the fleet. And then, over the subsequent years, we'll grow back into that volume. And then we will continue to build spares as the size of the fleet grows. So I don't anticipate any 2021 enormous step-up in the CapEx for more Trent 1000 spares.

Stephen Wayne Daintith

CFO & Executive Director

But as it stands today, this build of Trent 1000 engines will be a very good return on capital when we consider the cost that we're currently seeing for every day that an aircraft is on the ground.

D. Warren A. East

CEO & Executive Director

Okay. It's 10:30 on the clock. So let's assume the clock is now telling us the right time. So thank you all for coming. I mean, the key takeaway messages here, I think it's a strong set of results for 2019. Our performance to deliver on that, particularly after a very tough first half. As Stephen said, we left ourselves a lot of things to do in the second half. But the team has delivered and shows what this organization is capable of doing in terms of delivery.

I think COVID-19 and the disruption, which flows from that. This is a macro for everybody is a known unknown at the moment. We will keep you updated with the implications but we're in pretty good shape on that at the moment with daily monitoring of the situation, daily contact with the supply chain. And we're already seeing our suppliers and the customers with whom we deal in regions, which were first affected by the virus, i.e., Greater China, we are seeing a return to levels of normality there. But we look through that, and we can see the fundamental drivers of our business performance having improved. The fundamental levers that we talked about at our Capital Markets Day and before, we can see progress on that. We can see momentum, and we can see those drivers continuing. And that's what underpins our confidence in the medium term. And we also want you to take away the fact that we're not ludicrously short-term focused on GBP 1 billion in 2020 and GBP 1 per share of free cash flow in 2023. We are thinking beyond that as well. And developing a future for this business to build on that platform through the energy transition.

And with that, we'll be back in July, late July to tell you about how we've got on in the first half of this year. Thank you.

Stephen Wayne Daintith

CFO & Executive Director

Thank you.

Operator

Hello, and welcome to the Rolls-Royce trading and Trent 1000 update. [Operator Instructions] Just to remind you, this is being recorded.

So today, I'm pleased to present Warren East, CEO; and Stephen Daintith, CFO. Please begin.

D. Warren A. East

CEO & Executive Director

Right. Thank you, Hugh. Good morning, everybody, and thanks for joining us at relatively short notice.

You have seen our trading update this morning. And we also have distributed a presentation around the Trent 1000, and what we're going to do now is quickly go through the presentation on the Trent 1000. We're joined this morning by Simon Burr, who's our Head of Engineering in Civil Aerospace, and he will step through some of those slides.

Let me just start with a contextual slide to begin with. So I'm now on Slide 2. And this lays out the fact that on the Trent 1000, we have effectively 3 versions of the engine in service: Package B, Package C and TEN.

And on the Trent 1000, we have, for the last couple of years, been wrestling with 3 fundamental issues with the engine, issues with durability in the turbine section. And what has caused the hiatus really around Trent 1000 was when we discovered some issues in the compressor section of the engine where we discovered cracking in compressors that we worked out would have a potential safety issue. And therefore, we had to instigate a regime of inspections with removals of defective components and replacement of defective components to ensure safety of the fleet. And all of those inspections and the removals led to effectively overwhelming our repair and overhaul network in the state that it was in at the time. And that led to aircraft being parked on ground, which led to disruption for our customers, which has led to costs. And that's what the hiatus is really been about.

However, if you lay it out, as we have on this slide, we have 3 versions of the engine, 3 fundamental issues, and we need to fix all of those issues. So the slide shows a snapshot of where we are today. We have fixes for all of the issues on 2 of the [marks] of engines, the B and C. We have fixes for the IP compressor and the IP turbine blade on the TEN as well. A number of those fixes have already been certified. As you can see, the extent to which the replacement components have been rolled into the installed base, the fleet that's out there flying at the moment. And we've made significant progress on all of that over the last 18 months.

We now have one issue, the high-pressure turbine blade on the TEN version of the engine. That design has been ongoing and we expected to introduce -- to have a tick in that box and to have a green tick of that certified and be installing that in the early part of next year, but recent testing has shown that we can't achieve the durability that we want to achieve, and therefore, it's going to take us longer.

Now at that point, I'll hand over to Simon to just give you a little bit more detail on the issue with the TEN high-pressure turbine, and then I'll come back and talk about what we are doing about it.

Simon Burr

Director of Engineering & Technology - Civil Aviation

Okay. So good morning. This is Simon Burr.

So the high-pressure turbine blade, the illustration, hopefully you can see, expresses gases from the combustor. And you've probably seen, Rolls-Royce has communicated before, these blades each absorb the energy equivalent to what you see in a Formula 1 car, very energy-intense. The alloy system -- the

material system we use in this space has been the same for over a decade and we know how it behaves in-service. The same system is used on the XWB very successfully and on other engines.

But the issue isn't -- has nothing to do with the material system. It's about how it's cooled. The blade itself is surrounded by gases but -- or above the melting point at the center of the blade, but that design is used on all -- that concept is used on all jet engines and gas turbines for many years. In order for the blade to survive it has cooling that goes through the center of the blade through multiple passages and also has a film on the outside of the blade that protects the blade from these very hot gases. It's called film cooling. So the blades have around 200 very small holes in them to create that film. That design system is being used very -- for many years very successfully. The issue at hand is not the blade's materials or how it's made, it's the cooling. So the cooling, what we are doing is we're doing 2 things. We're increasing the amount of cooling air and making a slight redistribution of some of those holes that create the film -- that protects the film or the cooler air which protects the blade.

The engine went into service with an expectation of a particular life. And we've put an inspection rating with that, and that's been successful to make sure there's no operational disruption, i.e., no events in-service. It's a recurring inspection regime to make sure the engine performs in the air, take-off and in the air [in common] as expected.

Half the circuit we've done, as we've inspected engines, what we found is the engine is -- the turbine blades fell off, deteriorating faster than anticipated from the original design. So we don't have to take engines off and replace the blades.

The design change that we're putting in has increased cooling. And as I've said, a slight redistribution of the cooling holes, and then we have to do a series of arduous tests by, first of all, ourselves and then Boeing and then our regulators that we've got satisfactory life.

So that's the sort of core of the story. The HP turbine blade design simply takes engines live, so it's a critical part, as it were, in the design of the engine.

So what we've done, if I just go on a slide and spend -- to tell a detailed review, we've done a series of tests. Intently, the travel patterns hasn't -- is actually certified sort of higher for us than the previous [layer end]. So it's designed to operate up to 76,000 pounds of thrust, back seat, from 74,000.

The vantage point is in the take-off on climb, that's what we've -- that's the design point we have to worry about. And we've done a series of tests, and what we need to do is to make sure that [the MPs that blow the reed] will be absolutely robust in-service. The test results show that we need to make a further requirement, and we're going to do that. And we have a series of tests to complete to satisfy ourselves that the blade will operate in the way expected.

So that, well, actually you'll see those are the steps we are taking. The way the end blade is made, the material systems, identical in detail. It's in the detail of the design of the blade and the cooling system itself. Hopefully, that sort of covers the essentials of what we're doing.

The last thing I would say is that we now have a very good model of how the blade is performing in-service. In designing a solution, if you can model what's happening and replicate that in models, what's happening in-service, then you can be pretty confident in the design solution. So when you commit to testing, you know what -- the outcome you expect will be achieved. So we've got a good model now for what's happening in-service on the TEN fleet, and that's led to our strategy in terms of overall management of the fleet until the new blade is in-service.

D. Warren A. East
CEO & Executive Director

Thank you, Simon. So if we click on to what are we doing about this, well, the key thing is to provide certainty to our customers because as I've said at the start, the hiatus has been caused by aircraft on ground, which -- disruption for our customers, and what they need above all is certainty as to when they will have an aircraft available so that they can fill it with passengers.

And we also need, of course, to resolve the situation and put the final tick in the final box on Slide 1 as soon as possible. So what are we doing about putting that tick in the box as soon as possible? We're giving Simon more resources to deal with that problem, making sure that we have dedicated people working on it to bring this new design through testing as soon as possible. We have to create test engines in order for that to happen. And so we've freed up capacity to make sure that we can create test engines as soon as or as quickly as possible to accelerate the design.

The other thing that we really need to do is make sure that -- moving towards the certainty for our customers, we need to get through the backlog of all the overhauls that we need to do as quickly as possible, and that means increasing the capacity of our repair and overhaul network. And if you follow the story, we've been doing that consistently over the last 18 months. And indeed, we are redoubling our efforts there. We are repurposing some of our facility from assembly and test. We are repurposing some of our facilities with our component facilities to make the components required. We're adding test bed capability, and we're also attending to service near-wing with our customers, so maximizing the MRO capacity.

And the other thing that we're announcing this morning is that we are investing in additional spare engines so that when we do end up with an aircraft that would otherwise be on the ground because we can't get something through the repair and overhaul network as quickly as we'd like, then we can deliver a spare engine and have the aircraft flying again in a matter of hours rather than a matter of weeks or months. So those are the 3 actions that we're taking to effectively provide certainty as soon as possible to our customers.

I'm going to hand over to Stephen to talk us through the financial implications of all this.

Stephen Wayne Daintith

CFO & Executive Director

Thanks, Warren. Good morning.

So concurrent with the engineering review, we've carried out a detailed financial review of the consequences of these matters that we're announcing today. These are factored in the revised timing for the high-pressure turbine blade introduction, which is now the first half of 2021. We've also taken a more conservative view of the ultimate high-pressure turbine blade durability.

But putting this in very simple terms using the 20th year as the final year of the shop visit for our engine program, typically, we'd expect a shop visit every 5 years, and therefore, having 4 shop visits over that period. We're now looking at a period of closer to 4 years for every shop visit. So you're going to have 1 extra shop visit over that 20-year cycle. That extra shop visit then causes us to look at a -- our 20 customer contracts. We carried out a detailed financial review of our customer contracts and assessed the impact of that extra shop visit on each of those 20 customer contracts. And 3 of those contracts, we are highlighting as loss-making contracts and reporting those losses today as a part of our exceptional charge, which also includes the revised in-service cash cost estimates on the Trent 1000.

We've also carried out a detailed financial review of the Trent 7000 of customer contracts undertaken. I don't expect any material impact on profit or cash on the Trent 7000.

Moving on to the next slide. The Trent 1000 in-service cash costs, what does this do now? I know in this chart here we show that in the first half, how we guided on the Trent 1000 cash costs and our revised estimates that we're releasing today.

So first of all, 2019, we're now expecting 2019 to be around GBP 550 million compared to the GBP 450 million to GBP 500 million that we previously disclosed. 2020 will be similarly GBP 400 million to GBP 500 million. 2021 will be GBP 400 million to GBP 550 million. You can see there the impact of the Trent 1000 and TEN version in-service cash costs coming through. And just to be clear on this one as well, that the GBP 400 million increase over the GBP 1.6 billion increase isn't foreseen at the time of the 2019 [in Trent].

So previously, we have set that to be around GBP 400 million, and we guided that number as within normal contingency levels over '21 and '22. We're now expecting an incremental GBP 400 million to that number, taking the total therefore to GBP 800 million on the TEN. And that cash cost will be spread across 2021, '22 and '23. So when you add on the GBP 800 million cash costs on the TEN, that timing profile, the GBP 1.6 billion that we've previously disclosed on the other variance of the Trent 1000, that issue of total cash costs across the years 2017 to 2023 of GBP 2.4 billion.

Moving on to the next slide. How do we get to the GBP 1.4 billion exceptional P&L charge? This is principally composed -- comprised, I'm sorry, of these 2 items, broadly equal comps, the additional cash costs to cover the customer disruption and remediation shop visit costs. This is almost all of the GBP 800 million of in-service cash costs on the TEN that I've just run through on the previous slide. And then the second part of this is the upfront recognition of future contract losses on just a few -- on a handful of customer contracts that are part of those 20 contracts that we've carried out a review of as a consequence of this engineering review. The full accounting treatment will be finalized with the full year 2019 results.

On the 2019 outlook, guidance is maintained, but we now expect the outcome towards the lower end of the range. On the bottom right-hand side of that chart shows the guidance that we've given, underlying operating profits of GBP 700 million, plus or minus GBP 100 million; and core free cash flow is GBP 700 million, plus or minus GBP 100 million. So it's still within that range but towards the lower end of that range.

Civil Aerospace has had continued growth in engine flying hours, continued progress on OE loss reduction. It has been a modest impact on profit from the additional engineering investment on the Trent 1000.

Defence, continue to expect stable sales, investment in future programs and continuing to drive higher self-funded R&D. So Defence is still a very solid performer for the group.

Power Systems trading remained healthy. Within Power Systems, we see continued growth, but delivery deferrals on a small number of larger projects impacts the full year 2019 revenue growth. So we're now expecting low- to mid-single-digit growth in Power Systems. Clearly, that will flow through to margin and impacting the profit guidance here today.

ITP is trading in line with expectations.

D. Warren A. East

CEO & Executive Director

Great. And with that, we'll now be happy to take any of your questions.

Question and Answer

Operator

[Operator Instructions] Our first question is to the line of Chloe Lemarie of Exane.

Chloe Lemarie

Exane BNP Paribas, Research Division

Yes. I have 2 questions, please. The first one is on 2020 free cash flow, which is now actually a step change from 2019, with no year-on-year benefit from the Trent 1000 essentially. So could you please work us through your latest assessment as the key moving part there in terms of working capital tailwinds, the restructuring benefits, et cetera?

The second question is on the Trent 1000 TEN HPT blades. You now expect the fix to enter service in H1 2021. It's quite some time out from now. So are there any intermediate steps that we could track to see whether the fix risk any further delays until then?

D. Warren A. East

CEO & Executive Director

Okay. Do you want to...

Stephen Wayne Daintith

CFO & Executive Director

Yes, I'll take this 2020. The biggest single driver of growth in 2020 is going to be the growth in underlying operational profit that we're expecting. That's driven largely in Civil Aerospace where we expect to see an improvement in gross margins delivered by the continued OE deficit reduction program that we're working through and the benefits of our restructuring efforts. And so underlying operating profit, we're expecting material growth from 2019 levels. Not being explicit on that guidance yet, but clearly that's a key driver to our props for our cash flow performance in guidance in 2020.

We're expecting on the long-term credit set at the inflows that we're guiding previously of around GBP 400 million from that. CapEx, that includes capitalized R&D, will remain steady at about GBP 1.4 billion or so, so recurring free cash flow will grow nicely. And then we're going to have around, in total, around GBP 700 million of costs on the Trent 1000, which will be in respect of the GBP 550 million that we're highlighting today plus -- sorry, GBP 500 million or so that we're highlighting today plus the increased investments in spare engines that we'll see in capital expenditure, an extra GBP 200 million of cash costs there on spare engines to bring down the AOG levels from the levels that we're seeing today. And that investment has a very good payback, less within -- less than 12 months. We clearly would have liked to have done more during the course of 2019. We didn't have the capacity to build those spare engines since one of the benefits of the slightly softer wide-body market we're seeing today is that gives us that capacity now to build those spare engines to bring down the aircraft on ground. And then the bad news will be working capital benefit, which will offset the GBP 700 million, pretty much equal and an offset to the Trent 1000 cash costs of GBP 700 million. And the vast majority of that will be the inventory unwind that we finally expect to see, having clearly not made the progress we would have liked to see in 2019.

D. Warren A. East

CEO & Executive Director

And on the question about things to look out for between now and the middle of 2021 to see that we're on track, basically we need to do a lot of testing. We need to test the new designs on the ground and then test the new design in the air and then engage with the regulators for certification and approval.

And so we will have opportunity to update you at regular intervals. We'll be communicating. I'm sure there'll be an update on this with our final full year results in February. We'll provide you with updates

and regular communications throughout the period. And what you need to look for is that we're making progress on -- through that testing regime.

One thing I'd also highlight is the thrust of, well, all this extra effort that we're making and talking about this morning is providing certainty to our customers and bringing down the number of aircraft on ground. So you should look for the trajectory from where we are now to single-digit aircraft on ground by halfway through next year. And we'll obviously have an update on that in February.

Operator

Our next question is from the line of Olivier Brochet at Crédit Suisse.

Olivier Brochet

Crédit Suisse AG, Research Division

Yes. I have 2 questions as well, one as a follow-up to Chloe's. If you could also help us understand what will happen in 2021 compared to the various bridge elements that you've provided for 2020, please?

And the second one is on Power Systems. If you could provide a bit more color on the projects that are being deferred, please, so that...

D. Warren A. East

CEO & Executive Director

Okay. I'm going to be -- first question. Could you just say that first question again? We didn't quite hear it.

Olivier Brochet

Crédit Suisse AG, Research Division

Sure. On the first question is on the 2021 free cash flow. I understand it's not the point of providing a guidance there, but how can you -- or can you provide us some elements of -- to compare what will happen in 2021 on the free cash...

Stephen Wayne Daintith

CFO & Executive Director

Yes. I'll just -- let me just fix there. We're not giving sort of details on it. I'll just give you 3 big drivers in 2021. Clearly, we should expect ongoing profit growth, good profit growth, the restructuring efforts really flowing through by then. No material changes in things like capital expenditure or R&D. You shouldn't expect any material changes there. The Trent 1000 costs starting to come down, to an extent, in 2020. And clearly, working capital, not expected therefore to play a major contribution in our free cash flow. So that's the sort of rev guide you should be thinking about when we think about 2021.

D. Warren A. East

CEO & Executive Director

Your second question was about the Power Systems expectations for this year?

Olivier Brochet

Crédit Suisse AG, Research Division

Yes. So to understand, which sort of contracts have been postponed so that we can track when they come back?

D. Warren A. East

CEO & Executive Director

Yes. Well, there are a couple of large PowerGen contracts, and we are providing just part of the solution for large data center installations. And so although we have our products all ready to go, there are other project delays which have -- the project is basically being pushed over into 2020. We have no concerns over whether those projects will happen or not. This is a sector that's growing very strongly. There's no question about the demand for data centers. It's just the specific project logistics.

Operator

The next question is over the line of Andrew Humphrey at Morgan Stanley.

Andrew Edward Humphrey

Morgan Stanley, Research Division

I wanted to ask, first, on the IP compressor, the grid you put up at the start on Slide 2 and the 25% of the Package Cs have been refitted there. I would say that might be a kind of slightly lower number than some people have been expecting. Can you talk about the cadence of replacements there and how it fits into the bigger picture of where you would have hoped to be at this stage?

And secondly, on the kind of noncash charge that you've taken today relating to future contract losses on the TEN, could you give us an idea of, I guess, where that fits the Trent 1000 program in terms of overall profitability at this point and whatever implications that might have for, I guess, the profitability of future contracts on the Trent 1000?

D. Warren A. East

CEO & Executive Director

Yes. Okay. Well, as for the pace of fitting these fixtures, we only do this when the engine is in for an overhaul, when it's actually needed. This isn't like a sort of consumer world where you sort of have a product recall and the consumers bring their cars back to have new brakes fitted or whatever. These engines are very reliable engines, and our airline customers love flying them. It's the durability issue that we have. And so they carry on using that asset, flying the engine as much as they can until it actually reaches the time that the durability runs out and the compressor needs to be inspected. And then if it is inspected and is defective and it needs replacing, then it will be replaced with the new fix rather than the current -- rather than the one that's being withdrawn. So that's why we expect it will take several years just for all the boxes on this chart to turn green, but that's not a bad thing. That's actually a good thing.

Stephen Wayne Daintith

CFO & Executive Director

And then on the Trent 1000 engine programs. Well, it's important to look at this, first of all, in the context of the 20 contracts, first of all, that we have today. Clearly, the margin -- the aftermarket margin on those contracts has been weakened by the reduced durability of the blade and the cost that we're incurring over the next few years as well that will flow through the contract pacts. So that margin, you should think about that as material decline. Using round numbers, one could go from around 20% or so to now sort of moving into single-digit territory or high single-digit, that sort of margin, but that's made up of a mixture of very profitable contracts and some not so profitable. And it's those few not so profitable that we're highlighting today as loss-making contracts. But an important distinction here is that going forward, new contracts that are outside that period of increased cash costs will be at a healthy margin, and we expect, therefore, the margin over time to start improving and then get back towards that sort of 20% or so that I just mentioned.

D. Warren A. East

CEO & Executive Director

Do we have any further questions? Hugh, do we have any further questions in the queue?

Oh, well, in that case, thank you very much. I think you know how to -- if anybody does have any further questions later in the day, then you know how to contact us. I hope you found the material useful. And we'll be in touch with our full year results in February. Thank you.

Presentation

Jennifer Ramsey*Head of Investor Relations*

Great. Okay. So thank you for joining us here at the London Stock Exchange and for those of you joining online. My name is Jennifer Ramsey, and I lead the Investor Relations team at Rolls-Royce. It's my pleasure to welcome you to the 2019 half year results.

The agenda for today's presentation is that Warren will start with a presentation to talk around his perspectives of the business, the progress we've made in the first half. And Stephen will, our Chief Financial Officer, will talk about our financial results. And then Warren will round up with his view for the year ahead.

Our presentation today is expected to take around 50 minutes and then we'll have time for Q&A, and that will be both from the audience and online, if you can feed those through online. And if you wish to ask a question, you can do that through the webcast services if you're online. We'll endeavor to those -- answer those questions along with those in the room.

Finally, can I ask you to switch off your mobile phones so that we make sure there's no interference. And we're not expecting any emergencies today, so if an alarm does go off, please make an orderly exit.

And with that, I'll hand over to Warren. Thank you.

D. Warren A. East*CEO & Executive Director*

Good. Thanks very much, Jennifer. Good morning, everybody. Thank you all for coming out and joining us. And I was just sort of looking at the number of chairs in the room and thinking that either something must be going on or it's the middle of summer. So for those of you who made it here, thank you very much. I'll do a little overview of sort of from a group perspective and then a summary by business.

So starting off with a slide with which you're familiar, sort of key numbers. And we summarized this whole sort of set of results really when we were talking about it as further progress. And I think you can see some progress in these numbers. And as we get into more detail, you will see progress on both financial performance, from an operational point of view and from a strategic point of view. And I hope we can cover all that in this presentation.

But anyway, to start with, we're pleased to see a good uptick in underlying revenue and a growth in operating profit driven by our Civil Aerospace business, approaching breakeven, and good strong growth in Power Systems as well. And obviously that drove an increase in underlying profit before tax.

Core free cash flow was an outflow of approaching GBP 400 million. That is normal seasonality, and Stephen will talk about the drivers of that, but there's quite a bit of inventory build in that, which in absolute terms was a similar level to the inventory build that we saw in the first half of last year.

The dividend per share, constant for now. And obviously that's a matter for our Board to discuss in due course. But for the time being, that's constant. Underlying EPS looks like a very disappointing number. There is an associated change in a tax charge that sits behind that, and I'm sure we can cover that in the detail.

Looking at highlights from all around the business. Civil Aerospace, obviously 50% of our business, good engine flying hour growth, about 8% engine flying hour growth. And we were very pleased to see the OE loss reduced for our large engines. I'm pleased to see good progress on the Trent 1000 issues, and I'll talk about that in a little more detail in a short while. And around the turn of the year, there were some serious questions around Trent 7000, and that's the engine that powers the A320neo. And it's good to see a big turnaround in Trent 7000 shipments, and so we saw a good number of those being delivered in the first half of the year.

Power Systems, very healthy progress in the first half. Good bookings. Book-to-bill ratio, 1.1. We're seeing continued steady progress on connectivity in the installed base, which is driving a shift towards more long-term service agreements. That's sort of data connectivity of the engines that are out there driving that shift. But the order is really being driven by PowerGen-type applications and a move to more systems away from pure standalone engines.

Defence, again, a good first half, very strong order intake, book-to-bill of 1.5. And along with that order intake came some healthy customer deposits. That is part of the business model that sits behind Defence where we get paid early. So it's a -- that's the sort of financial dynamics of that business, so that was good to see some of those payments coming through. It was also good to see some of the efficiency improvements in our U.S. operations coming through to offset some of the lower-margin activities that we saw elsewhere in the business. And again, I'll talk about that bit more, later.

In ITP, I think good revenue growth. Clearly, it's exposed to Civil Aerospace, exposed to our Civil Aerospace business and others. And we're seeing growth right across the piece there. Lower profit, this is phasing of different programs. And so actually, what's driven the lower profit is more of an engine mix issue, and we'll see that mix issue change with phasing in the second half of the year.

More generally, across the group, our restructuring program, in line with our plans set out at the Capital Markets Day in June 2018. And the summary on financial, I think we can see good revenue growth. We are comfortable with the free cash flow phasing, its typical seasonality. And if I look to the balance sheet, an improvement in net cash position. And so later on, we'll discuss why we remain comfortable with the GBP 700 million free cash flow expectation for the year as a whole.

Now I'm going to step through 3 slides with slightly different perspectives. First from a shareholder perspective, then I'll look to a sort of external perspective and then I'll look at an employee perspective. So as far as an ownership sort of perspective is concerned, this is a reminder of the goals that we set out at our Capital Markets Day just over a year ago. And those goals have not changed one bit, and we remain absolutely on track to deliver on those goals.

So free cash flow ambition, going out beyond 2019 to at least GBP 1 billion in 2020 and GBP 1 per share of free cash flow as a midterm ambition. We are comfortable with those goals. We talked last year about disciplined capital allocation, and we're comfortable with how we're doing that at the moment. And in terms of strengthening the balance sheet, we completed some disposals this year, and that was good to see.

I think I'd remind people, at this stage, it's not just about disposals. So you saw some bolt-on acquisition activity that's happening as well, and that's helping us accelerate some of our strategic initiatives. We set out a type to that capital allocation. We set out some goals in terms of quality of cash return. And again, we're comfortable that we're still on track to return that measure through the cycle.

And as far as payment to shareholders is concerned, then it's not really a 2019 issue for us. As I've said, that's constant for the time being, but we're absolutely confident that we can start returning to some sensible levels sometime very soon. But the basic point is, what we set out at the Capital Markets Day a year ago, we're comfortable with those goals.

If I switch now to more of an external perspective. One thing we've noticed over the last 6 months is a little bit of a aviation as being set up as the villain of the piece as far as environmental damage is concerned. Well, yes, aviation is built on setting fire to hydrocarbons. And we've been talking for some time about the fact that we, along with a whole load of other sectors, need to wean ourselves off that and wean ourselves off it quite quickly. But from a business point of view, we would contend that it's up to us and our customers and others in the ecosystem to lead rather than react to public opinion. And so we are about creating a more sustainable future. But I think it's important as a business that we remember we have to generate the returns now in order to fund the R&D that's required to make those changes.

So if I look at our products, well, our products do probably drive -- they drive the carbon footprint. They are about converting stored energy into useful power. And today, that stored energy is in the form of hydrocarbon fuels. But our engines continue to get more efficient. Most of our R&D is spent on making

those engines more efficient. Some portion of our R&D is around new technologies, particularly around electrification to address this issue.

Internally, from an operational point of view, we've set ourselves a goal to be 0 carbon, except for that, that we use to test our gas turbines by 2030. And we're comfortable with that goal. And from a people point of view, within the business, we think it's important to create an environment and a culture for the people of the next several decades. And so we're setting about doing that.

So talking of people and internally and the changes that we have to make to our business internally, the key objective is really not in the key objectives box. It's here on the left-hand side of this slide. The key objective is basically to create a more sustainable, but importantly, competitive business. And in order to do that, we are setting about reducing our central costs. We are setting about making sure that decisions are made closer to the customers within businesses. And I'm pleased with the progress that we're making on those objectives.

If I quantify some of that in terms of run rate cost savings from our restructure program, we are saying with our release this morning GBP 134 million run rate cost reduction from the restructure program so far. Obviously, we set out last year GBP 400 million annualized run rate by the end of 2020. And at GBP 134 million to date, we believe we are actually on track.

You'll see more in the second half as we, flipping down to the bottom of the slide, as we make more progress on simplification. I've talked a little bit about the balance sheet and simplifying the portfolio. But internally, we're concentrating on introducing new systems, new processes. These are new systems dealing with people and talent management; finance and how we handle our finances; engineering, how we design our products; product change processes, how we ensure the integrity and safety of our products when we make design changes to reduce costs; purchasing and so on and so on. And these are not incremental tweaks to our systems and processes. This is where we're taking out as much as 50% of the steps in processes affecting thousands of people around the group.

So we've been putting the building blocks in place to make many of those changes over the last 12 months. And we're actually initiating using some of those, some of those new processes right now in Q3. And that will translate into further headcount reduction in the second half of this year. And so we expect to be at about 2,700 headcount reduction by the end of this year.

So now a little bit of a business update, looking around all the businesses. I'll start with Civil Aerospace, obviously our largest business. I'm pleased to see flying hour growth at 8%. That's ahead of market traffic growth. That's really because, of course, our fleet is growing, and it was pleasing to see that being driven by Trent 1000 and XWB.

XWB has also been a key driver in the reduction of the OE loss that we make, the loss that we make when we sell each engine. So on XWB, that came down by 1/3 over the last 6 months. And that contributed to an average reduction year-on-year of GBP 0.2 million or 13%, which we're quite pleased with.

Trent 7000. There were a few questions at the turn of the year around Trent 7000 and the rate at which we were able to deliver these engines. That rate improved in the first quarter of the year and sustained in the second quarter of the year. And so by the halfway through the year, we've delivered over 50 of these engines and we're comfortable that, that is now in production.

XWB, I mentioned growth is a driver for engine flying hour growth and unit cost reduction. If we just look at the stats for that particular engine now, it accounts for 11% of our fleet. So the reason we're so keen on things like the average cost of an XWB and the loss that we won't be making, that we'll actually be breakeven by the end of 2020 on XWB, is because it is the largest volume engine coming out of Rolls-Royce over the next several years. So far, that engine is with -- is operating very reliably with 27 airlines around the world and it's clocking up plenty of flying hours.

Business aviation. We shouldn't forget business aviation. There's a lot of emphasis on large engines when we talk about our Civil Aerospace business. 12 months ago, I stood here and surprised everybody with the launch of the Pearl family and the Pearl 15. We've now completed all the necessary certification around the Pearl 15 so that, that will enter service between -- sometime between now and the end of the year.

And it's up to the airframer and not us anymore because we've delivered everything we need to deliver in terms of a production standard engine. And that's giving us a lot of confidence around the Pearl family and the opportunity that, that gives us to gain further market share in the business aviation sector.

I can't not talk about Trent 1000. So let me start by saying this is still causing a number of our customers' significant disruption. And our main focus when we talk about Trent 1000, obviously we report it to the investor community, but our main focus is our customers because these are the people who've bet the farm on choosing Rolls-Royce engines for their Dreamliners, and we are causing some disruption. The good news is we're causing an awful lot less disruption than we were causing 12 months ago. The number of aircraft on the ground today is about half of what it was a year ago, which is very encouraging.

And that happened because we have got on with redesigning blades. We're now in the Pack C version. You can see Pack C accounts for approximately 50% of the Trent 1000 fleet. Every time we're replacing compressor blades on Pack Cs, we're replacing with certified new blades and so that engine flies off and it's healthy. And that's why I say that the health of the Trent 1000 fleet is steadily improving. It's a steady improvement because a lot of those engines are flying around absolutely fine and they won't need replacing for some time. So it is going to take us a while to roll the new design into all of the fleet. There's no need to do that immediately. The other versions of the engine, the redesigns of the compressor blades are underway. And we expect the TEN version to be ready for installation before the end of this year with Pack Bs following soon after that.

However, earlier this year, switching to the far right-hand side of the slide now, we did find that the reduced life expectancy of the high-pressure turbines on the TEN version of the Trent 1000 turned out to be even more reduced than we expected it to be. So the life limit of 1,000 cycles, let's be clear, is completely unacceptable for a typical customer. And so we were redesigning the turbine blades. However, we found that some of these blades come off a couple of hundred cycles before then and need replacing sooner. So even more unacceptable for our customers. We've obviously spent quite a lot of time and effort investigating this. We anticipate that this will affect around 1/3 of our TEN fleet. And you can see the portion of the overall fleet which is TEN, and so you can see what 1/3 of that would look like.

And in order to deal with that problem, at the moment, we're redesigning the blades. We're also managing those affected airplanes. That is putting an additional load on our repair and overhaul facilities. We've already grown our repair and overhaul facilities, but this additional load is extending the turnaround times in those shops. And that means that for the Pack Bs and Pack Cs in the middle of the slide there, we are going to take a little bit longer to return those fleets to a position of single-digit aircraft on ground. It is possible we'll get there for the end of the year. But it's also very possible that the polluting effect of the TEN will cause that to delay a bit longer. And that, unfortunately, is where we are. I'm still pleased with the progress we're making on managing and fixing all these issues, but the reality is that we've still got a lot of hard work to do before it's out of the way.

So that's Trent 1000. That's Civil Aerospace. Moving to Power Systems. Power Systems, this is a picture of a data center because quite a lot of our Power Systems products go into backup power supplies for a data center. I was very keen to have a data center picture that looked unambiguously like a data center rather than a factory, so you get the inside view, not the outside view. The reason I was keen on that is because this is a sector that, if we were actually playing in it, is growing at a compound annual growth rate of 25% or so per annum. So that fuels a huge demand for backup power, and that's why we're seeing such a lot of backup power demand in this sector for our Power Systems.

That's helped drive a very healthy order intake. And additionally, the regional penetration of these products is small in some parts of the world, and we see a fantastic opportunity to grow our market share in some of those areas. Our business here is much more resilient than that of some of our competitors, which is -- whose businesses are more narrowly focused on certain sectors. We have a very broad spread of applications in our Power Systems business, and that makes it much more resilient than some of our competitors. That regional penetration did contribute to some of the inventory build, by the way, and I think Stephen will talk about that in a few moments.

I'm pleased to see the operating profit performance as well. And if I look towards the right-hand side of the slide and look towards the future, we see a continuous evolution in the markets and applications for

our Power Systems business. And we're very excited by microgrids where our products are enabling the uptake of renewable power and renewable power technologies. And microgrids, generally, I had a picture of a train at the last presentation, that's a microgrid that hybrid trains -- a microgrid that goes along the railway track. We're seeing quite a lot of stationary applications now in renewable power, and we've established a joint venture activity or a partnership activity with ABB to accelerate that.

Defence. Defence really characterized by strong order intake and associated customer deposits that's coming with that. I talked about efficiency. And in the modernization box there, our facility in Indianapolis, we embarked on a modernization program a few years ago. We're seeing that come through now. We're starting to actually produce in the new facilities. We're busy demolishing some of the older facilities. And that extra efficiency is enhancing the profitability of those products, which is helping to offset some of the profitability headlines -- headwinds, rather, we're seeing in other parts of the business. It's been a healthy period for sales on the F-35. And it's been a healthy period for future products and future opportunities as well, both a couple there in the U.K., Tempest and the hypersonics program announced by the MoD a little while back, but also elsewhere around the world.

And finally, on ITP Aero, good to see the revenue growth there, as I say, heavily exposed to the Civil Aerospace sector generally. About half of the business being Rolls-Royce, so we know jolly well the growth that ITP is exposed to there. There was a temporary product mix effect, which we will see unwound. And we're actually investing in that business and continuing to grow it, investment in new facilities. As far as new technology is concerned, we're collaborating with the folks at ITP around some of our new technologies in UltraFan.

With that, I'm going to hand over to Stephen, and he's going to talk through the results in a bit more numerical detail. Thank you.

Stephen Wayne Daintith

CFO & Executive Director

Okay. Good morning, everybody. Thank you, Warren. So our results for the first half. First of all, a reminder of our reporting format. Our core business, Civil Aerospace, Power Systems and Defence and ITP Aero, that's our core business, and firmly cementing ITP in there as a core business for us.

Our half year results, pretty much as we expected 6 months in. Good revenue growth across the group, 7% core business underlying growth. And good profit growth as well, growing to GBP 203 million of operating profit. We also see the typically seasonal first half cash outflow. If you look back over the last sort of 5, 10 years, you'll see this in Rolls-Royce. We build in the first half of the year, we deliver in the second half of the year, so it's pretty typical seasonality. And I'll go into the drivers of the free cash flow in a little while.

Looking at the income statement through a slightly different lens, broken down into its parts. There's the revenue growth again. Gross margin, improving somewhat, the gross margin percentage, and actually quite pleasing when you consider that we highlighted the Civil Aerospace drag on gross margin in the first half of 2019 due to the mix of shop visits, and I'll come to that point shortly.

Commercial and admin costs, I'll talk about this, probably the one more disappointing number in our results today. We want to make more progress there. We expect to in the second half and even more progress in 2020. R&D costs are up slightly, but at cash cost, they come down because we're capitalizing less R&D than we did previously, just to explain that number.

There's the profit growth. The financing costs, that includes the first-time inclusion of the costs attached to the IFRS 16 inclusion for the capitalized assets, which come into our accounts for the first time as from January. And there's the cash flow number down at the bottom there and cash flow per share.

So looking at the -- on our revenue streams and the mix of revenue streams. All revenue streams growing nicely. I think probably what's most encouraging, LTSA service revenue, high-margin business, growing very well, 14%; organic change of 13% revenue growth. Service revenue is still growing nicely as well. A lot of this is the time and material type of revenue in Civil Aerospace on some of our older legacy engines. But OE revenue is growing at 4% around deliveries in Power Systems and Civil Aerospace.

And looking at the mix of our revenues. We now have 54% of our revenues as service revenues, and this is going to be a growing proportion of our revenue base as well. So higher margin and growing proportion of our revenue mix over the next 5 years.

So the progress on our key levers. Now these are the key levers that we called at our Capital Markets Day pretty much this time last year. And we highlighted 3 core drivers that between them would contribute GBP 1.75 billion of incremental cash flow to Rolls-Royce in the midterm.

Those 3 core drivers are: first of all, reducing the loss on the engines -- on the unit loss on each engine that we sell in Civil Aerospace, wide-body engine deficit reduction; secondly, the improved aftermarket cash margin, the receipts that we collect from our airlines in advance of the shop visits and the margin when you compare the costs, the receipts against the cost, and I'll show that in a second; and then bending the fixed cost curve, bringing down the proportion of our revenues that we put towards R&D, CapEx and commercial and admin costs.

Progress achieved against those targets on each of those. I'm going to go through the detail of them, but in short, we've seen a GBP 50 million benefit in the half on the OE deficit reduction. We've seen a further GBP 100 million benefit in the improved aftermarket cash margin. And we continue to bring down the proportion of costs that we're applying to R&D, CapEx and commercial and admin costs.

So a bit more detail on each of those. First of all, so GBP 200,000 improvement per engine, that's half year on half year. That's GBP 1.5 million to GBP 1.3 million half year versus half year loss per engine. Over 250 engines, that gives you your GBP 50 million benefit in the half year.

And you can see the wide-body deliveries, 257 delivered. We've put 14 in there, that's made up of 239 installed and 18 spare engines, 1 spare engine lower than the first half of last year. And I'll come back to that 18 number when we talk about the second half and what's anticipated there for spare engines. But we've also highlighted 14 engines here that have been shipped. They're sitting on the assembly line of the airframers. So that's part of our inventory build, this inventory that's just waiting for -- ready to be invoiced. We've got a further 36 completed engines in inventory, so 50 in total. At the end of the year, we'll be closer to 15, so I'll come back to that number shortly when I explain the inventory build.

Looking at the top right, a very nice and successful transition to the Trent 7000. So just comparing first half last year with first half this year, we invoiced 41 Trent 700s pretty much coming to the end of its OE life. But starting its OE life, the Trent 7000s, 61 -- sorry, 54 Trent 7000s and just 7 Trent 700s. So a very successful transition to that new engine.

Bottom left there, engine sales volumes. You can see how the mix is changing. These big 4 engines are going to dominate our OE production in Civil Aerospace over the next 10 years, which will shift -- make for, I would hope, a better coordinated supply chain and assembly line in Civil Aerospace as well and the benefits that will come from that. And there on the bottom right is the improvement that we've made over the various halves on the wide-body average loss per engine.

The aftermarket cash margin. The biggest single driver of our cash flow growth in the midterm is going to be the aftermarket cash margin. Remember that GBP 750 million aggregate improvement compared to 2017. In the half, we saw a GBP 100 million improvement half year versus half year. And what this chart does is highlight the income that comes in, at the top half of this chart and down at the bottom here are the costs to the income, is driven by the size of the installed base. The flying hours that, that installed base generates, 6.9 million engine flying hours this time last year, 7.5 million in the first half this year. That's an 8% growth. We're pleased with that growth. And that comes on the back of, if you recall, the 20% growth in the first half last year. So 20% and then 8%, that's 2 periods of good growth, driven by the installed base, the size of the installed base, but also the increased utilization of our engines as well. Being newer engines, that's an important factor in this one.

And then down below, what's the cost side of the equation? It's the cash costs, an important difference here. This is the cash cost of the shop visits that take place during the period. So in the first half last year, we had 137 major refurbs; and 141, pretty much the same number. These are the scheduled shop visits that take place.

The check and repair though, a very different dynamic. About 20% growth in check and repair visits. Shorter visits often at customer request and a big growth there in that. And that's driving the 18% growth that we're seeing in the long-term service agreement revenues in Civil Aerospace. That's the driver of that growth, not the engine flying hours itself. An important point on this one, we recognize the revenue and the profit in the aftermarket when the shop visit takes place. We're collecting cash all the time. We recognize the revenue and the profit only when the service takes place. That's why the volume of shop visits is an important dynamic.

One thing -- one more thing to say as well about this. Gross margin will be highly dependent period-on-period by the mix of shop visits that take place in the reporting period. In the 141 shop visits in the first half of this year, we had a lot more Trent 900 and 1000 visits than we had, say, 700 visits in the mix this time last year. 700, higher-margin business; 1000, 900, less good. And that explains the gross margin impact that we called out, the net potential negative gross margin in the aftermarket cash margin.

So GBP 100 million improvement in the underlying cash margin. Typically, we're expecting anywhere between sort of GBP 150 million to GBP 200 million per annum, so very much on track for the overall improvement in the aftermarket cash margin.

The third driver, bending the fixed cost curve. Core cash R&D at 6% of sales. Important to note here that we are coming out of investment cycle. We've brought to the market 7 new engines, Civil Aerospace, over the last 10 years. There's been a 70% increase in our R&D, looking at the bottom right-hand corner there, in R&D since 2010. So the 6% midterm ambition is very much in line with industry peers. If you look around, that's pretty much the industry standard, that 60 -- 6% there.

Core CapEx as a percent of sales, we've built capacity across our particularly OE line over the last few years to accommodate that ramp-up in OE deliveries. We expect it and aspire to a midterm ambition of 4% of sales. We're already in this year bringing down our CapEx by about GBP 75 million. R&D, should have mentioned, is coming down by GBP 100 million this year. That's the guidance that we've given. What you will see though in capital expenditure, you'll see a change in mix in CapEx over the next few years as we invest more in our MRO supply chain to accommodate that growing service business. That's certainly what you would expect.

C&A cost as a percentage of sales, I think this is where we would like to see more progress in the second half and certainly into 2020. And then finally, on the -- I just talk on the right-hand side there about R&D and CapEx. An important point as well is that the R&D cash cost reduction is largely driven by headcount reduction. The 1,300 heads that left the company last year as part of our restructuring, 2/3 of that were in engineering. So you would expect to see most of the benefits from restructuring that was carried out last year in our R&D line rather than the C&A line.

So -- and I should call out as well that what you will see over the next few years is R&D in Defence rising somewhat for some exciting initiatives that we have in there, largely around -- sorry, and largely around electrification, the growing investment there as well, which Warren talked about as part of his presentation.

So the progress on restructuring. The top part of this chart shows where we are year on -- for each reporting period on the gross headcount reduction, the net headcount reduction and then the cumulative at the end of the period. So at the end of 2018, we had a net headcount reduction of 1,300 heads, a gross reduction of 2,000. The first half, 540 gross headcount reduction; net 300. Therefore, at this stage, we're 1,600 heads into our 4,600 headcount reduction.

We have had some questions is that, can't you move at a faster pace? What we're addressing at Rolls-Royce is the underinvestment in technology, systems and process. And Rolls-Royce, over many years, its investment has gone into, as one might imagine, gas turbine engines. We're addressing that. So therefore, it's not so easy to take headcount out in the absence of that investment, which we're now putting back in to allow for the headcount reductions to take place.

During 2019, we will, notwithstanding that comment, see a further net headcount reduction of 1,400, taking us to a cumulative net headcount reduction of 2,700. And then in -- by 2020, delivering the full

4,600 headcount reduction. Table down -- at the bottom half of this table there shows the cash cost for each period and also the P&L charge as well. And highlighting once again the run rate savings at the period end of GBP 134 million that Warren called out.

Summary funds flow, really important slide. What we do with this table is we reconcile our underlying operating profit, the GBP 203 million that you'll recognize from those earlier slides, with the trading cash flow and, subsequently, the group free cash flow that we're reporting today. This is not the reported profit which, of course, is netted on a different base. So they have adjustments in between, we have Forex and so on, so this is the underlying operating profit that you saw in those previous slides.

Okay. So let's go through this. There are 5 key drivers of the free cash flow outflow of GBP 391 million compared to the operating profit of GBP 203 million. First of all, we do have higher profit, GBP 62 million. Inventory build, you'll see here inventory is GBP 433 million, higher than it was at the start of the year, not dissimilar though from the build that we saw to Warren's earlier comment in the first half of last year.

The Civil Aerospace net LTSA balance change, this represents the deferred revenue, the cash that we've received from our customers that we're not trading through the profit and loss account in the period. I've got a table that shows that in a second.

The movement on provisions -- sorry, I should say the change in net receivables/payables is GBP 391 million. That's almost entirely driven by the customer deposits that we saw in Defence that Warren mentioned, around GBP 300 million attached to those customer deposits in Defence, largely around 2 Ministry of Defence contracts and 1 Middle Eastern contract. So very good order wins there and the deposits that flowed with them. The movement on provisions of GBP 271 million, that's almost entirely made up of the Trent 1000 cash costs that we incurred in the first half of the year. Net interest paid and received, not much to talk about there.

And getting us down to our trading cash flows, let me just go through those key items, the 5 key drivers: the profit, the inventory build, customer deposits, the further growth in the receipts and the Trent 1000 costs. So the key drivers of the cash flow performance, underlying profit. Underlying profit across the group, clearly for the second half of the year, we're going to expect to see further improvement. If we're going to deliver our operating profit guidance of GBP 700 million, GBP 500 million of underlying operating profit expected in the second half of the year.

Inventory, down GBP 433 million. That reflects the typical seasonality and planned inventory build in Civil Aerospace and Power Systems. I've got a chart in a second that shows that detail. We expect to see in the second half of the year at least a GBP 500 million unwind in the second half. You'll recall that when we gave guidance for our 2019 cash flow, we did indicate that it would be an inventory upside or wind-down from the opening position at the start of 2019. So clearly, given that sort of GBP 433 million increase, there's a GBP 500 million-plus improvement expected in inventory in the second half of the year.

Receivables and payables, the inflow largely due to those customer deposits and advances of around GBP 300 million, driven by those recent order wins in Defence that I mentioned. Broadly neutral on trade receivables otherwise, and growth is offset by better overdue debt collection. And I have talked about this before, there's a lot that we can do on good old-fashioned working capital management of bringing in our aged debt better than we have done in the past. There's still lots of opportunity there.

Underlying increase in the deferred engine flying hour revenue, GBP 120 million. This is the contribution from the higher invoiced engine flying hours in excess of the revenue that we've recognized as our installed base grows. We recognize the revenue when the shop visit takes place. We collect the cash all the time, but only the revenue when the shop visit takes place. I've got a chart that shows this. It is lower year-over-year by GBP 175 million. That's primarily due to the absence of the material aftermarket deposits that we saw in the first half last year. We had one big customer that converted onto a TotalCare arrangement. There was a buying fee attached to that, that explains almost all of that GBP 175 million.

Provision utilization, the GBP 271 million, that reflects the utilization of the Trent 1000 exceptional provision. Total in-service cash costs were GBP 219 million. You can see the vast majority of that GBP 271 million. In the first half, it's worth highlighting that costs were not covered by a provision. We didn't have

a provision then. So those costs in the first half of the year of just over GBP 100 million would have flowed through the income statement, or the LTC balance, either of those 2. The remainder due to increased utilization of other provisions that we have around the group.

So inventory. Where does the build come from? And how does it unwind? That's what this chart does, and I'll try not to spend too long on here. There's a lot of detail in here. But in very simple terms, it's across the 2 businesses of Power Systems and Defence. So in Power Systems, there's been a build of buffer stock in India. We're moving the Series 1600 engine production from Friedrichshafen to Pune in India. We've got a joint venture with Force Motors, based down in the southwest of India. And they have partnered -- they're a partner of Mercedes, for example, a key partner with Mercedes. That comes online in the second half of the year. We've built buffer stock for that particular initiative to -- in anticipation of that move to India in the second half.

We've also built inventory for China. We're anticipating strong China sales growth in the second half. This inventory is built and in the supply chain on the oceans, on its way to China or into China, going through the supply chain, waiting to be invoiced in the second half. Very good visibility around that inventory.

Warren talked about building PowerGen systems solutions rather than moving -- changing our mix from loose engines towards a systems solutions. That has a longer lead time, for the build of those systems, and that's part of the inventory build as well. And again, that will flow through in the second half. There have been 1 or 2 project delays, particularly a large project in Chile, mostly customer-caused. And those projects, we're confident around those being completed in the second half and invoicing them.

And then finally, there were some earlier parts purchase in Power Systems to smooth the second half production as well, which will wind down during Q3 and Q4. So good visibility of how the inventory has got built, but also very good visibility of how it unwinds in the second half.

Civil Aerospace, inventory build for what we're anticipating to be a good delivery in the second half and good build in the second half, including 14 engines that are currently already on the airframer assembly line. Those will unwind, of course, in the second half. And there's, therefore, going to be a reduction of finished goods held in inventory right now. Right now, in inventory, we have 50 finished goods, 14 of which are on the assembly line. At the end of the year, we're looking -- our typical end-of-year run rate is about 15, so 50 down to 15 over the course of the year. That's, again, a key driver of the reduction. So there's a very clear pathway to reducing the inventory in the second half of the year.

The long-term contract creditor. An important point to think about the long-term creditor, this is all about revenue. It's not margin, it's not costs, it's revenue. It's the buildup of the revenue that we collect -- the cash that we collect, I should say, as our engines fly and the flying hours generate the cash from our customers. We debit the cash and we credit the balance. We started with GBP 4.5 billion on the balance sheet. We collect more cash as the half progresses, GBP 1.7 billion of cash collected. That's a function of the number of flying hours and the yield per flying hour. And then off -- we deduct from the creditor the revenue that we attach to a shop visit when it takes place.

So what we do under IFRS 15, we look at the stage of completion of the contract based on the cost that we've incurred and the cost to go. We know, therefore, what cost -- progress that we've made on the contract and we recognize the revenue that we then need to record in respect to that particular shop visit that's taken place. And we deduct, therefore, the revenue that moves then into the profit and loss account, debit this one and the credit goes into the P&L account.

There's an FX adjustment of GBP 150 million. And what this does is accommodate for the fact that you have a balance sheet here at a certain spot rate, you have a balance sheet over there at a certain spot rate, and in between, you have cash flows at our achieved rate. So we're accommodating and triangulating normally -- normalizing all of that. And there's an equal and opposite GBP 150 million that would otherwise be in the other line in the summary funds flow, but we've taken -- we've netted those 2 off for the ease of presentation.

So an important point, this is deferred revenue, reflects the difference between invoiced flying hour receipts and the P&L revenues traded. This is a piece of work that we did in April, May earlier this year,

following all the various calls that we had on this particular item and how it worked, but hopefully this simplifies it.

So looking at our balance sheet. We are well-funded. We've got liquidity of GBP 6.7 billion. You can see we've got net cash on the balance sheet at the half year of GBP 4.2 billion, debt of GBP 6.2 billion, that net position of GBP 1.9 billion. We've had a group free cash outflow of GBP 429 million. But we have got the proceeds from Commercial Marine, net proceeds of GBP 451 million. We also completed the disposal of Power Developments and that gave us GBP 29 million. We've got no material maturities coming up now until October of 2020. And we remain focused on our ambition to return to a single A rating. The drivers of the GBP 42 million higher financing cost, I highlighted that earlier on, it's the inclusion of IFRS 16 in those capitalized assets.

Our capital allocation priorities remain unchanged, a strong balance sheet and improving our credit rating, as I just talked about earlier. Funding organic investments, Warren talked much about this, to drive growth and technology leadership, particularly in the current environment of the airline industry and coming under close scrutiny with environmental concerns.

Payment to shareholders, increasing our dividend as free cash flow grows, an important ambition for us, and Warren alluded to that earlier on. M&A, we'll be disciplined and selective. I think it's fair to say that the focus right now in Rolls-Royce is driving operational improvement of our existing business rather than looking at M&A priorities.

We're committed to restoring our shareholder payments to an appropriate level over time. Free cash flow will be the key driver of growth and best indicator as the time -- when the time to do that. And we view it in the context of overall capital allocation priorities.

Business unit review, just running through our businesses one by one reasonably quickly. Civil Aerospace, organic revenue growth of 11%, good growth. And you can see that strong services growth there of 18% that I mentioned earlier. But also strong services growth in time and materials, growing at 17%, still growing very, very nicely. Gross margin improvement, notwithstanding that mix of shop visits that I alluded to earlier, and you can see the progress we've made on the operating loss.

Civil, very much moving towards profitability. We gave guidance at closer to breakeven. You never know, with a fair wind we might even see profitability in the second half and perhaps even on a full year basis, but we shall see. Lots to do still. The drivers, highlighted down the bottom there, anything else that I haven't called off. Gross profit and margin, of course, is improved by the OE losses. And what else? I've talked around those. The operating loss improvement, perhaps not as great as one might have thought. The R&D charge is higher, and the C&A cost increase is impacted by the absence of prior year credits that was in the 2018 number.

A little bit more detail, OE revenue growth. Good OE growth of 6%. Strong growth in business jets as well. These are offset by a material decline in the V2500, which is now pretty much a service revenue business for us. Services revenue growing by 18%; that 20% growth in large engine shop visits that we called out earlier. Business jets, again 29% growth, led by again the volume of shop visits but also some positive catch-up adjustments in that business.

Large engine fleet, I've talked about these numbers, up by 7% year-over-year; 8% flying hour growth, very good growth against that challenging comparison of 20% growth in the previous period. The outlook, around 10% revenue growth, Civil Aerospace, profit closer to breakeven. This is unchanged guidance from that which we gave in April this year when we gave our full year results for 2018.

Power Systems. Notwithstanding some market nervousness about these markets, very good growth in Power Systems, 6% revenue growth. Gross margin improvement and decent profit growth as well. A strong second half expected for Power Systems. Revenues will be about GBP 500 million, GBP 600 million higher than the first half as well. And a strong profit contribution from Power Systems in the second half of the year, very much a reflection of that delivery on that inventory build in the first half of the year.

OE revenue growth, 6%. Warren alluded to this and showed the photographs, strong demand for Power Generation products in data center markets. And this growth that we're reporting, despite the

nonrecurrence of the 2018 pre-buying effects on the emissions regulations around construction and agricultural markets, so very pleasing revenue growth with that potential headwind.

Services revenue growing at 7%; and an increase in the installed base, well over 150,000 engines in Power Systems. And good progress in the LTSA strategy. It's growing nicely, still only 7% of service revenues but growing nicely. And again, good order intake in Power Systems, so good confidence around 2020.

Looking a bit more, then moving on to Defence. Underlying revenue growth in Defence for -- I think the story for Defence the first half of the year are some big order wins and some big customer deposits and a good book-to-bill ratio and a good order book ahead for Defence. So a very solid performance for our Defence business. Gross profit is higher as well. Operating margin is stable despite the higher R&D spend on future technology with some good C&A improvement there.

The gross profit is hit, to an extent, by the lower U.K. combat profits, offset by benefits from the operational efficiency in our facilities. You recall the Condor investment, the benefits very clearly flowing through there to protect us against what would otherwise be dampened margins due to the cessation of the Tornado support contract.

Breaking that into a little bit more detail. Revenue growth, 4%, combat and naval growth, in particular, although lower transport volumes, particularly on the medium-range tanker transport engine. Service revenue growth of 1%. Strong order book, GBP 2.3 billion of orders coming in and a 1.5x book-to-bill. So really strong order performance in Defence in the first half of the year.

And then finally, ITP Aero, good revenue growth driven by higher Civil Aerospace OE volumes across Trent and the Pratt & Whitney programs. So the aftermarket decline is due to phasing there. And we called it out there that we've got lower high-margin aftermarket sales in this mix. So it's a mix impact in ITP in the first half of the year. We very much expect it and have good visibility around the unwind we expect to take place in the phasing in the second half of the year and maintaining our guidance at that 10% revenue growth and margin stable against 2018.

So just highlighting there that the margins are at lower levels of high-margin spare sales. That will improve in the second half. And they've got temporary OE mix headwinds that is, again, dampening the profitability in the first half of the year that will unwind in the second half.

So the guidance for 2019. Here's how we get from our GBP 400 million outflow in the first half of the year to a GBP 700 million inflow on a full year basis. Three big drivers of contribution: one is the higher underlying profit led by Power Systems, improvement in ITP Aero and Civil Aerospace moving closer to breakeven. In aggregate, contributing around GBP 500 million in the second half.

We're going to see at least a GBP 500 million unwind of those inventory levels in Civil Aerospace and Power Systems. And one point, I think, that's worth making on inventory is that we should expect to see inventory improvements and we should aspire to inventory improvements over the next 5 years. We carry GBP 4 billion of inventory on our balance sheet, which is around 6 months' worth of inventory. So there's a lot to go for in this space even after having done this unwind that we're seeing in -- that we are expecting and looking for in the second half of the year. Very good visibility around that.

And then the final piece is the GBP 100 million contribution from the growth of the engine flying hours ahead of sales. That's the deferred revenue, the long-term contract creditor growing by that much. And those are the 3 core drivers that get us to that GBP 700 million inflow on a full year basis.

Guidance. This slide is unchanged from the one that you saw earlier in the year and very much a further good step towards at least GBP 1 billion of free cash flow in 2020.

Thank you very much.

D. Warren A. East
CEO & Executive Director

Thanks, Stephen. I'm just going to make a few comments before we hand over to Q&A. And I thought we'd start with a little bit of an external perspective on the markets in which we're playing.

Top half of this slide, Civil Aerospace. There's been quite a lot of discussion about the wide-body market and its condition. So as we look forward, we look at the -- in terms of shipments of airplanes and, therefore, engines for us, we can see the airframes that we're designed into at the moment. And we can see what the airframers are predicting in terms of build rates, and that translates into an engine delivery rate as far as we're concerned. And if I'd been standing here a few years ago, you might have seen about 600 in that box. And you're looking at 500 today. That is where we are in terms of build rates.

When we analyze that, however, it is just putting into numbers what we have been saying in various investor meetings over the last year or so. After a period of ordering above trend, then we're seeing actual shipments of airframes align more closely with the underlying rate of growth of demand in the market. And that looks like about 500 engines over the next several years.

Don't forget, our installed base is comprised of the engines that are there, minus the retirements, plus the engines that get shipped in the period. And so the installed base that we expect to see in a few years' time, we can see going through the 6,500 mark in a few years' time. The 257-or-so engines invoiced in the first half of the year, offset by about 36 retirements in the first half of this year, so there's this kind of picture there. Actually, the installed base is probably the more important number for us, but we mustn't ignore the rate at which we're modernizing our fleet. That's the market environment.

In Power Systems, market environment there, I'd characterize that as what are the drivers there? And we're seeing a couple of drivers. We're seeing really environmental concern causing people to want cleaner power solutions. That's creating opportunity for us, particularly around microgrids and the like. We talked about data centers. It looks like that's set to continue for some time, data centers, and also expansion into parts of the world where we, frankly, don't have that much of a market share which we think we can go after. So those are the drivers there.

In Defence. Then in addition to the standards that you see on the slide there, which is really our key markets, I mean the U.S. customer for us is approximately 50% of our Defence business, the U.K. is approximately 25% and the rest of the world is the remaining 25%. And you can see the reasons for growth there. I think in addition, we're seeing new technologies. And particularly in the U.S., we're seeing investment now going into new technologies for Defence. And electrification plays across all 3 of these sectors. In Defence, it's much more about capability than environmental concern. So that's really the -- and I've already covered ITP Aero effectively in Civil Aerospace.

That's an external view. As far as we're concerned, we have a strategy which is unchanged. So this is a slide with which you are familiar. We think this is a framework which equips us well for the future. Activity in the first half was good in supporting these various initiatives, and I think the commentary that came out of the Paris Air Show demonstrates a healthy momentum there. So I'm not going to talk about that in more detail.

The power that matters is increasingly low carbon. We don't propose that Rolls-Royce is the panacea that's -- the company that's going to solve all the world's climate problems. We can play our part, however. And similarly, electrification is not the one answer to everything, but it will play a significant part in that. And electrification really flows through all of those boxes on the slide.

So just to summarize where -- what we're up to this year and looking forward. We broke it down. This is a slide I showed you a couple of months -- a few months ago. We look at customers, we look at technology, we look at what we're doing inside and how all of those translate into financial progress. I think we made, as I said at the start, good progress in terms of financial metrics, good progress both operationally and strategically as well in the first half.

But I stop at this point, and we'll go on to some questions and answers.

Question and Answer

D. Warren A. East

CEO & Executive Director

First one. We need to move the microphone along.

Unknown Analyst

I'd like to ask 2 questions, if possible, which are quite different from each other. Firstly, on working capital, we can have a really good go, I think, at modeling LTSA, cash profits and so on. But the, if you like, the conventional working capital, the other working capital is extremely hard to model. It's very volatile period-to-period and it was a big positive in '17 and '18. So what I wanted to ask was, what are you assuming within the GBP 1 billion free cash flow in 2020 and the GBP 1 per share of free cash flow subsequently? And are there any clues as to how we model that, if you like? What set of assumptions should we apply going forward?

And then should I ask the other question at the same time? The totally different question really for Warren is you've called out the electrification issue very early, and agree with your enthusiasm about it. The motor industry is a little bit further down the line. It's going through a big process of consolidation, JV-ing and so on, to sort of cope with the cost of that. Rolls-Royce is, if you like, medium size within the aerospace industry. And UTC and Raytheon, at least part of their rationale for their merger, is that they need to be bigger to cope with practical electrification. So where does Rolls-Royce sit in, in that? How are you going to afford it going forward? And how does that sit with the 4% to 6% R&D as a percentage of sales sort of aspiration that you outlined?

D. Warren A. East

CEO & Executive Director

Okay. Want to do working capital?

Stephen Wayne Daintith

CFO & Executive Director

Okay. So working capital, so what have we modeled for 2020? Well, I think you'll be relieved or pleased to know that we haven't modeled any benefit from either receivables or payables in 2020 in our working capital models. We have, however, modeled further improvement in inventory reductions, which, going back to my earlier comments, I think, is very attainable. In our very simple model, we have between GBP 200 million to GBP 300 million of further improvement in inventory. That's beyond that which we expect to deliver in the second half of 2019, but nothing well beyond that.

D. Warren A. East

CEO & Executive Director

Okay. And on the electrification question, well, I think it's early days at the moment. But I would point out that one of the reasons why we are so keen on the activities that go on in our Power Systems business is because our Power Systems business is exposed to applications where electrification is playing a key role today. And so I've always said that it's much better, I think, to develop our technologies, systems solutions and the like with real customers and real applications rather than develop them in a lab and then hope you can fly them one day. And that's what we're doing with our Power Systems business.

So as far as the 4% to 6% is concerned, 2 things: one, we're developing a lot of that technology on the back of existing revenue today; and secondly, I think you have to remember the context. As Stephen mentioned, we've been through a period -- a whole decade, actually, of huge investment in R&D to deliver our gas turbines that we have as -- in the portfolio today. The Pearl 15 was the seventh new production engine in a decade. And I said on the wires call this morning, that is the richest period of new engine development for Rolls-Royce in its entire history. We don't have to develop those engines anymore.

They're developed. Obviously, we're spending time and effort taking cost out of them, improving the efficiency, improving the durability and so on.

But we're already seeing the ability to basically shift resource away from those programs and deploy some of that resource. Had I had more time to talk about the last slide, I would have talked about the changing skill mix that we're looking for, different shaped engineers and so on. But basically, we believe that we can approach this problem with the resources that we have within the R&D envelope that we currently have. I mean when I say within, it will fluctuate by perhaps GBP 100 million or so in either direction, but it is quite a substantial level at the moment.

Unknown Analyst

Can I just follow up slightly on the working capital question? I mean normally, a growing manufacturer, you'd expect to use working capital a bit, although obviously you feel that you can squeeze inventory somewhat. So for our sort of longer-term modeling assumption, should we just sort of grow working capital with sales? Or do we assume that you can beat that?

Stephen Wayne Daintith

CFO & Executive Director

I think you can assume that we can beat that. And the reason why is that I do think there are opportunities, there are opportunities in receivables. I think there are old debts there to collect that run into small hundreds of millions of pounds to go for. And inventory durations, we can do a lot better on our supply chain to synchronize our supply chain than we do. Our S&OP process, sales and operations planning, is not what it should be despite all the effort that goes into it. So I think there's -- I'd point to the inventory opportunity as a way of dampening those what would otherwise be headwinds, as you've rightly point out, whether working capital outflows and challenges from the growing business.

But the one thing I would point out, it is -- whilst it's easy to model working capital, it's very difficult to know for certainty. Because, of course, you can have some big order wins in Defence, as we've seen in the first half that help, which is good news. And that's part of the characteristics of that business. So we have got a very clear model. It's largely around inventory improvement to offset any working capital drag.

D. Warren A. East

CEO & Executive Director

Okay. Going back.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

It's Andrew from Berenberg. Two questions. One on OE losses and one on Defence. So on the OE losses point, I think you said the XWB was down by about 1/3 on -- in scale terms. So firstly, how much of that was operational? And how much of that was pricing? And then a kind of follow-on from that. Overall, can you say anything about the other engine programs? Did they actually contribute? Or was it all driven by XWB?

And then on the Defence question. I think, Warren, you said several times about the profit headwinds in the Defence business being offset by operational performance in the U.S. What exactly was that? Is that just a mix? I think you said about the Tornado contract. What are we talking about, some kind of structural shift here that's just being offset by new facilities?

D. Warren A. East

CEO & Executive Director

Okay. Shall I just answer that Defence one and you can look up the numbers on the engines. So on the Defence one, I said that 1/2 the business is roughly U.S. and 1/2 -- and 1/4 is the U.K. and 1/4 is the rest of the world. We are seeing particular pricing pressure in the U.K. with single-source regulations and the like. And if it were not for operational efficiency gains elsewhere, then that would be showing through in the numbers. So that's the offset that's happening. There's more efficiency to come. We've only just

started. Our Condor program doesn't really finish until end of this year, beginning of next year, when we've got all the overhead cost out that is coming from withdrawing from the older facilities. But when that is in place, we will have executed a program to improve basically the fixed costs of running our operation in Indianapolis. And that will continue to be a benefit.

I think on Stephen's slide, there was something about profitability in Defence over the next few years. You will see a bit of investment in R&D. I talked about new opportunities in Tempest in the U.K., hypersonics in the U.K. I talked about the success that we've had with Bell on vertical lift in the U.S. There are also opportunities around B-52 that we are very optimistic we've got an excellent solution for reengine-ing the B-52. It's great that we've got an excellent solution, but we don't get it designed in without investing a little around that excellent solution to make sure that it gets designed in and then to make sure that we can produce it at a sensible economic cost. So there is, over the next several years, a little bit of a profit headwind in Defence caused by some increased R&D.

Stephen Wayne Daintith

CFO & Executive Director

But I think a key point is that Defence will remain a nicely profitable margin business for us. It's on the margin that we're talking about.

D. Warren A. East

CEO & Executive Director

No, but those OE loss reduction on XWB, yes, it is a mixture of continued removal of launch discounts from the mix and ongoing cost reduction. And XWB is the biggest driver of our average cost reduction. But those cost reduction programs are running across -- or the cost reduction activities, rather, are running across all the engine programs. And it depends whether it's a particular component change or a change in a methodology. If it's a change in the methodology, which we are introducing, creating a lot more automation in our component production facilities, then clearly that applies across all the engine programs.

Andrew Edward Humphrey

Morgan Stanley, Research Division

It's Andrew Humphrey at Morgan Stanley. Three questions on 3 different engine programs, if I may. First, on Trent 1000. As we look over the next couple of years, there still seem to be quite a few open slots where aircraft have been ordered but don't yet have engine orders attached to them. So how should we be thinking about that? Are you seeing any change in terms of customer body language around preparedness to order? How tight they can get to the delivery slot before ordering?

Second, on the Trent 7000. The A330 was a particular area, I think, where Airbus has seen some pressure from Boeing on the 787. I think you've indicated you've made some concessions on aftermarket pricing for that engine to make that aircraft as a package more affordable for customers. How material an impact on that -- on medium-term cash flow targets is that in the mix?

And thirdly, on XWB, I think we're coming up to the 5-year anniversary of some of the earliest engines in service. We should start to see material volumes coming in for first shop visits over the next year or 2. Can we draw any conclusions, I guess, from the earlier engines that are anniversary-ing their 5-year period at the moment?

D. Warren A. East

CEO & Executive Director

Gosh, 3 questions, all Civil Aerospace. So on Trent 1000, our assumptions are that we maintain the market share that we have today, that we -- which is approximately 35%. On a customer-by-customer basis, if the customer is a Rolls-Royce house, we would say we're more likely to win that, but we're not taking anything for granted. And we celebrate if there's a bit of a turnover. And I'm sure that the other guys do exactly the same. It is quite aggressive at the moment. However, if you look in the first quarter of the year, we were very successful. We took 100% of the orders in the first half of the year -- sorry, first

quarter of the year on 787s. We have subsequently lost a couple to GE. We're not surprised to lose Qatar. They're an existing GE customer on the 787. We were disappointed to lose Air New Zealand. However, it was a small volume. It was only 8 aircraft, and the customer told us there was an extraordinary offer that was non-refusable from our competitors.

And whilst -- moving on to the second bit of your question really around A330. Whilst obviously in a competitive environment, one needs to respond to aggression with aggression, there are limits of commercial common sense. And so we won't always go there. We will endeavor to be aggressive in secure business where we can. I don't think there's a material sort of center of gravity shift going on. There's always a spectrum. And we have a sort of expected business case. And we are taking some business way above that and some business way below that, and we look at it on a portfolio basis. And that applies to how we do Trent 1000 and how we sell 7000s on the A330neos at the moment as well.

And yes, of course, we have seen Boeing be very competitive towards Airbus and the Dreamliner pricing, I mean, now and giving the A330neo a run for its money. But actually, in the first half of the year, I think if you look at the mood music now compared with 12 months ago, then the story on A330neo is really very different from where it was 12 months ago.

On XWB shop visits, it's still a little bit early to draw any conclusions. The fleet leaders are -- well, the fleet leaders are getting to the time when it's due, but actually the engines are performing very well. And so they're not actually -- we haven't had as many shop visits as we would have expected so far. We do expect those shop visits to start happening as we get towards the fourth quarter and into the first half of next year. And so probably next March is a better time for that question.

Stephen Wayne Daintith

CFO & Executive Director

And just on that pricing point that you mentioned and how it might impact medium-term cash flows. Very little, is the answer because, of course, it will only represent a very, very small proportion of our installed base, which will by then be 6,000-plus engines. So a tiny impact. Margin compression on that particular engine program, to an extent, but still the volume impact will offset that of the size of installed base, the growing installed base and the flying hours and the cash that, that generates.

D. Warren A. East

CEO & Executive Director

We have some coming from online, and I'm conscious of the time and the online demand. So should we just, do you mind, just switch to online for a moment and then we'll come back.

Jennifer Ramsey

Head of Investor Relations

All right. We've got -- well, there are quite a few online. So I will do a four-part question, apologies for that.

Firstly, on free cash flow seasonality, a question about industry seasonality and why it's stronger in H2. And Airbus -- it's obviously an issue for Airbus. And Airbus have spoken about their ambition to fix it and whether or not we have any ambition around that.

The second question is on sustainable share of time and materials aftermarket growth because that has been very strong, and it continues to be strong, was strong in last year as well.

A question about our capacity. We've now spoken about delivering 500 large civil engines per annum. And previously, we've spoken about 600 and having a capacity of 600. So what would we be doing with any extra overhead recovery if we were actually delivering 500 per annum?

And then finally, on the LTSA, we have a question that talks about how quickly we would burn through the creditor. And given the fact that we've come down -- it's GBP 120 million this year, would this reduce to 0 in terms of on a 12-month run rate? The question is whether our order backlog would reduce to 0 and the LTSA creditor reduce. And if you can discuss a little bit more about the LTSA creditor.

D. Warren A. East*CEO & Executive Director*

All right. We're going to start off. Stephen is going to answer the first one about seasonality.

Stephen Wayne Daintith*CFO & Executive Director*

Yes. So seasonality, it's a good question because you can say, well, why is there seasonality in the industry? Because there isn't, engines are flying all the time and passengers are flying and so on. So why seasonality? I think it's just the nature of the industry. Just sort of, there's a -- it's build first half, deliver second half. And you'll see it's across the industry. The Airbus have the same issues. We know that other engine manufacturers with exactly the same issue as well. So that's just the natural cycle. There's no clever answer to this, I'm afraid. That just seems to be the way that the industry operates.

D. Warren A. East*CEO & Executive Director*

We'd love to smooth that out, if they want to. I think it will make a difference. And we're a supplier, so we will naturally benefit from their initiative.

Time and material is longevity. I mean time and materials contracts generally apply to older engines. And our older engine fleets, and there are a couple of portions, there's a regional fleet and a large fleet. The large fleet is about 1,000 engines at the moment. So out of around 5,000, we've got roughly 4,000 Trents and roughly 1,000 older engines. They are time and materials. And gradually, those engines are retiring.

But what we're seeing is that as older engines transition to subsequent owners, there is a greater propensity to move to time and materials or some of the long-term service agreements with Flex, with a greater proportion of a greater time and materials content even though it's a long-term service agreement. And so I think its longevity is going to be there to stay. The only thing that would destroy it is if we made our insurance contracts of the long-term service agreements so attractive, that it would wean people off time and materials. But you don't get something for nothing in this world. And if we made them so attractive, then they'd probably become less profitable for us. And so I think the mix is here to stay.

Overhead recovery. Well, I know the engine volume is reducing from 600 to 500. But don't forget, there's an installed fleet out there of nearly 5,000 engines today, large engines. Most of Rolls-Royce production facilities are used to create components. And a lot of those components are going into servicing the 5,000 engines rather than assembling the 500 or 600 engines. And so I think there's -- obviously we will, in terms of variable cost that would be dedicated to assembly, then we can respond to that change quite quickly and take the cost down. But as far as the fixed cost of installing capacity are concerned, it is mostly around the components. And so I don't see a serious issue with that.

And when we think about LTSA?

Stephen Wayne Daintith*CFO & Executive Director*

No, I mean it's a good question. As you might imagine, we model this as well. I mean essentially, it's a function of the size of our installed base, the flying hours that generates, the utilization of our engines and then we also model the shop visits that go with that installed base. And our plans assume a growing installed base. And if we look over the next sort of 5 to 10 years, a rule of thumb, a good rule of thumb is that the long-term contract creditor should grow by around anywhere between GBP 300 million to GBP 400 million per annum. That's a good rule of thumb. It can vary in that space according to shop visit experienced during the particular period.

And therefore, the GBP 4 billion will carry on growing. That deferred revenue on the balance sheet will carry on growing. That will ultimately trade through the profit and loss account in time when the shop visits take place, but it should carry on growing. So I won't put a number on it on that sort of what the number might be in 10 years' time. But if you use that sort of simple maths that I've given, you can get there. But certainly, it's not going to be winding down. It's still going to carry on growing.

D. Warren A. East

CEO & Executive Director

Okay. I think we better come back here into the room. Have we got any more online, by the way? Okay.

Harry William Freeman Breach

MainFirst Bank AG, Research Division

Harry Breach from MainFirst. Can I just pick up, firstly, just the T&M question that got asked online. Just the 17% year-on-year growth in the first half, just in terms of trends you're seeing at the moment in the shop network, are you seeing that sustaining July, August at the moment?

And then second question, if I can, and forgive me if I missed an explanation to this earlier on. But just the point of view about no longer accruing deferred tax in the U.K., a sort of a simpleton like me might assume that, that might indicate you're not assuming much taxable profit generation in the future in the U.K. Can you correct my mistake and just help us to understand a little more about why we didn't accrue that?

And then finally, again, I'm a bit of a simpleton. The hedge book, I think, in the release you said still at, what, \$1.54? We're 3 years after sterling started to crater following the Brexit vote in June '16. Can you just help me understand why the hedge book rate is still so much so far above spot?

D. Warren A. East

CEO & Executive Director

Yes, sure. The short-term time and materials...

Stephen Wayne Daintith

CFO & Executive Director

You do the time and materials, and I'll do the next 2.

D. Warren A. East

CEO & Executive Director

Yes. Okay, right. So unfortunately, Harry, that's just too short term. I'm not going to comment on that. I mean most of our day-to-day MRO discussion right now is about juggling things around to make sure we have sufficient capacity to deal with our customers that are getting disrupted by the Trent 1000 situation. And so that's our #1 sort of MRO issue that we deal with.

I think the growth year-on-year in time and materials is clearly not a sustainable level of growth. I mean all of these things will trend to the underlying growth of market demand for air travel. But you saw a little blip and it's a healthy, healthy blip that we have at the moment. And such things will happen from time to time.

Stephen Wayne Daintith

CFO & Executive Director

Okay. So the deferred tax asset. Well, first of all, what is it? So well, it's GBP 1.1 billion. That represents the tax, in very simple terms, the tax, the U.K. tax on the cumulative U.K. tax losses that we have that we will use in the future. So there's no time limit to using those losses. We will use them. Deferred tax asset stands at GBP 1.1 billion at the end of 2018.

When we look at the recovery period, in other words when we're going to recover those tax losses, it's actually a 25-year-or-so recovery period for those tax losses in the U.K. In the U.K., we make losses using a round number of around GBP 500 million. We make very good profits in the U.S. And in Germany, we get taxed from those profits in those jurisdictions. But in the U.K., pay very little cash tax in the U.K., so of course, we're making losses in the U.K.

So in order to use that deferred tax asset, we have to be making profits in the U.K. And the recoverability period for the full GBP 1.1 billion, to get full use of that, is 25 years. We took the view that it was prudent

to draw the line at 25 years. This assumption makes no change whatsoever to cash flows. It's just the effective rate of tax because, of course, when you've got a very small profit number and you're not getting any benefit for that GBP 500 million or so of U.K. losses, you're being charged on your U.S. and Germany profits, giving you a very high tax charge on a very small profit number, resulting in that very high, if not loss number, that very high effective negative tax rate, if that makes sense. I hope it does.

Harry William Freeman Breach
MainFirst Bank AG, Research Division

So would that effective tax rate be one we should model at continually?

Stephen Wayne Daintith
CFO & Executive Director

No, not at all. I mean just to put this in perspective, if we didn't have that effect, we're probably down at a 40% or so tax rate this year. Long term, what you should model, as we move into U.K. profitability, is something in the low 20s, which is really the -- what you might expect because that's a mix of the U.S. and Germany taxes both in the low 20s and the U.K. tax rate is at 17%. So that's what you should be modeling from sort of -- well, I won't put a date on it. But in the medium term, we should be modeling a low-20 tax rate. But the key, of course, is turning to profitability in the U.K.

And then the hedge book, yes, you're dead right, we did have a full hedge book of in excess of \$40 billion. We have been winding that down to an extent through natural usage. But also, we haven't entered into any new hedges in the last, what is it now, the last 8 months now. So we were already locked in at that \$1.54 rate that we're seeing for 2019 several years ago. And indeed that has been the rate in '18 and '17 as well, there or thereabouts.

You will start to see decline over 2020, 2021. And then in '22 and '23, you'll start to see, if you look at the shape of the hedge book, a sharp decline, assuming we don't take out any hedge rates. But even if we were at the forward rate, we would still see a material decline in our achieved rate. So it's going to be some time before we start to see the benefit -- the real benefit of the achieved rate being significantly lower and, therefore, taking benefit of that strong dollar. Just reminding ourselves, we have around \$6 billion of cash inflows coming into this business to pay for U.K. costs every year.

D. Warren A. East
CEO & Executive Director

Okay, thanks. I think that has to be the penultimate question, I'm afraid. So we've got time for one more because some people have to go.

No? We've got one more on -- should we do the last one from online then? Yes, Jennifer.

Jennifer Ramsey
Head of Investor Relations

Sure. Can you just quickly comment on restructuring plans? Because the results talk about exceptionals related to the June '18 restructuring plan, but there are other restructuring charges as well. Can you talk about the other restructuring?

D. Warren A. East
CEO & Executive Director

There were a handful ongoing before June. Do you know the numbers?

Stephen Wayne Daintith
CFO & Executive Director

There's no material change to what we highlighted at the full year other than an increase of around GBP 60 million in our provision for the cessation of the Airbus 380 program.

Jennifer Ramsey

Head of Investor Relations

Yes. It is related to restructuring.

Stephen Wayne Daintith

CFO & Executive Director

I'm sorry, well, we've given the numbers that we've highlighted today. Nothing to add beyond that, actually.

D. Warren A. East

CEO & Executive Director

I mean there were some ongoing restructuring programs in place when we announced the program that we talked about a year ago in June '18. And I would imagine the exceptionals being referred to are from those legacy restructuring programs that are still happening at the same time as we're doing this major activity.

Stephen Wayne Daintith

CFO & Executive Director

They primarily relate to Power Systems and our Defence business with the closure of the Oakland site.

D. Warren A. East

CEO & Executive Director

Okay. With that, I'm afraid we're out of time. But thank you all very much for coming along and for your support.

Ian Edward Lamert Davis
Chairman

Presentation

Ian Edward Lamert Davis*Chairman*

Well, good morning, everyone, and welcome to the Rolls-Royce Annual General Meeting. I hope you didn't have too much difficulty getting here. I know the traffic has been very, very difficult around Central Bristol, but very, very pleased to see you all here.

My name is Ian Davis. I'm your Chairman. And I'm joined on stage by Warren East, our Chief Executive; Stephen Daintith, our Chief Financial Officer; and members of our Board Committees, Lewis Booth, Chair of the Audit Committee; Ruth Cairnie, Chair of the Remuneration Committee; Sir Kevin Smith, Chair of our Science and Technology Committee, who's also our Senior Independent Director; and Irene Dorner, a member of the Safety and Ethics Committee and our employee champion on the Board.

You will shortly hear from Warren, who will provide a review of 2018, and then we'll move on to the formal business of the meeting. But first, I'd like to highlight a few key developments.

We entered the year with a refined vision and strategy and the determination to improve our efficiency and operating performance. During the year, we embarked upon an ambitious restructuring program and increased the focus of the group by rationalizing our portfolio and simplifying our corporate structure. Your Board and management absolutely recognize the need to improve our operational competitiveness and performance. This is an ongoing task, but signs of progress are increasingly clear.

After a period of heavy investment, we're focused on generating strong returns and the cash flow that will allow us to compete even more effectively in what continue to be attractive growth markets. During 2018, we took a significant step on this journey.

Our performance has improved significantly from the position in which we found ourselves 4 years ago and we further strengthened our balance sheet in 2018. However, it is sustainable free cash flow upon which we must base our shareholder payment strategy, and we still have work to do in order to deliver that. It remains our stated objective in the long term to progressively rebuild payments to shareholders to an appropriate level, subject to the cash needs of the business.

We did experience setbacks in the year, the most significant of which were the operational issues with our Trent 1000 agent -- engine. This has caused pain for us and, even more importantly, for some of our customers. This has been an area of continued and continuing focus and oversight by your Board. And I would like to praise the sterling efforts of our engineering and customer support teams in addressing these issues while maintaining our absolute dedication to ensuring product safety, which is and always must be our most important priority.

You will have to be relieved to hear that I do not intend to spend much time on the U.K.'s withdrawal from the European Union. Suffice to say that we took steps to prepare for different potential outcomes, with a particular focus on supply chain continuity and retaining essential capabilities. We have continued to brief the U.K. government, other governments and regulatory agencies on our Brexit-related issues and your Board is regularly updated on our risk mitigation activities. These measures remain in place today as we await clarity on the political situation.

Strategically, we continue to invest in the innovation that will help us realize our goal to be the world's leading industrial technology company. During 2018, we increased our momentum on technologies to protect the competitiveness of our core products, on digital technologies to drive productivity across manufacturing, design and services and on developing hybrid electric technologies. Hybrid electric and all-electric technologies are becoming increasingly important across all our markets. We have always pursued clean, safe and competitive solutions to deliver society's vital power needs. With rising prosperity and increased demand for power on one hand and the impact of emissions on the other -- on the climate on the other, this task is becoming more and ever more urgent. We have a crucial role to play in creating

cleaner, more sustainable and scalable path for the future. Our ability to help customers and society with the transition to lower carbon solutions is and will be a critical priority for your board.

We also understand that technology in and of itself is no guarantee of success. We must have a high-performing culture with a diverse and ambitious workforce capable of sustaining our innovation.

During the year, significant work was carried out to reinforce the behaviors that we need to foster our work environment where every employee can be at their best. In addition to generating exciting growth and technology options, we must strengthen our culture in order to retain and attract the talent we need for the future.

Delivering a long-term impact requires us to have a sustainable business and that means our commercial organization needs to be as world-leading as our technologies. Across Rolls-Royce, our immediate focus is on improving our financial and operational performance to generate improved returns. This will give us the sound and credible financial platform we need in order to remain at the cutting edge of innovation in our markets. Our medium-term prospects remain bright and our long-term growth opportunities are truly significant.

I'll now hand over to Warren to provide a review of 2018.

D. Warren A. East

CEO & Executive Director

Thanks, Ian. Morning, everybody. Thanks very much for coming along, as Ian said. Now, we -- you could be excused to thinking that we are making a bit of a habit of holding the AGM at football grounds. Conference facilities are very convenient, but there isn't really a theme here.

The reason that we're here this morning is, of course, to underline the importance of Bristol to the Rolls-Royce Group, a connection that goes back to 1966 with the acquisition of Bristol Siddeley Company. But of course, you can't come to Bristol without sort of feeling aviation and aerospace. Back to the early part of the 20th century, I'm told that Sir George White announced his intention to build a factory and build some flying machines and 5 months later, a Bristol-designed aircraft to the skies. And when I was told about that, I thought, gosh, we can learn a thing or 2 about timescales from some of our forebears.

But today, in Bristol, we have about 3,000 employees and more than half of them -- just more than half of them are associated with our Defence business. And there's really -- a lot of our Defence business happens out of Bristol: the EJ200 for the Typhoon, the TP400 for the Airbus A400M, the LiftSystem for the lift -- the vertical takeoff versions of the F-35s, and looking forward then, the Team Tempest activity around the new combat aircraft for the U.K. announced at the Farnborough air show last year. Well, the team working on that is here in Bristol. And it's also responsible in Bristol for Naval activity and, in particular, the MT30 gas turbine, which serves for a number of navies around the world. Naturally, if we look at all the support that we do to navies, there are about 17 navies around the world being supported effectively from Bristol.

Outside of the Defence realm, here in Bristol for our supply chain components and technologies for our Civil Aerospace activity and, looking forward, new lightweight components built around carbon fiber composites for really lightweight fan cases and fan blades and the like. So actually, there's a very long heritage and a very long history, but also there's emphasis on looking forward as well, and that's a good proxy for the group.

I put up this slide last year at the AGM. We had redefined our vision and strategy for the future. And this really talks about a balance between current product and services, making our operations more efficient and innovating around new products, services and technologies for our operations to make us fit for the future and create that leading industrial technology company that Ian spoke about a few moments ago.

We began 2018 by talking about restructuring the group and moving from 5 business units to 3, doing things like aligning all of our Defence activities into one business would be an example. But moving from 5 to 3 has enabled us to get close to customers, increase the pace of operation and really build a foundation to remove the unnecessary duplication, which should grow over many, many years, in our business. And

the 3 interlocking circles there on the slide represent our 3 businesses. And we're already seeing benefits of this new structure where the businesses operate within what we call a principle of freedom within a framework. And I'm delighted to see that, that's starting to bear fruit now.

If I move on as well at that restructuring, Ian also mentioned the portfolio, the range of our activities. Well, during '18, we completed the sale of L'Orange, a fuel injector business, and that enables our Power Systems business to focus on growth opportunities now and enables us to allocate capital to cool, future, cleaner technologies.

And we also announced in 2018 a strategic review of our Commercial Marine activity -- or of our Marine activity. We moved, as a result of that strategic review, some of our Marine activities to different parts of the group. So the Naval Marine activity moved to Defence. Some of our large naval engine or marine engines moved to our Power Systems business. And then that resulted in the sale of the rest of the business, the Commercial Marine activity, and that was completed just last month. So there was quite a bit of activity on tidying up of the portfolio.

And that created a great foundation. So in the middle of last summer, we did announce the restructuring that Ian mentioned. This is a 24-month program of fundamental restructuring, creating a much smaller corporate center, much smaller corporate support functions, reducing layers, removing complexity.

Now, some of that obviously results in reduction of headcount and that's always a difficult topic and a difficult thing to do. However, we have to think about the future and we have to think about the future of all of our workforce and all of our customers. And we have to fundamentally change the way we work, creating a simpler business, healthier, more dynamic, with greater productivity where you can make faster decisions, all those sorts of things, targeting really an environment where we can realize the benefits of the investments that have been made in the past and seize the opportunities now that we need to seize for the future.

One of the big changes that we are trying to make, as I think Ian alluded to, was changes in behavior. So when I talk about the way we work, I don't just mean the structures in the way the business is organized, but actually how people go about their day-to-day jobs. And it's been great to see some of those changes starting to happen during 2018. And a great example of that was how the organization responded to the challenges that we faced around the issues that emerged on the Trent 1000 engine. That's the engine that powers the Dreamliner.

Now, as Ian mentioned, many of our customers experienced severe disruption according -- as a result of that. There were all sorts of interesting facts and figures. And I went to Japan in September and I gave an interview in a magazine article and I was referring to almost 0.5 million passengers in Japan alone that had been affected or had their journeys affected by the Trent 1000. So this was a big deal and it's a big deal for our customers and our customers' customers, and we understand that.

But the good news was the organization responded in a thoroughly constructive, collaborative way. We saw new parts, new service techniques developed. We quickly increased our capacity to create small -- to create components. We quickly increased our capacity to do repair and overhaul and deal with and support our customers through that operational disruption. And we closed the year with a new design for the compressor blade, done and certified, and it's now being fitted into engines. And the health of the Rolls-Royce-powered Dreamliner fleet is now improving on a day-to-day basis.

And we haven't got it on this slide, but facts and figures around there. We had between 40 and 50 airplanes on the ground for most of the second half of last year. In the first quarter of this year, to a roundabout, now that number's between 30 and 40. Actually, it's in the lower 30s for -- at the moment. And we expect to be in single digits, which is back into a sort of normal zone for the size of our Trent 1000 fleet, by the end of this year. So that is how we dealt with the Trent 1000 issue.

Now I want to -- just a quick summary of some of the financial results. We described the year a couple months ago with our annual results as a year of solid progress, and that's because we don't want to get too excited about it. But this revenue growth, top line growth was really very strong, driven by good performance in our Civil Aerospace business with 12% overall revenue growth and our Power Systems

business with 15% overall revenue growth. And that good growth in revenue was also reflected in a healthy growth in profitability measures, albeit I know off a very small base. And that led to a doubling of our free cash flow, which is a good step on the journey to at least GBP 1 billion of free cash flow by 2020 and GBP 1 per share of free cash flow in the medium term, a good step towards those goals particularly when you take into account the GBP 430 million that we had to spend on the Trent 1000 issue last year.

Delving into some of the numbers in a little bit more detail behind those headline numbers. Our Civil Aerospace business, notwithstanding the Trent 1000 issue, aside from that, actually had a pretty good year. Very strong growth in flying hours. We now have 4,700 -- well, as of the end of 2018, 4,700 large engines in store. That's 25% greater than the number 5 years ago. They're more efficient engines so airlines tend to use them more because they're more efficient than some of the older engines and therefore, these airplanes are flying more hours a day. So that helped to drive the 14% growth you see in flying hours there.

Back inside Rolls-Royce, we worked hard on things like reducing the deficit when we supply one of these engines out to our customers. We also saw entry into service of 3 new engines in February. The more powerful version of the XWB, the XWB-97K was launched in February. And at the end of the year, the Trent 7000 is powering the new version of the A330. And we saw some important milestones during the year as well, be it 84k version of XWB past 2 million hours. It's now over 3 million hours. And the Trent 700, which powers the earlier version of the A330, passed 50 million hours and has been very successful.

And just to share that we haven't forgotten the corporate jet business. We launched the Pearl family in the middle of last year as well, the first of the Pearl engines going on a new aircraft from Bombardier. And obviously, we couldn't talk about that before because corporate jet people like to keep these things quiet until they're absolutely ready to announce them.

But moving away from Civil Aerospace, some of you might have traveled either to or from London. I found the line that comes through Bristol Parkway and will be traveling these days on these new Hitachi trains. They are powered by Rolls-Royce Series 1600 engines. Very pleased to see those entering into service. And actually, pioneering some new long-term service agreements, taking that service business model from our Civil Aerospace business and starting to apply it into other sectors.

Our Power Systems business, not only did it see strong revenue growth, but also saw strong order growth last year, driven by actually strong markets indeed, but also increasing market share, particularly in some regions like China where in order to service the expected demand that we see there, we created a new joint venture. It was launched -- about 12 months ago, the first engine was produced. And by the time, 2 months ago, I stood up and talked about our results, we have produced over 100 engines out of that facility.

If I flick onto Defence, we described that as a solid year. It was a particularly strong year in terms of order backlog and -- order intake rather to grow the backlog. So we saw orders for more F-35 LiftSystems, more EJ200 engines. We also saw design wins so -- that will lead to more orders in future with, for instance, the U.S. Navy. And we saw some new customers for the Multi Role Tanker Transport, which is powered actually by the Trent 700 engine, a Civil Aerospace engine, but still in the Defence application there. And we saw a continued success for the MT30 in Naval, MT30, again, coming out of Bristol. So that's a quick run around the businesses.

I just wanted to talk a little bit about technology investment. And I've said before, this is about both current and future. It's very important with very long-term contracts that we continue to invest in technology for current products. That investment goes into things like optimizing the designs for cost reductions so that over time, we can make more profit out of selling the same things and importantly, out of improving the in-service performance, longer time on wing. Again, this is key to driving our profitability. And you don't get something for nothing in this world. So that's the result of investment in technologies for our current businesses, and that's things like material science, design tools, production techniques and so on.

But it isn't all about current technologies. We also need to keep an eye on the future. And here's a picture of what our new UltraFan demonstrator might look like in a few years' time. This is a very significant

architectural change to our gas turbines, first significant architectural change for many decades. It's going to lead to a step function improvement in efficiency that will result in a big improvement in carbon emissions and also achieve a significant improvement in terms of noise and nitrogen oxide, perhaps 50% improvement in nitrogen oxides. The core of the engine, the Advance 3 core, we tested during 2018. We tested it at full power. It's performing brilliantly. Our people who are working on that are delighted with how that's going. We also tested the gearbox which drives the large lightweight fan at the front of the engine. The gearbox is being run up to about 70,000 horsepower and testing for that is going well also.

Now, at the end of last year, we made an important commercial decision about UltraFan which we announced in February when we decided not to take part in Boeing's new mid-market aircraft. And that was because we absolutely did not want to do anything that will jeopardize the success of this UltraFan program. And we concluded that the timescales for the Boeing project would simply be too aggressive and we would not have a product mature enough in the time line of the Boeing project. And so that's why we withdrew from that opportunity, but it doesn't in any way indicate a -- any dent in our appetite for making this an excellent product when it comes to market.

However, we have to think also beyond UltraFan. And I've spoken before about electrification sweeping across the industrial landscape. Electric propulsion is coming to the air as well. We set up a separate capability group in Rolls-Royce because we do need to adjust our skills and position our skill base for the future as well. So we created that electrical group. And by the end of the year, we have 3 programs targeted at electric flight. We have a partnership activity with Airbus, a hybrid demonstrator aimed at regional transport, and so regional type -- size of aircraft. At Farnborough last year, we announced the concept in EVTOL. That's a -- just to sort of size that, that's a hybrid concept, but it -- and it would take 4 to 5 people about 500 miles at about 250 miles an hour. So that's the sort of size we're working on there. And thirdly, a local project here, a partnership with a local company where we are targeting an all-electric flight, very small aircraft, but all-electric flight. And we are hoping to break the world speed record for electric flight with that aircraft. So innovation there for the future in electric flight.

But it's not just about flying, although that's quite interesting and sexy and you can have good pictures about it. It looks quite boring on the bottom of the -- on the bottom right of this slide there. But we are also spending a lot of time and effort investing in new materials and production techniques to make things lighter and tolerate higher temperatures and the like to make our engines more efficient. You saw on the video the little robot that you can send into engines to inspect things. And in our Power Systems division then, we're very keen on microgrids where we see great potential for encouraging the take-up or faster take-up of renewable power.

So that's a quick run around the business, a quick run around the technologies. Where are we going looking forward? Well, having stabilized the business, having built some foundations in 2017 and 2018, you see from what I just presented, we're busy targeting the future, playing our part as the world looks towards a power which doesn't damage the environment so much. We have a key part to play in that. But very much also remembering there isn't going to be a future unless we have a healthy competitive business with the right skills with -- where operational excellence is celebrated alongside technical excellence built on diverse talent. And so it's essential that in the immediate short term, we complete our restructuring program at pace, we start to realize the economic benefits of past investment so that we can seize those opportunities in the future across all markets.

Thank you. That's a quick review of 2018.

Ian Edward Lamert Davis
Chairman

Okay. Thanks, Warren. I hope that gave you all a sense of what we were up to in 2018 and the momentum in the company.

I'd now like to start the formal proceedings of this Annual General Meeting. All shareholders will have received the annual report by post or a notification by post or e-mail. That's -- it is available to view on our website. All shareholders will also have received a notice of meeting together with explanatory notes of resolutions being put to the meeting today. This was published on the 25th of March.

In line with best practice, a poll will be taken on each of the resolutions set out in the notice. The poll will be administered by our registrar, Computershare Investor Services.

Please do not complete your poll voting cards yet. I'll explain the procedure later in the meeting and I will indicate when you should mark your votes on the cards.

I now declare the meeting closed. Sandwiches and light refreshments will be available outside the meeting room in the Heineken suite. As I said, my fellow directors and I will be joining you and we'll be happy to take any further questions or comments and to chat with you in a more informal setting.

Presentation

Pamela Mary Coles

Company Secretary & Chief Governance Officer

Hello, good morning, welcome. I think we're ready to start. My name is Pamela Coles. I'm the Chief Governance Officer. We'll just start with a few housekeeping items, if we may. So I'd just like to say that there are no safety fire alarms this morning. So if anything, if you hear any alarms, please would you follow the signs and follow the staff out of the building.

The second thing I'd just like to say is that there is a safe harbor statement in the back of the slides and for those of you on WebEx, we'll come to them at the very end of the slides, so I just would like to draw your attention to that.

And thirdly, would those of you in the room please just turn off your mobile phones. Just turn them to silent, that would be great. Thank you.

So the agenda this morning is on Slide 3 of your packs, which is in -- in the packs that you've got on your chairs. So we're going to go through this morning, this morning it's being on WebEx as well. Just get to the agenda quickly.

So Warren is going to give us some time this morning. He hasn't got very long with us. So Warren is going to give us a quick presentation and then we'll have a very quick Q&A with Warren. And then we're going to go into some presentations, which will be part of the WebEx and then we'll have a break and then after those presentations, we'll have a short break and then there's an opportunity to have some Q&A in more informal sessions after that. So that's the outline for this morning.

And I'll just hand over to Warren.

D. Warren A. East

CEO & Executive Director

Thank you, Pamela. Good morning, everybody, and thank you all for coming along. So I'm going to give a very short reprise of some of what we talked about when we presented our annual results a few weeks ago by way of introduction and then hopefully we'll have 5 minutes or so for Q&A from me before we do the other sessions.

A few weeks ago, we presented our full year results and we described this as a year of solid progress, and I think it was a year of solid progress, good growth in underlying revenue, I mean, very strong growth in revenue. Half our business in Civil Aerospace, and the real driver here is growing fleet and increase in flying hours. However, good -- improving discipline around the business translated that growth in revenue into good growth in all the profit measures, a roughly 30% increase in underlying operating margin, delivering a more than twofold increase in cash flow for the year.

So we talked at length about our financial results a little while ago, and I'm not going to really dwell on that much more. It was good to see, however, the results being delivered right across the business.

So in Civil Aerospace, the engine flying hour growth up 14% year-on-year, a key driver of top line. But internally as well, we worked hard on reducing the loss that we make when we sell every large engine, and that loss reduced on average across all the engines shipped last year from GBP 1.6 million to GBP 1.4 million.

We also launched 3 new engines in our Civil Aerospace business during the year, the 97k version of XWB, that's on the A350-1000. And at the end of the year, the Trent 7000, which goes on the new Airbus A330. And in the middle of the year, we launched the Pearl 15, the first of what we hope will be a series of new engines for business jets.

The year was dominated by commentary and news around how we were dealing with an issue on the Trent 1000, which powers the Dreamliner. And we did have an issue there on the compressor section of that engine, and good news is that by the end of the year, we had turned the corner on that and we now foresee a gradual decrease in the number of aircraft on the ground.

Now I know there was a little bit of news yesterday -- that broke yesterday around the high-pressure turbine section of the TEN version of that engine. And if anybody wants to ask me a question on that later, please ask a question on it and we'll deal with it then; otherwise, we'll be here all morning.

Power Systems. Power Systems is about 25% of our business and we saw excellent growth there, driven admittedly by some buoyant markets, particularly in PowerGen, but we also saw new product introductions, growth in service revenues and some encouraging long-term service contracts being signed.

Our Defense business saw a solid year, very pleasing increase in order backlog in defense and some strength right across the defense portfolio. It was particularly pleasing to see in the middle of the year us being part of the new group of companies engaged with the U.K. Ministry of Defence on their Team Tempest Program, which is next generation of combat aircraft, being contemplated by the U.K. Ministry of Defence.

Back inside the business. In the middle of the year, we announced a restructuring program, targeting a GBP 400 million per annum cost saving, targeted mainly at commercial and administrative type areas, removing duplication and the like. I'll talk a bit more about that in a moment, but at the end of the year, we were on track for our objectives set out there.

And bottom of the slide there, I talked about finances before.

So let's look forward for a bit, our long-term vision. And you've seen -- or some of you have seen this slide before. I'll start at the bottom of the slide. Our business is now simplified into 3 businesses. So our Civil Aerospace business, otherwise known as commercial aerospace by some companies, that's about half of our business. And it is a very long-cycle business. And the sums of money involved in investment programs are very large. So it's essential that we have a balanced portfolio from a financial point of view with shorter-cycle businesses and stronger, reliable cash flow. And so 25% of our business is in Power Systems, much shorter-cycle business, 25% of our business in Defence, where we have very reliable steady cash flow. So that gives a balanced portfolio, which is a firm platform.

But looking forward, there are some inescapable trends and observations to make about our business. First of all, we need to vitalize our existing capabilities. We have grown market share in all of these sectors over recent years and we spent about 2/3 of our R&D money on making sure that our existing product portfolio continues to be refreshed and maintains our competitiveness. And we'll talk about that a little bit more as we go on.

Other inescapable trend sweeping right across the industrial landscape is electrification. Now we need to move away from connecting things by mechanical shafts and improving our environmental footprint with an electrification, whilst maybe not the panacea, is certainly a serious contributor there. And when Paul talks a little bit about innovation shortly, then I'm sure he will cover some of that.

In terms of how we go about doing our business, another inescapable trend is digital technology. And we are busy embracing digital technology, just the same as everybody else to maintain our competitiveness. And that translates into transforming how we do our business from both a production point of view, and the picture is obviously interesting from a production point of view, but also more importantly, perhaps in the way we work and when Harry talks a bit later about some of the changes we're making around culture then that's also about transforming our business.

So little lead in there to how we change the way in which we do things. First of all, structurally, this is the new structure that we announced in the middle of last year. And the idea here is to, as it says at the top of the slide, really create conditions for our businesses to be successful and solve problems themselves. We're seeking to remove duplication and unnecessary bureaucracy that exists within the group by empowering our businesses, giving them freedom within a framework. And as such, we then hope that our businesses can deliver improving returns, not hampered.

So the diagram on the right-hand side of the slide shows a very lean head office and this is a substantially reduced section and that's supported by Group Business Services, which is really in 2 parts, the traditional Group Business Services, transactional services that run across our businesses, but also what we call our Innovation Hub, which is about having part of the group that is very lightweight, that supports the businesses with underlying technologies and strategies that are perhaps beyond the investment horizon of individual businesses, but necessary for the future success of the group.

So Group Business Services and Innovation Hub are 2 parts there supporting our 3 businesses and they're drawn as 3 interlocking circles because of the collaboration that exists between the businesses. For example, service models switching between Power Systems and Civil Aerospace; technologies and supply chain switching between Civil Aerospace and Defence; and similarly, common customers existing between Power Systems and Defence.

So talking about that Group Business Services and the Innovation Hub, obviously, we spend a large amount of money on R&D every year. And as I said, a good proportion of that is about revitalizing and vitalizing our existing portfolio. Some of it is about the future, however. And so we're continuing to make progress at the moment on the next generation of our gas turbines. This is the first serious architectural change that we've made to our gas turbines for about 60 years. So it's absolutely vital that we continue to invest in this technology to make sure we have a competitive solution, which just, as it says up there, 10% more efficient than Trent XWB. Trent XWB is the most efficient gas turbine on the planet today.

And by changing our architecture, we're aiming to get at least 10x more efficient and that means 10x cleaner in terms of carbon emissions, and also, we're addressing nitrogen oxide emissions and noise. So that's a serious development.

But looking further beyond that, I mentioned electrification and our developments in bringing electrification into the world of aerospace. Again, Paul will talk a little bit about this in future, but the futuristic image at the top there is showing some distributed electrical propulsion in an aircraft, taking another step forward in terms of efficiency beyond the architectural change that I just talked about.

And our Power Systems business, the picture at the bottom here, refers to the fact that we have launched some new products in microgrids. I mean, the electric or hybrid aircraft that I referred to a moment ago is essentially a flying microgrid. And so why not have the technology on the ground as well. In fact, we're developing it on the ground and then translating it into the air.

And then we're talking about how the Innovation Hub also serves the rest of the business in terms of bringing underlying technologies that then get turned into products and services.

So building beyond breakthrough in 2019. This is the slide that I put up at our annual results, just laying out what are our key priorities for 2019. There is a near-term mission, of course, to make this business perform. And so when I talk about on the right-hand side, financial progress, this is the acid test of, are we actually making progress? We need to continue to improve our underlying cash flow and performance of the business, and we have been fairly explicit about near-term targets of more than GBP 1 billion of free cash flow in 2020 and we have reasserted our confidence in achieving that a few weeks ago with our full year results.

And we also talked about a slightly further out financial measure, getting to more than GBP 1 per share of free cash flow in the medium term, and I'm comfortable that the market seems to have interpreted that medium term as around the 2023/'24 time frame. That will, of course, enable us to continue to strengthen our balance sheet. And that combined with discipline around the capital allocation builds us a resilient financial platform to take the business forward, so that we can continue to service the growing fleet that our customers use.

We can -- in '19, we need to make sure that we increase our production volumes, that growing fleet needs more spare parts, the fleet is growing at a faster rate, so we need to supply more new engines. And during 2019, we aim to make a lot of progress in terms of mitigating the disruption that we suffered last year around the Trent 1000. Paul will talk more about technology in a few moments and Harry will talk more about our people and culture and the activities that we're engaged on there.

So with that, we have a few minutes in the agenda, I think. That is probably the fastest presentation I've ever done in this sort of forum. I've never actually been on time before, but there is time for a few questions. But we're very happy to move on if there are no questions.

Question and Answer

D. Warren A. East
CEO & Executive Director

Yes, we got 1 question.

Unknown Analyst

Can we talk about yesterday's news that...

D. Warren A. East
CEO & Executive Director

Yes, right. So yesterday's news, yesterday's news concerns the high-pressure turbine area of the Trent 1000 TEN. And when the TEN was launched, the high-pressure turbine blades were launched with a limited life because we already recognized that these blades when they are subjected to at high temperatures and they were rotating very fast, effectively, they sort of stretch and cracks develop. And what you want to do is make sure that you can contain the temperature and contain the material so that the cracks develop at a rate which gives a life for the turbine blade that is within the normal expected life of the turbine blade. These things are consumable parts in a jet engine. And what's happening is that they're actually being consumed a little bit faster than we anticipated when we introduced the limited life on those parts. This has been observed as part of our normal inspection regimes. It's been observed with some airlines, notably Singapore because they have large -- larger fleet of these engines. And also because they have particularly arduous mission, which accentuates this issue. Now it is a known issue. It's one that, therefore, we were addressing. And obviously, at the moment, we are working hard with Singapore Airlines and we're investigating to see how many other airlines may be affected by this earlier-than-planned cracking of the blade. What it may mean is that we have to replace a load of blades sooner -- load of turbine blades sooner than we would otherwise have expected on the engines that are deployed by some of our airlines, the airlines that use the engines in a way that exposes them to high temperatures, which causes the crack to propagate faster than expected. It's a known problem. We expect to be able to manage this problem with the normal service operations within the cost limits that we talked about a few weeks ago and within the timescales that we talked about a few weeks ago. And the new design of turbine blade is in progress, it's being tested at the moment, it's being live tested. It's making good progress through that live test. And it will be available towards the back end of this year, as it was always going to be available towards the back end of this year. And so aside from the incremental disruption to some of our customers, which obviously we express a lot of regret to those customers and we work very closely with those customers to minimize the disruption that's caused by this, we expect to be able to contain the issue. It's in no way related to the issue that was highlighted last year around the compressor, it's a completely different part of the engine.

Any others? One more. Yes?

Unknown Analyst

You mentioned Warren the drive to [indiscernible] the individual businesses.

D. Warren A. East
CEO & Executive Director

Yes.

Unknown Analyst

How do you make sure you get the balance right between [indiscernible] the individual businesses? And yet retaining good oversight?

D. Warren A. East
CEO & Executive Director

So this is down to the way that we manage sort of leadership across the group. And it starts with our executive team and the 3 business leaders are peers as part of our executive team. And when I appoint people to our executive team, they're told you're an executive of Rolls-Royce first and you happen to be assigned to running the Defence business, or you happen to be assigned to running the Power Systems business or you happen to be assigned to running HR. They are peers as a unified executive team, and we work on issues together. And that propagates down to the next layer of our enterprise leadership group, where again we encourage lots of working between the businesses as peers, as executive leaders of the group.

Final one, I think.

Unknown Analyst

Can you talk a little bit about incentives and how you're thinking about driving incentives through the organization under the new structure? So you talked for example about certain measures like CF ROI, like cash per share and I'm just wondering how you think about -- how do you sort of organize the entire group around certain measures?

D. Warren A. East

CEO & Executive Director

Yes, well, I mean, some of it is about communication and making sure that people across the group are aligned behind those measures, understand the importance and the interrelationship of those measures. And you can incentivize all you like, but you actually need people to sort of understand it. To the extent that some individuals will be a little bit more incentivized by financial reward, of course, we align our financial rewards behind these as well. Now for the time being, our senior managers are all incentivized around, and there is a serious emphasis on cash flow, but of course, that is balanced with profit. And I think when Ruth talks a little bit in some of the breakout sessions about remuneration, you'll also see how that's joined up.

All right. Thank you very much.

Presentation

Ian Edward Lamert Davis*Chairman*

Well, good morning, everyone. I'm Ian Davis, I'm the Chairman of Rolls-Royce, and thank you for taking the time to be with us.

You will have heard from Warren a brief summary of the business. And I do just want to say although the focus of this meeting is ES&G, the absolute priority of the board is to ensure the financial and operational performance improvement in the company to get to where we can and we should be, but also to ensure that we're making investments in building the organization capacity to position ourselves for the future.

And at bottom, I've said this before and I'll say it again, Rolls-Royce is a growth company in a growth sector. And we have to take our fair share of the financial rewards as well as the business opportunities of that.

So I hope what Warren illustrated and the reason we started off with the business, this is about performance, it's not about governance, it's about performance. And I'd like to just say a few words in that context about the role of governance or ES&G in terms of performing. I sometimes fret that governance in the debates has got divorced from performance. My philosophy is that they are the same. They are 2 sides of the same coin, except to me, governance, in particular, is more about the sustainability of performance. Those of you that work in the sector would know there is very little academic evidence that links narrow performance and governance strength, but there is a lot of evidence suggests that well-governed companies continue into the future much more enduring and we can see high-performing companies with weak governance sooner or later crash and burn and all of you will have your own example.

So the way I think and the board thinks about governance, it is actually a performance tool as well as something that it allows you to fulfill your obligations to society, to investors and your employees and so it's an integrated part of the way we try and see things.

I sometimes fret that ES&G are linked together, environmental and social issues are important and governance is a different type of issue. You think about boards, you think about systems or controls, you think about cultures where E&S are specific issues, but nevertheless, we'll go with the Zeitgeist, ES&G is the way it is and that's what many of you folks saw and that we will try and cover each of those 3.

I'd just like to say a few words about governance and about what Rolls-Royce is doing to strengthen and improve its governance systems. And I hope you will understand, they do it in the philosophy, this is part of a high-performing company, a high-performing culture that's going to be around in 20 years' time, which we absolutely intend to be.

So let me just say, in terms of governance, you can either think of it in terms of legalistic framework, what the FRC is saying and all the rest of it. We do look at that very carefully, Pam is going to talk about that and we're very, very mindful of regulatory and social trends, not just in the U.K. by the way, but also across the world, though I think it's fair to say that the U.K. is probably more active in this space. But fundamentally also, what are the underlying trends that are coming from investors, from employees, from customers and society. And our view is that there are 4 or 5 trends that are not going to go away. These are enduring trends that they've been building over time. On the whole, I think these are very welcome trends. I think they're good for everyone. And our philosophy is not trying to react in the context of regulation, but try and get ahead of them. How can we actually just get ahead of these trends and be the innovators that we want to do in everything that we do.

I won't spend too much -- the issue will be familiar to you, and many of them came from you, but I just want to just put them down, that there is this focus on purpose, culture and risk. You can be cynical about it because people talked about that a lot, and Drucker talked about that a lot 30 or 40 years ago. These

are enduring trends, these are not new, but they are -- if you're a cynic, you could say they're coming back into fashion. I personally think people are realizing just how important they are.

Risk, I think has got a bit lopsided. Everyone talks about risk. No one talks about opportunity, and you have to look at risk in relation to opportunity. Purpose and culture, the Zeitgeist words at the moment. I don't think that's going to go away. I call it democratization of the company. I think this is an enduring trend across all societies, including Asia, that workforces expect to be more involved in the companies or the organizations that they work for. I think this is an entirely welcome trend. I can't talk about how responding to that, not something to be resisted by boards, but to be embraced. So for example, I'm not hostile to the idea of workers on boards, it may not work, but I've seen it work for us or in the U.K., but I've seen it work in Denmark and in Sweden. And so the attitude of the board is not to dismiss any idea around these things.

ESG, it's absolutely -- again, those of you in the room, this is going to be a big, big trend, even in the U.S. if I can say that is where they're beginning to get quite interested in this because they see the link to performance, they see the link of the relationship of business to society. And if business doesn't have a good relationship with society, we will not perform, we will not be able to do what we're meant to do.

Financial audit. This isn't a -- you could have just said this is just Rolls-Royce saying, and I would understand that, but I think all companies, particularly in the U.K. and in the U.S., this is not going to go away. The truth everyone talks about too big to fail. No company can fail without somebody saying there's an audit or a governance failure. That's reality, and as failure is a bad thing, even though we were taught that failure was part of how markets work, the reality is society thinks of failure, there must have been an audit screwup, there must be a governance failure. That's not going to go away. And so we are going to respond to a need for increased scrutiny of audit finance and indeed ethics as well. There is tremendous focus on ethical behaviors across companies.

And finally transparency of everything. This is the most dangerous of all. I think on the whole, transparency is thought to be a good thing. But when it is bogus transparency or partial transparency, this can be incredibly dangerous as well. But nevertheless, I think we all think as a board, this is a trend that is not going to go away. People expect more. The role of social media, the expectations of younger generations is they expect people to have access to these things.

So this is the way the framing if you like of the key governance trends, and the philosophy of our board is, let's get ahead of those trends, not wait for the regulators, not lobby, not argue, and all the rest of it, engage, and I hope you realize we are trying to engage with all the regulatory bodies in the U.K. and indeed in the U.S. and where appropriate in Germany and countries like that, but we really want to try and get ahead of these trends so that we can get a bit of a march.

And if I could just pick 2 or 3 examples of how as a company we're trying to get ahead of the trend, and I'll just say a little bit how does it influence how I think about board composition as just one specific example.

So if we take democratization of the company and board, we talked about how can we get the workers' voice and I don't mean just the union's voice, I mean, the workers' voice. People who actually work for us a bit more visible in the board, there are 2 or 3 ideas we're experimenting with. First, we'll have you hear from Irene who is our designated workforce -- worker representative on the board. She is a board member. She'd say she is also a worker as well, which she most certainly is, a very hard worker too. But this is an innovation by U.K. terms, it has somebody who gets out, meets across the world with the workforce, engage them, listen their views, talks not just to unions, and that's proving very, very successful. And from a board point of view, incredibly enlightening as well. We are hearing things that we would never have heard or seen that are more than just anecdotes.

We've embraced on democratization and meet the board philosophy. So whenever board members go to a subsidiary or an operating unit, which we all do, all board members are expected to visit at least 1 and preferably 2 companies across stint, they will have a meet the board event with the workforce. So you get that Q&A open, that's partly to demystify the board. So a lot of workers think of boards as having some weird people, who want to sit there sort of plotting things. They only realize when they talk to you, "Oh

you did what I did 30 years ago," just the right fact of engaging when trying to create an open dialogue and the best way to do that is through people, so we have a meet the board culture.

And we're also trying to get more employees involved in the board, so you will be listening to Summer, who is a board apprentice. Many of you know that Rolls-Royce has a history of apprenticeship, but we're very keen that apprenticeship isn't just 15-year-olds with spanners learning to be great electrical engineers. It's a concept. All of us in this room could be apprentices and we're trying to use apprenticeship as a concept to build the capability of the company. And we have a board apprentice team, 6 of our highest-performing -- 6 to 8 of our highest-performing young managers apprentice themselves through access to a board member, board relationship and attend nonconfidential board meetings. So I hope that just gives you a flavor of how we're doing on that.

On the financial audit and ethical integrity, I won't go into the detail. That's been a huge issue for us. We have an extraordinarily complicated set of financial systems, which we have managed to make even more complicated ourselves. We're trying to work very hard on that, and we are going to -- that will be one area we're increasing board reps that have skills around that area. So building deep -- bringing in deep financial audit skills will be another way to help deal with that. So that's an area where a governance approach would influence how we think about board composition.

And then just finally, if I can just talk about transparency of everything. I hope you will have seen in our -- what we write and what we say that we're trying to be more open as a company, we welcome it, we learn from it. But also even this meeting itself is an attempt at transparency. It's a danger that -- we just get happier and talk, but in reality it's an opportunity for you to talk to us, to ask us, we got 6 board members here. So I do hope that you will treat this as a transparency opportunity, just to lobby us afterwards, talk to us, ask a question. So this is all part of intent for us to be more open with our investors, our workforce, our customers and with society in general.

So that's just a few words that frame the philosophy of what we're trying to do. We're trying to innovate and do specific things around each of these areas in addition to absolutely following and being best practice citizens on all regulatory and other requirements.

So just with those few words of introduction, I'll now hand over to one of our board apprentices, who's going to talk a little bit about the role, but also I'd just say, do please, any of you that want talk to me or any of the board members, just find me, and if you don't get to talk to me, just drop me an e-mail or give me a call if you'd like a discussion.

Summer Smith

Vice President of Talent Management and Diversity & Inclusion

Thank you, Ian. As Ian said, my name is Summer Smith and I have the privilege of being a part of the Board Apprentice Program. We are about 6 months into the Board Apprentice Program. And through that process, it's an 18-month program. It's the second time the program has been run and actually, there is quite a lot of lessons learned from the first one and structure being changed from the first program. There are 6 of us that go across all business areas, and we have been participating since November in this program and focusing on attending multiple committees, as Ian said, focusing on where the committees are not confidential. You'll see that atop here, looking at audit, safety, ethics and sustainability and science and technology.

The first 9 months, we participate in one of the committees and then the second 9 months we participate in another one. And it's designed, me for example, coming from HR, I go to a committee that's not linked to what my day job is starting with audit -- or starting with science and technology, and working with Paul on that committee and then rotating the one that's more akin to my day job like safety, ethics and sustainability.

We also attend some of the other committee meetings as we're allowed to, to get exposure to the range of things that the board work on and what they do and looking at the key trends Ian talked about when he talks about workforce engagement and transparency. I have been absolutely shocked at how much we get access to. It is very beneficial for all of us. Many of us interact with the board in our day jobs, but many

of us would never have the opportunity to see the breadth of responsibility the board has, how they use governance to drive performance. And a big important part that we've always looked on is just listening to them and how they make decisions. This group of board members has been very transparent and open with us, and that's been a very valuable part of the 6 months of the program.

Additionally, we also have executive team sponsors. So I -- for example, I'm assigned to Harry and we review our learnings within the program. We also attend additional board events like the AGM and meet the board, which Ian has referenced.

And lastly, we attend master classes and those range from looking at board evaluations to what are key topics that have happened in the last couple of years that the board looks at. And as a manager -- high-potential manager in the company, having this very unique opportunity, having a small group of 6 in a very intimate setting with this group of board members will be very invaluable in my development and one of the best programs that I have been on. And I'm very excited for the year ahead to continue that learning and also pay it forward for the next group that hopefully comes in, in terms of what can be improved and what's been the best part of it. But I do see it as an absolute privilege in living up to the key trends that Ian has referenced.

So with that, I'll hand over to Pamela.

Pamela Mary Coles

Company Secretary & Chief Governance Officer

Thank you, Summer. That's just a picture of our 6 Board apprentices that we have this year. So I'm only going to be up here for about 30 seconds because actually my corporate governance report is in this book which you've all got and it would take me quite a long time to go through that. So I was really just going to say that, as we know, there's been a lot going on in the corporate governance space in the last year. So we have reported and we are fully compliant with the 2016 corporate governance code but we've tried to report in the spirit of the 2018 corporate governance code in our annual report, which hopefully if you haven't had too much chance to read because it only came out last week, you will have a chance to read in full when you can't sleep at night. We have as a Board -- that we've taken the Board through quite a number of initiatives, the new initiatives that were in the 2018 code and we've reported in the spirit of the code. And we spent quite a bit of time on stakeholder groups and if you get a chance if you look at Pages 66, 68, we've got quite a stakeholder engagement map that we've put in there and there's more details on our website. So I'm not going to say any more about that. In the Q&A sessions. I'm happy to say more about that at any time, I'm also happy to take any calls at any time during the year or if anyone has any questions in advance of our AGM then please do just give me a call or anyone in the team. So that's all I'm going to say. And I'm going to hand onto Lewis Booth, who is Chairman of our Audit Committee, who's going to just say a bit more about that.

Lewis W. K. Booth

Independent Non Executive Director

Thank you. Good morning. It seems to have been another busy year in the Audit Committee. So I thought I would just try and summarize the things we've been considering during the year.

First of all, we completed the transition to PwC as our new corporate auditors. And they've done a good job during the transition, including shadowing KPMG at the end of 2017 when they rid themselves of nonpermitted work. We benefited from having a new team auditing us, but I have to say there's been a lot of additional work during 2018 to make sure we didn't see any reduction in audit quality. So we did an extensive review prior to the half year results. We did a full balance sheet review in the second half of the year, we had a hard close in October to make sure that they and us were doing the things that we needed to do and that all led up to the completion of the 2018 year-end accounts.

In addition, the FRC completed an audit quality review of KPMG's audit of our 2017 accounts, that was their last piece of work for us as our auditors. The AQR identified a couple of estimation -- a couple of areas of estimation risks and we reviewed that with PwC in detail before we closed the year-end accounts to make sure that we had learned the lessons from the 2017 AQR.

2018 was also the first year that our accounts were prepared embodying the new standard of revenue recognition IFRS 15. I'm glad to say the company have done an enormous amount of work preparing for that, so the transition went pretty smoothly. There were a couple of issues that we went through and the company reviewed that with us and we agreed the appropriate treatment. But I have to say it went much more smoothly than anticipated in recognition to the company for the work they did.

A key part of the role of the audit committee is to review the judgments made in our long-term contract accounting, particularly in Civil Aerospace. I wanted to just pick out 3 highlights, I guess, you'd call them, things we spent special attention to during 2018.

First of all, the abnormal cost on the Trent 1000 issues. We established a set of ground rules on when to treat unexpected cost, including significant disruption costs as abnormal costs and reviewed these at half year and the full year. Only the Trent 1000 was affected with abnormal costs. We also examined the impact of the curtailment of the Airbus A380 program. The exceptional costs associated with the reduced production period were reviewed and subsequently excluded from underlying performance. We also did a thorough review of our contracts to satisfy ourselves that we've made provisions where any contracts were judged to be onerous. The company continues to implement the rewire program, and we reviewed the criteria for classifying costs as restructuring costs and then excluded them from the underlying results.

And finally, we continued to review the risk management process as well as the 3 specific areas of principal risk that are allocated to the Audit Committee, those are business continuity, IT vulnerability and market and financial risks. We believe that the risk management process is being successfully embedded into Rolls-Royce and it's increasingly being factored into the decision-making process.

And with that very quick summary of what we've been doing in the Audit Committee, let me hand over to Sir Frank Chapman on Environmental.

Frank Joseph Chapman

Independent Non-Executive Director

Good morning, everyone, and welcome. Let me add my welcome to those of earlier. I'd like to introduce myself Sir Frank Chapman. I'm a nonexecutive Director and also the Chair of the Safety, Ethics and, as recently added, Sustainability Committee. I'm joined this morning with by Sir Kevin Smith, who's Senior Independent Director and Chairman of the Science and Technology Committee; and Paul Stein, who is the Chief Technical -- Chief Technology Officer. He's also the Chief Technical Officer as well. But -- and together, we're going to attempt to answer your questions later on in the breakout sessions in the areas of environment and sustainability and there are 1 or 2 other areas that we might like to think about in that.

Now remember when we speak about -- we speak about environment and sustainability, we could also drop that into 2 large buckets. The first bucket is we, of course, have an ongoing business. We manufacture products and we sell these products, and there's no time to stop actually when you manufacture and market these things to stop thinking about environment performance and actually cost performance and the series of other things. So we're working very hard, for example, to improve fuel efficiency. And it's mentioned by the Chief Executive earlier on, the real success story there as an example is Trent XWB, the most efficient aircraft now in the sky. So we like to say that because it's true and we ought to recognize that for our customers and also for our employees and for our followers. It does go beyond that though when we create waste, we take materials and we dispose of materials, which are valuable. So we must work very hard to reduce the amount of waste and indeed, the amount of waste that goes into landfill because waste also has the potential to create contamination. So we're doing a lot of work also in those areas.

The second area we can think about is actually the proceeds, if I could put it that way, of the very large investments we're making in future technologies, the new family of UltraFan mentioned earlier also by Warren, has the potential to make a step change in the emissions footprint of our products, we're working very hard to bring that forward in a whole family of products that can address a series of power ranges, very important investment. Beyond that, of course, we have the electrification. Now electrification, let's not kid ourselves, it's not going to come in overnight. It's a very long program, but it has the potential to

fundamentally change the impact on our environment and our mode of travel, it will take a long time. We need to invest in it now.

So having said that, I don't want to wrap this up by forgetting to say that when we talk about the committees in the context of environment and sustainability, we don't always mention all the things they do. And one of the topics very close to my heart is safety performance, both in terms of product safety performance and occupational safety performance. This is one of these things if you take your hands off of it, you could end up in the place where you would wish not to be. We have a moral obligation to do these things properly. We have an expectation growing amongst our shareholder community and those that follow us, and our employees have an expectation that we should do well. And I'm happy to share with you some of the things that we are doing in those areas in the breakout session.

So let me not take the real work away -- the time away from the real work, which is from Paul. Paul?

Paul Stein

Chief Technology Officer

Thank you very much, Sir Frank, and that gives us a chance today to give you an environmental perspective on our technology investment and how Rolls-Royce is pioneering both evolutionary and revolutionary change to help the environment.

So Rolls-Royce technology can help reduce net CO2 emissions in several sectors. Aviation, which accounts for 2% of global CO2 is clearly a focus for us and we'll see how we're helping with that in a while, but we're also actively developing technology to reduce emissions in rail and maritime and power generation, which, in fact, is the world's largest emitter of CO2 accounting for 42% of the 32 gigatons of CO2 produced globally. And we'll see later how we're helping to decarbonize that sector as well.

In terms of governance, Sir Frank has touched on this, our group environmental strategy is governed by an Environmental and Sustainability Committee, which we set up internally to provide a focal point for the executive team and that's overseen by the Science and Technology Committee for our products and services and the Safety, Ethics and Sustainability Committees for our operations and that gives us some clear accountability now for driving the environmental agenda. And our strategy really falls into the 3 elements: ensuring our products remain on an improving environmental trajectory; investing in brand-new approaches, made possible with new technology; and ensuring the environmental impact of our operations are minimized with an aggressive target of 0 greenhouse gas emissions by 2030 from our operations.

In aviation, our environmental strategy is mostly focused on reducing net CO2 emission and it really itself divides into 3 areas. So firstly, steadily improving the fuel efficiency of our products on the trajectory of about 1% per year for the past 15 years. So aircraft, it's about 1.5%, but the engine nowadays is the lion's share of environmental performance. We're working increasingly closely with fuel companies now to reduce net CO2 emissions by encouraging sustainable, scalable and compatible fuels for more organic waste and sustainable biofeedstock, and we're planning to make some joint announcements with the oil and gas industry shortly on increasing blends of sustainable fuels with time.

And finally, breakthrough technology, as Warren alluded to earlier, mostly through the electrification of aviation. Our engines powering the widebodied aviation fleet have been steadily improving from the Trent 700 that powers the original A330 through, as has been said already, the Trent XWB powering the A350, which is the world's most fuel-efficient gas turbine flying today, a 15% improvement in efficiency per thrust. But we're now developing a new engine core, it's called the Advance 3, itself a 5% improvement, but for our next-generation engine, this will be mated to a large composite fan, driven through a gearbox to create UltraFan, an impressive 25% improvement over the Trent 700. UltraFan will be nearing the aerodynamic and thermal dynamic limits of pure gas turbines even though it will be powering aircraft for the next 40 years, but another technology leap is needed to meet these flight path 2050 goals that the industry signed up to in the year 2000. But UltraFan itself is a tour de force of the latest materials technology, a lean-burn combustor to reduce nitrogen oxide emissions, a new gas turbine architecture really made possible with high-performance computing clusters that let us really understand now the full thermomechanical performance of these products and whole new material systems like ceramic matrix composites. So this is going to be connected to this huge composite fan through a 70,000-

horse power gearbox, which we've tested in Germany, which slows the rotational speed of a fan down, allowing a very fast-moving core, which is small and a huge fan, and to give you a sense of scale, you can thread Concorde through an XWB engine or the front part of Concorde anyway, and you could thread an Airbus A220 through UltraFan when we finally put the fan together. But a revolution is coming, which is the electrification of aviation, which for the next 2 decades, just to emphasize, is probably going to affect the smaller aircraft more than the larger ones, new types of small machines, some will be just helicopter replacement machines, but some addressing whole new markets -- such as air ambulance, cargo delivery, new military payload delivery drones will emerge over the coming few years and we've developed an evolution of our model 250 helicopter engine into a hybrid drive power pack to serve all of those companies, some startups and some big companies, that are building EVTOL platforms.

In the mid-size, regional hybrid aircraft will start to evolve based on hybrid electric technology, which allows for aircraft to be 10% to 20% more environmentally friendly, but also have much shorter runways and much quieter. And we believe that's going to create a new mode of mass transportation, actually moving some traffic away from other transport modes either people or cargo. And some you will have seen Boeing's recent announcement of a series of cargo turboprops with them anticipating that trend.

And then finally, in the much longer term, middle of the market aircraft up to widebodied, will eventually be equipped with electric fans to control the airflow around the aircraft. But this is not the next decade, this is more like 2035 to 2040, but such is the gestation time of aerospace technology we're having to invest now. We're very pleased that in the regional hybrid area, we are ahead of the game with Airbus on the E-Fan X program, which we anticipate will be the world's first flying demonstrator of this hybrid electric technology.

Moving on from aviation, our Power Systems division is doing much at both the engine level and the systems level. So making our engines operate on synthetic gas derived from waste power is providing a whole new market for us. And to give you a sense of scale, some studies have shown that 4% of the U.K.'s electricity could be produced through waste gasification processes, which is why we're investing in that technology.

Gas operation of engines, while gas is still a fossil fuel, at least, it reduces CO₂ and NO_x compared with diesel by 22% and 90%, respectively. And so many customers, particularly marine customers want to convert to LNG. And then hybrid trains where we're pleased that we have a global lead by anticipating the market before others, which uses regenerative braking and a parallel drive system, which allows trains to coast into stations on electric power, regenerating a battery, leave stations on battery power and then the engine starts down the track, which reduces noise and emissions. And we already have 4 customers that we've announced recently, Irish Rail, Porterbrook, Abellio in Germany and Alpha Trains in Germany.

Microgrid technology combines reciprocating engines under smart control, and that provides a much better balance into a grid full of intermittent renewables than large combined cycle gas turbines. So many of you will have seen manufacturers of these large combined cycle gas turbines in trouble because these systems don't work very well at part load, and so we're taking up the slack. The global market for microgrids is estimated at GBP 40 billion by 2030, and now we've announced a partnership with ABB to work more closely with one of the big players to really capitalize on that growth and we're very optimistic about that. And perhaps, the biggest impact on global CO₂ from Rolls-Royce technology is our design for a small modular reactor, a prefabricated nuclear power station, which gets shipped to site and made on-site, which has been accredited to be able to deliver 0 carbon energy at GBP 60 a megawatt hour, which is about onshore wind levels of electricity, and we're working with the U.K. government to try and get this over the line.

And then finally, as has been said, our operations, where we are targeting 0 net CO₂ emissions by 2030 covering scope 1 and scope 2. And the picture at the top shows our MTU operations in Aiken in South Carolina, where we're producing a megawatt of solar energy, which provides 20% of the energy for the plant at peak. I could've put a picture up of our facility in Seletar where 11% of the power for that site is now derived from solar power. So we really are on trajectory to meet our target of reaching 0 greenhouse gas by 2030.

So that's all I wanted to say to you to summarize what we're doing with our technology to help the environment. And I think, I'm now handing over to Harry.

Harry Holt

Chief People Officer

So last year as we were refreshing our vision and strategy, we also looked at the business system and the people framework that were going to deliver that vision and strategy. And in the people framework, which is in the annual report as well as listing the capabilities and competencies that we felt we needed over the long term, we also listed the behaviors and values that whilst not a completely exhaustive list of everything that we would like to see in the company was what we felt to be the most powerful concept that could deliver the sort of culture that we aspire to as a leading industrial technology company. Now the problem with lists is, particularly of values and behaviors is they can become a little bit sort of utopian and never ending. So we limited ourselves to just 4 behaviors and 3 values. In certainly all my experience and external study suggest that just coalescing around a small number of simple rules, behaviors, values, call them what you will, is actually the surest guide to cultural change. So our desired culture starts at the top of this slide with a care promise that we're going to create an environment where everyone could be at their best. And I know that sounds a little bit fluffy, but actually as the saying goes, "You can create a much more wonderful company based on love than fear or more importantly, if you want happy customers make sure your employees are happy first." But that statement for us in Rolls-Royce is actually quite powerful because it draws very heavily on the high-performance culture work that we've been doing over the last few years, which is all about individuals being at their best. It, I think, sends a very powerful message about diversity and inclusion, it's a very inclusive statement. And it also signals our aspiration to change the way in which we lead and moving away from the traditional hierarchical command-and-control model to one where leaders focus less on controlling others, but more on actually supporting, enabling and coaching their teams to succeed and to grow. So our 4 behaviors or our ABCs, as we've called them, are up there.

First of all, embracing agility. Now that's designed to help us from a behavioral perspective adapt to changing circumstances, to be a little bit more open-minded to different ways of doing things and ultimately, to be more entrepreneurial, to be bold, clearly you need to be bold to be pioneers, that's part of our vision. But also being bold in terms of challenging the status quo in all aspects of our work, and being bold also implies being prepared to fail occasionally, but if you fail, you learn, you pick yourself up and you move on.

Pursue collaboration, particularly important internally to make sure that we breakdown the silos, which may be a result of creating 3 empowered businesses. So that collaboration is a way of guarding against that, but it's also beyond the boundaries of Rolls-Royce so that we collaborate and become the best possible supplier to our customers, customer to our end suppliers and partner with our external partners. And collaboration is clearly a prerequisite for us to go on being as creative and as innovative as we want to be. And seeking simplicity there really to cut through the complexity that has previously sort of beset the business so that we can communicate simply with our employees, so they understand what's expected of them and that we can reduce our internal processes to the smallest and simplest number of steps. Our core values, they're sort of eternal. They start with what we previously called our brand promise of being trusted to deliver excellence, that's a source of great pride and purpose and loyalty within the company. Acting with integrity, obviously there to ensure that we don't lapse into the sort of behaviors that led to our Deferred Prosecution Agreement, but also to make sure that we treat each other with the integrity, respect and dignity with which we ourselves would like to be treated. And then operating safely, as Frank mentioned, not only because tens of thousands -- hundreds of thousands of our customers lives hang on the slender thread of our own product safety, but also because all of our employees and their families and loved ones expect us to return them home at the end of the working day safe and unscathed. So our previous efforts at cultural change have perhaps slightly petered out between deciding what we want to be and deciding what we're actually going to do, and that's partly been because we haven't had many of the foundations in place, it's partly because we've tried to advance on too broad a frontage and it's particularly because we haven't addressed leadership and leadership is absolutely fundamental, in my view, to any successful cultural change. So last year and this year, our focus is on these 5 things, doing these 5 things really well, starting with embedding those values and behaviors, making sure that they

don't just remain nice words on a pretty slide, and we're doing this through a framework of making those values and behaviors very clear, making them known, making them real for people, and then ensuring that all of our reward recognition and talent management systems are aligned to reinforce those values and behaviors throughout the company.

Second and third both focus on leadership. So first of all, we are bringing about a significant change to the composition of our leadership cadres at all levels. Warren has said previously that the executive team is 90% different to what it was just 3 years ago, it's also 35% smaller. And last year, we did a similar exercise on the next leadership layer down in the organization the so-called enterprise leadership group. And that leadership cadre is now about 35% smaller than it was a year ago and about 35% different with probably a little bit more change to come, and we're going to continue that exercise throughout all leadership levels in the company. The leaders that do stay with us need our help to be the best possible leaders that they can be. They need learning, they need education, they need training, they need coaching, mentorship and they need that throughout their career, but particularly they need it when they move from one level to another, so they get a license to operate at the next leadership level up in the company.

So building a really coherent framework of leadership learning and a culture of continuous improvement among our leadership population is a real area of focus.

We then have a specific issue to address to eradicate the residual bullying and harassment that still goes on in the company, particularly it has to be said here in the U.K. and in Derby. And how on earth can we aspire to an environment where everyone could be at their best if we've still got pockets of this behavior going on. So we're right in the middle of a campaign to address that and Irene will speak a little bit more about that in a moment.

And then finally performance enablement, a much stronger performance enablement framework and culture, partly because that's the way in which you reinforce the values and behaviors, partly it's because an area that we've traditionally been weak on and partly because if you want to actually stretch people and get higher and higher performance, you have to give them challenging goals and then help them to achieve that. So that's what we're doing. How do we know if we're going to be successful? Well, ultimately, the right culture is all about creating the right business outcomes so rather glibly that's the place to look for the acid test of whether we got the right culture, but there are a number of other ways in which we can measure progress. Here are some objective measures, it is worth just saying that the subjective measures are equally important. So what do we, as an executive team hear, when we're out and about talking to people? What does Irene, as the employee champion, hear when she is out and about? What are our employees posting on Yammer? And most importantly, what is our holding team telling us? Now our holding team has been put together specifically through the restructuring program as a means for us to really tune in and listen to the company as a whole. So there's a number of subjective measures, but the more objective ones are up here. We have an ethics helpline. So analyzing the data about concerns being raised, the substantiation rates, the anonymity rates would all help us to gauge progress. We can, of course, measure the actual physical change to our leadership cadres and I gave you some statistics earlier on. We have an annual employee survey where the scores have held relatively flat over the last 3 years, which is actually quite encouraging given the amount of turbulence and change in the company, but clearly we want to improve and we're moving to a new employee survey platform, which Irene is going to talk about in a moment.

We have an aspiration for all of our sites to be accredited on the LiveWell Scheme by 2020. We're making very good progress towards that. And that's because our leaders are increasingly recognized looking after the well-being of their employees ultimately enhances engagement and ultimately leads to better productivity. And we've got a balanced scorecard for safety measures to gauge that value of operating safely and D&I targets, which are well-publicized in our annual report and we're making progress against those and I'll speak more about that in a moment. So diversity and inclusion. Now I normally talk about diversity and inclusion sort of under the heading of our people agenda as opposed to our cultural agenda. But, of course, the 2 are inextricably intertwined. D&I is both a contributor to and a consequence of the right culture. And during the restructuring program, we have both an opportunity and threat from the perspective of diversity and inclusion. I mean, clearly the opportunity is substantial change across

the company allows us to accelerate our D&I agenda, but the threat is that the 4,600 job cuts that we announced last year will, of course, largely fall in those support functions, particularly IT, finance and HR, which are traditionally more diverse than the rest of the company. So we've had to think very carefully about how we exploit that opportunity and mitigate that threat. We've done a number of things in terms of changing how we govern and lead D&I to be more aligned with our empowered business model. So we've moved away from an overly centralized approach and now we have our 3 businesses taking more accountability and leadership for D&I because after all they actually own the majority of the hiring and firing decisions. And they clearly own the environment in which the majority of our people work. We spent time making sure that internally we have a much more coherent and comprehensive suite of targets to support the delivery of those external targets that are published in our reports. And we've made a concerted effort to have a much more powerful leadership shadow on D&I with each member of the executive team having 3 or 4 personal commitments on D&I, and we also continue to increase and enhance our network of employee resource groups. These are groups that our employees put together to concentrate on a particular area of diversity across our global footprint. Most importantly though we are looking at and we have been looking at our policies and practices to ensure that we do our level best to attract and recruit diversity that we can then retain it once we got it, and then most importantly perhaps we can develop it so that it reaches its full potential. So under attract and recruit, last year, we did a complete end-to-end review of our recruiting process. We made a number of improvements, for example, gender neutral job specifications, job -- sorry, gender neutral offer letters, specific training for hiring managers, particularly focused on unconscious bias, increased use of social media, and a particular focus on our early careers pipeline, where we try to reduce where appropriate the qualifications to make those early career programs more accessible. We provide specific coaching to ethnic minorities going through the recruiting process. And, of course, we've run a number of outreach programs with our ERG groups to attract in particular sectors of the diversity spectrum. Retain. Our focus has really been on retaining the diversity that we have as we go through restructuring. We're doing a reasonable job there. Actually, our statistics tell us that, particularly on gender, we're retaining our female employees at about the same rate as our male ones, but clearly, we want to do better than that in order to shift the dial more quickly. And then on develop, the focus here has been on ensuring a high degree of diversity on all of our key development and succession plans. You heard about the Board Apprentice Program, which is 50% female and 50% from ethnic minorities. If we look at the internal succession plans, for the executive team, for example, that's gone from 8% female to 30% female. And if I look further down the talent pipeline, we're at about 40% to 50% female managers in our longer-term succession and talent pipeline plans.

So lots more to do, but quite a lot done already. So on that note, I'm going to hand over to Irene, who's going to talk on employee engagement.

Irene Mitchell Dorner

Independent Non-Executive Director

Good morning. I'm Irene Dorner, I'm the Employee Champion, and I'm standing between you and a stretch of the legs and a cup of coffee, so I'm very well aware of my responsibilities this morning.

This slide, I think, is probably in the wrong order. So I'm going to go to the third point first. I've been an Employee Champion for probably 2 years now. And Ian billed it, nice to know that I'm hard-working though, Ian. Thank you for that. Ian billed it as an experiment when we first started this. And I think that's probably right, bold, but not floating by itself in the organization because, I think, you can see that there's a lot going on. We have our diversity inclusion activity, we've got our Board apprentice activity. We particularly got the meet the board activity and I really, truly believe that had we had an Employee Champion, who was dropped into the organization without this other network and web of people and culture activities going on, it would not have worked, because I connect into those things and also a stakeholder committee of interested people not just of Harry on HR, but Pamela from the governance side of things, the union side of things and interested employees around the organization, who help direct my activities into the organization so that we can maximize the impact. So I think that the -- my activities have been wide-ranging, it started off as an experiment, I had to invite myself to things. We had to invent an idea of where I might go, and now I can tell you that I'm invited all over the place, in fact, trying to limit the amount of time I spend in the organization has become the problem rather than actually trying to encourage people to invite me. I am not the whistleblower of last resort. I'm not the person -- although I

could be, and if I saw something that I thought was thematic, I would bring it back to the center, but I'm not part of the daily whistleblowing activity. And I would say that the -- I am sometimes just the eyes and ears of the management, people ask me to look at things, while I'm out now. I would sometimes say I find things that management might think are there, but sniff it but can't quite tell it. I'm an independent pair of eyes. I find out a lot, I confirm a lot, actually. I don't think I've brought anything back to the Board in the center, which has been a total surprise to everybody. And I think that we will watch now as we develop and we've realized that 1 person can't do this, so not only do all of the nonexecutives hold town halls and meet-the-people events when they go out. But we have now recognized the need to appoint a new Employee Champion in North America, which will be Beverly Goulet, and we're working on how she will get around an extraordinary large geography and link in to other people who can help her as well. Some of the outcomes of this, Harry alluded to the new employee opinion survey, it's not that we didn't like the old one really, it's just that we couldn't get it all the way through the organization. We had feedback that it wasn't getting right the way down, it was too long, too cumbersome. It has been flat, it's been shortened, it's been turned into much punchier questions, a few of them, very few of them actually compared to a standard employee survey. And it's much more focused on leadership and much more focused at the changes that we are trying to generate and therefore, much more actionable. And we've already had some good feedback that it's being used more than the previous survey.

The biggest deal probably on Harry's slide in terms of if you don't want to spread your activity over too wide a field, there are some things that you can see and focus on immediately. The biggest deal, in my opinion, is the anti-bullying and harassment campaign that we now have going. And I brought this back to the Board as part of my report last year with some trepidation, you don't come back to the Board as experienced as ours with the report like that without some concerns about how this might be seen. I could not have been more changed in my approach when I turned up with the report not only were the nonexecutives totally on-site, but the management have jumped on this in a way that has been seen in the organization as just an extraordinary sea change of "Oh, you really get this then, and we're really going to change something." It fits perfectly with the CARE campaign and we're bringing everybody to work in their best condition so that they can perform the very best that they possibly can. And frankly, it's just the right thing to do, but it has caused change to the organization, which I think will help in all sorts of different ways like changing HR processes and changing the way that leaders lead the organization. I'm going to wrap up because I suspect that my role is better as part of the Q&A session, as part of a wider Q&A session in the breakout session. And so I'll stop there. I think I'm probably introducing coffee, I'm apparently introducing coffee, and so now you're allowed out to go and stretch your legs and grab a coffee. Thank you very much.

Pamela Mary Coles

Company Secretary & Chief Governance Officer

Thank you, Irene. So just before you go to coffee, that ends our presentation this morning. So I'd just like to say thank you to everyone on the WebEx and that we'll say thank you to you.

Presentation

Jennifer Ramsey*Head of Investor Relations*

Okay. Good morning, ladies and gentlemen. It's 9:00, so we'll start. Thank you for joining us here at the London Stock Exchange. And for those of you joining online, my name is Jennifer Ramsey and I lead the Investor Relations team at Rolls-Royce. And it's my pleasure to welcome you to the 2018 full year results presentation.

The agenda for today's presentation will be Warren, our Chief Executive, will start. He will share with you his perspectives of the 2018 year and the challenges that we've encountered. Stephen Daintith, our Chief Financial Officer, will talk through the financials. And Warren will round up with an outlook for the year ahead.

The presentation should start, which should take about 45 minutes, and we'll have about 45 minutes for questions. We'll have questions in the room. And for those of you who want to ask questions online, please do so through logging your questions on our webcast service, and we'll endeavor to ask those in the room.

Finally, can I please ask you to turn off your mobile phones?

We have no plans for emergencies this morning. So if any emergency alarms do go, please make an orderly exit.

And with that, I will hand you over to Warren.

D. Warren A. East*CEO & Executive Director*

Good. Thank you very much, Jennifer. And thank you, everybody, for being with us this morning.

So I'm going to start with an overview of the group, and then we'll talk a bit about the different businesses. We'll talk about, as Jennifer said, some of the issues and then have a little look at where we're investing at the moment for the future.

So in terms of a summary of results, we've summarized it as solid progress. Actually, it -- we're very pleased with the performance in 2018. It was a year of actually quite strong growth in underlying core revenue. And that revenue growth drove, when combined with good discipline and rigor that hopefully we're introducing or you're seeing us introduce through the way we're managing the business, that revenue growth has helped us translate into good growth on the profitability measures. And that's resulted in a more than doubling of free cash flow when you look at our core business. And core, we're defining as the business looking forward. There's a little bit of a restructuring which happened during the year that I'll come into in a few moments.

It's a significant step on our journey towards our 2020 goals, about more than GBP 1 billion of free cash flow in 2020 and our midterm cash ambitions that we started talking about in the middle of the year at the Capital Markets Day in June. Obviously, there is more work still to be done in 2019, and we'll talk about that as well. But in reflection of that more work to be done, you'll see the dividend per share held flat.

Summary level look at the group.

Civil Aerospace, good results in terms of flying hour growth and good progress on reducing the cash deficit that we realize on every engine sold. We had a good year in terms of new engines launched, and I'll come to some of those shortly. And obviously, the year was dominated by -- all the news flow in the year was dominated by issues around the Trent 1000, which we'll cover in more detail.

Power Systems had another excellent year. At the half year, Power Systems was the standout performer. And Power Systems continued to perform through the year. And as we say, there's strength across key markets and very pleasing to see good growth in service revenues. I'll come back to a bit of detail on that.

Defence, we describe as a solid year. The standout piece there was additional new contracts, particularly in the Aerospace parts of our Defence business. And that left us with a very encouraging book-to-bill ratio and a very encouraging boost to our order backlog in Defence.

At the Capital Markets Day in June, the subject was a group-wide restructuring. And at the end of the year, we would say we are on track with the time line that we set out in June. On track in terms of net headcount reduction, on track in terms of trajectory to our goal of saving GBP 400 million per annum run rate by 2020.

When you put all that together, the financial performance showed good strong revenue growth, more than doubling of free cash flow. And it's particularly pleasing to see that happening, although we'll talk about exceptional charges from a cash flow point of view, it's particularly pleasing to see that happening against the headwinds of resolving the issues that we faced on Trent 1000.

Now I'm going to talk around the different businesses, and I'll start with Civil Aerospace. And we have a few slides on Civil Aerospace because Civil Aerospace is half of our business. And the good news is that we saw fleet growth during the year. So now by the way, with 4,700 large engines out there in service, that's 25% more engines, large engines, flying around than 5 years ago. And that fleet growth, together with the fact those engines are newer and more efficient, and therefore, better for the airlines to use, is one of the driving factors behind the strong growth in engine flying hours.

At the same time, back at Rolls-Royce, we've been working hard on reducing the deficit on -- that we make when we sell a new engine. We still do make a loss on average when we sell a large engine. But that loss has come down by 13% year-on-year. And that's in spite of introducing, as you'll hear a bit later, new engines. Obviously, on the new engines, when they're first launched, their losses tend to be significantly larger. So that 13% reflects some very good progress in things like the XWB.

And coming on to the XWB. The 84k version of the XWB continues with excellent performance in service, over 99.9% dispatch reliability. We hit the 3 million flying hours milestone a little while ago. And actually, in terms of volume shipments, that engine is going very well. And it's also going out the door very reliably.

Obviously, there was a little bit of news flow in the other direction around Trent 7000, particularly towards the end of the year. The good news is that we did get the Trent 7000 into service before the end of the year. And as everybody in the room I'm sure knows, we didn't get quite as many into service as we had hoped or intended to. But actually, the first couple of months of this year have gone very well for that as well and so now there are growing deliveries on the Trent 7000.

Halfway through the year, we talked for the first time about the Pearl family, new family of corporate jet engines. And the Pearl 15 was launched, that's going to power the Bombardier aircraft. And we're looking forward to the Pearl 15 entering into service towards the back end of this year.

Now as I said, the news flow was dominated by Trent 1000. This is the engine that powers the Dreamliner. And this morning, we are talking about adding an extra GBP 100 million to the expected cash costs of dealing with this issue over the total period from 2017 through to 2022. Most of those costs are incurred in 2018, the year just gone, GBP 431 million in 2018. We're expecting GBP 450 million this year. Notice that's a round number at the moment, GBP 431 million is a slightly more precise number because we've done that. So I can't guarantee it'll be exactly GBP 450 million, but it's of that order in 2019. We do expect that to decline significantly in 2020 by approximately GBP 100 million. And it's falling materially after that.

Now the thing about the Trent 1000 issues, it has, of course, caused a huge level of disruption for some of our customers and a portion of those Trent 1000 customers have been seriously affected. And clearly, we've been putting an awful lot of effort into managing that from an operational point of view and helping those customers by minimizing the number of aircraft they have on the ground. So we do sincerely regret the disruption caused to those customers, and that's why we're spending all this money on fixing it because we want those airplanes all flying as soon as we possibly can.

There is a bit of P&L treatment on Trent 1000, and I'm sure Stephen will cover the detail of that later. But because of the nature of the costs incurred, we have extended the exceptional P&L charge.

In terms of what's happening on the ground and resolving the fixes, here's the issue -- here's an update on the fixes. We had a fantastic Christmas present, which was the Pack C version of the compressor blades, the new designs were certified. And the first airplanes with those new certified blades are flying now, which is good, because that is an over -- that's signaling an overall increase in the healthiness of the Trent 1000 fleet.

We had another Christmas present, which was sort of over the Christmas-New Year period in that the TEN version of the Trent 1000, which has hitherto had a hard life limit on its compressor drum, that hard life limit has turned into an inspection regime. And as we inspect those engines, we've discovered no issues whatsoever to date on the Trent 1000 TEN. But that has saved our customers an awful lot of disruption by resolving and removing that hard life limit.

There's an order here, you'll see from the dates there, there's an order. We've dealt with the Pack C first because most of the 600 Trent 1000s that are in service are Pack C. So clearly, to minimize disruption, we had to deal with that one first.

Trent 1000 TEN is the new engines going into service as we speak. And that's why logically, that's the next one to deal with. And that compressor blade design is effectively the design that is done, and we're now going through the process for certification. And the equivalent blade for the Pack B engines is coming along behind that. And the reason it's coming along behind that is because there's a relatively small number of Pack B engines out there. The incidence in the Pack B of the fault is much lower than in the Pack C. And so in disruption terms to our customers, this has minimal effect and that's why we're doing it in that order.

The little chart on the bottom of the slide shows the trajectory of improvement of aircraft on ground as we go through this year. So aircraft on ground on Trent 1000 is going to be a feature for at least the remainder of this year. But we do expect to be in single digits by the end of 2019.

Just to put that in perspective, the number in the second half of 2018 oscillated between 40 and 45 engines. And as we speak in Q1, it's around 35 engines. Today, it happens to be 31. But that is -- it varies according to which engines get inspected and which we have to deal with.

So that's the update on Trent 1000.

Continuing with Civil Aerospace. The other little bit of news that cropped up in the second half of last year was the issues we had with delivering new engines. And we did expect to deliver, and we updated guidance actually shortly before the end of the year. We're expected to deliver approximately 500 engines. We actually only made 480 -- or we made 480 deliveries. We made more than that, but we didn't get them all tested and out the door.

And so we did actually manage to minimize disruption to customer deliveries. So 96% of the aircraft flew away on time to their customers during 2018. But the reason for the shortfall is shown up on the right-hand side of the slide. There were some very well-known issues in the Aerospace supply chain which affected us, affected our competitors, and that was a little bit of the capacity issues with some key suppliers.

The thing that particularly affected us was mix of engines in the second half of the year. The newer engines played a more significant role in the second half of the year. And when you're introducing new engines into production and coming up that sort of period of industrialization, then you do run into issues. And indeed, we did run into issues, particularly around the Trent 7000, where we had some initial learning curve, basically, poor yield on final test.

And just to sort of quantify that a bit, you can see that in the second half of the year, we were shipping significantly more, a greater proportion of those new engines. And to put it in perspective, the Trent 7000, in particular, on the bottom right of the slide there, in the whole of last year, 32 engines; in January this year, 11 engines. 11 engines is roughly at rate for the year 2019. In fact, if we can do 11 engines every month, that would exceed the number of engines we need to supply this year on Trent 7000. So we are confident that we have those learning curve issues behind us.

So just a little bit sort of post the end of 2018 but relevant, I think, for this morning, some recent announcements. So a week or so ago, a fortnight ago actually, it became public that Emirates had been doing a fleet review. And in conjunction with Airbus and ourselves, they were looking at effectively derisking their business, and they concluded they needed a different mix of airplanes. So they made 2 decisions: to cancel outstanding -- some of the outstanding A380s and order some more smaller airplanes. And the good news is that the more smaller airplanes that they ordered, a mix of A330neos and A350s, of course, they are Rolls-Royce-powered aircraft. So broadly, this is good news for us.

Now as far as the A380 is concerned, obviously, the A380 and the canceling of the A380 program is a matter for Airbus and not a matter for Rolls-Royce. So you have to talk to Airbus about that. But what we do know is that we have a good number of airline customers who operate the 380 and whose passengers enjoy flying on the A380. And we are totally committed to supporting those customers and keeping those Rolls-Royce-powered A380s in service for the next 20, 25 years, as long as it takes. And so that's the message from us on the A380 cancellation.

Now this morning, we have also announced that -- or we have announced that we have made the decision to withdraw from Boeing's proposed NMA platform. Many of you have heard me talk before about the NMA being potentially an attractive proposition from a strategic point of view, and it was all a matter of overlapping our UltraFan development program with the NMA requirements and seeing if we could achieve a sufficient overlap there to make a sensible answer from a commercial and a risk point of view. We have concluded that there is not sufficient overlap to create an engine out of the UltraFan architecture within the Boeing timescales at a sufficient level of maturity to tick those boxes in terms of risk and commercial common sense. And so we have made the decision to withdraw from that program, and we have notified Boeing. We actually notified Boeing shortly before the end of 2018. And it's all a matter of our conclusion that we could not achieve a sufficient level of maturity in the time available. And if you don't achieve a sufficient level of maturity, you lay yourselves open to all sorts of in-service issues, customer -- potential customer disruption, and that's not a good place to go from a risk and a commercial point of view. We remain, of course, completely committed to the UltraFan architecture and creating that architecture, all the technologies behind it, and I've got a bit more on that to say later.

Just having a quick look at the time there. We'll step on it a bit here.

XWB-84k, we're very pleased with that. This has been an excellent engine. Great reliability in service. Customers love it. We have made significant steps in closing the cash deficit on every engine that we ship there, and we still expect to be at cash breakeven in 2020 on XWB-84k.

The 97k version entered into service in February last year, and so far, our customers are telling us that, that is also doing very well. And later this year, we expect the first shop visits for the 84k version.

Now moving on from Civil Aerospace. I had a great weekend last weekend. Went down to Cardiff. And I spared you the Welsh regalia this morning. But the other reason it was a good weekend is because I left Paddington Station here on one of these Great Western Rail-operated Hitachi trains, which is, of course, Rolls-Royce-powered with our series 1600 engines in a diesel-electric configuration. And we have had a lot of success with new rail programs that are being introduced at the moment with this product. That puts us in a great position as all these train operators need to get their trains cleaner in those regions of the world where there is not wired systems for electrifying the rails to introduce our hybrid platform. And we've had considerable success with our hybrid platform in 2018. So far, only in terms of MOUs and evaluations, but I'm confident that we'll see some of those turn into orders shortly.

It was a good year then and that sort of thing has been driving things like order intake. The reason I put the train up there as well is because we've been introducing long-term service agreements, taking the Civil Aerospace model into Power Systems and being successful in signing up several of these long-term service agreements. All of that is -- has driven volume and that volume has driven an increase in operating profit.

China represents a great growth opportunity for our Power Systems. Our presence in China is relatively small today. But through our joint venture, we are hoping to grow that significantly.

As a measure of just how fast things can move in China, we introduced -- or we actually rolled off the production line our first engine in April last year, and we've now delivered over 100 from that joint venture.

Around the rest of the Power Systems business, we also saw a number of product launches, which we hope will translate into business in due course.

So moving to our Defence business. Structure there in the bottom left-hand corner. We pulled the various strands of our Defence activity together into one business. And so the picture this morning is a frigate powered by the MT30 marinized gas turbine rather than a picture of an airplane, thought you might like a different picture this morning from Defence.

But actually largely driven by the Aerospace portions, we've seen a significant increase in the backlog in Defence, and that's probably the highlight for 2018.

Halfway through the year at Farnborough, we were also pleased to be selected as one of the full key partners on the U.K. MoD's Tempest program.

ITP Aero. Very much part of Rolls-Royce but runs separately. We saw solid growth in ITP Aero. Obviously, that is significantly driven by not just Rolls-Royce activity in the Civil Aerospace sector, but by some of our competitors who have programs active with ITP.

Moving on from the business overview, restructuring. Halfway through the year in June, we talked about our restructuring program. This is a recap of what we said. We're simplifying to 3 businesses. We're getting rid of lots of duplication and enabling our businesses to operate with a little bit more freedom, yet within a framework, so that we can get the center out of the way and operate in a more modern, faster way.

So how have we been getting on? That was in June. What we've done so far is established a Group Business Services section. And this is pulling, basically, the internal services together, removing lots of duplication, removing lots of multiple interfaces between people within the business creating friction, slowing things down. Got rid of all of that. And that's been active since the beginning of 2019.

Similarly, an Innovation Hub, where we've pulled skill sets together that are relevant right across the group, so that's things like our technology group, digital group, strategy group. If you think about it, makes a lot of sense to have your future technology and your strategy tied together.

We also announced in June that there would be an associated headcount reduction with all of this, 4,600 people. As of the end of the year, it's about 1,300. And that, by the way, is concentrated on the indirect headcount rather than the manufacturing headcount because actually in some parts of our business, we're needing to grow capacity. But we believe we are on target, too, at about 30% of the way through on run rate cost savings.

We announced the sale of a couple of parts of our business during 2018 and they are proceeding. We expect the sale of Commercial Marine to complete sometime in the first half of this year. It is probably in the second quarter of this year that, that will complete rather than in March. But it's on track for completion with the necessary regulatory disposals having taken place.

Little look to the future, where are we investing. We're investing in 3 buckets, basically. So the current technologies make our current product portfolio healthy and future-proof. We're investing in enabling technologies to make that all more cost-effective. And then we're investing in some future technologies to get out beyond the current products and services. So those are the 3 key buckets. Right now, this is -- we're investing quite a lot in the current technologies, both from a sort of underlying material science point of view and a new design point of view, but also enabling tools to make our engineers more effective.

Looking a little bit further forward. UltraFan. In UltraFan, we had a great year in terms of hitting the milestones on our UltraFan architecture development. Just a reminder, this is basically a high-power

gearbox driving a very low speed fan to create efficiency. It's going to be a significant step forward in terms of efficiency, in terms of noise reduction and in terms of emissions.

And during the year, we have run the core up to full power. We've been demonstrating to ourselves and experimenting with the new composite materials around the fan and the fan case and also with the combustion system, the new lean burn combustion system. So actually very pleased with how the UltraFan program is going.

Looking a bit further forward. We said we're championing electrification. That's manifesting itself in a few electrification programs in Aerospace. It's manifesting itself in things like entering into the microgrid business. And the 2 pictures on the bottom right there, robotics in engine maintenance. We think this is an area where we can take a lot of cost out of the engine maintenance and actually improve some of the reliability of that activity as well. And the picture on the bottom left there is demonstrating some of our investments in advanced materials.

So with that, I will hand over to Stephen, and I'll be back for a summary shortly.

Stephen Wayne Daintith
CFO & Executive Director

Thanks, Warren.

Morning, everybody. I'll do my best to stick to the timetable and I've got only about 15 minutes to go through the financial, so I'll do my best. It's okay.

So the full year results for Rolls-Royce. And I'll just pause on this side -- slide for a second. Warren showed this, but just to reinforce, I think, the revenue growth and remind ourselves that Rolls-Royce is a growth business and a strong revenue growth business as well. And that's a core part of our progression and ambition over the medium term.

A reminder of our reporting format. We will be talking mostly in this presentation around our core business. And our core business, Civil, Power Systems, Defence, ITP, that's where it stops. Below the line, Commercial Marine, L'Orange, they're noncore businesses that either have been sold or going through a sales process to get you down to the group results. So it's core business is what we're highlighting here.

The core for 2019 will become the group for 2019, just to reinforce that point.

So the group underlying results. Just putting it all in perspective by each division. Particularly strong revenue growth in Civil and Power Systems, 12% -- sorry, 12% and 15%, respectively. Defence, solid, getting us to core business revenue growth of 10%. Really good progress.

Earnings per share growing nicely from 2.3p to 16p, but still a long way to go in earnings per share.

I'm looking at the income statement in entirety. Revenue growth, 10% revenue growth. Gross profit growing at 4%. Gross margin growing at -- to -- is now just 10 basis points up to 15.7%. Impacted here by the contract catch-ups in the Civil Aerospace business that we'll see shortly. If you take that number out, you get closer to a 17% margin.

And if we put the gross margin in the context of our midterm ambition of GBP 1 of cash flow per share by the midterm, we're looking at a gross margin of around 20% for Rolls-Royce. That's the sort of number that's consistent with that GBP 1 of cash flow per share.

I'm going to get through each of the line items over the next couple of slides.

Underlying operating margin of 4.4%. Again, a lot of room for improvement there. Again, midterm ambition, putting it in that perspective, around the 10% operating margin over the midterm.

Cash flow per share, growing nicely, 34.5p, GBP 1 in the midterm.

And cash return on invested capital, and I'll talk about that in a little while as well, 12% for the year, down 13% from the 13% last year, but I'll share that detail with you.

Looking at the breakdown of the revenue growth. So Rolls-Royce is not just a revenue growth story, but it's across all revenue streams as well. It's not just one that we're dependent on, it's across all revenue streams.

OE revenue growing by 10%, driven by the growth in activity and deliveries, particularly in Power Systems.

LTSA service revenue growing a nice 11%. The strong flying hour growth is a key driver there.

And then other service revenue as well, a nice high-margin business for us, and that's in respect largely of sort of spare parts sold to some of the older engines, such as the RB211, the Trent 500 and 800 as well. Getting us to that group gross margin of 15.7%. And if we adjust for the contract catch-up accounting adjustments, we're closer to 17%.

Core business R&D. So as a group, our gross R&D cash spend was up to GBP 1.378 billion for the year. Net cash spend was up 8%, you can see there, the GBP 1.1 billion. And once we deduct the capitalized amount of GBP 498 million and then add back the amortization impairment, we get to a net R&D P&L charge of GBP 650 million. So our capitalized R&D was GBP 100 million or so higher than we had anticipated, largely driven by, well, first of all, the increase in cash spend but also just the timing and phasing of certain engine programs, particularly around the Pearl 15 that drove that increase in net capitalization. We're guiding today that we're expecting that capitalized amount to come down by around GBP 100 million in 2019.

Just as a reminder, at the bottom here, at the bottom left-hand corner, 2018 is expected to be the peak year for R&D cash spend.

Commercial and admin costs, declining organically by 2%. This is a line item where we expect to see good progress over the next few years, particularly as the benefits of our restructuring program start to kick in. Our midterm ambition is to get to 5% of sales, we've made progress on that during 2018 at 6.9% of savings, but still clearly some way to go. The headcount reductions that Warren mentioned, the 2,000 to 2,500 or so during 2019 will be a key driver of that.

Restructuring and exceptional costs. We have a GBP 1.4 billion in total exceptional cost that we're reporting today for 2018, made up of 4 key buckets: the Trent 1000, GBP 790 million, an increase from the GBP 554 million at the half year, largely driven by the numbers of aircraft on ground being at elevated levels for longer than we thought at the half year, and I'll go through the accounting on that, I'm sure, during the Q&A, but I want to eliminate it now because I'm sure 1 or 2 questions might come up there.

The restructuring in the bottom left-hand corner is largely around the group restructuring program that we announced in June of this year. Total cost for that program of around GBP 500 million. Run rate savings of GBP 400 million. The cash cost for the group restructuring in 2018 was just GBP 70 million, to put that in context.

Trent 900, the closure of the A380 program, GBP 186 million exceptional cost for us, largely around onerous contracts, the impairment of some intangibles and various tooling write-offs.

And then, finally, a pension adjustment in respect of gender equalization provisions.

Summary funds flow statement. As -- what we've tried to do here is summarize the key movements between underlying profit before tax and then group free cash flow. I think the 2 key numbers to highlight: working capital change, a GBP 581 million benefit; and then the growth in the Civil Aerospace, net long-term service agreement balance change. And let me just go through those items one by one.

So the underlying working capital reduction. We benefited GBP 581 million from this. So what were the key moving parts? Well, first of all, we had a materially higher payables at Civil and Power Systems, driven by increased trading, particularly in Q4, at Civil, related to the ramp-up, particularly around the Trent 7000, and in Power Systems, with a strong order book that I'm going to talk about in a second and that Warren alluded to as well for Power Systems that ceases into 2019.

We also benefited from around GBP 400 million of supplier payment terms standardization led by Civil Aerospace. And this is effectively looking at our extending, where appropriate, our supply of payment terms so that we can essentially extend those payment terms, for example, let's say, from 60 days to 90 days, and benefit from that.

What we -- we did a lot of work on working -- we continue to do a lot of work in working capital at Rolls-Royce and we do see opportunities around the group. And I've alluded to this previously. Whether it be collection of old receivables, inventory management, supplier payment terms is one just opportunity.

We improved our overdue debt collection. It was another driver for us. At the same time, a couple of negatives. We had GBP 150 million concession unwind in Civil, you recall the benefit we had last year. We had higher receivables in Civil and Power Systems, driven by the increased trading activity. And finally, the most material of these items was increased inventory reflecting the operational challenges in Civil and the volume growth in Power Systems. So we had around GBP 400 million growth in inventory over the course of the year. Putting all these together got us to the GBP 581 million benefit for 2018.

Looking at the change in the Civil Aerospace net long-term service agreement balance. And this is -- the movement here is largely driven by the customer receipts that we receive from our airline customers, driven by widebody engine flying hour growth, growing at 14%, and also increased business aviation flying hours. This cash outflow from the major shop visits, which is up from 240 to 286, and also from the check and repair shop visits growing from 356 to 569.

Now this balance, this credit balance also includes the negative contract accounting catch-up adjustment of around GBP 300 million. And that adjusts for the difference between revenue and cash flow.

So this balance effectively represents deferred revenue for Rolls-Royce, cash collected in advance of the shop visit. Cash receipts are higher than revenue and it's a core part of our business model, this particular mechanism. It will continue reflecting flying hour growth.

So looking at the group balance sheet. You'll recall that the group balance sheet is the #1 of our 4 capital allocation priorities. We've materially improved our free cash flow. And we've actually improved our net cash/debt position, moving from a net debt position of GBP 305 million at the end of '17 to a net cash position at this year around of GBP 611 million.

We completed the disposal of L'Orange. We've announced sale of Commercial Marine that Warren talked about. We issued preemptively EUR 1.1 billion of bonds at attractive rates. We've prefunded all existing debt maturities to the end of 2019. We did that during the year as a sort of in anticipation of a Brexit event in 2019.

And we reiterate our ambition to return to a single A rating.

Shareholder payments. We are holding the final payment at 7.1p per share and that gets us to a total payment of 11.7p. And I've put that in the context of the capital allocation priorities, in the bottom right-hand corner here. Strong balance sheet to improve our credit rating and returning to that single A rating, to fund organic investment to drive growth and technology. The dividend payment to shareholders, we'll increase dividend as free cash flow grows. We aspire over the midterm of 2.5x free cash flow dividend covered through the cycle. But we put -- we look at our shareholder payments in the context of our capital allocation priorities. And finally, disciplined and selective mergers and acquisitions activity.

Moving one by one through the business units. Civil Aerospace, revenue growth across the board. OE revenue growing 8%; services, 12%. And I mentioned earlier that strong services growth, that spare parts revenue growth, high-margin growth out of the legacy engines, the older engines, the more mature engines, 12 -- 21% growth there. The V2500 was a big contributor to this revenue growth.

The gross margin impacted by the contract catch-ups. We put in a line in here. If you were to adjust for both '18 and '17 for the contract catch-up adjustments, and this is in respect to the long-term service agreements, and I'm going to talk about this, I expect, during the Q&A, and the volatility that's implicit within IFRS 15, it would have been a 10.4% gross margin at Civil Aerospace.

Engine sales. Just to go into bit more detail for Civil Aerospace. As we're using Warren's words, half of our business. Widebody sales went to 469. We did ship 11 further. We're guiding to 520 for 2019.

Bottom left-hand corner, a reminder that around 2,300 widebody engines that are on order and a mix of those with the Trent XWB being a key driver of that.

So you recall the 3 key drivers of growth for us over the midterm. The number one of these being the reductions in the OE deficits. We made good progress again in 2018 on this goal, a 13% reduction. The average OE loss is now down to GBP 1.4 million.

Looking at the top right there, the XWB-84, particularly good progress with 32% improvement in unit loss. And as a reminder, our goal is that for 2020, XWB-84 will be breakeven. And indeed, across the -- by 2022, we expect the margin across the widebody fleet OE to be breakeven.

I won't dwell too much on this slide on the interest of time.

Engine flying hour growth. Large engine invoiced engine flying hour growth grew by 14%, reflecting the growth in the installed base but also the increased utilization of those engines. The large engine in-service fleet, just going back to the earlier comment, 8% growth to 4,757 engines now in service.

Shop visits. Shop visits grew, 46 shop visits extra in 2018. This is the major shop visits, the ones that take place every 5 or 6 years or so. And then check and repair visits, growing significantly, largely driven there by the accelerated maintenance activities you might expect on the Trent 1000.

That -- putting all that together gave us a GBP 200 million benefit to the widebody cash margin. The OE deficit improvement gave us a GBP 100 million benefit to -- at the OE level.

When you put all that together, together with the benefit from the increased growth in spare engines to support the growing fleet, we finished with a GBP 400 million improvement to the widebody underlying cash margin.

And this is a slide that we first introduced in 2017 in an attempt to give a more user-friendly perspective of how cash flow works in Civil Aerospace on a driver basis.

So just moving very quickly through the rows. First of all, we solve for original equipment, number of engines invoiced times the sort of loss per engine. Then underlying services, the growth in flying hours. Spare engines, you can see the Trent 1000 costs coming in there as well, taking us through -- to a widebody cash margin of GBP 900 million after the Trent 1000 costs.

And then after we go through the other engines and through to R&D and CapEx and so on, working capital benefit, you end up with trading cash flow of GBP 200 million for Civil Aerospace.

Going forward, over the midterm and into 2019 as well, we are expecting working capital change to become more normalized. I'll talk about that later.

Power Systems. Strong revenue and profit growth. 15% organic growth in Power Systems, really strong growth, flowing through nicely to growth in our operating profit of 20%. The margin -- the gross margin is impacted by the product mix. We have a -- there were an increased lower-margin sales in construction and agricultural markets, offsetting any benefit from the increased volumes and the improved factory utilization.

Looking forward for Power Systems and just coming to that order book point. There's more than a 20% increase in the order intake year-over-year. Better order cover ratio than the prior year as well, so Power Systems is well placed for 2019. But as a reminder, and Warren mentioned this, 2018 did benefit from that pre-buy-in effects in respect to the emissions regulations that are being introduced in 2019 for diesel engines. So one shouldn't expect the sort of revenue growth we saw in 2018 and 2019 for Power Systems, and I'll get to the outlook in a second.

Defence. A solid year for Defence. Revenue, pretty much flat year-on-year. Operating profit down slightly due to gross margin deterioration with lower combat and submarine volumes, but partially offset by the increased demand for the Multi Role Tanker Transport engines that Warren mentioned.

Operating margin down. Slightly higher R&D spend. Our Defence business is moving into an investment phase over the next 3 years. We should see the sort of trend that we saw in 2018 be replicated in 2019 as well.

I won't dwell on this. I think I've mentioned -- strong order book for Defence as well. Good orders received during 2018, a 1.3x book-to-bill. And the closing order backlog there now is GBP 6.8 billion. So good progress on the order book in Defence.

ITP. Solid growth in ITP. 6% revenue growth. Operating profit, growing nicely as well by 3%. And I won't dwell on this one. The outlook for ITP for 2019, 10% revenue and profit growth.

A couple of accounting policy updates. With effect from the 1st of January, 2019, IFRS 16 will be bringing operating leases onto the balance sheet. The effects here will be an increase in our assets by GBP 1.8 billion and an increase in our liabilities by GBP 2.1 billion. The impact on PBT is negligible. No change to cash, of course. Just sort of update you on that accounting change.

And IFRS 15. IFRS 15 requires the disclosure of unrecognized revenue. This is the closest, I guess, proxy to the value of the order book. But it is quite different from the way we used to disclose the order book. First of all, it includes only firm purchase OE orders. That represents about 9 months' worth of OE orders. And it represents the entirety of any contracted aftermarket revenue. Whereas the previous order book value prepared included all OE orders at list price and then just 7 years of aftermarket. So very different basis of calculation. But somewhat reassuringly, the numbers aren't dramatically different, although it's complete. One might argue, it's a coincidence, but that's where we've got to.

Guidance for 2019. So just running through these. 2019 outlook. Civil Aerospace, around 10% revenue growth; Power Systems, going back to my earlier comments, mid-single-digit revenue growth; Defence, stable, again reinforcing those earlier point -- comments that I made; ITP, around 10% growth; Civil, the loss reported of GBP 162 million will be approaching the breakeven position during 2019. Power Systems' margins will be about 100 basis points higher. Defence, 100 points lower. ITP, stable.

And you put all that together, we get to core profits of GBP 700 million, plus or minus GBP 100 million, and free cash flow of GBP 641 million. Again -- sorry, GBP 700 million plus or minus GBP 100 million.

Just those ranges, putting it in the context of a GBP 15 billion revenue business, those ranges seem large in respect of the absolute numbers of profit and cash that we're guiding to. But in the context of the size of our business, you -- they're actually quite small, just to put it in that context.

And a further step towards our free cash flow of at least GBP 1 billion in 2020.

Finally, reinforcing and reiterating our midterm ambition to move to at least GBP 1 of cash flow per share by the midterm, currently at 34.5p.

Cash return on invested capital, at least 15% through the cycle. We're now at 12%, a little higher than we reported at our Capital Markets Day. And just as a reminder though, that cash return on invested capital we reported then of 9% was on old GAAP balance sheet basis. This is an IFRS 15 balance sheet basis and they're markedly different balance sheets. So just to put that in perspective. And that has caused us, therefore, to be more ambitious around the 15% cash return through the cycle. Just to make that point.

We're using CROIC now, increasingly so, within the business as I -- to help us to with our capital allocation decisions as well, which is encouraging, that the -- it's not just how we report progress, but it's how we measure and manage and work within Rolls-Royce as well.

And with that -- just before I wrap up, I just want to say I know the group finance in Derby are watching now and PwC are watching. Just want to say thank you very much to the team who had done with our first year orders and the first full year of IFRS 15, an absolutely cracking job over the last 2 or 3 weeks. So thank you very much for everybody watching up in Derby and to Price Waterhouse.

Warren, over to you.

D. Warren A. East

CEO & Executive Director

Thank you, Stephen. Bearing in mind, mind the lousy job that I did of keeping to time in the first half. I won't keep you long on this, and we'll get on to Q&A.

So rather than stepping through this, you can read this in the book. This is a very logical set of our sort of high-level objectives for 2019. You'll see not a huge change in terms of what we're doing year-on-year because they all sit within this sort of wider-term high-level thing. We've put this in as a reminder, that it's about making sure we have a balanced portfolio. A lot of our expenditure goes into vitalizing our existing capabilities. That means that products and services that we operate today, how we make sure we continue to operate those and develop new versions of products and services evermore cost-effectively. The tools that we're using to do that and then largely reinventing the business through digital, through adopting digital technologies, to link our designs to our manufacturers, to our supply chain and so on. Transforming the way we actually operate the business, both from a manufacturing point of view, and as you heard Stephen say a moment or 2 ago, by how we measure and manage our performance. And then looking forward to the future, with new technologies, very much embracing the inevitable electrification that's sweeping through the industrial landscape at the moment.

And so with that, we'll move straight to your questions.

Question and Answer

D. Warren A. East

CEO & Executive Director

So I'm sorry, I didn't spot who went first. Those who are driving the microphones, please, we've got a couple here. And then in the middle. Why don't you fire away, Christian? Do you want to go first?

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Two questions from me, the first on the Trent 1000 and then second on the NMA. On the Trent 1000, are you at -- or do you see on the horizon the point at which you will be comfortable or confident in that you will have fully provisioned for the cash outlays required in the future to get this program back on the right footing? And then secondly, around NMA, can you elaborate a little bit on your concerns about not reaching sufficient maturity on Boeing's time line? I mean, it seems a bit from the outside and granted, obviously, we're observing from the outside with a lot less information, but that UltraFan has been actually progressing quite nicely against a number of development milestones. So if you can just clarify or elaborate a little bit on what's kind of changed your mind or drove the decision, that would be great.

D. Warren A. East

CEO & Executive Director

Okay. So I'll do the NMA one and you talk about the Trent 1000.

Stephen Wayne Daintith

CFO & Executive Director

Sure.

D. Warren A. East

CEO & Executive Director

So it's hard to put much more color on it, really. The reality is that Boeing have a specific engine program that they are working towards. The exact specifications of that engine are not completely tied down yet in terms of requirements. But based on the extensive work that we've done with Boeing in tracking those specifications and looking for how that overlapped with our UltraFan program, we simply couldn't find sufficient overlap and there would have to be additional work that needed to be done specifically for the engine variant that would be required for NMA. Now of course, technically, we could make that work, that wouldn't be a problem. But we do know from bitter experience, that you need to do a huge amount of very rigorous testing work to ensure a certain level of maturity when the engine enters into service. And we simply couldn't find enough hours in the day, even if you threw many more bodies at it and much more money at it, there's simply not enough hours in the day to do all that work in time to get to a sufficient level of maturity in time for Boeing's timescales. And it -- so it comes down to what makes commercial sense and how much sort of risk do you want to put into that program. And we chose to be completely open with Boeing and our customers and our investors that rather than get into a program and get towards the delivery dates and saying, sorry, we can't do this, it's -- we need to do an extra year's worth more testing. Once we've ascertained that we just couldn't make it fit in the timescale to get to that level of maturity, we had to withdraw. And that means that we can concentrate on our UltraFan architecture development, which, as you rightly observed, is going pretty well at the moment. I'm very pleased with the progress in 2018 on that. But that is targeting an architecture development and the milestones that we have to hit in that. And it just takes you to a different place than what was required for NMA.

Stephen Wayne Daintith

CFO & Executive Director

So the Trent 1000. So the Trent 1000 will -- is, first of all, just as a reminder, is a multiyear cash cost over 6 years from 2017 to 2022. In total, around GBP 1.5 billion of cash cost, being broadly GBP 100 million in 2017; GBP 450 million in '18 and '19; GBP 350 million in '20; and then the balance of GBP 150 million or so over '21 and '22. That's the profile. That is GBP 100 million more than we expected at the half year. But we do believe now that with the regulatory approvals that Warren mentioned in his presentation that we've received over the last couple of months and the 1 or 2 that is still expected and with the improvement in the aircraft on ground situation falling into single figures towards the final quarter of the year, those will be the key sort of drivers of us getting certain around the cash and the cost profile on the Trent 1000. Around 80% of the cash costs are being incurred over '18, '19 and '20. And just as a reminder as well, that just over half of the total cash costs are broadly in respect to the customer disruption costs and claims that were -- in respect to our customers, caused by the aircraft on ground. So the aircraft on ground, we have made improvement over the last couple of months, reducing from the average of 41 during the second half of last year to 35 now. We expect to see that continued decline during 2019. And it's that, that gives us the confidence. Along with the approvals from the authorities, regulation authorities, we feel confident that the GBP 1.5 billion cash cost is a solid estimate.

D. Warren A. East

CEO & Executive Director

Pass it along, and then we'll go to the middle.

Robert Alan Stallard

Vertical Research Partners, LLC

Rob Stallard from Vertical Research. A couple of quick questions on the 2019 guidance, probably for Stephen. First of all, you said working capital normalization. Does that mean roughly breakeven for 2019? Secondly, what are your expectations for group CapEx this year? And then finally, looking at the Civil division, how do you expect the aftermarket to progress both for long-term service and for older engines in 2019?

Stephen Wayne Daintith

CFO & Executive Director

Okay. So 2019 guidance, so working capital normalized levels. I think the only material item of working capital that we're expecting at this stage is a reduction in inventory. And one might expect that given the growth in inventory that we saw during 2018, which is largely driven by the Trent 7000 production ramp-up but also the growth in Power Systems. So that's the only single material item of working capital that we're expecting. Aside from that, we're not anticipating or planning for any significant items in either the payables or the receivables line. Having said that, and I've mentioned this before, Rolls-Royce in our industry is an industry of lumpy cash flows, and they can -- the timing impact -- can have an impact. But at this stage, there's nothing in our guidance that assumes anything other than the inventory improvement. Second question, sorry, was?

Robert Alan Stallard

Vertical Research Partners, LLC

CapEx.

Stephen Wayne Daintith

CFO & Executive Director

Yes, CapEx. I don't know whether we gave an explicit guidance, but CapEx, if anything, we should be declining slightly from current levels and then, let's say, anywhere between GBP 50 million to GBP 100 million and then steadying down at that level over the next 5 years. That's the plan for CapEx. And it has grown over the last few years. Just as a reminder of that to accommodate the production ramp-up that we've seen over the last couple of years and continue to see.

Robert Alan Stallard

Vertical Research Partners, LLC

Finally, on the aftermarket?

Stephen Wayne Daintith
CFO & Executive Director

The aftermarket progression?

Robert Alan Stallard
Vertical Research Partners, LLC

Yes. I expect old engines versus long-term service.

Stephen Wayne Daintith
CFO & Executive Director

I think we had very good year on old engines. We can't expect that sort of growth to continue. We still think we're going to see good growth, particularly on the V2500 to the next sort of 3 years or so. But I don't think we can expect to see that sort of revenue growth continue. So we ought to be a bit more circumspect in our longer-term horizon and moving into single-digit territory for revenue growth there.

D. Warren A. East
CEO & Executive Director

Can we -- thank you.

Nick Cunningham
Agency Partners LLP

Nick Cunningham from Agency Partners. I wanted to ask about the thinking behind holding a dividend. Because it's sort of -- it sends an opposite signal to the commentary and the guidance, the medium-term guidance, and it's not actually very much money. These are percentage increase and it's not very much money. So I wanted to understand that. And then second, different question. On the NMA decision, what's the route to market for UltraFan in that case? I mean, the obvious one would be a sort of A350neo stretch. I -- will you be ready for that? And does it also mean that, effectively, the pairing has now become Rolls-Royce and Airbus, GE and Boeing, and Rolls won't do another Boeing program?

D. Warren A. East
CEO & Executive Director

Shall I do that one?

Stephen Wayne Daintith
CFO & Executive Director

Yes and I'll do the dividend?

D. Warren A. East
CEO & Executive Director

You do the dividend. It's certainly not our intention that the sort of Airbus-Rolls, GE-Boeing thing is accentuated. And to that end, it would have been very good to being able to participate in the NMA program. But we've gone into why we couldn't participate in that, so I won't repeat that bit now. As far as UltraFan is concerned then, it's a scalable architecture. And it's scoped to scale from by 2,500 pounds of thrust through to about 110,000 pounds of thrust. And that means we can go after widebody, we can go after single aisle. We expect the first opportunities will be in widebody, things like you suggested just then in the question. Obviously, introduction of new airframes is a matter for both Boeing and Airbus. But I can assure you that our relationship with Boeing is very rich and very healthy. And over the last 12 to 18 months, while we've been working together very closely on the Trent 1000 program, it's been a great opportunity for some of the Boeing engineers to wander around in Derby and get a much better idea of how our UltraFan program is developing. So I'm actually quite optimistic with both airframers for the future and UltraFan.

Stephen Wayne Daintith*CFO & Executive Director*

And on the dividend, yes, the dividend will be under review in 2019. We are clearly approaching that territory where it is appropriate to reconsider our dividend and restore it to previous levels. Just to put that in the context of a couple of things. Number one, we're also extremely keen to return to a single A rating and improve our balance sheet. So that's a key priority for us. And number two, we have the ongoing issue of the Trent 1000 and the GBP 450 million or so of cash cost there as well. So we're just balancing it against those other priorities and managing through there. It will be under review in 2019, but it was certainly approaching that territory where it's appropriate to start restoring the dividend again. And just on CapEx, sorry, we do -- we are explicit about that guidance and it's GBP 75 million reduction in 2019. So between that GBP 50 million to GBP 100 million that I mentioned.

D. Warren A. East*CEO & Executive Director*

Okay. The microphone is just moving that way. And then it's going to go back a row.

Andrew Edward Humphrey*Morgan Stanley, Research Division*

Andrew Humphrey at Morgan Stanley. Just a couple of quick ones, one on IFRS 16 and one on Power Systems. Stephen, you mentioned IFRS 16 will be neutral at PBT level. Can you tell us what the impact would be on EBIT? And the second question on Power Systems. I think over the course of 2018, you've highlighted a level of prebuying there ahead of some regulatory changes. You're still guiding for growth in 2019. Clearly, there -- I mean, if that's the case, there must be a stronger level of underlying growth in that business. So maybe talk about the offsetting factors there a bit, that would be great.

Stephen Wayne Daintith*CFO & Executive Director*

Shall I take quickly the IFRS 16? Yes, the operating profit level will be about GBP 30 million, GBP 40 million benefit. Just an estimate at this stage, but that's what it will be, yes.

D. Warren A. East*CEO & Executive Director*

And on the sort of the situation in Power Systems, I mean, we highlighted a couple of things. As Stephen said, 15% growth last year. The prebuying was one of the factors behind that. And unlikely that, that can be sustained. However, we're not looking into complete reversal because some of the other growth in Power Systems is in things like PowerGen. It's in things like adoption of some of our new variants in gas engines where, don't forget, we're coming from a very small base. And as I alluded to in the presentation, a little bit in terms of geography as well where, again, in some parts of the world and in particular in China, we're coming from a very small base. From a cost point of view, we've had a significant barrier historically in China and that's why we set up the joint venture. And I think when we set up that joint venture, when we talked about it, first of all, we said it's partly about cost to make ourselves more competitive in China, but also to make ourselves more competitive generally because then we can export some of that to the rest of the world. But in terms of initial production from there, it's about targeting growth opportunities in China. And compared with some of our competitors, we do target a much broader field of applications. And so that's really what's underpinning our growth expectations for this year. Not as racy as last year, there was that particular factor, but we still expect single digit -- mid-single-digit growth.

Zafar Khan*Societe Generale Cross Asset Research*

It's Zafar Khan from SocGen. Stephen, just on Slide 40, the change in Civil Aerospace net LTSA balance, which is quite a big benefit to the cash flow, Slide 40. Obviously, you've got, on the positive side, the growth in the flying hours. But I suppose as the fleet matures, you're going to get more shop visits. So what should the decay look like in that number going forward?

Stephen Wayne Daintith*CFO & Executive Director*

Yes, I've been asked this before and I think we -- we're expecting this margin to grow nicely over the next 5, 6 years. Growth will continue. It will carry on growing, albeit at a much smaller rate as the 6-year anniversary comes up for those first shop visits of those delivered 6 years previously and when the ramp-up first started in OE production. So we should be thinking around sort of 2024, '25 is when we start to see the growth plateauing and then instead growing more steadily at more moderate levels. But over the next 5 or 6 years, we are going to see good growth in this margin.

Zafar Khan*Societe Generale Cross Asset Research*

But that particular number in the cash flow statement, should we be looking at that number being stable over the next 4, 5 years?

Stephen Wayne Daintith*CFO & Executive Director*

It will depend. It will depend on the nature, a mix of the shop visits year to year. Essentially, it'll also depend on flying our patents as well. We've had some very good years of flying hour growth and it will depend on that. So -- but your logic is not wrong. It's -- that -- it ought to be a relatively linear type of relationship, but it will depend very much on the mix and type of shop visits.

D. Warren A. East*CEO & Executive Director*

So let's move that way, and then we'll come over to you, Celine.

Charles J Armitage*Citigroup Inc, Research Division*

If I could just sort of -- Charles Armitage at Citi, just continue that a little bit more. The GBP 944 million, is that about where you would have expected it? Was it particularly good? Or was it particularly bad? Are we looking at GBP 700 million to GBP 1 billion or are we looking at GBP 700 million to GBP 900 million?

Stephen Wayne Daintith*CFO & Executive Director*

Yes. We should also, on this point, remind ourselves that this includes the credit to the balance sheet from the expense, the debit of the contract catch-up in Civil. So approaching GBP 300 million of this is noncash. So the number is closer to GBP 600 million rather than the GBP 944 million one. And we do point that out on the slide once you adjust for that. But notwithstanding that point, yes, that's how we should be thinking around the sort of the cash receipts from the aftermarket activity.

Charles J Armitage*Citigroup Inc, Research Division*

So GBP 600-ish million for next few years, then...

Stephen Wayne Daintith*CFO & Executive Director*

Again, very much depending on how flying hours, aircraft, particular engine growth but also on the type and mix of shop visits. And we are going to see a ramp-up in shop visits to mirror the growth in the installed base over the last few years as well.

D. Warren A. East*CEO & Executive Director*

Could you pass the microphone on to that end of the room to Celine? And then we'll come up to the back on that side.

Celine Fornaro*UBS Investment Bank, Research Division*

Celine Fornaro from UBS. My first question would be regarding the growth in the old engines and the flying hours. And some of these engines you're probably paying those yourself as a compensation to some of the airlines that have got 787 issues. So I just want to understand if that's capturing that revenue number and how would you account for that? And my second question is regarding the single A credit rating, which is clearly one of your top priorities for the year. So how do you think the rating agencies will react to the results today and the guidance?

Stephen Wayne Daintith*CFO & Executive Director*

So I'll do the second question first. So...

D. Warren A. East*CEO & Executive Director*

And I'll do the first.

Stephen Wayne Daintith*CFO & Executive Director*

And you could -- definitely. So the single A rating. I think in my conversations with the rating agencies, underlying free cash flow is their core metric and growth in the free cash flow. I think they'll be pleased to see net cash on the balance sheet. But they also look very hard at the quality of the cash flows as well. And there are those that will look in -- and we -- clearly, we benefit from working capital in our current year cash flow. And whilst we have a benefit from those normalizing -- standardization of supplier payment, something that you only do that in the year and it's a permanent benefit in the year, but it's not repeatable year after year. So the rating agencies will look at that. So I'm expecting they'll be pleased with the progress. They are extremely keen that we deliver our at least GBP 1 billion of free cash flow by 2020. And they'll be looking at the quality of that cash flow as well. So as it stands, I think they'll be encouraged, but I'm not expecting any material change at this stage from the rating agencies. Warren?

D. Warren A. East*CEO & Executive Director*

And I think if I've got it right, it was about older engines and the service revenue that's flowing from those older engines and the possible contribution of that caused by us leasing older aircraft as -- to help our customers with the disruption. It's true that that's one of the tools that we've used to help our customers through this time, and that's one of the things that we're paying for in these extra costs. But actually, compared with -- I'd draw your attention to one of the slides in Stephen's presentation where we're talking about key cash drivers in Civil Aerospace and the service piece. I'm afraid I haven't got the number of the slide here because I'm on another version than yours, but there is just a lot of activity amongst the older engines. And if you think about the quantities of aircraft that we've had on the ground, there just simply haven't been that many Trent 1000-based aircraft on the ground. The volumes of other aircraft we've had to lease to help customers out is very small compared with the numbers that are contributing to this older engine service revenue. So it probably is a very small factor in that. But we're talking typically -- and not on all the airlines affected, but some of the airlines affected, it would be small single-digit number of aircraft that we've been leasing for periods of months. I think we've got a few over here. And it's important to go to Jennifer because she has some of the online ones. So should we just do some of the online ones first? And then we'll come back to the group on that side.

Jennifer Ramsey*Head of Investor Relations*

Okay. So this is my chance. I'll ask in typical sell-side fashion, so I have 3 parts. So the first part, first question was, is it ethical to pay -- to delay paying suppliers? And is it effectively borrowing money at expense of suppliers? Stephen, if you wanted to answer that question. Secondly, are we prepared for a no-

deal Brexit? We haven't had any Brexit questions, so I thought I'd raise that because there were a number of Brexit questions. And finally, can we comment on where we are in terms of win in orders for the Trent 1000? And are we seeing our market share being lost there, given the number of campaigns that we ran in '18? And how do we view the future?

D. Warren A. East

CEO & Executive Director

Okay. You do the supplier and I'll do the other 2?

Stephen Wayne Daintith

CFO & Executive Director

Yes. So is it ethical to delay paying suppliers? Well, first of all, we're not delaying paying suppliers, we've renegotiated payment terms with suppliers, which is an important distinction. And let me just put this in perspective as well. On average for our large suppliers, we pay on 75 days on average. The industry averages anywhere between 90 to 120 days. So if anything, we're well below industry practice. And we're also signatory to the Prompt Payment Code. And when we look at that and compare ourselves, again, with others in the industry, we're a top quartile performer in terms of paying on time. So I can see the point that's being raised in the question there, but it's not applicable to Rolls-Royce.

D. Warren A. East

CEO & Executive Director

And Brexit. Brexit has wasted a huge amount of a lot of people's time over the last several months, and it's not going to waste anymore of our time. We are ready for whatever outcome happens with Brexit. Clearly, we've had to plan for the contingency of a no-deal Brexit for a long time because, obviously, we have to operate our business on the 30th of March, whatever happens. And to that extent, we have been building necessary buffer inventories. We have made the necessary movements of job functions, no actual transfer of jobs, but job functions, from out of the U.K. into mainland Europe based out of our Dahlewitz site for regulatory approvals. And so we're as ready as we can be. We can't guarantee that every single one of our suppliers is as prepared as they could be. We've spent a lot of time making sure that we've asked our suppliers and we have challenged their answers. But at the end of the day, one of those engines takes an awful lot of parts and it only takes one of those parts not to be there for the engine not to go, and so that is a risk. But we have taken all the steps that we can see is necessary. And I should also point out that in terms of flight disruption around Europe, flight disruption between the U.K. and EU countries, typically, this is a narrow-body activity rather than a widebody activity. And of course, with the exception of the number of V2500s, and that's a relatively small part of our service revenue, then we're not exposed to that Brexit risk. On the Trent 1000 and the market share, a couple of facts. Our market share has declined in terms of new orders. And it does set -- our market share today is about 35%. We had, obviously, hoped ahead of this issue that, that share would be growing from mid-30s towards 50%. I would interpret what's happened as a delay in that trajectory. The Trent 1000 is actually a very reliable engine, has a 99.9% dispatch reliability, and our customers who are flying the Trent 1000-powered Dreamliners, whilst not initially, clearly, they were very disrupted, are able to partition in their minds the operation of the aircraft when the engine is behaving normally and take that away from when the engine isn't there at all. And so we do think we have a product. It would be wrong of me to say that the issues we faced haven't affected things. Certainly, our competitor has utilized the situation to their advantage with some very aggressive sales campaigns. Wouldn't you? And so I actually don't think this is a long-term thing, but it's undoubtedly an interruption. It's one we're obviously very sensitized to. And it just so happens that the campaigns that happened in the -- particularly in the first half of last year, didn't -- did not go our way. But that doesn't mean to say that we're wringing our hands with horror. And we're putting our best foot forward on what we believe is a competitive engine and a good solution for those customers. We're engage in campaigns now and in the future. So now we need to move into a few questions here in the second row.

Harry William Freeman Breach

MainFirst Bank AG, Research Division

Harry Breach from MainFirst. Can I just ask, firstly, the large engine OE losses, I think GBP 1.4 million for the full year, I think you said GBP 1.4 million for the first half as well. Is the fact, therefore, that we don't seem to have seen second half improvement just a function of new product introductions in second half? Can you give us any color on the sort of the pace of improvement in '19 on that? And then next question, completely different, sort of slightly relooking at Rob's question on T&M aftermarket. Appreciate what you say about unsustainability at 21% organic. But at the same time, the dynamics of V2500 are quite favorable. Can you give us a bit of your sense about current T&M spares and shop visit demand in your fleet here in February 2019? Is it still running at last year's pace? And then the very final one, and sorry to labor this, Warren, in particular. We talked earlier on about cost estimate stability on Trent 1000. Can we maybe look at the technical side? Can you give us a little bit of feeling like what gives us a confidence that we're not going to make further durability discoveries on Trent 1000 where we've kind of got to the bottom of the barrel on discoveries?

D. Warren A. East

CEO & Executive Director

All right. So the first one was cost trajectories and how it's unfolding with the balance of this year on OE. Is that right?

Stephen Wayne Daintith

CFO & Executive Director

Yes, the OE improvements that we're expecting.

D. Warren A. East

CEO & Executive Director

The OE improvements that we expect to see this year. Well, Stephen outlined that there are 2 data points: breakeven on XWB by 2020 and breakeven on the portfolio by 2022-ish. The latter is obviously dependent on the product mix because what's going to happen is XWB will actually go into a state where we make a positive contribution every time we ship an engine. And some of the -- for some of the other engines, low volume, I'm sure the Trent 900s that we ship over the next couple of years we'll never make an OE profit on. For the others, then Trent 1000, Trent 7000, you know there's a lot of commonality between those engines, and there's actually a lot of commonality between the 97k version of the XWB and the 84 version of XWB. So we're moving from a situation of multiple engines in a relatively small volume to essentially 2 engines and variant and 1 variant each thereof. And therefore, a higher volume of all of those engines, which is why we expect to see that second trajectory. But the rates at which we get there will depend on the product mix. And as we look through 2019, then we can see we're going into 2019 with XWB accounting for approximately 50% of the shipments, and the remainder made up by these new engines, largely the 97k variant on which we make a loss and Trent 1000/7000. So I think we'll see a continuation of the trajectory that we're on. And we absolutely -- there's nothing that we can see today to suggest otherwise.

Stephen Wayne Daintith

CFO & Executive Director

Should I do the T&M one?

D. Warren A. East

CEO & Executive Director

T&M one.

Stephen Wayne Daintith

CFO & Executive Director

Yes, T&M one. I don't think we're going to see the 21% growth that we saw in 2018, 2019. But it remains a healthy -- today, you asked the question about today, it's a healthy and growing part of our business. So I think if you held me to it and if I were to hedge my bets, I'd say you should be thinking around sort of 10% growth in 2019.

D. Warren A. East*CEO & Executive Director*

Okay. And are we going to find some further durabilities on the Trent 1000? Durability issues? Look, I cannot sit here and rule out that we won't find some issue on any one of our engines in the future. That's just how things are. However, what I can assure you of is that the Trent 1000 situation was, if you look at the whole history of the thing, very unusual in having multiple issues with one engine. And if you think about it, there were a number of iterations of that engine to get the thing right. Where we are now with Trent 1000 TEN, we are confident that we have solved the fundamental turbomachinery issues that have caused all the hiatus in 2018. We know we've got that design right to the extent that we have been thoroughly testing, Boeing have been thoroughly cross-examining, and the airworthiness authorities have been convinced not only in terms of certification of the redesigned parts, but very thorough analysis of the failure mechanism and what sits behind that. So the best brains in the world on this have spent the last 6 months on it. So that's as confident as we can be. As I say, you can't possibly rule out there might be some other issues in the future, but that's the same as any other engine. I think we've got Rami before we...

Rami Yehuda Myerson*Investec Bank plc, Research Division*

Rami Myerson from Investec. On spare engines, you talked about an increase of GBP 112 million of revenues from sales of engines to your engine-leasing JVs. Can you maybe talk about the profit and cash contributions from those JVs to underlying profit and cash? The second question would be on long-term deliveries. In the past, I seem to remember a chart where you talked about 550 to 600 deliveries a year. Next year's only 520. Do you still plan on getting to that 600 in the time frame of 2022, 2023? And lastly, on NMA, would you consider participating as a partner in one of the engine programs of one of the -- of your competitors if they are selected for that program?

D. Warren A. East*CEO & Executive Director*

Okay. Should I...

Stephen Wayne Daintith*CFO & Executive Director*

Shall I kick off with the OE one, the spare engines?

D. Warren A. East*CEO & Executive Director*

Okay.

Stephen Wayne Daintith*CFO & Executive Director*

Yes, you should think about half of that number as sort of contribution to profit and cash, sort of as a rough guide.

D. Warren A. East*CEO & Executive Director*

Second question was, okay, volumes of large engines.

Look, when we put up our projections of volumes, it is our best estimate at the time. What I would say is we've probably got a tighter grip on demand signals from our airframers than we possibly had a couple of years ago. And that isn't to say that they take some orders and they try and shove a few other things in. So things could change. I think we're in the zone of 500 to 600. We know we have the capacity and the run rate to deliver at over 600 per annum if we need to because we've done that. We've done 160-plus in a quarter over the last couple of years. Clearly, when we're going through introducing new engines, that gets interrupted a little bit. But as I say, that's largely behind us. And what you see today is basically

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

the result of our sales and operations planning process for 2019 based on the demand signals from our airframers. And as we look forward, the demand signals that we're getting at the moment are for in that zone of 500 to 600, but it could change. And on NMA, would we partner with somebody else? Well, we'll have to see what happens and who gets selected. We've made our decision in terms of our proposed offering. If we can do something useful and it makes commercial good sense to partner in future, then, of course, we're open. But now we have to see how the future unfolds. One behind and then one over there and then back to the middle, okay? And we're at 10:29 at the moment, so we're going to have to be fairly swift.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

Andrew Gollan from Berenberg. The question is on contract catch-ups, quite a big negative in the year, almost GBP 300 million. Firstly, specifically on that, what's driven that this year or in 2018? And then perhaps a broader question. The negatives generally have trended to be bigger over the last few years, if we look back at the data you offered us. Is that indicative of a bigger issue in terms of contract assessments over the long term because we're making increasingly large negative adjustments. So a bit of a devil's advocate, but can help us understand that, please?

Stephen Wayne Daintith

CFO & Executive Director

Yes, okay. So first of all, the contract catch-ups. First of all, this is an IFRS 15 treatment. This is a very different treatment for contract margin reviews that take place during the year we -- on our 187 contracts that we have with various airlines. And the way IFRS 15 works is that it looks at the cost to go on the contract. And any variation in that cost to go, either positive or negative, has an adjusting effect on the revenue previously reported. This is the catch-up of revenue. So what this can mean is that -- and the volatility of IFRS 15 has demonstrated here that the very small changes in estimates of the cost to go on high-margin business -- high-margin engines that are significantly through their program but was still with a large amount to go, relatively small changes can lead to a disproportionately high adjustment to revenue previously recognized. And in respect to the GBP 276 million, that's most true of the Trent 700, of course, high margin, but halfway through its program -- of its revenue collection. And that's largely what this is in respect of. And it's largely just around utilization of the aircraft by these customers, causing us to have a slightly different view on the cost to go. And it's implicit within the volatility of IFRS 15 and how that works. And what we will be doing is building, I would say, more contingency into our estimates around contract margins going forward to protect us from those volatile swings. So a slightly technical answer, but it's an important one. And it also plays into sort of how we think about outer years as well. And then the second one. I think this -- I don't think it is indicative of any sort of malaise, generally. I just think it happens to be first year of IFRS 15 and that impact. But you're not wrong that if we look over sort of '14, '15 or so, we were seeing benefits, and then sort of '17 and '18 unwinds. I don't think one should read too much into that. It's a very specific event in 2018 that's led to this Trent 700, in particular, contract catch-up.

D. Warren A. East

CEO & Executive Director

Okay. Thanks. Final 2 questions. I think we've got one there and then we're coming back to -- did we ever get to you? Right. And sorry, Zafar, you've already had a go, okay? So we'll do one there and one up there.

Olivier Brochet

Crédit Suisse AG, Research Division

Olivier Brochet with Crédit Suisse. Two questions quickly. The first one on spare engines for 2019 and beyond. Can you help us understand what you have in your plans compared to the 50 that you did in '18? And second on UltraFan. I understand that you don't have a -- you don't have an engine for an aircraft, so it's very difficult to answer that question. But what sort of RRSPs do you have in mind for that program?

Stephen Wayne Daintith

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

CFO & Executive Director

Okay. So spare engines, 50 spare engines delivered in 2018. And spare engines are an important part of the whole ecosystem for the airlines and ourselves, particularly important in 2018, of course, for the Trent 1000 issues to have spare engines available to help service that particular issue. We're not expecting significant growth from the 50 in 2018. You might be thinking around sort of 60 or so, but not massively dissimilar from the number that we saw in 2018.

D. Warren A. East

CEO & Executive Director

And risk and revenue-sharing partners for UltraFan engines, probably the usual suspects. I couldn't be any more specific than that at the moment. I mean, it's a new architecture, but it's still a gas turbine, and we still need to work in the domain. So it will be the usual suspects.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

Jeremy Bragg from Redburn. One question on working capital, sorry to keep hammering away at this. So there's a GBP 400 million benefit from payables which, I guess, reverses next year. So that's GBP 400 million in my free cash flow bridge as a negative. What I don't really understand is exactly what happened with the engine concessions because that was a big benefit last year and you've given this number of GBP 150 million and I don't know whether that's an absolute number or a bridge number. So did you in fact see a GBP 600 million headwind this year in respect to engine concessions, which was offset by the GBP 400 million positive of...

Stephen Wayne Daintith

CFO & Executive Director

Yes, we did.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

Great. And then the next question, again, a clarification, please. You said breakeven on the portfolio for OE engines by 2022. But unless my mind is playing tricks, I thought the last deck said GBP 0.4 million loss per engine, please?

Stephen Wayne Daintith

CFO & Executive Director

Yes. Well, maybe I'm thinking sort of midterm 2023, but that's certainly the direction that we're in, so -- we're on.

D. Warren A. East

CEO & Executive Director

It's math and we'll look at the difference between those 2 things. But as we sit here today, we're on that trajectory in the medium term. And as I said in an answer to a question, I wouldn't want to step in too accurately. It has to be 0 at this particular month because it is going to depend on the product mix that we're actually shipping at the time.

Thank you. I'm sorry, we're out of time. But thank you all very much for your attention.

Presentation

Jennifer Ramsey

Thank you for joining us here at London Stock Exchange and for those of you who joined us online. My name is Jennifer Ramsey, and I lead the Investor Relations team at Rolls-Royce. Welcome to our 2018 half year results presentation.

In terms of the agenda today, Warren East will be -- our Chief Executive will be sharing his perspectives on the progress of the first half of the year. That will be followed by Stephen Daintith, our CFO, he's going to talk you through the financial results in more detail. And then, Warren will then round up with the outlook. In terms of format, the presentation should take around 45 minutes and we'll have time for Q&A at the end, and we'll be here to take questions online. Please access the webcast services to access the questions via our web page.

And we'll endeavor to take these questions as long with the questions -- that are in the room. We're not expecting any fire alarm test today, so if the alarm does go off, please leave in orderly fashion by the doors. And can I kindly remind you to switch off your mobile phones. And with that, I'll hand over to Warren.

D. Warren A. East

CEO & Executive Director

Great. Thank you very much, Jennifer. Thank you, everybody, for coming along with us this morning. So as Jennifer said, I'll start with a quick overview, and I'm well aware of my reputation for not being able to keep the time, so I'm going to do my best this morning. So we have quick plenty of time for questions and answers.

So a quick summary. This is a good slide. It shows good half-year progress for 2018, and that's really what is underpinning our confidence in the full year, which is why we've made the comments we've made this morning about full year free cash flow and profit at the upper half of our guidance range.

Basically, all of these metrics are moving in roughly the right direction, and it's a strong performance across all parts of the business. And I'm particularly encouraged by good control of some of our costs -- particularly our discretionary costs as well in the first half. So we're feeling pretty good about it from an overall point of view.

I'll talk about that in a little bit more detail and run around the businesses, and then some comments on the restructuring. So our Civil Aerospace business, good metrics here. Obviously, overshadowed by the issues we're seeing on Trent 1000. I'm going to talk about Trent 1000 in just a moment. But large engine production is up, it's up about 24%. Encouraging to see the run rate there. We're well positioned on a run rate for the second half of the year. We do have a change in product mix going into the second half of the year that we can probably talk about a bit later but -- and that's going to bring its own challenges, but it's a very good first half position to start with. And that's obviously, led to growth in the installed fleet. So we are now up to about 4,600 large engines in the installed fleet, which is great and you're seeing the size of the fleet driving growth in engine flying hours. It's encouraging seeing that come through to the business. We've also made good progress in the OE losses. And I think both Stephen and I can talk in a little more detail in a few moments about that.

Very good to see new engines launched as well. We obviously couldn't talk with you in March about our new Pearl engine that's launched in business aviation, but it's also encouraging to see some of the other new engine activity as well. So all in all, a good half for Civil Aerospace, and I'll talk about Trent 1000 in a moment.

Power Systems, again, a standout performance from our Power Systems overall growth of the about 13%, driven by volumes and strong growth in the target markets, particularly in Marine and Industrial sectors.

Defence was a solid performance, very good on cash and a good development of pipeline, the opportunity pipeline, which we believe can turn into orders in the second half of the year.

At our Capital Markets Day, a few weeks ago, 6 weeks ago now, we talked in more detail about the restructuring program that we announced. And I'm pleased to say that that's going down very well inside the business, and we're making good progress on that.

Taken all together, that gives us a good platform from a financial results point of view at this half way stage in the year, growing in confidence for the full year. And now I'm going to go into a bit more detail. And I'll start with the Trent 1000 issues, since this is really a sort of contextual backdrop that has been a big issue for us in the first half of the year.

It's been an even bigger issue for our customers. And I have to say that, of course, we apologize and do regret all the disruption caused to our customers. If you are customer who has a large fleet of Rolls-Royce powered, 787s then there is -- there has been an unacceptable level of disruption. However, we are working very constructively with each and every one of those customers on a customer by customer almost engine-by-engine basis, so that we have the situation with each customer's engines plotted out over the next 12 to 18 months. And that is a dynamic situation, but we're working very closely with them on that. And I have to say that in spite of all the disruption caused, our customers generally are being incredibly supportive and by working together, we are achieving minimal disruption for those customers.

So from an operational point of view, at our Capital Markets Day, we had just passed what we believe to be the peak of aircraft on the ground, and I'm very pleased with the team performance that has managed that situation. We have seen a lot of creativity, we've seen a lot of commitment and some very good results. The actions and the pace of response has been very good. We are now sitting a well below that peak of just under 50 aircraft on the ground and increased MRO capacity is absolutely keeping pace. We're just slightly ahead because we are on a slight-downward trend of the inspections and the fallouts from the inspections.

More importantly, we're also making great progress on the long-term fixes here, and obviously, 6 weeks since our Capital Markets Day and the update I gave then, I'm 6 weeks more confident in the final fixes to the situation around the Trent 1000s. So from an operational point of view, that's good.

When we stood here in March, we talked about the cash impact on 2018 and 2019, and obviously, the additional inspections that have come to light since then and the full sort of extent of what it takes to deal with all those inspections. We were able to quantify the '18 impact at our Capital Markets Day in June, and say that, that's actually increased from the expected GBP 350 million to GBP 450 million in 2018. And over the last several weeks, we've been busy quantifying the cash impact in 2019 and 2020, and that's what we're talking about today, the cash impact in 2019, we now expect to be the same as 2018, GBP 450 million. We do expect that to reduce in 2020 by GBP 100 million and fall very significantly after that. And Stephen will talk, I'm sure, in a little bit more detail around the exact timing of that. And moving on to the expected P&L treatment of that where we've taken an exceptional charge this morning. So we'll cover anything else about Trent 1000 in the Q&A session.

Another key topic at our Capital Markets Day was our rewire program, the restructuring and addressing significant change to Rolls-Royce across structure, across process, people and culture. And I'm pleased with the progress that we've made over the last 6 weeks since the Capital Markets Day. But of course, what I'm really pleased with is the progress that we've made internally since February when we kicked off this program in earnest. The restructuring that we announced at 3 business units has taken place. We are making good progress with tightening down on what is going to be our smaller, very lean head office. We have launched group business services, organization, and generally, marching forward on that restructuring. Our executive team has been in action around the business consulting with thousands of our employees.

So here's a summary of what happened. The group business services organization is bringing together about 2,000 people from functions like finance and HR and legal, to support our empowered businesses. We have established another central grouping, bringing together things like strategy and our technology group, really focused around beyond the investment horizon of our businesses, creation of genuine

competitive advantage and intellectual property, and that's quite a small team of a few 100. So I said, the executive team's been around the business. We have face to face met with thousands of our employees around the business since the middle of June. And that's been an effort from all of our execs who've been hunting in pairs. It's been a very rewarding exercise, a lot of 2-way communication. We've actually been able to use the input from our employees to help set priorities. It's actually initiated some short-term immediate actions, which have been quite useful and helping us with our zero-based budgeting approach to making significant changes with our processes.

And in terms of the headcount reduction that we announced in the middle of June, then we're on target for our goals there. We're conscious of the fact that this is about real people. It's 4,600 people leaving the business by the end of 2019, with approximately 1/3 of that happening during 2018. We are on target for that.

So that's restructuring. Now I'll just do a quick [cantor] around the 3 businesses. And looking at Civil, it's not all been about the Trent 1000 in Civil in the first half of the year, and that's really what's quite encouraging. Trent 1000 is, I'll say, I'm being very pleased with the excellent response from our business, but we've been able to do that at the same time as a lot of other good things happening. So it's good to see growth in usage of the fleet, and you see a significant growth half year on half year in invoiced flying hours, partly, of course, driven by the increase in the size of the fleet. So it's encouraging to see the ramp-up in volumes. We've been on this journey of 300, 400, 500 and hopefully, this year about 600 engines being -- large engines being produced. We're on track for that. And encouraging as well to see progress on the OE losses, driven by XWB, but Stephen will show a bit later some of the other engines contributing there to reduction in cash losses.

In terms of fueling that in the future, encouraging to see the new engines coming through, so Trent 7000 achieved certification and those of you who visited Farnborough a week or 2 ago, will have seen the Trent 7000 on the new A330. And again, on new engines, very good to see the launch of Pearl. Obviously, it's been in development for some time. We haven't been able to talk about it. It's a very well-kept secret. But good to see a resurgence there and at the time was when we see a little bit of uptick in the business jet market as well. I mean, it isn't all about the current activity. We're also seeing good progress on new technology, looking further ahead and our UltraFan core demonstrated we've had some very good results in terms of testing there.

On Power Systems, as I said, another standout performance, really, very encouraging momentum at Power Systems, the pipeline for the second half and for '19 also looking good, driven by strong markets, particularly Marine, Industrial. And that's been -- that extra volume has been helping our margins, looking ahead to cleaner technologies, demand there for gas power. And in terms of what we've been doing inside the business, then a continuation of the simplification I've talked about several times, standing in this very spot. We're continuing with the reduction in the number of product variants. We've now reduced about 30% of the product variants. Obviously, progress is bit slower at that because you get the low-hanging fruit first. But we're continuing on that journey. I also talked before about Power Systems and service and the massive installed base we have out there and how we aim to do a much better job on service in our Power Systems business pushing digital, pushing connectivity. Obviously, we are prioritizing the relevant applications there. We've also -- we have actually seen the first, really, digitally driven applications in people's hands to help with the service there and the replication of the service center model that's in our Civil Aerospace business, up and running in Power Systems. It's good. And looking ahead, Power Systems, we also, again, driven by underlying fundamentals cleaner, fewer emissions, more efficient engines and also system solutions that we're working on in Power Systems. So all in all, a good first half year there.

Defence. So what we can describe as solid progress, I mean -- actually we haven't any huge announcements to make about what's been going on in Defence in the first half of the year. Clearly, there was some work upfront on the structure, putting together different pieces of our business, all related to Defence under one umbrella. That's been encouraging. We're seeing actually some early signs of first customer contact where that's actually becoming quite useful to join up.

Good to see the F-35s appear in the U.K., from a U.K. perspective. Good to see the MT30 getting outside of the U.K. and the U.S. traditional navy, so in Korea and in Japan. I mentioned before the pipeline in

Defence looking good for the second half of the year and again, those of you who are at Farnborough saw us on the platform alongside BAE and others with the U.K.'s new combat program that was announced there.

Just one tiny bit to finish on the overall shape of the portfolio, so we've talked about cleaning up the portfolio and we talked about the elements of that before. So as of the half year, pleased to be able to talk about the bottom half of this slide there where the sale of commercial Marine has been announced. We rearranged a few of the pieces in the -- in our formerly Marine business before we embarked on this process, which meant that we had essentially just a Commercial Marine operation to sell. I'm very pleased that we found an excellent buyer in Kongsberg for that business and a good result financially.

And with that, I'll hand over to Stephen. Thank you.

Stephen Wayne Daintith

CFO & Executive Director

Great. Thank you, Warren, and morning, everybody. So Warren's kept us on time, and I'll do my best to stick with that. So thanks for joining us for the half year results. And as Warren said, I think an encouraging start to the year, certainly ahead of our own internal expectations. We don't issue half year a consensus -- sorry, guidance numbers for consensus. But it's certainly ahead of our own internal expectations. So just running through the numbers. There's the agenda: the half year results, a quick cantor through the business units, accounting policy updates and then guidance for the balance of -- well, for the full year 2018.

So the half year results. First of all, we'd like to introduce a new format, that we're going to be using on a go-forward basis to how we present the Rolls-Royce numbers. Highlighting what we consider now the core business, so we've announced the sale of Commercial Marine, we completed the sale of L'Orange. So those are coming out of our core numbers. Late December last year, we completed the transaction for ITP, so that comes into our core numbers. And that's how we've arrived at our core business. So this is when you see the expression core business throughout the presentation and in the RNS. That's what this is all about.

And in fact, we've got a -- we've shown our guidance, updated our guidance to show this new format as well, which is consistent with the treatment that we adopted audit for the group in March earlier this year with the full year results.

So the group underlying numbers. First of all, revenue growth, 26% growth in revenue across the group, and we'll see that's some very strong contribution from Civil, Power Systems and ITP as well. And -- sorry, that was 26% for Civil Aerospace, that was 14% across the group. Civil Aerospace growing at 26%, that was growing in OE, long-term service agreement revenue but also in time and material revenue as well. So good growth across all 3 revenue streams. Power Systems growing at 13%, ITP growing at a very nice 19%. That's largely driven by its share on the Rolls-Royce engine programs.

Core business, therefore, growing at 16% and the group underlying results of 14%. So good revenue growth, and as we'll see in a couple of slides, across all our 3 core revenue streams of OE, LTSA and time and material revenue.

And then looking at the profit on a business-by-business section. And the underlying operating profit or loss in Civil was a GBP 112 million, but that's GBP 149 million improvement on the equivalent period last year.

Defence was pretty much flat. Power Systems, nice profit growth in Power Systems. So GBP 56 million on an organic basis to GBP 80 million, and that's good flow through of profit from revenue growth into profit.

ITP growing by GBP 32 million to underlying operating profit of GBP 40 million, and you get to the group perspective there. Core business is growing by GBP 183 million. And as a strapline there, just to remind us on free cash flows, we'll see in a little while, GBP 211 million growth in organic, free cash flow to GBP 72 million negative, but a significant improvement on the first half last year. And group free cash flow and -- at GBP 267 million improvement there as well. So good progress across the group.

Looking at the core business underlying results when you add all up and take into account R&D and C&A and bring in some details in there. So there's a 16% revenue growth, gross profit growing by 12%, R&D costs are down slightly by GBP 100 million or so, 28% organic change. But just to make the point, and I'll show a slide little later that really demonstrates this clearly. Our cash spend on R&D is actually up on last year. So we are spending more than last year, but the hit to the P&L account is lower, largely driven by the increasing capitalization in line with our new policy, and I'll show you that detail in a second.

C&A costs are up by 4% to GBP 479 million, this is the indirect expenditures across the group. Most of our businesses, in fact, are flat, if not down on C&A. And it is in Power Systems that was -- that's really driving this increase at a group level, and that's largely a phasing difference, which we expect to correct itself to an extent in the second half of the year. So core underlying profit growing by GBP 183 million and core free cash flow at the bottom there, which I'll explain in a second growing by GBP 214 million.

Looking at the 3 revenue streams that I mentioned a little while ago. So whilst we were reporting core underlying revenue growth of 16%, it is not as though it's just one of our revenue streams that's sort of driving that 16% growth, it's pretty much, it's good growth across our 3 core revenue streams. OE revenue, 19% organic growth, largely driven by the Civil Aerospace ramp up, which we'll talk about in detail and the growth in Power Systems.

LTSA service revenue, again, the flying hour growth is a big driver of that. But also the shop visits growth as well in LTSA service revenues, and again, largely Civil Aerospace. And then other service revenue, time and material revenue, we see this growth in Power Systems but also in Civil Aerospace, where -- which you'll in a little while, the growth there in the -- on legacy engines, the old-fashioned time and material parts and so on -- high margin business growing very nicely. So it's encouraging to see a balance of growth across the group and not just in one particular area.

Key point here, we actually have a good visibility of revenues as well. We have a very clear order book around Civil Aerospace. And as we'll see in a little while, Power Systems as well has good visibility around its order book and, indeed, a strong order book as well. And we'll go into that.

And you can see the mix there of the types of revenue streams: OE 49%, growing at 19%; LTSA 25%; and other service revenue 26%. So a good balance of revenue streams as well.

Here's the chart on R&D. So R&D actually increased by GBP 43 million on a cash basis to GBP 663 million. Third-party contributions represents government funding and so on to contribute towards our R&D programs. So our net cash spend is up by 14% to GBP 518 million. We're capitalizing GBP 239 million of that spend. And if you recall, when we highlighted our new accounting policy, we're capitalizing a little earlier and stopping capitalizing a little later than previously and the comparative for the first half of '17, did not have that new accounting policy in place. So that's why you got a bit of a disconnect between those 2 numbers.

So the core R&D P&L charge for the first half GBP 296 million. What else is there to say on this slide? I think where there is increased investment is in Civil Aerospace largely, the advanced-development programs, the UltraFan progress continues as Warren talked about. And we've got the new business aviation family, the Pearl 15, which we announced earlier this year. There's an increased spend in Defence as well, which we'll see shortly, explains the Defence profit before tax, operating profit coming down slightly, and that's on future program investment to support those new orders that Warren talked about that we're expecting in the second half of the year.

So restructuring. And Warren's talked quite a bit about this already, but let me just put these sort of -- the financials on this. The exceptional P&L charge that we're reporting today for the first half of the year is GBP 132 million and the test for this, this is largely headcount-cost related. The test for this is that our employees have a reasonable expectation of being impacted by this program and that's the test for when you -- is the trigger for the -- for putting the provision in place for that headcount reduction. And as a Warren mentioned, we've carried out, I think, every [ELT] member -- executive team member has probably done 40 to 50 town hall sessions around the Rolls-Royce Group over the last 4 weeks, not just U.K. but across the U.K. but also Singapore, Germany, the U.S. around all parts of the global Rolls-Royce, and explained in detail the restructuring program, the implications of it, but also what we're looking to try

and achieve out of it from a cultural and a process change across the business. So it's been a good start on delivering plan.

The next 5 months are -- is a critical time when we then start implementing on those headcount reductions. Just as a reminder, we have highlighted that we're expecting around 1/3 of the headcount reduction to be in 2018 and the balance in 2019.

The benefits of this reaffirming the benefits, GBP 400 million of net savings run rate by the end of 2020 around fixed cost and headcounts. Going back to my point about process, a much simpler, more responsive business structure, improved efficiency and effectiveness. And what's been encouraging, just to reinforce Warren's words, is the degree of enthusiasm across the workforce to get involved in this restructuring. So we've been delighted at that reaction.

Total costs of GBP 500 million, so the GBP 132 million is a proportion of that GBP 500 million. I think we guided to around 25% in 2018, so we're kind of a broadly on track with that, maybe a little bit ahead of it. But on its own way, that's good news because it demonstrates the progress that we're making on the restructuring.

Just as a reminder as well, the underlying profit and free cash flow excludes the one-off restructuring items. So this GBP 500 million cash cost is excluded from our underlying cash flow and profit numbers.

The Trent 1000 and 900, I have combined the 2 engines on this chart, but the numbers, particularly as we get into sort of '18 through to '20 and beyond, a very large majority of those are in respect to the Trent 1000. So the 7th of March guidance that we gave was GBP 350 million cash cost for the Trent 1000 and 900. Since the Pack C and Pack B Airworthiness Directives, that cost has increased to around GBP 450 million. As Warren mentioned in his presentation, we are now expecting 2019 to be broadly flat with 2018 at around GBP 450 million, 2020 falls by GBP 100 million to about 350 million and then, we have a material reduction into '21 and '22 beyond that. The updated impact, what does this extra cost reflect? It reflects the cost of the compressor rotor blades and the significant ongoing customer disruption over a period of time as these Airworthiness Directives remain in place. We'll talk about that in a second.

I should say, as well, that all the cash costs for the Trent 1000 or 900 are included in our underlying free cash flow guidance and targets that we've given for the years ahead, just to make that point. So whilst the accounting treatment, we'll get to in a second, is around the accounting of it, in cash, Trent 1000 and the 900 in-service cash costs are included.

So the triggers for the exceptional treatment and over the last few weeks, we've exercised a lot of brain cells on this treatment with our auditors, with our audit committee, with our brokers, and we have all landed on the -- this accounting treatment that we're highlighting today for the Trent 1000. A GBP 554 million provision that we're setting up for the exceptional costs of the Trent 1000. Total costs over the next 5 years that's '18, '19, '20 '21 and '22. So what are those triggers?

Well, first of all, and we've put these words very -- prepared these words very carefully because these are the sort of triggers that we will use going forward, should we ever be in the position again. We're certainly not expecting that and what we have is a pretty unique event with the Trent 1000 and -- but this is just to clarify exactly what has triggered this treatment. So first of all, a series of abnormal events, giving rise to a significant level of cost of a nature not normally expected. And most importantly, it's not reflected in the contract price, not included in the original long-term contracts. The abnormal events, I think this is -- the material technical issues arising from the regulatory Airworthiness Directives and the Airworthiness Directives fleet wide is an important trigger as well. It's a wide-ranging impact across the fleet of an entire product type, Trent 1000 and is causing significant disruption to our customers. In these cases then, the cost of disruption, wasted material, labor, et cetera in respect of the abnormal events will be treated as exceptional in the P&L.

When we do all our sums, that item comes out at GBP 554 million and that represents around 40% of the total cash cost of resolving the Trent 1000 issues for the period over 1 January '18 through to 2022. So it's a multiyear provision, 40%. The balance of around 60%, therefore, will be recognized over time in the P&L

through our normal contract accounting margins over the next 15, 20 years, that balance of around GBP 800 million also.

Final bullet point is just reinforcing my earlier comment, the cash costs will continue to be fully reflected in underlying free cash flow as they are being for 2018.

The drivers of the growth in free cash flow, and we're reporting a GBP 267 million improvement on the prior year and a number of drivers that get us to that number. First of all, increased cash inflows from civil aftermarket and engine flying hours. Flying hours growing at 20% on an underlying basis, a good strong growth there and a good cash generation from there.

Higher spare engine volumes. We have a much better mix of spare engine volumes, first half, second half compared to last year, which was very much second half weighted. So there is a growth, therefore, in the first half this year compared to what was a relatively low number in the first half of last year, as the spare engine volumes were very much second half weighted. So there's a benefit in what is at the moment a very buoyant spare engine market, and not just because of the Trent 1000 issues because there are so many new engines going to a number of operators who'd like to build up an inventory of spare engines for their new fleet.

Defence and other business working capital improvements. You might recall from the Capital Markets Day, we're encouraging all of our businesses to work harder at working capital in inventory, in debtors, in creditors. We still have a large balance of old debtors to be collected. We still have some supplies that we tend to pay a little earlier than the terms than we ought to. So there are old-fashioned opportunities for working capital improvements. Inventory remains at too high a level as well, which I talked about. There's good opportunities there. And then mitigation actions are continuing as well to the Trent 1000, as Warren alluded in his presentation, managing discretionary spend very tightly, particularly on travel costs, which have come down quite significantly over the last few months and in capital expenditure as well.

On the other side of the coin, the outflows, Trent 900, 1000 engine in service costs, we've guided to the number around GBP 450 million in 2018 in -- for the full year. Power Systems is modestly lower due to the order book composition, but also if you recall Power Systems last year had a particularly good cash flow performance, and particularly, in the first half of the year, which of course, you can't tend to repeat that year after year. And then we've talked about the high future program R&D investment across Civil and Defence. And that gets us to the numbers in the middle of the page there. Slightly higher tax, slightly lower pension costs reflects in the surplus that we have in our pension scheme, and there's the out turn below of group free cash flow but also highlighting the core free cash flow. And all of these items give us confidence, therefore, around the full year 2018 cash flow. Hence, the updating to guidance today to be in the upper half of our guidance range for cash and, indeed, profit as well.

Looking at working capital a bit of detail, we tend to get quite a bit of questions on working capital, so we put this slide in just to help that analysis. Inventories have grown by GBP 427 million. One shouldn't be surprised at inventory growth with Civil Aerospace and Power Systems and the volume growth that we're seeing in those businesses. Of course, I think there's an argument to be had around the efficiency of our inventory balances, but that's another story. The increase in trades and other receivables, again, largely volume driven. And then increase in trades and other payables, there's been a material increase in the Civil long-term service agreement creditor balances, which has been driven by the engine flying hour growth in advance of revenues recognized. And within that number, there's also the GBP 154 million prior year contract catch-up adjustment, which is a debit, a cost to our P&L accounts in the first half of the year, which I'll talk about in a second.

We've got phasing ahead of the H2 volume ramp-up. The Power Systems, again, as you would expect that given the order book and growth expected in the second half of the year. And you got underlying volume growth in Civil Aerospace as well. So an equal and opposite match for that inventory growth that we're seeing up above at the top of that chart.

The group balance sheet -- just reinforcing our ambition to return to a single A rating category. Single A rating, I should say. And just a couple of things, during the first half, we completed the disposal of L'Orange. We announced the sale of Commercial Marine. And at the same time, we successfully issued

EUR 1.1 billion bond at attractive rates to pre-fund the existing debt maturities until the end of 2018. So our view that '18 is probably going to be a better year than '19 for debt maturities, and so we pre-funded that.

And just on this point on a balance sheet on these disposals as well. I mean what I like about these 2 transactions is that we end up with broadly GBP 1 billion extra cash on the balance sheet, but 0 loss to profit or cash in our numbers, which is a nice piece of portfolio management from a financial perspective.

Shareholder payments, we're holding those flat for the interim payments of 4.6p per share, cost of that is about GBP 86 million. We are committed, we mentioned this at the Capital Markets Day to restoring shareholder payments at an appropriate level over time. And 2.5x free cash flow dividend cover through cycle, this is sort of a rough guide that you should be using to think about how we're approaching dividends. We view dividends in the context of our overall capital allocation going back to the Capital Markets Day and the source of cash return on invested capital that we're looking for across Rolls-Royce.

So the business unit review, much of this I've touched on already, so I will try and run through these slides. Underlying revenue growth in Civil 26%, right in the middle of the chart there. And you can see the growth in OE revenue, there's a benefit there in that number related to those spare engine volumes in the first half of the year, which sell at a list price, of course, rather than at the post-concession price that we see in the deliveries to the airframers and then subsequently on to the airlines. Long-term service agreement driven by the growth in flying hours and shop visit growth and then services time and material around often legacy engines and sales of spare parts.

So revenue growth of 26%, good profit flow through, improvement profit by GBP 149 million. Within these numbers, the operating loss, there's a net capitalization increase of GBP 174 million. But at the same time, in that middle bullet point, there's a GBP 154 million negative contract catch-up in our numbers, which are broadly awash -- those 2 things. And you'll recall that in roughly May and November of every year, when we have our material contract pack reviews to look at things like what are the operational assumptions for our fleets, what's our assumptions around retirements, what are we seeing about what visibility are we getting on the cost of shop visits and how much they're aligned with the plans that we have for those long-term contracts, and we adjust our contract margins for any changes in all of those things. This year, we have had times when there's -- this has been a positive number. For the first half of this year, it's a negative number to the tune of GBP 154 million.

Engine deliveries grew by 24% to 259, wide-body engines in the first half of the year. And again, with reinforcing Warren's comments there, looking at a number there in the high 500s, if not getting towards 600, on a full year basis, therefore. Looking at the mix of the revenues there, 45% Trent XWB, you can see a few more Trent 700s and 900s and around a quarter or so, 28% Trent 1000s. The order book profile is on the left-hand side, and again, just reiterating the increased spare engine deliveries.

Seven business -- a growth of 7 business aviation engines, so there's an improving market for business aviation. Pearl 15, we believe is arriving at the right time.

The OE loss on our engine, there's a 15% improvement, a bit of this is mix improvement. XWB-84 continues to make good progress towards its break-even target by 2020, which we're -- again, which we're reaffirming today. It's both cost and price reductions improvements, I should say. The Trent 900 has a temporary pricing impact, so please don't read too much into the 15% for the first half. I think that's going to be completely replicated in the second half. The mix will change significantly in the second half. We have a large ramp-up in the Trent 7000 production in the second half, and traditionally, our newer engines have a higher OE deficit than our older engines.

Engine flying hour growth grew at 20% over the period, one of the standout numbers in today's results, I think. We have a growing fleet, but we also have a growing flying hour growth as well, represents invoiced flying hour, representing good passenger traffic. But also the use -- our fleet is getting younger. And as our fleet gets younger, the utilization of our fleet gets better. And that's also driving flying hour growth as well. And that's the fleet now just short of 4,600 wide-body engines.

Shop visits. On the left-hand side, are the regular overhauls that take place, the major shop visits, they've grown by 46, from 91 to 137. And then the right hand-side are the check and repair type visits, the unanticipated shop visits for various items. And as you might imagine, the key driver of that significant growth in the first half was around the accelerated maintenance activity on the Trent 1000 that Warren has talked about.

Looking at the XWB, we talked a lot around on the Trent 1000, quite rightly, given its financial impact and customer disruption. But as a reminder just on the XWB-84, now entering its fourth year over 2 million flying hours now, 99.9% dispatch reliability and the 1 or 2 engines that we have brought in for routine inspection or to carry something out are performing very well at this stage. So it's a case of [touched] -- we're 4 years in, but at this stage, the XWB-84 is performing extremely well. And this is important, given its significance to the order book and what the fleet will look like in 5 years' time. So it's an important health indicator for us.

Power Systems, moving on to that business, again, using Warren's words, a standout performance for Power Systems. Very much showing the conviction that Andreas demonstrated during the Capital Markets Day, and these numbers reinforcing those statements around the strength of that business. 13% growth and good profit flow-through, GBP 26 million operating profit growing to GBP 80 million. And this growth is across pretty much all end markets. And the one market, which is down slightly is Power Generation markets, which is largely due to a very good first half of the sale of engines into China to support the growing data center market in China. A good operating margin improvement as well as 330 basis points.

On Power Systems, again, growth across both of its core revenue streams of OE and services are pretty much said -- talked to those words. Just on the order book as well, there's good visibility at the order book but also a very good order coverage as well. It's over 80% coverage of the order book right now, and that's well ahead of where it was this time last year. So it gives us confidence, therefore, around the Power Systems revenue performance in 2018.

And then finally -- sorry, not quite finally, but ultimately, Defence, a solid performance in Defence underlying revenue flat on an organic basis, operating profit down slightly but largely due to higher R&D spend. That's partly offset by reduced C&A costs. And looking at Defence. And again, reinforcing Warren's comment, we do have a good pipeline of orders that we're expecting to flow through in the second half of the year, the orders are very much weighted in that direction. And we remain confident on the outlook that we've given for 2018 for our Defence business.

Quick word on ITP. We completed the transaction at the end of December. ITP is a very important partner to Rolls-Royce. It has shares on all our key engine programs, particularly the newer engine programs and it has it where it has, for example, shares of around 10% or so on the XWB. The underlying revenue growth is driven by the growth in Rolls-Royce Civil Aerospace program. The margin shows good improvement, higher aftermarket volumes and improved OE mix and some good growth in operating profit as well, growing from GBP 8 million to GBP 40 million. Organic change of GBP 32 million, and there's a 19% revenue growth.

Quick accounting policy update IFRS 9 is effective 1 January '18, small adjustments to reserves on that date, no restatement of comparatives and has no material effects on our first half numbers. And this is just accounting for financial instruments. IFRS 16 will come into play on the 1st of January '19. We'll update you on this later on the year and the impacts on Rolls-Royce. But all of our leases, including operating leases, we'll come on to the balance sheet. So for example, leases for our car fleet, for example, will come on to the balance sheet.

And we'll update you more on that one, we're making good progress on the policies. The impact assessment working with a very good software tool to capture all the data. So we'll be in a position later this year to report you what that looks like for Rolls-Royce.

The property and aircraft engines are the most material item. Interestingly enough, the car fleet cost has the most complication with all the detail that's attached to that, but that's a different story.

So the guidance for 2018 that we are updating today. This is just a reminder of where we were, free cash we guided GBP 450 million that excluded ITP at that stage on the 7th of March. Updated free cash flow guidance on a like-for-like basis, so the red bar there shows you where we think we're going to be on a like-for-like basis comparison to where we were on the 7th of March. So we now think we're going to be somewhere in the top half, the upper half of the range. The core business, if we then add ITP in and take out Commercial Marine and L'Orange, free cash flow there is at GBP 400 million. Because as we highlighted at our full year results on the 7th of March, we expected ITP to have a GBP 50 million cash outflow in 2018.

Profit outlook. The guidance we gave was GBP 400 million, plus or minus GBP 100 million for profit, again, that excludes ITP. On a like-for-like basis, again, similar to the free cash flow guidance, we're highlighting now we expect to be in the top half of the range. And then if we look at our core business, so we throw in ITP, take out commercial Marine and L'Orange, we're now expecting to be GBP 450 million because we guided this ITP would deliver around GBP 50 million of profit in 2018. So just hopefully, you can get your heads around that matters. It's a little complicated, but I hope you can see now how we're looking at Rolls-Royce.

And that's it for me, and I'll hand over to Warren for some concluding comments.

D. Warren A. East

CEO & Executive Director

Great. Thanks, Stephen. Right, I got 3 slides here and I'm going to cheat a bit. So we can get on to Q&A, and I'm going to flick through and go slightly in reverse order. So first half results. Obviously, the emphasis is very much around 2018. And we put this slide in because we wanted to say that, yes, we are concentrating a lot on what we're doing this year.

We've got a lot of things on our plate in terms of restructuring, in terms of Trent 1000 and so on. But the future doesn't just happen. We have to make it happen. And you saw this slide at our full year results, but you saw it with different pictures. And so we're putting it up here, same slide, to show you that our approach to the future is very consistent, hasn't changed, and we're executing according to plan. But in spite of everything that is happening and that we're doing in 2018, we have an eye on the future. So yes, it's about the balanced portfolio, and we just talked about restructuring -- restructuring the portfolio. But starting on the left-hand side of the slide, clearly the inescapable theme towards more electrification, okay. We're actually doing things about it.

Those of you who visited us at Farnborough would have seen us investing in pure electrical, seen us investing in small-scale hybrid and seen an update on the larger-scale hybrid activity that we're doing in conjunction with Airbus, and so the picture changes a little bit there. Reinventing with digital. Yes, we've been dealing with this Trent 1000 issue this year. Actually, we've been deploying R2 Data Labs team to work on that program, and the Trent 1000 team have been benefiting from the data analytics that we've been deploying through R2 Data Labs. So the reinventing with digital is starting to be real. And transforming our business in terms of production. A couple of weeks ago, those of you who look at these things very closely will have spotted us announcing a little robot developed in conjunction with Nottingham University, been doing that for a little while, but now we're actually bringing that into use, so that we can automate some of these inspections that are costing us a lot of time and effort and people and if we can automate that a little more, it can be both cheaper, faster and more reliable.

And down at the bottom, the picture here is a picture of composite fan, which will be used on UltraFan in the future. As these fans get larger and larger, you just can't make them out of the titanium anymore because they get too heavy. And clearly, we need to be working. This is one of the ingredient technologies for the future. So I just wanted to put that in. Coming back to 2018, at our Capital Markets Day, we talked about restructuring. This is a fundamental big thing that we really need to get done over 2018 and 2019. And the must-dos that we put on the slide in June. This is a reminder. We're working on all of these must-dos now.

And you heard from both Stephen and I, how pleased we are with the start of that progress. And continuing in reverse order on the slides, our priorities for 2018 completely unchanged in terms categories

of priorities, good start to the year in the first half. In the second half of the year, we absolutely need to continue to think about our customers, we need to make sure that our production ramp-up continues to happen. We're well positioned at the half year for it to happen going forward. There's a change in engine mix. We do have some challenges producing significant quantities of new engines, 7000s and 97Ks in the second half of the year. We think we're well positioned to do that.

With that growth in the fleet now 4,600 large engines out there, as Stephen mentioned, we have been expanding the service network, again, the eagle-eyed would have spotted a few press releases about joint ventures and licensing out there. So that we can build the MRO capacity in line with the demand. And we continue to deal with the Trent 1000 issue, both the operational management of the inspections and the customer issues and the long-term fix -- that we're [indiscernible] fixes that we're working on for the Trent 1000 engines. So very much priority there. Not forgetting the future, the technology pieces, I spoke about not forgetting resilience, the future of the business built very much around the transformation program, the restructuring that we're doing, pleased with the progress there.

Put all that together, that's why we're confident in tone this morning with the financial outlook for 2018. But this is only half time, and we've got a lot of work to do in the second half. So with that, I'll let you ask us some questions.

Question and Answer

D. Warren A. East

CEO & Executive Director

So I'm not sure who want to go first. Who wants to go first? In the middle, Jaime.

Unknown Analyst

It's Andrew, I'm sorry. Three, if I may. One is on the 20% flying hour growth, which I think was a standout number this period. Can you tell us how much visibility you had on that in June, particularly in relation to guiding around mid-term targets? The second one is on working capital, clearly there's been a substantial benefit in the half year. A lot of that came from organic flying hours growth but there are clearly other moving parts around that. And there's been limited discussion around the concessions, which we thought would unwind after a pretty favorable position in December. So perhaps give us a little bit more color around that and how those that evolves in the second half. And then finally on the Trent 1000, you've taken a charge representing around 40% of your overall costs. Can you tell us to what extent that sort of derisks program margin on the rest of the Trent 1000s, as we look ahead and as we try and kind of model it on a P&L basis over the mid-term?

D. Warren A. East

CEO & Executive Director

Sure, I'll do the first one and -- you're doodling...

Stephen Wayne Daintith

CFO & Executive Director

I was scribbling down the question for number two [indiscernible] number three when we get there, but I'll come back to it.

D. Warren A. East

CEO & Executive Director

Okay. I mean, yes, of course, we have some visibility of flying hours. We're in daily communication with our customers, and we haven't got thousands of customers, there are several hundred. In terms of being precise about this, then, we can't always model accurately and when we talk about invoiced flying hours, then we can see significant growth over the next several years. I think Stephen's comments about the age of our fleet are particularly pertinent. And so if you consider airline customers who have a mixed fleet but want to retire some airplanes, they're going to retire the older airplanes first. So the Rolls-Royce share of the underlying growth in the market will tend to increase because of our younger fleet. And of course, we are growing our fleet and compared with competitor, we're actually shipping more large engines, and so you got the underlying growth in our fleet as well. So there's those 3 things.

Stephen Wayne Daintith

CFO & Executive Director

Okay. And on the working capital guidance. I think, first of all, on the concessions item. Well, in the first half of the year, we actually again had some Trent 700s and 900s that we delivered that again have the concession that it gets paid in subsequent periods. So we were able to offset that potential headwind. We still expect it to flow through ultimately, as the Trent 700s, in particular, wind down. And that may very well be in the second half of the year. As it stands, working capital as a contribution to free cash flow for a variety of reasons, I still expect it to be a modest generator of cash flow for us going forward each year. Inventory levels, we have around GBP 4 billion of gross inventory on our books, there's opportunities there. Less than 3 turns of inventory. So I think there's a really good opportunity to improve that one. Debt, as I've talked about and, indeed, payables as well. So I think there are working capital opportunities. So we shouldn't expect that there should not be contribution going forward. But certainly that headwind on the concession item, I'm expecting it to be second half of this year, but it may move into

the first half of 2019, very much dependent on the profile of the 700 and then 900 deliverers. And sorry, your third question was?

Unknown Analyst

Was just on the Trent 1000 charge and the extent to which taking that charge upfront now basically derisks program margin for the [indiscernible].

Stephen Wayne Daintith

CFO & Executive Director

Yes, to an extent, it does. I mean, clearly, if we're taking GBP 554 million of cost now through the income statement that would otherwise flow through the contract margin. And if I try and put this in sort of financial terms what it means, in 2018, for example, it would have been about GBP 32 million hit to profit through in the contract pack margin in 2018, had we not accounted for that GBP 554 million. So trying to put in financial terms for you.

Jaime Bann Rowbotham

Deutsche Bank AG, Research Division

Jaime Rowbotham from Deutsch Bank. Three questions, very similar topics, I'm afraid. So Stephen, on the working cap in the first half, if we x out the benefit from the increase in the contract creditor, there was an underlying working capital outflow. I think not perhaps as big as we might have seen in previous years despite the seasonality of the business. Did that benefit from some of the work you've been doing around bad debtors or debt factoring or sale-and-leaseback type stuff or is that all still to come? Secondly, I was grateful for Slide 24 on the Trent 1000. The comments you made, so you'll spend an extra GBP 200 million roughly than what you previously thought over the course of 2019 and 2020, and that does not affect your confidence in the ability of the group to deliver around the GBP 1.2 billion of free cash by 2020 from what I understood, but perhaps you could clarify. And then lastly, cash costs of restructuring, were there any in the first half that were excluded from the GBP 72 million free cash outflow? Apologies if I missed it, what was the cash cost on the Trent 1000 in the first half? And presumably, having now identified some of Trent 1000 as exceptional, you're not about to start x-ing that out of the underlying free cash flow?

Stephen Wayne Daintith

CFO & Executive Director

Okay. So the short answer to the first question is, yes, that pretty much flowed through. There might be some impact, but it's not material on those first few items that you mentioned, the washout in terms of working capital. On the Trent 1000, yes, we are reaffirming our confidence in 2020 free cash flow, getting to our GBP 1 billion number. I mean, clearly, as we're indicating today, not 2019 and 2020, are each GBP 200 million more than we had anticipated on the 7th of March. But our visibility and confidence around the rest of the group, across Civil, Defence and Power Systems means that we still feel confidence around that GBP 1 billion around -- GBP 1 billion by around 2020 that we've highlighted earlier. Clearly, it means, of course, that number might be a little lower than it might have been a few -- a couple of months ago, but it's still nice -- we're still nicely confident around the overall conviction around that number. And indeed the GBP 1 of cash flow per share by -- in the mid-term. The cash cost of restructuring in the first half of the year, no, there were no at all, in fact, cash costs in the first half of the year on the restructuring.

Jaime Bann Rowbotham

Deutsche Bank AG, Research Division

Trent 1000 cash costs -- is there some?

Stephen Wayne Daintith

CFO & Executive Director

Trent 1000 cash cost? We don't actually disclose that number, and we're choosing not to. I will give you an update on the full year cash costs at the end of 2018.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Just 2 questions for me. Firstly starting with the XWB-84. Just broadly speaking, how do you think about the drivers of the unit cost improvement year-over-year with respect to pricing getting better and getting through launch customer pricing, if that's applicable or how much of that is applicable? And versus, say, reduction of unit cost from learning curve improvements and benefits from any other initiatives. And the second question is around the, say, for lack of a better descriptor, the legacy portion of your aftermarket portfolio, Trent 800s, older 700s that are maybe on their second contract or in time and materials and then RB211s. How has performance of that group over the last half changed your outlook going forward, for the rest of this year and beyond just at least in general trends, positive, same, negative?

Stephen Wayne Daintith

CFO & Executive Director

So the XWB-84, I think that we mentioned previously, the improvement in the deficit still the majority is price driven rather than cost driven, but cost increasingly paying a contribution. So I would kind of think about sort of 70-30 in that mix in terms of its percentage contribution to the deficit improvement. But moving much more in the cost direction, as the volumes pick up in particular. So that's where we are today. And then Warren, the second question.

D. Warren A. East

CEO & Executive Director

Yes, so on the second question, the -- basically, the older engines and the service revenue that we derive from the older engines, there's not been a material change that I want to highlight in the first half of the year. I think the confidence that we are portraying about the full year is not really driven off. I was asked a question earlier this morning, what's the one thing? And there isn't a one thing. It's across the piece. And the fact that there is effectively no material change in those legacy engines, doesn't affect our confidence in the second half. I think Celine is next.

Celine Fornaro

UBS Investment Bank, Research Division

And so 2 questions, if I may. The first one would be on the 787-10, if you could talk about that one a little bit and I guess, you may have done some checks on that engine, too. How is it flying? How is it behaving? And if there is any charges there or any risks there from a technology perspective or what you've had on the other 787s? And the second question is related to the business jets, if you could just give us a little bit of a view on how should we think about the deliveries of the BizJets and also commercial interest on the Pearl engine and maybe getting another OE backing. What's the time frame on that?

D. Warren A. East

CEO & Executive Director

Okay. Right-o. So on the TEN, it is a different engine but it is clearly -- it's a Trent 1000 and there are common components. And so a couple of things. When the TEN was originally certified, there was some life limitations on some of the components built into the certification. Those life limitations have not all been alleviated yet. And so I think there will be some overhauls, as a result of those life limitations, as we get into the fourth quarter of this year and the first half of next year. As a precautionary measure, then we are changing the design, we're taking the lessons out of the Pack Bs and the Pack Cs around the compressor that we're dealing with at the moment. And rather than wait for potentially those issues to arise on the TEN, we are redesigning the corresponding blades on the TEN as well. And part of the costs that we've talked about and fully scoped out this morning, include both the expected additional overhauls from the life limitation on the TEN that we have at the moment and on the precautionary redesigns. The Pack Bs and the Pack Cs also have some issues that we're dealing with in the turbine section of the engine as well. And we're not anticipating those issues to occur on the TEN because they're already a different design of turbine blade and they already have different coating. But the turbine blade life-ing is something that we attend to in terms of putting engineering effort into taking cost out of the whole engine maintenance program, if we can extend the life of turbine blades generally, then we will. And we're

doing that on the TENs, as we speak, but it's rather separate from the question that you asked, I think. On the business jets, then, yes, we're seeing a little bit of an uptick in the market at the moment, which is good. And Stephen mentioned, from sort of sentiment point of view, it's a good time to be launching a new family of engines. On the Pearl 15 on the Bombardier planes, Bombardier are really hoping, I think, to have those planes entering into service around the end of next year. And so in terms of sentiment, and how they're being taken up is really a question for them right now. But we're seeing positive signs from all our business jets, airframers in terms of demand signals, as we look into 2019. So then, I think, we had a couple in the middle.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

Jeremy Bragg from Redburn. I've really only got one question, please, and it's on Trent 1000 again, sorry for that. You've described the situation as dynamic and without -- we need to be sort of abrasive about it, the cost estimate has increased a couple of times. And at what point -- what needs to happen for it to stop being dynamic, i.e. at what point do you think, okay, we can draw a line under this, it's not going to increase anymore? Or is there a risk that as we get through '18 or '19, you say, well, actually '20 is a bit worse?

D. Warren A. East

CEO & Executive Director

So first of all, let me caveat the whole thing. On all of these engines, until you actually get a sustained period of operation between regular maintenances with no issues, then you can't guarantee that there won't be some other issue. Okay. So I'll say that. Everything I'm now going to say about the Trent 1000 is about the identified issues. The identified issues, it came to light back end of 2016 through '17, and it was described as a dynamic situation because we were learning about what those issues are. And that culminated in discussion with the airworthiness authorities just before Easter this year when we agreed with them, Airworthiness Directives around the compressor. The turbine section was pretty much understood by that stage, but we had issues with the compressor, which frankly, weren't really well understood until we got to around about the first quarter of this year and realized that we had to basically redesign these blades. I am, as I said, 6 weeks more confident in the final solution than I was at the Capital Markets Day. And in terms of the diagnosis of the problem, and the manifestation of the problem that has now not really evolved since around the end of last year. So it's pretty stable. So you can never say never. But as far as these issues are concerned, that we're dealing with at the moment, we think we have them fully scoped. We have a maintenance program agreed, as I said, with the airworthiness authorities and we have an operational program agreed on a customer-by-customer basis with each of our customers. And so as far as this set of issues is concerned then, I think, we have a very good handle on it. And that's why it's sort of ceasing to be a dynamic situation.

Nick Cunningham

Agency Partners LLP

Nick Cunningham from Agency Partners. Couple of questions, a nerdy working capital one and then a more general question. On the working capital, short-term trade payables went up a lot and long-term trade payables fell. Now I'm just struggling a bit to understand that because you would have thought if the payables are reflecting the increase in LTSA receipts that you've received ahead of overhauls, that would be a long-term issue. So I wondered if one could get inside that a bit. And should I go on to the -- on the second question is a much wider one and slightly odd, but CFM and IATA announced a deal to liberalize the aftermarket for CFM56s and LEAPs, early this week, sort of nicely timed for the [indiscernible] world to be at the beach, I think. But the -- one suspects that was to fend off an European Commission enforcement action and that would seem to be quite a monumental event, which might undermine the business model at least for them but maybe for the industry. I mean, do you see other OEMs, including you having to do similar deals is one question and then the second question is, would you go after the CFM aftermarket, if it effectively opens up to you?

Stephen Wayne Daintith

CFO & Executive Director

So working capital. Yes, you're right, it is a nerdy question and I anticipated that, and I've got a pretty nerdy answer as well, actually. So I'm happy to talk on the telephone with you later, if you'd like to go through it. But right now, I'll just go through the key drivers of each and without specific numbers. And if you want to follow up, we can do that. So on the increase of GBP 1.4 billion in the current liabilities, we've moved Commercial Marine's assets held for sales. That's a big chunk of the adjustments. And the Civil and also it includes Civil LTSA revenue on shop visits that are greater than the cash received. So that's 2 of the big drivers in there. And then the GBP 1.7 billion increase on the -- sorry, delta on the other side, on the current liabilities, it represents Civil and Defence deposits, the AE 1107 in particular. Then the Civil LTSA cash received has been greater than shop visit revenue for certain items there at -- in advance of the shop visits. We've also included in that movement is the Civil LTSA catch-ups of around GBP 150 million that I highlighted earlier. There's also some risk and revenue-sharing partner deferred income money that's in there. And finally, there's quite a significant movement on the regional and business jet, LTSA movements as well. So there's a lot of things going on in this classification. Again, if you'd like to have a follow-up, then I'm very happy to do that, but that's the best answer I can give you at the moment.

D. Warren A. East*CEO & Executive Director*

Okay. And on the general question, I'll try to be brief because we could go about that -- it's an interesting topic. So the EU inquiry that came to light, although it was launched a couple of years ago, that this appears to be related to. Yes, we did respond as requested to the inquiries. We've eventually heard nothing about this since. At the time, we said we think it's rather more to do with the narrow-body section of the market than the wide-body section of the market. And indeed that looks like that's the case. To your sort of then broader question about what happens to the service market. Well, there is a profit pool there, and you know the relevant interested parties are the airlines themselves. Independent repair and overhaul operators, airframers and engine manufacturers. And our hook to maintain a claim on that profit pool is the knowledge that we have of our engines and the intellectual property that's embodied therein. And I see that profit pool and the different players as a sort of normal market evolution. You take a snapshot today, and this is how it works. Clearly, there's scope there for evolution as different players jostle for different shares of that over the future, and all the engine manufacturers have the same hooks as we do in terms of knowledge and intellectual property in the engines. And so I can't predict exactly how that will play out over multiple years. What I could say short term, about our intention to go and service a load of CFM engines and vice versa is that we all are playing battles with the boundaries of the laws of physics. We've all got what you might call issues with our engines and our customers in terms of durability of components and reliability and so on. And I don't think -- I think all of us are pretty occupied with dealing with our own issues for now.

Harry William Freeman Breach*Raymond James Euro Equities*

It's Harry Breach from Raymond James. And just 2, firstly, I was really struck by the strength of T&M revenue growth at Civil in the first half. Can you give us a feeling about the particular engine programs driving there? On the margin impact of the T&M revenue growth being so far in excess of the LTSA growth and how you're thinking about T&M in the back half of this year. Is it sustainable? Was there some big lump in overhaul scheduling, given how you're seeing the lives of those T&M engines. And then just turning on to maybe a much simpler thing. The R&D capitalization resulting from the policy changes, clearly, very significant in the context of operating profit overall. As we look to the sort of second half, should we be thinking about roughly double that number in the second half and can you give us some feeling for how that net capitalization number is going to be evolving, given it's sort of looking like about GBP 350 million on annualized run rate?

Stephen Wayne Daintith*CFO & Executive Director*

Okey doke. So on the time and materials, the 2 key engines that are generating revenue there are RB211 and the 700, and these are the more mature engines that are not necessarily on long-term service agreements. The margins are good margin on this business and it's a business -- it's a revenue stream that we don't probably talk about as much as we should do. It's a nicely profitable. And clearly over time,

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

it will become smaller over a long period of time as we move to a very ambitious sort of total [care] agreement-type basis. But it's going to be with us for quite a bit of time to come and at a very healthy margin. And I think I've answered the sustainable question there as well. R&D capitalization, you should be thinking around GBP 400 million or so on a full year basis, the capitalization and then that will be a pretty good sort of steady state amount for the next few years, particularly as we go through relative new engines, finally getting certified, finally getting on wing, and then we'll start to tail down as we get into sort of, I would say, the 2021-, 2022-type time period, and you would naturally give -- as the engines becomes more mature, that the capitalization will cease and we'll move into a steady state.

D. Warren A. East*CEO & Executive Director*

Over here. And then we must remember, we've got a couple coming through online. So let's go just there first and then down to the online ones.

Rami Yehuda Myerson*Investec Bank plc, Research Division*

Rami from Investec. Three questions. On the free cash flow guidance, in the AGM statement, you talked about a similar cash outflow to H1 '17, and you've obviously done a lot better than that commentary provided at the trading statement in Q1. But guidance is still -- the change is smaller than we would have anticipated. Is there something we need to be concerned about -- you concerned about in H2, which limits the upgrade to guidance? Second on Trent 1000, we understand that part of the compensation, some of the engine manufacturers have provided to airlines has been through credits on future engines, sales and on maintenance events. Does the GBP 1.4 billion include the credits that you may provide to some of the airlines for future engine sales and maintenance? And the last one, just on the French, German, the SCAF program, would you be able to bid for that via your German facility in the future?

Stephen Wayne Daintith*CFO & Executive Director*

Okay, so free cash flow on a full year basis. I think Trent 1000 cash costs in particular will be more second half weighted than first half weighted, so that's another reason. And then I don't want to raise -- I come back again to this sort of the working capital subject, but I think it's just -- it's difficult to be precise around working capital, given the very nature of the sort of items that take place. You've got concessions, you've got customer deposits, you've got repayments of customer deposits, you've got collection or payment of risk and revenue-sharing partner fees. And so we naturally built in a degree of estimation around working capital, therefore. So as it stands, we're comfortable to give the guidance, the updated guidance that we have given to finish in the top half of the range, and nothing more beyond that. And then the second question, the short answer is no.

D. Warren A. East*CEO & Executive Director*

And the third question, the short answer is yes. I think Jennifer, we have to come to some online, just to be fair.

Jennifer Ramsey

Yes, there's a question from Chloe at Exane. How should we think about the margin profile of the Trent 1000 aftermarket. Arguably at this stage, you've put a quite a lot of costs on a small margin. So going forward, does that mean that margin improve -- could improve slightly with time, as risks are retired or will the margin remained depressed through the life of the engines, which are affected by the current issues?

Stephen Wayne Daintith*CFO & Executive Director*

I think -- well, the Trent 1000 margin has a lower aftermarket margin than, for example, the Trent 700, which has a good aftermarket margin and XWB and so on. But we do, as the questioner asked, we do

expect that to improve as we retire the risk and the costs that are attached to the remediation of the current issue, around '20, '21, '22, we ought to start seeing improvement then.

Jennifer Ramsey

Another question. In terms of the restructuring, Warren, how do you plan to keep the restructuring in line with your current long-term strategy post-2020? I guess, this is in regard to increasing development costs of new products, post-2020, and keeping a cap on our indirect costs.

D. Warren A. East

CEO & Executive Director

Yes, so what we're doing with the restructuring at the moment is basically a bit of long-term maintenance on the organization. We are modernizing a lot of behaviors and processes and simplifying, removing activities that perhaps were appropriate at one stage in the past that are no longer appropriate going forward. And behaving a bit more like a sort of modern competitive company. I think that is a one-off change, and we hope to get through most of that change during 2018 and 2019. Of course, then companies, such as ourselves, that depend on technology, as the sort of the life blood of our future products and business. Of course, we have to spend money on that. And that's the very reason why we're doing all this effort on transformation. We have to generate a sensible, competitive amount of cash. So that we can reliably continue to invest in R&D at the sort of levels that we need to invest in. I don't anticipate any great kick-ups in investment in R&D after 2020. It's business as usual, and you'll see us investing a sensible competitive proportion of annual turnover in R&D, generally, going forwards. Right, we don't have any more from online line?

Jennifer Ramsey

We have one -- we a few from David Perry, but some of them have been answered already. So this is his third question. He's just suggesting that he wonders, Stephen, whether you answered Jaime's question around if any of the Trent 1000 cash costs would be treated as exceptional items in free cash flow.

Stephen Wayne Daintith

CFO & Executive Director

No. Sorry, just to absolutely clarify -- our underlying free cash flow will include all the cash cost outflows in relation to the Trent 1000.

D. Warren A. East

CEO & Executive Director

Thanks for that clarification question. Any others in the room before we wrap up. No? Great. Well, in that case, thank you very much, everybody, for your support, and we'll be back with some full year results early next year.

Presentation

D. Warren A. East

CEO & Executive Director

Good morning, everybody. And I must say thank you all very much for coming along. This is a fantastic turnout, shows that there are a lot of people interested in Rolls-Royce, so thank you very much.

I'm going to start with a few of the sort of boring things, probably, like the fact that if there is some alarm, we go out through there, and the Rolls-Royce people will direct us to where we have to stand. And just to be good if everybody can turn off the noises on their mobile phones, please. Thanks very much.

The agenda that we have for you this morning is, I'm going to introduce things for a few minutes at the start, and then we're going to have an example of one of our businesses from Andreas. Harry is going to talk about the restructuring that we announced yesterday. Stephen will show how that translates into numbers, and then I'll make a few comments to close with.

So after my introduction, why have we chosen Power Systems, it's an example of one of our businesses that's in transition at the moment. And Andreas will illustrate some of the improvements that we've been making over the last 12 months and we aim to be making over the coming years. The other reason we chose it is because when we discuss things with the financial community generally, we spend about 55 minutes of every hour talking about Civil Aerospace, and we thought it'd be a good opportunity to talk about part of -- another part of the business.

Yesterday, we announced a fundamental restructuring. I'm going to talk a little bit more about that in a few moments and Harry is going to plunge into some depth. Yesterday, the emphasis was very much on the people side of things. And today, we're going to, in the last session with Stephen, talk about how that translates into returns. I hope you'll go away with an impression of why this change that we're making is absolutely fundamental and why it's not just another cost-reduction exercise.

However, before we get started on the business of the day, I do know that there's a lot of interest out there in what's happening short term and, in particular, what's happening with our Trent 1000.

So right at the top of this slide, as we said in March and as we said in April, this is a situation which is causing a number of our customers a huge amount of disruption. So we had a team down at [iarta] in Sydney last week, and they were absolutely [flat tack] with our airline customers spending a lot of time reviewing the plans that we have and basically working -- checking in at a high level on how the close interaction with those airline customers is going in the detail.

I think to summarize the situation where we are at the moment, we have completed the first stage of the initial inspections on all the Pack C engines. The good news is that we've sort of gone through the peak of that, and the incidence of aircraft on the ground turned out to be less than we actually feared. And the incidence of failure on the repeat inspections, because we're now into repeat inspections, so far, is going better than we had anticipated, which is all good news. And we have started a one-off inspection of the Pack B engines, there are 166 Pack B engines, and we're going through a one-off inspection right now of those to establish some data. It looks like at much, much higher cycles, much, much later in the engine life, there may be a similar issue. And I mean, the good news is it's much, much later in the engine life, so it actually happens after a scheduled maintenance in the main, but we want to gather some data to get to the bottom of that.

However, the -- we anticipated a pretty grim situation with aircraft on the ground. And so we told you in March, we were going to add lots of capacity to deal with this. The good news is we have added lots of capacity. We've trebled our maintenance capacity. We've reduced the cycle time, the time it takes to go through one of the inspections and to go through replacement of defective parts. And the bottleneck has now shifted from MRO capacity to logistics. The fact that an airline is based in one part of the world, we have a repair and overhaul, which we have spread around the world, but it's still physically removed, in many cases, by up to a week or so of transport for a very heavy item in both directions. So logistics is

probably now the bottleneck on bringing this peak of aircraft on the ground down and for an individual airline to bring the number of aircraft we have on the ground down. The good news is, when we wrote this slide, we were getting on for 50. We never actually hit 50. And as of last night, we were at 44, and it's starting to decrement pretty daily at the moment.

Now there are 3 stages. First of all is inspection, then there's deal with it and then there's fix it. And on the fix it side of the chart, as far as the Pack C compressor rotor blade is concerned, which is what's caused a lot of the concern over recent weeks, we have a new design. It's -- testing is going well on that new design at the moment. I saw it last week. And we hope that, therefore, we will be able to pull the fix for that in from Q1 next year into the end of this year. So that's continuing to move on a positive trajectory.

We'll then fall back to the limiting factor, which is turbine blade capacity, and we have been addressing that. And since the 7th of March, then we've continued to improve on turbine blade capacity. And actually, since the beginning of this year, we now have approximately 50% more turbine blade capacity than we had at the start of the year. And so we will, we believe, be able to eke through this problem.

What difference does that make to our guidance? Well, the key message here is that our guidance for 2018 is unchanged. We clearly laid out on the 7th of March that we expected 2017 costs to approximately double in 2018 and then fall in '19 and '20 and so on. Since the 7th of March, we've had accelerated inspections on Pack C. We've decided that we want to investigate for data gathering on higher cycle engines on Pack B. But because we had a better aircraft on the ground situation than we anticipated, because our MRO response has actually been at the high end of expectations, then actually the good news is that the cost of those incremental pieces is not going to be quite as much as we thought. And so netting out those, we end up at approximately GBP 100 million of additional cash in 2018 compared with where we were on the 7th of March. And as we said in April, we've taken additional mitigating actions to cover that GBP 100 million, and that's a bit of re-phasing of some nice-to-have projects, cuts the discretionary expenditure, and that's how we are maintaining our guidance.

So now I want to get into the business of the day. That's the end of the Trent 1000 update. Getting into the business of the day. So I put this slide up, our full year results. This was a summary of where we got to with our transformation program announced in 2015. In 2015, it was obvious that some significant change was needed. We did some change. We completed some of what I called organizational hardware, and we needed to do some organizational software. In March, I reported good news, we've done some of that, but there's a heck of a lot more to go. And today is about that awful lot more change that we need to make in terms of the organizational software.

And what we have discovered is that in order to do that, we need to make some much more fundamental change to what I was previously calling the organizational hardware; i.e. the structure of the organization. So much more radical change is needed to the structure in order to achieve this whole thing and make the obvious change that is necessary for Rolls-Royce.

So today, it's a pivotal moment. And it's an intentionally big word, pivotal, and I'll come back to it in a moment or 2. Basically, an awful lot of preparation has had to be done, not just over the last few weeks, not just over the last 6 months since we got A&M in to -- to help us with this, but actually over the last several years. I had a number of questions yesterday from the media about, well, why on Earth didn't you announce this 3 years ago? Because actually, that would have been exceedingly foolhardy to announce that 3 years ago. We had to get on with stabilizing the business, do some really sort of crucial things, tighten grip on the business and prepare for a big change to do it properly, things like we did have to stabilize the business.

A crucial question a few years ago was, could we deal with the volume ramp-up from approximately 300 engines to approximately 600 large engines per year, okay? So that's getting there, well over 500 engines last year, nudging towards 600 this year.

We had to bring several new products to market. And actually, over the last 3 years, 4 new civil engines have entered into service. Now it's absolutely essential to get these solid foundations in place. There was

some tidying up of the portfolio to do, and we've been addressing that through a combination of some reorganizing and some disposal activity that you've heard about.

And last but not least, I had to establish a leadership team that was up to the task and up for the task of leading this company through a fairly pivotal change. And that leadership team has changed significantly over the last couple of years, and you can't do that overnight. So 90% of the executive leadership team has changed. And we now have a mixture, approximately 50-50, of established players promoted and fresh thinking from outside to deal with this task. So that was the answer yesterday.

A summary of what we announced yesterday in terms of facts and figures. Well, we're going for something which is much, much slimmer, leaner, more nimble. Net savings, GBP 400 million net costs per annum from the end of 2020; net cost approximately GBP 500 million. That will unfortunately involve the loss of about 4,600 jobs. I spent a lot of yesterday explaining that a lot of those jobs will be lost in the U.K. And consequently, a lot of them will be lost in Derby. They are management and support functions, largely. And that is making the big structural changes necessary so that we can really effect a proper culture change, and Harry is going to talk about that in a lot more detail.

The idea is to create a world-class business that matches our world-class technology. And it's no secret or it's no coincidence that we've got a picture here of our newest engine, one of the Pearl Series for business jets that was announced a couple of weeks ago -- was launched a couple of weeks ago. No coincidence we've got that picture there to reflect the newness of the new management system and the new behaviors that are going to be apparent in this business from now on.

So what now? Oh, before I go on to what now, sorry, a bit of context. And again -- so this is back to why I used the word pivotal. It's important to understand that this is a new phase in the development of the company. This isn't a cost-reduction exercise from 2015 to 2020 to achieve some better returns. This is about making an organization that is ready for the next phase of its development. I said in the media yesterday, we've been around for 100 years, we want to thrive for another 100 years, and a fundamental change is required. So at the left-hand side of the slide, we've got a period of evolving engine architectures. We've got a period of developing market share. We're now going from the developing market share phase into the using market share phase, where we use that market share to generate returns and invest in new technology going forward.

So to put some metrics on that. 15 years or so ago, we had about 1 in 7 of the large jet engines flying around. Today, we have about 1 in 3. And we have an order book that will take us to about 1 in 2 in a few years' time. We invented the TotalCare product way back before the turn of -- into the 21st century, but actually, we had a very small share of that. Now to make this business really work, we need to have an annuity type income. And so what's been developing over that period is the TotalCare packages evolved from few to most of them. And in fact, when we take orders today, about 99% plus go out with a TotalCare package. And we needed to move from what is essentially a bespoke business, where we made very small volumes of a large number -- or a number of different varieties of engine to much higher volumes of only a few varieties of engine. We need to move from bespoke to industrial and also, as I mentioned earlier, double that capacity in just the last 3 years. So that's the wider context for this change.

What now? What now then? Our ambition is a much, much simpler business, one which doesn't celebrate complexity, but celebrates simplicity. And we've structured the business, we'll talk about, in terms of 3 empowered businesses. And we think that those businesses can deliver materially improved returns as we move into this next phase. We understand on technology that we need to be using the world's best technology, but we can't necessarily own it all. We need to be quite selective in terms of what we own, what we produce, where the key intellectual property is and where there's other world-class technology that perhaps isn't key intellectual property for Rolls-Royce, where we need to do some partnering, so that we can be the world's leading industrial technology company. And by world's leading, I mean not just a company that responds to market changes, but a company that actually makes the market change, and that is a market leader. And Stephen is going to talk a bit later about translating some of this into financial returns. And there are a couple of midterm ambitions here on this slide. And I want you to note that we're talking not just about quantum, but about quality as well. It's not just about how much return, but it's return related to input and, therefore, a measure of the quality of that return that we're going after.

And so what are our resources available? I tell our people that our competitors have access to all the same technology that we do. They have access to all the same customer base, all the same equipment and so on. The only difference is the people. Well, that's true. The people are the differentiating asset. We have access, of course, to 3 basic categories of asset: the people, the things and the money. And the difference is in the people, and the people determine how we use the things and how we use the money. And so the emphasis in this change is going to be around the people and how the assets get used.

Now Harry will show -- so this is the proposed structure that enables the change. And Harry is going to show a contrast between what we have today and where we're going. And what we have today has brought us through the last phase, has enabled that growth in market share and that evolution of engines and the creation of the next generation of engines. So it's not bad, but the complexity that is buried therein has generated a huge culture of bureaucracy, slowness, duplication and just a culture of complexity. And we need to move to a much, much smaller lightweight corporate center. We need to have empowered businesses that operate with freedom, but freedom within a framework, not chaos.

And I've deliberately pushed people in preparing these presentations that you're going to see this morning, that we represent this as 3 interlocking circles, not 3 blocks of PowerPoint. And the 3 interlocking circles are there because although these businesses face different market sectors, these businesses share intellectual property and share technology and share philosophy. So the synergy in our supply chain between Civil Aerospace and Aerospace Defense is obvious, the synergy between the Power Systems, Defense activities and our broader Defense business is obvious in the customer relationships, as is some of the technology. And the technology and service synergies between the Civil Aerospace business and Power Systems business are there, and they're there to be exploited. But we do it in a lightweight empowered way, rather than through the treacle of an overweight center.

So we're going to talk about accelerating culture change. Harry will go into bit more detail than this, but I want to get across the message that simplicity is a state of being. That's what I told our leadership conference this year. And that is the sort of overwhelming state of being that you need to get to, to make this happen.

So pace. Pace is appropriate, but generally, I mean, faster. And if you look at the complex situation we've come from, you have a chunk of people doing things in a complicated way, so it takes them a long time to do it, but you've still got to do a whole load of things. And so you end up hiring more people in order to get more stuff done in the same period of time, but that makes things even more complex. And so you get weighed down even further, and you get into a negative spiral or vicious circle, and that's what I mean by complexity killing and why we have to move to a state of simplicity. So pace and simplicity lead to efficiency, and that's enabled by a framework which is empowering.

And that efficiency will improve our productivity and give us the world-class business to match the world-class technology. And we're looking for efficiency in those 3 things: the people, the things and the money. So that's the message. And when we get there, we will have replaced the vicious circle or negative spiral by hopefully a virtuous circle where, again, thinking about those 3 things, the people, the assets and the money, we -- those are key to create the outputs, which is market leadership and strong financial performance.

So that's a little bit of introduction. We're going to step back from the restructuring program that we announced yesterday to give a flavor of what it looks like in a business that is transitioning right now. So over to Andreas.

Andreas A. Schell

Chief Executive Officer - Rolls-Royce Power Systems AG

Thank you, Warren. Good morning, everyone. I'm very proud today to present Power Systems. And as Warren said, if you only get 5 minutes of an hour of your attention, I need to use my time wisely.

Since I'm also new to Rolls-Royce, a quick introduction. Andreas Schell, 48 years old. I started my career in Stuttgart with a company, back then, Daimler-Benz, then DaimlerChrysler. Then I spent about 10 years of my time in the U.S. and then followed by about 4 years here in the U.K. I've also worked with Fiat

Chrysler on their private equity ownership, and then later in my career moved over to UTC and in the UTC Aerospace business. And then in December 2016, I was hired by Rolls-Royce. And since then, I'm running the Power Systems business, and I'm very proud to be part of the power -- of the Rolls-Royce business.

With that, let me kind of introduce Power Systems to you. I will -- since you're not so familiar with Power Systems or you may not be so familiar with Power Systems, I will start with a quick overview. But then, most importantly, we have been driving a lot of change in the last 1.5 years, and I'd like to introduce what we have done to make this business fit for the future. And then follow and finish it out with our plans for the future and give you a perspective on what, midterm, you can expect out of the Power Systems business.

All right. So I'm very proud to stand here on behalf of the 10,000 employees of Power Systems, and they sit mainly in 11 locations in 5 countries around the world. We sell about 25,000 engines and units per year. These include the lower power range that we do together with a partner. The engines are grouped mainly in 4 product families: the 4000 Series, which is really the very, very famous main product line; the 2000 Series; then a series called classic engines, large engines, mainly the 8000 Series; and then a smaller series called the 1600 Series. And they are used in 24 sub-applications. The way we sell into the market is we go partially directly to the end customer, but we also sell through a distribution network. And this distribution network is a hybrid distribution network. So we have some of our own MTU subsidiaries in certain countries and regions. And in other regions, we sell through third-party distributors, so a hybrid network, and there are benefits for our business to do it that way. This gives us about 140 sales partners, but more than 500 authorized dealerships around the world that sell our product.

The one thing that I find extremely attractive about the Power Systems business is the installed bases. It's more than 100,000 engines. Now you could kind of say, how does this relate to the 25,000 engines sold per year? The 100,000 units installed bases are the ones that we really develop and make within Rolls-Royce Power Systems and MTU. Those are the ones that are mostly serve as revenue-generating engine, and we'll come back later to what we do with the installed bases already and what we're going to do with that in the future. Customer concentration, top 10 accounts for about 17% of the sales. I'll talk about the customers later again, but I can tell you, we have fantastic customers in the Power Systems business.

Some key attributes. There's a lot that Power Systems has in common with the rest of Rolls-Royce: a very high brand recognition and we have a significant R&D experience in Power Systems. I think this is something that both have in common. But there are many areas where Power Systems can learn and has learned from Rolls-Royce. One area is the experience that the Civil Aerospace business has in aftermarket when it comes to developing products like long-term service agreements, which is something that Power Systems didn't have. And I can tell you, within 1 year, because of the experience we have across Rolls-Royce, we were able to kind of close the gap towards our competitors quickly and aggressively.

But there are some things that are different and that -- they are good ones. When I look at the financial side, we have a very short-cycle order book. There are certain engines that are standard type engines where we can fill the order book in 3 to 4 months. The governmental business is the longer side of it, which is about 3 or 4 years after order when we can put it in the order book, so again, a couple of months up to 3, 4 years to fill the order book. The business enjoys a double-digit EBIT margin, and it provides the opportunity and, as shown last year, that it has a very high cash conversion rate.

The market profile. I said before, we have fantastic customers. The customers are everything from small, little family-owned business that operate our engines, and they rely on the function of that engine day to day. If the engine fails, they can't generate revenue. But at the upper range, we also have large mining conglomerates that are multibillion-dollar businesses. But I can tell you, what's common to all of the customers is the passion for what they do, and this is something that's reflected also within Power Systems, so diversified end markets and customers.

Revenue profile, about 2/3 coming out of OE, 1/3 generated out of service revenue, something we'll talk about that later again that we will want to change and increase the percentage of service revenue as a total.

Geographical split, 45% in Europe, but what needs to be considered in that number is that a lot of the European customers actually take the engines, generate systems and then export to global markets. Also noteworthy, between China and Asia Pacific, today, 27% of the total revenue in that region and growing. Also noteworthy, 23% in the Americas, so we have to always monitor geopolitical situations and respond, and that's what we do in the business, but well-diversified. And that diversification has helped us going through downturns, through down-cycle situations, and we're not as susceptible (sic) [susceptible] to down cycles as other peers in the industry.

Now let me talk about the -- what value we generate out of the market. The market itself is about 1.2 million units or EUR 27 billion of value. That's the total addressable off-highway market, excluding automotive, truck and on-highway applications. With our product lineup, as we have it today, we can service about 440,000 units or EUR 13 billion of that. Now we punch above our weight. We get 5% of the unit share, but we take 15% of the value of that market with our products. So we are premium in that segment, all in.

Let me introduce some of the segments that we do business in. First, Marine. We are amongst the top 3 participants in the Marine segment. In Marine, we do mostly direct sales. About 70% of the sales we transact directly to end customers. Keep in mind, end customers are often shipbuilders. And then in the service, the end customer is the owner or operator of the vessel, so a multistage industry.

On applications, we are very strong in naval with a share greater than 25%. And I really like this, when you ever consider to buy a luxury yacht, the engine you want to have should have the MTU brand on it. And this is what a lot of the customers aspire. It really is something they show off when you go to boat shows. They open the engine rooms, and they are really proud for the technicians to kind of open it and show the MTU brand in their engine compartment, really something to be proud of in that industry. Projected growth, about a 4% CAGR, and so we expect the market to be EUR 2.1 billion in 2022.

Second segment, and we like this even more than the Marine segment. Why? There is a lot of growth in that in Power Generation. There is so much power demand out there. And with what we do already today, we are right in the sweet spot of this. There is growth, and there is about a 6.7% growth projected in power generation. Now we're very focused in Power Generation. We don't do everything. Our equipment is used in mission-critical applications. If you use your smartphone later on today, there is a very high probability that the backup power provided when the grid goes down comes from Rolls-Royce Power Systems MTU. This is what customers are willing to pay a premium for. When the grid goes off, there is a battery storage that takes over for a few minutes, but then an MTU-branded engine has to switch on and provide power within minutes thereafter and basically back up the facility. So data centers, hospitals, companies, everybody who needs reliable power, this is basically the market we care about.

The other reason we really are very passionate about Power Generation is, we are going to talk about microgrids later on today, which is a whole new different business segment. And I think we fit right in the sweet spot of that with our ongoing development. Again, we enjoy 1 of the top 3 market positions there. Products we sell in that market, 4000, 2000, 1600 Series, both diesel and gas systems.

Third segment, Industrial. The Industrial market is a bit different to Marine and Power Generation, which are somewhat easy to introduce. This is a very complex and very diverse segment for us. What you find in that segment is everything from railway application, oil and gas, huge mining trucks. Mining trucks, we have our engines on a mining truck with ballast, which can carry the weight, the takeoff weight of an A380 on its back. There's 2 4000 Series engines that power up that truck, largest mining truck in the world. So very diverse. We're doing well in, in particular, railway, in mining, fracking, but also in construction and agricultural equipment.

Now this market is very sensitive to regulations, and they are not the same all across the globe. They vary strongly, so we have to kind of monitor this always. And that's why in that segment, you often have very special effects and cyclical behavior of that. For instance, right now, because of the introduction of a new regulatory emission stage coming next year, there is a prebuy effect in the smaller, lower power range that we enjoy right now, but we'll have to deal with that then next year. The reason I'm really passionate about this segment is all of these applications are heavy-use applications. This is the best place to be for service,

we'll come back later on. This is where we start connecting the engines because we need to monitor the use and the wear of the engines.

Let me give you one example, a mining truck. The engine in a mining truck is pretty much dead after 3 years. So it will come back, and we basically repair it, restore it. And we can do this 3 times over the lifetime of an engine. That means in about 10 years, you have generated about 3x the value of that engine on that engine. So this is how mining, for instance, works for one example. 5.4% CAGR, but as I said, we really like that segment because of its potential in-service.

I'm not going to spend much time on this chart. But for completeness, we also work -- or we also offer our product in the Defense sector, so land-based battle tanks, infantry fighting vehicles and howitzers. It's a stable market with a recent increase in governmental spend. We enjoy a bit of a future upside in that market. We also, after the realignment of the businesses across Rolls-Royce, have now ownership for the civil nuclear business. There, we are present on 195 reactors in 20 countries. And I think all of you are aware, we just recently completed the sale of L'Orange to Woodward. While we have transacted this, we enjoy a long-term partnership with L'Orange since injection systems are still an important part for our engines.

Now I'm very proud of this chart, really, on behalf of my team. In the end, doing business and having fun with all of these end market applications is one thing, but it needs to translate into financial results. And I think you all agree with me, 2017 was a very strong year for Power Systems. Now a lot of people were quick to say, okay, the markets came back and -- okay, yes, the markets came back.

We also were able to take share last year because we made changes in the sales organization and we approached customers in a much different way. In parallel to this, we also focused last year on cost reduction in the business. We took C&A down by 7%. We reduced R&D down by 6%. I'll explain later why we reduced and why we were able to reduce R&D. Which then resulted in a 240 basis points gross margin improvement, and it allowed us to increase operating profit by 61% in 2017.

How do I feel about 2018? We've given guidance for revenue on high single-digit growth, and I'm quite comfortable at this point in time with that guidance. Operating profits, I expect the margins to be stable, but there are going to be some effects. I talked about the prebuy effect in the lower power range, and that's revenue but very little margin coming along with that. And then in Power Generation, we will have less lose (sic) [lost] engine sales with higher margins, but this will be basically made up by more systems sales. So at this point in time, I feel comfortable with the margins being stable. And 2018 looks, at this time, to be yet another strong year for Power Systems. And I can assure you, we will continue to monitor and optimize our cost in the business.

Now Warren talked about the importance of people being a strong and an important asset in the company. And when I talk about what we have done last year, this will also be a story about the people and what our people have done in Power Systems to make it fit for the future. When Warren asked me to join Rolls-Royce in December 2016, I needed a few weeks to kind of do an assessment of Power Systems. And here's what I saw, here's my view on arrival.

A bit of a personal story, my family comes out of the area in Southern Germany around Friedrichshafen, and I've always admired MTU. It was kind of like a dream for me at some point in time to lead this business. I mean, you look at this blue and red, they resemble the flames in an engine. It made me really kind of wanting to work for that company. I was a little puzzled when I started how this icon, how this hidden treasure did not perform the way it should or it could. And here are some of my views. Positive, a real hinge for engineering. Our people pride themselves, we don't play Premier League in engine development, we play Champions League. When we do engines, we do the best engines. So a hinge for engineering.

A strong market share in niche markets. You wouldn't believe how proud our people were to tell about the stories when we kind of took in certain niches pretty much everything away. There is the Marine segment where our engine has pretty much kind of gotten 2 competitors out of the segment altogether, but again, in niches. Super-dedicated workforce and a transformation program that I felt was really, really good, maybe not kind of delivering the results yet, but it was a well-set up program.

There were a couple of things that I felt I needed to do to take a deeper look at. The leadership culture in the business, I needed to understand the core drivers of this business. And again, when you kind of operate in such a diverse end market, this takes a little while to understand how you kind of generate orders and how you deliver against these orders and, more importantly, how you generate margin out of that. I noticed an absence of digitalization. Lots of PowerPoints about how digitalization could be, but very little in place. And there were some things that really required immediate attention. 20% of our portfolio was driving the majority of the profits. In fact, 20% of the portfolio also generated 80% of the revenue in the business.

By the way, a big dissimilarity between H1 and H2 financial results, very big dis-balance (sic) [imbalance] between the 2 halves of the year. I -- an absence of a customer-focused mindset in the business. And then I think very similar to the words that Warren has chosen for the company, we needed to improve pace, simplicity and agility. There were always endless discussions. There was a governing body. It took about 3 months for presentations and for big topics to get to the top of the house for a decision. And if you couldn't decide on it, it took another 3-month cycle to bring it back. We now have a much faster decision-making cycle in the business. There is alignment on the top. There is very little time spent on protocols and minutes of the meetings. And there is focus on execution right there after once we come to an agreement in the business.

So for 2017, the key focus was to address culture and leadership, number one. 80% of the folks that work with me -- and I have one of my colleagues here with me, Matthias Vogel, who is in a new position, has been in the business for quite a while. He is the Executive Vice President of Network Distribution and Service, a new position we created because we needed to separate OE sales from service because they have to be focused on selling and focused on differentiation through service excellence. But 80% of the leadership team, we made changes. We brought people in from other industries, people in from the outside, but we also focused on promotions inside of the business through identifying talent.

Sales and service, clear messages, putting the customer front and center. That doesn't mean to kind of sell for free. And then as I said, service excellence and different -- to create differentiation in the industry.

Clear focus on product and quality. It's not that product quality was completely out of whack, but it wasn't there where you would expect the premium manufacturer to be, so focus on that. We appointed a new vice president of quality, and he had the clear mandate to show everything that's not per standard. And so we have a bit to work through, but the results are stunning because the customer is experiencing a much, much different product already right now. On product development itself, more rigor on product development. We introduced a new organization called product management to avoid generating small variants and pretty much not seeing the sales coming -- following through.

And then last but not least, clear focus on cost and cash. The leadership team meets once a month. And we look at this meeting, it's called performance assurance meeting, it's a mandatory attendance meeting, and we see where we are against budget. And it drives and promotes accountability in the business. When in the second quarter, we needed to focus on cash, we added cash as a KPI to this one, and I think the results speak for itself. But clear accountability in the business, no hiding in the organization, the people in sales stand up for their KPIs, the people in operations stand up for their KPIs and we all come together. And if we're off, it's not a question how did we get there, it's a question what do we do to kind of mitigate this. And I think it has really sparked a different culture in the Power Systems business.

I said we had a transformation program in place, and it was really, really good. 15 work modules, we weren't in the position to really generate results out of that. That has changed. So 2017 actions, I spoke already about the H1 versus H2 activity balance, and this creates for a much better absorption in factories, as you all can imagine. So to give you an example, Q1 in 2017, the factory was down for a couple of days because there was nothing to work on. We started on January this year with a full production schedule on the factory loading, and that's what you want to have because then you have better absorption rates in the factory and your cost basically is much better applied.

Then on direct material cost reduction, 4.3% material cost reduction. To be quite fair, the team has done material cost reduction for years. The 4.3% was a little bit of uptick. We are now looking also at technical measures to take cost out. You don't always have to use the most expensive material. You have to use

the material that works and belongs to the function of a part in an engine. And then very importantly, looking at target operating model, the way we work, so we made changes to sales and service. We made changes in the engineering organization, changes in the quality organization, and I can see the benefits of it because there is more clarity. So again, coming back to the concept simplicity, people understand what their job is and, therefore, we can operate much faster.

And then 2018 focus: ongoing product review, a lot more sales and service campaigns, focus on net working capital and most importantly, I'll speak about this later on, digital where we have made a massive improvement in just 1 year.

Let me give you one example out of the transformation, and this is about product portfolio. I said -- I mentioned already 80% -- 20% of the product portfolio generating 80% of the revenue. So we had to really kind of take a look at the re-prioritization of the engine roadmap. There was one engine we had developed and in years, we had sold 5 of them. Now we kept the parts in the business because, I mean, of course, if you want to sell it one more time, you need to kind of have the parts. So there are people in indirect who renegotiate supplier contracts for an engine that you don't really sell. So we put up an organization called product management, gave them the mandate to review this.

Here are the results. This started in 2015 already, but we are now down from 850 engine variants that you could order back in 2015, down to 600. And long term, we will be around 500 engines. And again, if an engine is taken off, we take the part out of the system. We'll keep a few parts in service because we need to stand by our customers should they have a repair on the engine sold, but that's it.

So rationalization of the engine portfolio. Now then that begs to the question, what do you do going forward to avoid this? So there is now continued modularization. In the future, when sales comes back and says here is a great application, think about the industrial market, a lot of diversity there, we really go together and there is a clear assessment done, do we really need that engine? And if we need it, how can we use the parts we already have in the system and take a modular approach?

Another thing we have done is, the 1600 Series engine was always, in its 11 years, suffering from -- there were some variants that were selling very well, but most of the variants were sold at a loss. We didn't really make a lot of parts for that engine. Most of it came from a supply base in Western Europe. So that engine, I'll talk about this later, was moved into a joint venture with an Indian partner and the supply chain will get localized in India. So -- and from there, we will basically then export to the global market.

All right, so much about change in Power Systems. And now the question comes, what next? So I'll talk about key trends. I will talk about our strategy and the implementation. And I will also speak for a moment about what I define success for Power Systems in the medium term.

I could speak about this chart for hours, and I had to already this year a couple of times because it's so key for the business. Let me start with a very small anecdote. When I started last year, I have 2 sons, 14 and 12 years old. The 12-year-old came one day home and said, "So dad, all of this discussion about the diesel, is diesel everything you make?" Yes, we had the same laughter at the dinner table. I -- but it makes you think about the business you run.

Now let's be clear, we play Champions League in diesel. And it's a pretty profitable business. However, the diesel is not only in the public perception and the public discussion, the question also is, what do we do with this business? And let me be very clear, the diesel is anything else but that. If you speak to customers in the Outback in Australia, 3 flight hours north of Perth in a mine, and you speak to them about alternatives other than diesel, you have to have a lot of arguments to convince them because diesel is a very energy-efficient carrier and, therefore, they love it.

The same for yacht customers in the end. Now having said this, there are clear rules and emission regulations out there that we have to comply with. In a yacht, for instance, a 4000 Series engine, you have to increase the volume by about 40% to incorporate future emission regulations and put exhaust gas after-treatment on it. So you give the owner of that yacht less cabin space and increase engine compartment space. That's not what yacht builders want to sell.

Having said this, so these are the key market trends, regulations and green policies all around the world. Norway putting a ban on any internal combustion engines in the marine usage in fjords for instance. Alternative fuels and energy sources. A Marine example, only 0.3% of all Marine today is penetrated by the use of natural gas instead of diesel. So a big opportunity.

Propulsion and electrification. So we have customers who come to us and say, well, is there any chance you can do some sort of a hybrid on our application? Also, this industry, when you go to a mine, and mines, as remote as they are, they are highly digitized today already, connected autonomous operation of mining vehicles, for instance. And then last but not least, I really believe the era of repair and spare parts comes to an end also in the off-highway industry, therefore, thinking about life cycle services. So we really had to think about new solutions and new approaches for Power Systems.

Integrated power solutions, again, we will continue to do diesels. We're good at this, and there is no reason to kind of get out of it. We need to make sure that diesels are compliant to emission regulations, and that's very important to us. But we also need to be open to new fuels, gas. We already have a Marine 8V and 16V for a mobile application in gas. We have gas in our power generation lineup, and there are some product portfolio gaps that we are about to close. We are also thinking about fuel cell technology, hybrids in 2.5 years from now in the marketplace, and down the road on our roadmap also, are pure electrical solutions. Then system intelligence, integrated automation, remote and autonomous operating engines. And then last but not least, life cycle offerings. I mentioned that before already, this is where we really greatly benefit from the experience in the Civil Aerospace organization.

So 3 key schemes. We need to reshape our core. Examples -- and again, we need to retain our competitive engine portfolio, very important, because that fuels everything we do for the future. But additional growth coming through joint ventures and partnerships and localization of production.

Life cycle services. Digital-enabled, which we'll talk about on the next page, and then turning Power Systems into a solution provider. Again, we are good in engines today. In the future, we will be very good at being a solution provider, that requires us to do a bit of a capability buildup in electrics and automation.

Reshaping the core. We signed an agreement with Yuchai Power to establish a joint venture, and I was personally in the city of Yulin, which is about 300 kilometers away from the Vietnamese border. And I was personally there in April to take receipt of the first engine coming off the production line, about 1 year 14 month after we had finalized the agreements with this. Working very closely together, so we have a couple of people from Friedrichshafen, Germany, who are permanently in the city of Yulin. We are not going to build the latest model of our 4000 Series engine over there. But because of the parts commonality, after localization, we will be able to kind of get locals' parts also out of Yulin for usage in other factories around the world.

And then we signed an agreement in April this year with Force Motors in India, and this is the localization of the 1600 Series in the City of Pune in a joint venture with them. They will do assembly and tests of the engine, but we will -- we also plan to localize about 80% of the supply chain in India and then use it for the domestic power generation market and also export for global markets.

Life cycle services. Life cycle services, for me, go hand in hand with digitalization. I cannot imagine how companies really will be in a position to talk about life cycle services unless you really kind of make sure your assets are connected. Because that drives advanced analytics and data-driven value care agreements, in the end, you really need to know how you tailor your life cycle offerings to your customer. And we, last year, signed an agreement where we guaranteed uptime of the equipment. And as an example here in the U.K. with a railway company, the duration of the agreement is 27.5 years. You cannot sign an agreement like this unless you really kind of get the data to understand what you're doing there.

So in 2017, as I said earlier on, we really didn't have a digital organization. So again, the leadership team got together in March. On April 1, and this was not a Fools' Day joke, on April 1, we started the digital organization with 40 positions. Those were filled -- 3/3 of them -- 3/4 of them were filled by domain experts, by system experts from inside the company. And 1/4 came from the outside because for digital, we needed new capabilities there, so we started the digital unit. And today, we have digital products, whether these are applications, we started first with digitizing the customer interface there. And by now,

we have more than 2,000 assets connected. It's a KPI that I follow every week and every month very closely because, as I said before, there is more than 100,000 units out there that want to be connected.

2018 focus is continuously to connect the fleet, but we will also now embark into horizontal digital transformation. And what we mean by that is that we will go rigorously through every function in the company. And inside Power Systems, we talk about X of the future, so service of the future, which I will show to you on the next page, and sales of the future, factory of the future. And every one of these functions has to own the future picture and then we use digitalization to really kind of optimize the business. The digital team will be doubling in budget and the team size during the course of this year.

So here's a picture on services of the future. And I'm sure you have seen these pictures before. Again, we did have very little to nothing about a year ago. Many of the elements of this picture are in place. And for me, this starts with the customer. Our customers, for their equipment, want more uptime. And it's hard to see, but that makes them rest well, and it allows them to kind of spend time on their leisure. We, at the other end of the whole chain, we care about data because that data is worth to us a lot. It helps us to kind of drive the business, make the right decisions within the business and steer the business.

So this whole chain, if the customer is up there, he has -- he or that customer has their own operations center, and we are connected to this. So on the example of the train here in the U.K., these trains are connected. I could pull out my smartphone right now, and I could take a look where each one of these trains are operating. And we had 6 failures of the engines. That wasn't good. Good thing is we were able to predict failure #7 and avoid that failure from happening and, therefore, from disrupting the service of the customer.

So -- but now we, on our end, we have a customer care center. This is where the data comes together. There is a team permanently sitting there monitoring operations. And this team is fully empowered. If they feel there's a need to call Warren and get a plane orchestrated to get a part out there to a customer, they are empowered to do so. We didn't have to do that because, so far, we didn't need it. But this is the empowerment that team has to really serve the customer and make sure the equipment is in place.

Now down the -- downstream, it's very difficult for us to have all of the spare parts available. Wouldn't it be great for us to know the failure rates based on the utilization of the assets and have an optimized inventory management? That's the next step in the journey on services of the future. But as I said, a lot of the elements of this picture after 1 year of work are in place already.

Turning Power Systems into a solutions provider. Now a solutions provider, it is a little bit more than selling product because you're selling all of a sudden solutions. And it's a different thing for the sales force. And that's why we talk very often about we need to develop new capabilities in the business. This is more about consulting the customer. So the way this works today, our people look into the spec, they negotiate with the customer sometimes about elements of the spec, but in the end, it's a product or a gen set or a marine system.

Well, in the future, a lot of the customers, especially in the energy market, asking for wider systems, and so we need to kind of develop our sales force and develop capabilities for them to become and act more like consultants. And this has implications on the product side, where we talk more about integrated propulsion, where we will talk more about microgrid. A microgrid is the combination of a controllable energy source and a noncontrollable energy source, like photovoltaics or wind, an energy storage device and an intelligent control.

Now today, we do with gas and diesel-powered generators one element of that one. We have started to develop a battery storage container made by MTU. And I can tell you, it's been a very -- it's a very interesting product, short time before launch. On the capabilities, we need to kind of embark more on project development. And then we spoke already about life cycle services and the advancements we need to make there.

Coming to the end of my presentation. Where do I see the Power Systems business in medium term? An average sales growth of 3% to 5% above GDP. Why do I feel this is possible? We will be -- we will continue

with what we have developed and what we have in our pipeline to take share, and we will also embark in new applications that will allow us access to markets where -- that we don't play in.

Operating margins, I can imagine us being in the mid-teens. Volume is our friend, and we have more volume than we had in recent years, so good factory absorption, and I can see this trend continuing on. Localization also will help because it will allow us to kind of get parts at a lower cost. And I think 1 year ago, we were trailing -- I was a bit jealous on some of the peers in the industry. It was kind of hard to imagine that we would get close to them. I think we have surpassed many of them within 1 year, and that's why I'm confident, if we just stay the course and optimize cost in the business, we will continue on that trend.

The next line is a very important one to me, given all of the environmental challenges there to kind of lower our dependence on diesel as a main product and, therefore, 10% to 15% in the midterm need to get generated out of a non-diesel product line. And then I think also very important to change the split of OE and service more towards the 60:40 range, eventually even kind of doing better than that. So this won't happen overnight. But I said, I can see us going there in a couple of years.

Last page. I hope I gave you a good impression of Power Systems and that you now know a bit more about this business. I really think this is a fantastic business. It has fantastic customers with a great leadership team in Power Systems that has just started to work together to transform this business. There's more to be expected from us. And there is a strong drive amongst the leadership team to transform this business into a solutions provider. I think we already have a very good position in the marketplace today, and we are a worthwhile investment. Thank you very much.

Harry Holt

Chief People Officer

Right, hello, everybody. I'm Harry Holt, I am the Chief People Officer in Rolls-Royce. I've been in the company for just over 7 years. I've held a number of different appointments, in our headquarters, in our Civil Aerospace business and most recently running our Nuclear business division.

Before I joined Rolls-Royce, I had another career. I was an officer in the British Army for over 20 years. I commanded men and women on combat across the globe, and I also held a couple of senior jobs doing policy and strategy in the Ministry of Defense.

I've held this role for just shy of 6 months, and I have to say it's a very invigorating and exciting role to have for 2 main reasons. First of all, I always think that there's no such thing as good or bad companies or good or bad organizations. There's only, really, good or bad people and good or bad leaders. So being the Chief People Officer, accountable for making sure that we've got the right people and the right leadership, seems to me to be quite a stimulating and rewarding place to be. And the second reason why it's an exciting time to be in this position is because of the restructuring program that I'm about to talk about because I believe that it's a fantastic opportunity for Rolls-Royce's future.

So I'm going to talk about restructuring. I'm going to talk, first of all, about our approach. I'm going to talk about structure, culture, processes and people. And then I'll leave you with our next steps.

So I think Warren was crystal-clear on the requirement for restructuring. After a period of really significant investment by the company, first of all, in R&D to develop a whole series of new civil aircraft engines; and secondly, in the capital expenditures, so that we've got the wherewithal to deliver those engines at volume, we now need to reposition ourselves, make ourselves fit for purpose for this next phase in our cycle so that we can generate the right returns on the investments that we've previously made and also so that we can achieve our longer-term strategic ambition of being the world's leading industrial technology company.

So with that goal in mind, how have we gone about trying to achieve it? Well, we have looked at more than just structure. We've looked very thoughtfully and strategically at structure, culture, processes and people because of course, the 4 are highly interconnected. And it's only by simultaneously changing all 4 that you can bring about the sort of lasting change that the company needs.

If you just change structure, there's a real danger you just end up with the same old people operating the same clunky processes in the same old culture, but with just some different reporting lines. And we're categorically not going to do that. Instead, we focused on culture, structure, process and people, applying those 4 common principles of pace, simplicity, efficiency and empowerment, looking not only at where we can potentially reduce activity and take heads out of the organization, but also where we may wish to enhance operational or strategic capability.

Now Warren has been very consistent and clear on the principles of pace and simplicity. They are both really states of mind, states of being, where in any given business circumstance, you ask yourself, how can we go quicker, how can we make this simpler? And efficiency is more than just doing the same for less. It's also about potentially doing more with the same resource. And empowerment is a theme that comes across very strongly every year in our annual employee opinion survey, when our people tell us they don't feel fully enabled to do the jobs that we ask of them, we have a tendency to centralize and elevate decision-making as opposed to delegate decisions to those people that are best informed and most capable of making the decisions in a timely manner. So we need to invert that traditional hierarchical command and control pyramid, and that's a theme I'll return to later on.

The outcomes are twofold: firstly, to generate better returns on the order book and the product portfolio that we have today; but secondly, to make Rolls-Royce more strategically resilient. And by that, I mean more capable of absorbing the inevitable ups and downs that happen in our market and, at the same time, to invest in new technologies and growth for our future. So fundamentally, the restructuring program is a risk-reducing measure for the company's long-term future.

So what have we actually been doing since January when we announced our restructuring program? Well, we've been doing a very great deal. With the help of Alvarez & Marsal, who joined us in early February, but firmly led by the new executive leadership team, we have been doing a really rigorous diagnostic of the organization, which we've now largely finished. And we've also been developing plans for implementing the new structure.

We've had a team of about 80 people working on this full time, about 50 from Rolls-Royce and about 30 from Alvarez & Marsal, running a number of different work streams, each one of which is sponsored and owned by a member of the executive leadership team. And in fact, the executive leadership team has met almost weekly to review progress on those work streams. We've managed to rack up over 3,000 man days of diagnosis and planning. And we've used a number of tools, we've used a number of A&M proprietary tools. We've used a number of industry standard tools, like SQL and Tableau, to help us to identify and visualize where we've got areas of duplication, where we've got areas of inefficiency. And we've applied those tools to over 18,000 different job types, and that's given us sight of about 2,000-or-so things that we can either completely stop doing or we can significantly change.

We've also been doing analysis on our structure. So we've applied these tools to our structure and discovered, for example, that in areas of the headquarters, we have up to 9 to 10 layers between the Chief Executive and the bottom of the organization, which is clearly far too many, and the new structure drives us down to about 6 or 7. Equally and linked very closely to layers, we've looked at our spans. And in some areas, again often in the central functions, we discovered that the average number of spans is down at about 2 or 3, which is clearly too low. And again, in the new structure, we'll push that up closer to 10.

We discovered a number of managers who don't even have any direct reports. We discovered a number of technology projects that were still going, but now they seem to be misaligned with the original business objective that conceived them. As well as all this structural and activity analysis, we've also looked at the health of the organization, conducting an organizational health diagnostic, and I'll return to that later on.

I think it's worth saying that from the outset, we asked Alvarez & Marsal to challenge us. We asked them to make us feel uncomfortable. And I'm pleased to say that 5 months in, I'm giving them an 11 out of 10 on that front.

So the outcome at a summary level, as you heard yesterday, is that we believe by changing the structure, simplifying the business, reducing the number of layers, increasing the number of spans, simplifying our

processes and, most importantly, overall, stopping nugatory activity, we can reduce by about 4,500 jobs. And broadly speaking, they come out of the functional support, first of all, functional support in the center. So the corporate center of about 4,300 will move to about 100 in our lean head office and about 2,600 in Group Business Services, and a number of functional support resource coming out of our businesses at the same time.

So let's look first of all then at structure. So the current and old Rolls-Royce structure was based on the traditional matrix model with a considerable amount of resource, about 4,500 heads in the corporate center grouped into the traditional functional groupings of IT, HR, finance, legal, et cetera. And partly because those functional groupings were in the center and partly because they owned and controlled the majority of their resource, they were far too dominant in the matrix. They were able to launch initiatives almost at will. They were able to insist on the businesses taking services that the businesses might not require. They had almost endless meddling rights.

And the cost of all that, all that resource and activity, was about GBP 1 billion per annum. And that was then recharged back to the businesses, allegedly in proportion to their size. But in reality, that meant that the businesses had almost no visibility of what they were being charged for, and they certainly had no control or ability to reduce it. The matrix was complex. Accountability was opaque. There was considerable scope for duplication of activity. And decisions took a very long time to reach because almost every one had to agree them. And if, heaven forbid, something went wrong, it was all too easy to legitimately point to somebody else in the matrix.

So the new structure is simpler, focused on 3 empowered businesses, each one of which focused on our customers, enabled by a Group Business Services organization, providing demand-led support services for those 3 businesses on a best value for money basis and a lean head office doing corporate governance, group strategy and ensuring that we fulfill our corporate responsibilities as a publicly listed company. And we show this very deliberately with the customers and businesses at the top, and funnily enough, the lean head office at the bottom because that signifies that inversion of the pyramid that I mentioned earlier on.

So I'll just go through in a little bit more detail, starting with our 3 empowered businesses, Civil, Defense and Power Systems, where we've made some minor adjustments to make them more customer-focused and to make us easier for our customers to do business with. So for example, putting naval marine and submarines into the Defense business means that our Defense customers now really only have to deal with 1 or 2 Rolls-Royce businesses as opposed to 3 or 4.

Our empowered businesses will be the absolute mainstay of the organization. It will certainly be where the vast majority of our people reside. And they will drive competitive and financial performance for the group. They'll have the maximum accountability for their own outcomes, consistent, of course, with overall corporate governance, the group strategy, shared value across the group and our corporate responsibilities. What that does mean is they now have accountability and authority for their P&L. And most importantly, they get control over the support services that they require and visibility and control of the costs of those. They now get their hands on all of the resources they need to really continuously drive productivity, quality and performance improvement as well.

Now as Warren said, we are very clear that we're not creating 3 independent fiefdoms. The businesses will also share the same business model. They will all be developing advanced technology to apply to system solutions for our customers that we then service through life. They'll continue to collaborate and learn from one another. Power Systems, for example, being able to take advantage of the decades of learning that we have in our Civil business on engine health monitoring and long-term service agreements, so that they, too, can extract greater value out of the aftermarket. And our Civil and Defense businesses clearly share the same core gas turbine technology. They share a number of the same suppliers.

Enabling those businesses, we have the Group Business Services organization, where we are going to effectively pool our support services, so our professional and transactional services, into one entity to drive value across the group. That will have a real culture of customer service provider and a mindset where services are driven solely by customer demand and then measured solely through customer satisfaction. It'll have a culture of continuous improvement, looking to continuously enhance value through

process standardization, process simplification, leveraging the obvious economies of scale and then, of course, taking advantage of outsourcing, offshoring and increasingly, robotics and automation.

Interestingly, it gives us an opportunity for the first time to really create a multifunctional, multi-process, end-to-end capability, and that's a bit of a mouthful to say. What I mean by that is that we have some of our big processes, like Source to Pay, where at the moment, you have different functions manning -- managing different discrete elements of that process and, therefore, managing all of the handoffs and interfaces between them, which is unduly complex. In this new model, we can put those people together into one coherent team to manage and improve that process genuinely from end to end.

I think Group Business Services will grow. I think the scope will grow as we learn and as we bring in new capability and as the businesses get used to working in this new model. And it will certainly be a very exciting opportunity to build and grow global and diverse talent.

The lean head office, and you may spot that we've got a leaner font on the word lean, just in case you'd miss that point, based in London but in a new location, a new smaller location, more accessible for the majority of our people, closer to King's Cross. And that will provide the senior leadership for the group. It will provide the group strategy. It will ensure the disciplined allocation of capital consistent with that strategy. And of course, it will continue to provide corporate governance, control and assurance.

So moving on to culture. So culture, it's such a nebulous concept, isn't it? But we all know that it is very, very important. I think the saying goes that culture eats strategy for breakfast. So in the same way as we conducted an analysis of our structure, we've conducted an analysis of our culture using an organizational health diagnostic tool, using our annual employee opinion survey and using Alvarez & Marsal to conduct a number of focused interviews for us.

And the first thing that came out loud and clear is there is plenty about our culture that's really laudable and really fantastic and we need to preserve and enhance. We need to preserve and enhance that sense of pride that all of our employees feel for working for Rolls-Royce, and that engenders a fierce sense of loyalty to our company. We have a consultative and inclusive atmosphere, and that engenders very high degrees of innovation. But equally, there are some aspects of our culture that we certainly need to change, and I've just listed the sort of to and from on the right-hand side of this slide.

So first of all, we revel in complexity, and we need to get much simpler and much clearer. So we have a thing called the Rolls-Royce Management System, which is designed to provide people with the processes and procedures that they need to follow to get their job done. That feels like an eminently sensible thing to have. But when you look inside it, you discover we've got 167 group procedures containing 751 different steps, which are governed by 6,955 different rules. And if you look even further, you can find 3,424 embedded links to take you to separate documents, providing how-to guides and local work instructions. And in fact, if I printed it off and brought it here today, I'll have to cut down 28 trees to produce the 5,450 sheets of A4 paper, and that's printing them on both sides. That is what I mean by reveling in complexity. Maybe it's because designing and building the world's most efficient gas turbine aero engine is actually a pretty complicated thing, otherwise, everyone else would be doing it. We somehow believe that complexity is an end in itself. And clearly, it isn't, and we need to become much simpler and clearer.

We have a tendency to gold plate and duplicate. The Rolls-Royce solution is not often -- not always a good moniker. I remember running the Nuclear business. We made a small acquisition in North America for about \$5 million to \$6 million, only to be told by our own people that we were going to have to spend considerably more than that to bring the single facility of this new business up to Rolls-Royce's group property standards. And this was on a building that had been cleared by the U.S. regulator to handle nuclear contaminated material.

We have a culture where we tolerate low productivity and poor performance. Last year, less than 0.1% of the workforce left due to poor performance, or put some numbers on that, that's 1 engineer out of a population of about 17,000. I know we have some really great people, but they can't all be that good. So a much stronger performance management culture is where we need to get to.

One of the reasons why the performance management culture is poor is because of the lack of accountability in our structure. It's really difficult to put your finger on someone and say, this was your accountability, this is how it's turned out, here are the outcomes, good or bad. And of course, the stories of internal approvals needing 25 or 26 signatures are more than just sort of anecdotal. They are symptomatic of an organization that shies away from individual accountability and somehow thinks that the more people that can take shared accountability, the better the outcome. And we all know from experience that it's often the reverse that applies.

And then last but by no means least, a lack of cost awareness. And of course, the danger of giving you lots of stories here is that you come away thinking that we're profligate, which we are not. We actually have a lot of very good people working on cost reduction very successfully day in and day out. But we still have too many aberrations where we seem to incur ridiculous cost just because someone, normally acting out of their best of intentions, thinks that they're upholding a group policy or standard. Again, in my last business in Nuclear, I discovered that 3 people had flown all the way from Bolton to Grenoble simply to erect a Rolls-Royce sign because they didn't trust a local contractor to be able to do that consistent with Rolls-Royce's branding policy. So we haven't yet got the sort of cost-conscious mindset that we need.

Now clearly, changing culture takes time. It's not going to happen overnight. It takes strong leadership. So the new leadership team that we have is really driving the cultural change. We've launched our new behaviors, our ABCs, as we call them, so be agile, be bold, be collaborative, be simple. And those new behaviors are woven through our new leadership expectations. And we're increasingly judging people, judging leaders on how well or how badly they can live up to those expectations. And that will clearly have an impact on their performance appraisal, on their rewards and, clearly, on their longer-term prospects within the company.

And as I mentioned earlier on, we are changing the leadership model, seeking to move away from that traditional hierarchical pyramid, to invert that pyramid where leaders are less focused on how they control others and more on how they can build and develop and enable their teams to solve the problems that are in front of them. We call it leadership through people. I think it was Steve Jobs who says, "It's not clever to hire smart people and then tell them what to do. We hire smart people so they can tell us what to do."

So our processes and systems are clearly another area which can help to shift culture. And of course, we need to simplify our processes. We need to reduce the process burden, otherwise, we can't reduce by 4,500 jobs, or at least we can't unless we want to have an organization that's got fewer people in, simply working twice as hard to keep the old clunky machinery going.

So we've looked at a number of our processes, of which we've got several hundreds, many in the Rolls-Royce Management System, many elsewhere. And we've applied the 4 simple principles of stop, simplify, improve and automate. We've started with some of the biggest first, and I'll just give you a couple of examples to show you what we've achieved, but also to show you the opportunity for future achievement.

So the management system I spoke about earlier, 167 group procedures, 44 of those procedures had to do with how we manage customer relationships and the services that we provide them. By putting together a small team, applying some good lean methodology, applying a good dollop of common sense, we've managed to reduce those procedures down to just 18. And more importantly, we've reduced the 1,065 rules governing those procedures down to less than 40.

We've also had a lot of success with indirect procurement. 3 years ago in 2015, we spent about GBP 2.7 billion per annum on indirect procurement using very outdated systems that lacked pace and lacked transparency.

Over the last couple of years, through a project called IPEX, indirect procurement excellence, we've introduced a new world-class source to pay digital platform called Coupa, which is integrated across our ERP systems and across our major geographies. And at the same time, we've upskilled the buying teams and simplified our processes.

And the outcome has been very pleasing. We've managed to reduce the time it takes to process purchase orders by about half. We've managed to exceed the 5% industry benchmark savings in the various indirect

commodities that we procure. We've reduced the total spend down from about GBP 2.7 billion in 2015 to a target of GBP 2.3 billion this year. And we've done all that with a team that's 23% smaller than it was. So it shows you what's possible.

We've also tackled our annual budgeting cycle, which Stephen quite rightly is very pleased with. Up until recently, our annual budgeting cycle took us 10 months. We were in the cycle from April through to February. It involved over 10 -- well, tens of thousands of different spreadsheets all being developed bottom up. And you can imagine the number of man-hours that went into that. And at the end of it, in February, we then had a locked and pretty static budget. So by changing our approach, swapping all those thousands of spreadsheets out with one simple tool, driving the budget top-down based on a few simple value drivers, we've now shortened that process to just a couple of months, September, October. And because you can change the assumptions on the value drivers, it is actually a dynamic tool and you can update your forecasts whenever you so wish.

All that is a sort of corporate office process improvement. Clearly, the businesses continue to drive improvement on the shop floor, in our operational processes, where we continue to get really good results through a combination of lean methodology, but importantly, by empowering the teams and leading in that different way, leading through people.

So for the XWB, for example, we've managed to reduce the snags on the build line by 27%, simply by linking the engine fitter with the engine inspector by a new IT system, so that each time the engine inspector sees something that's wrong, the engine fitter that caused the fault gets instant feedback. That was more than just a system improvement, of course. It's a cultural improvement where we work with the unions to make sure that the fitters were really embracing a culture of continuous improvement, desperately trying to drive the snags down and the product quality up for our customer.

Sticking with the XWB, obviously, our biggest volume engine, we've managed to drive the turnaround time, turnaround time is the amount of time the engine spends on the testbed before it gets shipped to the customer, from 58 hours down to 22 hours, the Holy Grail being to get it down to 15 hours because if you can get all our large engines down to that sort of level, then we don't need significant additional testbed capacity and a single testbed is about GBP 70 million to GBP 80 million of capital expenditure. So some of these simple operational process improvements, as well as clearly improving our productivity and customer satisfaction, actually can help to lower the overall investment bill for the company.

So you can have the best structure in the world. You can have all the best processes in the world. You can have the best culture in the world. But if you haven't got the right people in the right jobs with the right skills and the right tools at the right time, and most importantly, with the right leadership, you are doomed. So our people strategy is absolutely essential to the overall restructuring and it includes 4 elements that you can see here on this slide.

So first and foremost, we need to enhance our leadership capability across all levels of the organization, from the top to the bottom; and at the same time, change the leadership model to one where we lead through people and we enable our teams as opposed to controlling them per se. And we have rolled out, as I mentioned, new leadership expectations, and we're also going through a complete refresh of all of our leadership learning and leadership courses, not only so those new expectations are embedded in them, but also so that our leaders get a license to operate, as it were, before they move to the next level of leadership.

Linked closely to that is improvement in our talent management to make sure that we've got the right leaders in the right place at the right time, and also to improve and strengthen our succession planning.

Three areas of focus here. So first, to ensure that our leaders really understand that identifying and developing talent is one of their core accountabilities. Secondly, being much more proactive and systematic about how we manage people's careers, moving people across the company so that they can get the right experiences and grow the right capabilities so they can fill some of the biggest jobs in the right time frame. And then thirdly, being slightly less risk-averse and conservative in some of our appointment decisions. And obviously, as we go through this restructuring phase, we've got a particular focus on keeping and promoting our key talent.

This will all help with our diversity agenda. Diversity is important to us, not only to make sure that we've got access to the largest possible pool of global talent, but it's also important because it's only by having diversity of experience and diversity of thought that we can be as creative and as innovative as we need to be to succeed. So diversity is all about creating better business outcomes for Rolls-Royce.

And then finally, capabilities where we have certain capabilities where we're strong today and we need to preserve them. So we do have deep functional and technical expertise that we want to preserve. We are innovative and we certainly need to preserve that. But there are other areas which need enhancements or indeed growth. We need more business and commercial acumen across the organization. We need stronger program management in all of our businesses. And as we pursue our new strategy based around the 2 pillars of electrification and digitalization, we clearly need more electrical skills and data scientists in the organization.

So next steps. So yesterday, we made our announcement. That really signaled the end of the diagnostic phase of restructuring. We've now very firmly moved into the implementation phase and we will be beginning consultation with our people. You're familiar with the overall number of 4,600, and broadly speaking, we would expect about 1/3 of those jobs to be lost this year and the remainder to be lost during Phase 2 and Phase 3, complete by mid-2020.

4,600 is actually a very big number. I think it was Stalin who said one death is a tragedy, a million is a statistic. And even though, thankfully, we're not talking about life and death here, we are talking about peoples' livelihoods. There are real people behind this slide with real families, real dependents and real hopes, dreams and fears. And so how we as a company treat them is of the utmost important (sic) [importance]. We will absolutely treat them with fairly -- with fairness and respect. We will make sure that we involve them as indeed we have done over the last few weeks and months. We will involve them and their representatives at every stage of the process. And where we are selecting people into new roles in the new organization, we'll make sure that that's a completely transparent process based solely on merit.

All of that is important clearly to the people that are going to leave. But it's actually equally important to the people that are going to stay behind because it sends a very, very powerful signal of the sort of company that we are and we will remain.

So can I just leave you with 3 messages? So as Warren said, having stabilized the business, having created and built and developed a new leadership team, we are now ready for this restructuring program. And it is a program that focuses not just on structure, it's actually a really fundamental change to structure, culture, people and processes. The second thing I'd like you to take away is it's only by stopping, simplifying, improving and automating our work to reduce the overall burden on the system, that we can let these jobs go. And then the final thing is that this is all about better results today, but it's also about preparing ourselves and building ourselves so that we're better positioned to seize and exploit the opportunities in our future.

Thank you very much, everybody. I think we have now got a much needed coffee break and not Stephen.

[Break]

Stephen Wayne Daintith
CFO & Executive Director

Okay, I think we're all set. Morning, everybody. My name is Stephen Daintith, Chief Financial Officer for Rolls-Royce, been here just over a year.

This session is around delivering the returns, and I think just to put sort of Rolls-Royce in context, we're a growing business. We reported good growth in 2017, we expect to report good growth in 2018, revenue growth, and we expect that revenue growth to continue over the next few years as well. We're also coming out of a significant investment cycle. So we're entering the phase now of delivering the returns on that investment cycle.

And today, we're going to share with you our 2 KPIs that we'll be tracking most closely to measure the success of those returns. Number one is cash flow returned on invested capital, I'll talk quite a bit more about that a little later; and then cash flow per share. And just to give you some context as to how we've built this model up and Harry alluded to it as well and I talked a little bit about it a year ago at the half year results, we're building and have built within Rolls-Royce a driver-based approach to modeling our business. So X times W divided by Y equals Z with the 3 key drivers there, using that as an example, to get to an absolute number. And that way, we can better track performance and delivery metrics, and very much as Andreas was talking about in his business in Power Systems, tracking our progress.

So we've developed this model and this model allows us to develop a rolling forecast for Rolls-Royce, whether it be over a 5- or a 10-year period with great detail behind it as well. Clearly, a lot of assumptions driving that, but that's the essence of where we're trying to get to. And in time, this rolling forecast will in fact replace the budget process because we'll always be updating our model on a driver-based approach.

What we're going to hear about this morning are the 3 key drivers. There are plenty of others, but 3 key drivers to deliver those returns. At the end of this session, there'll be about an hour for Q&A. So just to let you know that we won't finish immediately after me. There is an hour set aside for Q&A.

Right, let me get into the presentation. So what are the key drivers of the increased returns? And there are 3 significant ones: reduced OE cash deficit per engine; the improved aftermarket cash margin; and what we're describing as bending the fixed cost curve. Important at the top there, underpinned by significantly increased returns across our 3 businesses. Andreas talked about those mid-teen margins for Power Systems. We expect something very similar for our Defense business as well. And our Civil business, perhaps not quite at that level, but certainly moving up into the high single digits as Civil progresses over the next few years. All 3 of those will drive and result in cash return on invested capital growing. We've given a midterm ambition this morning around what that means. And midterm ambition, you should be thinking 5, maybe 6 years, that sort of time period because I'm sure that question will come up.

So first of all, looking at this key driver of OE cash deficits. There are 3 key factors behind the drive to reduce the cash deficits on our original equipment. As you know, we sell off civil engines at a small deficit today of about GBP 1.6 million cash loss per engine. And through 3 key factors of pricing, cost and mix, we expect that to come down significantly over the next 5 years and I'll be a bit more explicit about that on the next couple of slides.

The Trent XWB-84 in particular, we're highlighting as a breakeven engine by 2020 and that's a key driver of part of the journey that we're on. And looking at the cost reduction side, in particular, as a contribution to that reduced cash deficit, there are 4 key drivers of that: sourcing, engineering change, commercial terms and partnering and then how we manufacture the OE.

Let me just give you some practical examples of what's happened within Rolls-Royce. So the Trent 7000, for example, we've transferred the pipe supply from Spain into Mexico. We get about a GBP 50,000 benefit per engine from that. On the right-hand side, there is a fan case. That's this part of the engine here. We've reduced significantly the amount of raw material that we get before we start forging it to produce the finished design. We've reduced it by around 2 tonnes lower per engine of raw material and that again drives around GBP 50,000 benefit per engine. So there's 2 changes, GBP 50,000 each.

Commercial terms and partnering, this has been very effective. We work with our suppliers to get improved commercial terms for them, but at the same time better pricing for us in cost of the engine design. XWB-84 and 97, in particular, driving a GBP 20,000 benefit per engine from that collaboration working with our suppliers. We haven't always had a great reputation for working with suppliers at Rolls-Royce. I would hope that we've dramatically improved this over recent years or certainly over the last couple of years or so. I would say on this whole area as well, the civil team each year have a very detailed list of initiatives to pursue along these lines to deliver that ongoing opportunity of cost reduction in original equipment.

Method of manufacture is important as well. We have a large disc facility. Many of you may have visited it, up in Washington in the Northeast, big investment going in there. I'm going to talk this one in a second

when we talk about the cash return on our invested capital, and that's delivered a benefit of about GBP 30,000 per engine.

So when you pull all that together, what does it mean to us in terms of cash flow over the next 5 years? Well, our widebody installed deliveries are going to grow from last year's 444 to about 600 this year. And we lost last year, if you remember from the full year results, about GBP 1.6 million cash per engine. That GBP 1.6 million we expect to decline to about GBP 400,000 over the next 5 years. So we decline by GBP 1.2 million per engine. And using simple maths, we get to an average cash deficit reducing by that much and an incremental cash flow contribution to the group of about GBP 500 million per engine, number one of our key drivers.

Number two of our key drivers is the aftermarket cash margin and probably the single largest driver, certainly one of the largest drivers. The key factors around this one: the growth in the installed base, I'll show you the numbers in a second; the flying hour growth that will follow that growth in the installed base; shop visits and how we expect those to develop over time; the in-service issues. There'll be a lot around this presentation that we'll talk about the future and the good things that are going to happen but we shouldn't forget there is risk within our business. The Trent 1000, the Trent 900 is a very good example of the risk that is within our engines and their performance. We assume a certain level of performance. The Trent 1000 has shown that it doesn't always happen that way and we're accommodating it this year and next year and so on.

The risk and revenue-sharing partnership program shares as well. This is a significant part of the equation to take into account that we've modeled. This is going to grow quite significantly over the next few years as a proportion of our engines have a higher contribution of the partners that we've worked with to develop those engines in the first instance. So that's an important factor.

However, having looked at all of that, modeled it through, this is where we get to on our assumptions. So the installed base will grow from 4,400 to around 6,500. Here are the assumptions that we've taken, around 550 to 600 deliveries per annum, and this won't be linear completely over the years but it's pretty -- that's a good guide. And we have about 100 to 150 retirements per annum when we look throughout the aging of our fleet and so on as well.

We've got 2,400 widebody engines on order. There's the 6,500 we end up with in 2022. And this should drive a 10% growth in engine flying hours by 2022, getting us to that 6,500 number.

Major shop visits, what's going on here? Well, these are the major shop visits, first of all, and then we've got check and repair visits. The major shop visits are when the engine reaches the point of its regular service interval, whether that be 5, 6, 7 years. In 2017, we had 240 of those. In 2022, we're going to have around 650. That's a reflection of the size of the growth of the installed base, but also looks at the maturity of the fleet. We have a younger fleet than most as well, which is helpful.

The check and repair visits are the Trent 900, 1000 type visits that are out of the regular sequence of scheduling. So well over half the 350 number in 2017 was down to the Trent 900, 1000. So that's the area of most uncertainty in terms of how that develops. 2018, for example, that number will grow to maybe 500, 600 check and repair visits, depending on how we get through the inspections of the Trent 1000 engines.

The average cost of each of these varies considerably as well. As a good guide, you could use GBP 1.5 million also for the cost of a shop visit, a major shop visit. And in 2017, GBP 400,000 per visit as a guide to what that number looks like as well. But I'm hoping you can pick up a degree of the granularity that have gone into our modeling to help us get to the midterm ambitions that we've shared this morning.

Two additional important levers down the bottom here, maximizing the time on wing but also driving down the shop visit costs, both key contributors.

So what does this mean when you put it all together? We are aiming to exceed GBP 2 billion of widebody cash margin over the next 5 years, growing from GBP 1.3 billion in 2017 to GBP 2 billion, in excess of GBP 2 billion, over the next 5 years. And we've taken certain assumptions here. So there's the bit that I've just talked about in terms of the installed base. As a good guide, net of risk and revenue-sharing partner

percentage contributions, you should be thinking around GBP 500,000 per engine per year in terms of modeling this as a good guide.

We talked about major refurbishes. We talked about the check and repair. There are other parts of the aftermarket cost base that are outside of this driver-based approach, things like the cost of leasing engines for total -- for the TotalCare provision. Transportation costs are in that number as well. And also, the engine health monitoring business as well and activity is in there.

The products in-service costs, these are any additional costs that might creep into the margin in respect of items like the 900 and the 1000.

An important point: as often sort of speculated in the commentary as to when this growth might slow down, we've modeled through the '20s to see based on what we think deliveries are going to be, what we think retirements are likely to be, looking at the aging of our fleet, and we actually see continued growth throughout the 2020s in absolute terms. Growth will slow down. The rate of growth will slow down as the installed base grows and starts to flatten out, but also as the shop visit-cum-incidents per installed base starts to get higher as the fleet gets older. So the growth will slow down, but it will carry on growing throughout the 2020s. That's an important point.

The third item, bending the cost curve. So what do we mean by that? Three key factors that will help us bend the cost curve: the restructuring program that Harry talked through a little while ago; the investment cycle, the significant investment cycle that we're coming out of; and then the capacity that we've now built into our production capability to deliver those 600 engines a year.

There are 4 components to what we call the cost curve. Commercial and admin costs, that's indirect expenditure. That's the amount largely that Harry was talking about in respect to those recharges across the businesses. Net R&D cash spend, you'll be familiar with that number, whether it be across civil, Defense and Power Systems and we'll show the profile of that in a second. And then certification and participation costs. These are costs that go in, first of all, when we test the engine prior to delivery to the customer, that's certification. Participation fees are the fees we pay to an airframer to participate on a program. And then finally, capital expenditure. These are the 4 areas of fixed cost, GBP 3.1 billion in total.

So first of all, bending the cost curve, the restructuring program. We highlighted yesterday GBP 400 million of net savings, run rate savings, by the end of 2020. It's driven by reduced fixed costs but also headcount, simpler, more responsive business structure and efficiency and effectiveness around the organization. Much more simple, less complex, lots of things that we're going to stop doing that we do today and deliver a more streamlined and simple and effective business.

The savings will flow through. Just thinking about timing, I think there'll be a small portion in 2018. Clearly, we've got a lot to do this year to start delivering. We have a target of 1/3 of headcount by the end of this year, but only a small portion this year. '19 and '20 will be the 2 years when we start to see those savings really flow through. We'll share more at the half year on the phasing of the savings. In terms of 2,000 -- in terms of the costs of the restructuring program, we have a GBP 500 million cash cost estimate to implement, largely redundancy costs, but a decent portion of system investment to facilitate the delivery of this program. And you should be thinking roughly around, I would say, 80% headcount redundancy costs and the balance being the systems investment as a rough guide today. Again, we'll update you more at the half year results.

In terms of timing, around 25% of that in '18 and then the balance over '19, '20. I'd probably say about sort of the remaining 50% -- or maybe 60% in 2019 and then remaining 15% in 2020 as a rough guide. Again, we'll give you updated estimates as we go along.

The treatment of this, we'll treat the costs outside of underlying profit and free cash flow. So we'll disclose the amounts, but we'll take it outside of underlying performance. Timing and impact, we'll confirm again with the half year results. GBP 400 million of savings, GBP 500 million of costs, so a pretty good payback.

So commercial and admin costs. This is the profile over the last few years of how these indirect costs have moved. '14 and '15 was quite a significant reduction driven by the absence of the Energy business but also by the fact that in those years, a bonus was not paid, to be frank, due to the performance of the business

at that time, and that's quite material to our numbers. That's about GBP 100 million or so of that number across the group, but relating again to that 1.1 billion that we see today. We expect those costs to reduce to around 5% of sales. That's our ambition, that's our midterm ambition. And largely driven by the GBP 400 million of restructuring savings that we announced yesterday morning. Previously, we had operated at about 8% or so, dropping to around 5%.

R&D. Putting this in context, our R&D, net R&D, has grown by -- from GBP 700 million to GBP 1.2 billion over the last sort of 7 years or so. Again, putting it in context, we have brought to the market 6 new civil aero engines during that period during the last 10 years. On average, Civil NPI has been around 50% of group R&D spend. We're unlikely to see that period of activity again over the next 10 years as we move into a service business after having been an R&D, an OE business, very important point. So whilst the trajectory of that exact curve, don't read too much into the slope of that curve, the point is here that we do expect net R&D to decline rather than grow over the next few years. We will still be investing, as you might imagine, significantly in products for the next 10, 20 years, but not at the absolute amount level as we've seen in recent years. That's the key point.

The ambition, to decline to around 6% of sales as the pace of Civil NPI slows down. And then at some point, we will again move into an investment cycle, but that won't be in the next sort of 10 years. We won't see this sort of activity again. We're very much moving into an aftermarket space.

CapEx. Similarly, there's been a 60% increase in CapEx since 2010, up from 3% to 6% of sales. We've built in the capacity for our business to deliver those 550, 600 engines a year. So it's important to put Rolls-Royce in context of the investment cycle that we've been in over the last 5, 10 years. 60% growth, we expect to decline to around 4% of sales on a go-forward basis. That's our midterm ambition.

So bending the cost curve, what does it mean when you put it all together? We expect -- this is the rise from 17% to 23% of sales. Our ambition is, as we'll show on the next slide, is that this comes down significantly over the next few years. Putting this into practice and showing the numbers, we decline from around 23% of sales to 15% of sales over the medium term.

So another of our 3 -- the third of our key drivers. Contributes around GBP 500 million per annum. So OE, around GBP 500 million; aftermarket, around GBP 750 million; bending the cost curve, around GBP 500 million. All 3 of those will then help drive the improved cash return on invested capital and cash flow per share.

Working capital is a key consideration. It is a feature of Rolls-Royce. It will continue to be so. We are a negative working capital business, but we have not included a material contribution from working capital in the modeling that we've got over the medium term.

So capital allocation. How do we approach capital allocation? We have 4 key priorities across Rolls-Royce as to how we allocate our capital. Number one is a strong balance sheet; number two is to fund organic investment; three is our reward payment to shareholders; and four is M&A.

Let's look at those in a bit more detail. So strong balance sheet, why is it important? Well, credit rating matters for 3 key reasons. Number one, customer confidence. We do have, as we showed on those previous charts, long-term investment cycles for our aerospace programs, multiyear service contracts. Our customers need to be confident they are investing in a strong and healthy business. Number two, our competitive position. The credit rating does matter. It does matter when it comes to our debt and our funding. It's important and it supports our ability to continue to acquire competitive financing. Thirdly, we run a very large hedge book, as you know, approaching \$40 billion, to manage our exposure to dollar inflows over the next 10 years or so. So a strong credit rating really matters. We have an ambition to return to a A rating. All my conversations with the rating agencies indicate that they, too, have an eagle eye on free cash flow and as do we, so that will be the key guide as to the rating agencies' view on free cash flow and rating.

Number two, funding organic investment. So how are we approaching organic investment or the R&D and CapEx of around GBP 2 billion that we spend today across the business? First of all, increased rigor on R&D and CapEx across the board. We have an investment review committee that meets now every month.

I chair that committee. The majority of the executive team also attend that committee. We run through all the investment proposals. We have -- these are the 4 metrics against which we assess the credibility and the traction of each investment that's being put forward: internal rate of return, net present value, cash return on invested capital and also the maximum negative cash flow to the business.

We prioritize our projects accordingly as well, and I was asked a question earlier on around sort of Power Systems getting investment in the business, for example. Well, it gets -- there is not one business that's favored. It's the returns that we favor and the visibility and credibility of those returns. So we shouldn't think necessarily that this is a Civil Aerospace-dominant business in that respect. We have a suite of metrics providing us the balanced appraisal, you'll see them there.

We include within our investment proposals now mandatory minimum contingencies. There has been a, I would say, a streak of optimism in previous investments that have taken place, which have caught us out.

Demand and cost scenarios are assessed to measure sensitivity. So we carry out rigorous sensitivity analysis to see how sensitive a proposal is to a particular individual assumption. We view them quarterly to monitor progress, and they must demonstrate a return 5% above our weighted average cost of capital of 10%, which is the group. So we're targeting a 15% cash return on invested capital for each investment. This was -- this process was introduced in 2017, so it's still pretty new the way it's working today. But I would hope and expect it to make a significant contribution to Rolls-Royce going forward, particularly how we look at our investments.

Let me just give you a couple of examples of things that have worked well and one example that -- of things that haven't worked well. So our Washington Disc Facility was a GBP 100 million investment. We delivered it under cost, a net NPV 24% better than plan, a 50% lead time reduction, and this was despite a 7-month slip in the program. Lessons learned, we used well-proven production methods, knowledge transfer from previous projects such as Crosspointe in the U.S. and dynamic on-spend phasing to cope with timing changes. So this one worked well.

What didn't work so well? Well, this was a new engine control facility that we built in Birmingham, GBP 35 million increase in cost. There was an investment cost of GBP 84 million, so pretty significant slip. A 2-year slip to the timeline. Pretty bad net present value. And 2 years post-launch, we'd underestimated the costs. A 12-month delay as well. 1 year later, that had got even worse. So lessons learned: increased rigor, segregated phases of breaking down our projects into individual time lines and milestones and put controls in place to strengthen the whole process through more rigorous and ongoing reviews.

Capital allocation priority number three, payments to shareholders. So this shows our dividend history over the last 10 years, rising from 14p through to 23p and currently back down at 11.7p per share.

Free cash flow will be the guide for us as to when we reconsider our dividend. That bullet point down here, that will be the key driver of how we look at our dividend and how a dividend might grow. We aspire to midterm 2.5x free cash flow dividend cover through the cycle. So this is our guide as how we're looking at dividend.

We are committed to restoring payments to an appropriate level for our shareholders. They have been patient, and we hope at the right time when free cash flow is at the right level and the balance sheet is strong, that we can then revisit the dividend.

Mergers and acquisitions, a key criteria that we use to assess M&A opportunities. Alignment with strategy, there's synergy potential across the group; value creation, again, linking in with that 15% cash return on invested capital; the cultural and management fit, but also our own balance sheet resilience, the ability to carry out and afford significant M&A. Technology, portfolio and growth are all key aspects when we assess the M&A opportunities that come our way.

So measuring our success and pulling this all together into KPIs, and this was an interesting part of the exercise as we approach and say, how do we translate into a couple of succinct and effective KPIs that we can use not just to report performance but also to manage performance across the business. There's no point having a cash return on invested capital KPI if you're not working that way within the business and

rewarding our people through that KPI as well. So it became interesting developing this one. We settled on these 2 and here's the reason why.

So again, around a year or so ago, I started here. I think then we made the point that cash flow was the key driver for us going forward of economic performance. Rolls-Royce in the past has, I think, largely been a profit-driven business and has benefited from long-term contract accounting through using a profit measurement. But its cash flow is the best and key indicator of economic performance. And our goal is to drive a cash flow culture across the group. We've made some progress with that. We've got a long way to go, but it's a key part of what we're trying to achieve.

So cash flow per share, this will be key to long-term incentive plans, and I would hope directly aligned with shareholders' interests.

Cash return on invested capital, it's a measure of investment efficiency. Let's just go through these 2 in a bit more detail. So cash return on invested capital, cash flow based, and this is the key aspect here, is that it's not just cash generation itself but it's asset efficiency. It's the return on the investment that we've put into Rolls-Royce, that its R&D and capital otherwise can be quite a lazy tool to generate cash flow. There's just cash flow itself per share in absolute terms. You're not looking at the efficiency of that investment. And that's the way we want to work as a business and get our business managers working that way as well.

So cash return on invested capital, how have we looked at this? A couple of things: we've worked a lot with Credit Suisse on their HOLT instrument. You'll all be familiar with the HOLT tool. So this methodology is anchored in HOLT, although it's not precisely the same as HOLT. HOLT starts with profit, we start with cash.

It's probably best if I start on the right-hand side of the screen here on the denominator. The denominator is the invested capital in the business, and here is how we've arrived at our denominator of GBP 18.7 billion invested in the group today at the end of 2017. So we've used a 15-year historic net R&D investment.

Most of these numbers, by the way, you can get from our annual report. And where you can't, well, the IR team will be helping the analysts show how we've derived these numbers. PP&E and software gross at cost, product, plant and equipment. Participation and certification costs are on the invested capital as are other intangibles. Working capital and provisions is in invested capital, and operating leases are in there as well. On operating leases, we've used a perpetuity valuation of current operating lease payments to arrive at that invested capital for operating leases. An important point as well is that the deferred income from our aftermarket is not in the working capital number.

Annual cash return. So then having decided what the denominator is, the invested capital, clearly, you need to approach free cash flow to make sure that you've got a right sort of apples-and-apples comparison. So free cash flow, we then remove and add back to free cash flow, net R&D spend, CapEx on product, plant and equipment and software spend, participation and certification fees, other intangibles. The inflow, outflow from working capital, adjusted for the -- that's not excluded from cash flow, just to make that point, and then operating lease payments. And we come up with GBP 1.8 billion of cash generation from our invested capital on a like-for-like basis. Anchored in HOLT and a 9% return, therefore, in 2017.

So what are we calling out today as our goal for the midterm? We've got a 15% target. Looking at that, its important context is how the business model works for Civil Aerospace. And we put in here a very simple illustrative example just to remind us as to how Civil Aerospace works for a typical 2,000 engine program. Typically, it costs us around GBP 1.5 billion, GBP 2 billion of R&D and CapEx for that engine program. We then have installed OE losses of around GBP 3.2 billion. So there's 2,000 engines at a GBP 1.6 million loss per engine currently have today. And then on a go-forward basis, over the next 25 years, we have around a GBP 10 billion aftermarket cash margin that flows through over the next 25 years. That's the most simple way of looking at the business model of Civil Aerospace.

So right now, we have quite a few engines that are just entering this phase of the cycle. There's 6 new engines that we talked about. Some are newer than others, but you -- hopefully you get the feeling of where we are.

So annual cash return on invested capital, how do we expect this to develop? Well, you'll see that we've declined quite significantly over the last 4 years from 17% down to 9%. I guess, one key point out of this is that we have been there before at high cash return on invested capital. Right now, the 9% shouldn't come as a huge surprise when you think about the dynamics of how the whole calculation and process works and the investment cycle that we're in at the moment and coming out of. So we're at a low for our cash return on invested capital. We expect that to grow over the medium term, 9% currently, and a 15% growth through the cycle.

So how are they going to embed it in our planning? Well, improved returns on current invested capital. It goes back to my earlier comments really, making sure that as we review all investments, they're at least achieving returns that support our cash return on invested capital ambition. That's how we're going to work as a business when we assess our investment.

Cash flow per share, very simple terms, this is much more simple, this one. We are dividing underlying free cash flow by the number of shares.

Just as a reminder, underlying free cash flow is everything before dividend and M&A and, currently, the SFO fine that we're paying off. Delivered by the 3 key drivers, but also underpinned by the 3 high-performing businesses.

Currently, our cash flow per share is around 15p. Over the medium term, again, you should be thinking 5, maybe 6 years, to exceed GBP 1 billion cash flow per share -- sorry, GBP 1 cash flow per share. That would be something.

I think one thing I would say in respect of this midterm ambition. The model is there. The metrics are all clear. The roadmap is clear. We've got a new executive team. We've gone from 14 down to 9 executives over the last 12, 18 months or so. Pretty much everyone is brand-new in the role. We have a team aligned around this ambition, determined to deliver it. But at this stage, it's just a PowerPoint.

And we shouldn't forget that. There is risk in our business, there's execution to deliver on as well. But there is a clear way ahead and it makes sense the way ahead, and we're all determined to deliver it in our own parts, but also collectively. And that's an encouraging place to be, acknowledging though that currently it is just a PowerPoint, and there's lots of work to do.

So hopefully, that's given you a good indication around our ambition. And now I'm going to hand you over to Warren for some closing comments before the Q&A. Thank you very much.

D. Warren A. East
CEO & Executive Director

Good. Well, thank you, Stephen, and nice to see everybody was awake for his rather ambitious cash flow per share target.

Anyway. I'm picking up where Stephen left off because, to summarize, it's all about execution. So Harry talked about the state of the way we have been doing things at Rolls-Royce. And that way that we've been doing things, call it culture if you like, has been very, very resilient.

We've had a few generations of Rolls-Royce management try to tackle this, and we've spent the last couple of years preparing. Because you can't just tackle it by wading in and cutting a few costs here and there because it doesn't go away. And that's why it's taken a little while to get to today. And as Stephen mentioned, a crucial part of that is the leadership team.

But I think we have prepared, over the last 2 to 3 years, to get to this pivotal point. And so even though it is just PowerPoint at the moment, and we all acknowledge the fact that the proof of the pudding is in the eating and it is really all about the execution, I believe we are now prepared to execute. We're capable of executing and we're determined to do so.

And there are a handful of things from this restructuring that we absolutely must do. And driving out unnecessary costs, more often than not, that's simply about stopping doing unnecessary things. Removing the complex and duplicative processes, well, Harry described quite a lot of those -- sort of the duplication that's there. So my favorite word, simplify, is really the next step to remove those processes, so that we can get on to the improve and automate phase, which is developing a real performance culture.

But behavior in that is key. And I'm looking for ownership behavior from the executive leadership team, from the senior leadership team and from the people in Rolls-Royce. And I think because we're building on a very, as Harry said, proud workforce that is totally committed to this company, I think we're standing in a great place to be able to do that.

So I hope you got the message from today, it's fundamental restructuring. This isn't a short-term thing. This is a moving from one phase of Rolls-Royce to another phase of Rolls-Royce. It's moving from building market share based on years of development through to using market share to deliver both returns and to deliver the sort of cash we need to invest to build ourselves a thriving future.

How are we going to do that? Well, it's about empowered businesses and freedom within the framework. And that's really how we're going to implement simplicity. And that simplicity enables the release of the benefits from all those past investments.

And we had a bit of debate about this slide internally, and I insisted on using the word release rather than realize because actually, those returns have been there all along, embedded in the business model, and they're there for everyone to see. But unfortunately, they've been trapped, captured by the complexity and the bureaucracy of our operation. So I deliberately used the word release because now we're about to do that.

And my second favorite word probably after simplify is rigorous. Stephen talked about a rigorous investment process. And too long, Rolls-Royce has had a fundamental confusion between detail and rigor. And that applies to our engineering, and it also applies to the way in which we've run the business.

Now the good news is we've been learning some lessons, and I'm pretty confident that the leadership team now fully understands the difference between rigor and detail. And of course, it's rigor that matters when we're developing success. So that rigorous investment process is very necessary.

And it's also necessary to remember that you can't just do change and then sort of pack up and go away. It has to be a continuous process. I talked about being a leading industrial technology company, which means moving the market. That means we constantly need to adjust and move and think about where we can do things to enhance our position vis-à-vis our competitors, and that's what will make us a really leading industrial technology company.

So now we're going to have -- the good news is we have managed to finish more or less on time on that bit. So now we're going to go to Q&A. I'm going to sit down over there. There are microphones, I believe, Jennifer? Yes. And it's got some, and we'll take your questions.

Question and Answer

D. Warren A. East

CEO & Executive Director

Yes. Let's go. We've got one here at the front, so let's start here. And then we'll go over that side. Have we got 2 microphones? Yes, okay. So let's have one over this side. Thanks.

Philip John Buller

Barclays Bank PLC, Research Division

Yes. It's Phil Buller from Barclays. Just a few questions, please. I guess it's obvious that it's a story of future cash flow. But can I just start a little bit nearer term and ask about 2019, please? There do appear to be a number of headwinds. And if I look out where expectations were, a couple of days ago, I think consensus was looking at around GBP 700 million or GBP 800 million of both EBIT and cash flow into 2019. I guess it'd just be helpful to know where we might be so we can help get the starting point of the bridge to the GBP 1 of the cash per share. The second question is on the shape of the underlying balance sheet leverage over the next couple of years, as EBIT is obviously a little bit volatile near term, cash flow is depressed near term and, I guess, IFRS 16 also [giving] some lease liabilities onto the balance sheet with debt next year. So where do you see leverage getting to coming to the end of 2019? And should we assume that there's no prospect of the 1.8 million of outstanding shares changing, I guess, over that timeframe? And longer term, I'm just keen to get a handle on your top-down assumptions of the market environment come the early to mid-2020s? Have the -- has Boeing launched the NMA? Do you foresee any pressure from transition pricing on widebodies in a high oil price environment? Do you think that there's any prospect of narrowbody aircraft impeding on North Atlantic routes and so on? I guess just the macro items which are outside of your gift to control.

D. Warren A. East

CEO & Executive Director

Okay. Thank you very much. Stephen is going to start with the first 2.

Stephen Wayne Daintith

CFO & Executive Director

Okay. So '19 cash flow. Well, as you know, we don't -- we haven't given guidance on 2019 and market consensus is just north of 4 -- GBP 700 million or so, I think. You know that we've guided to GBP 450 million free cash flow for this year and are on track to now go beyond the GBP 1.2 billion in 2020. So I'm not going to give any guidance on '19 right now. As we normally do, we'll do that at the full year results early next year. But I think, clearly, somewhere between those 2 numbers is where we would expect to be, notwithstanding the headwinds, as you've pointed out, on things like 1 or 2 areas of working capital, and indeed the Trent 1000. But the growth that we see in the business and the other opportunities around working capital, I mean, good old-fashioned working capital, we have over 100 days of inventory on the balance sheet, for example, that we're having a crack at. And in classic sort of debtors and creditors, we have opportunities there as well. So as it stands, I'm not giving guidance on '19, but it's somewhere, with a good step, towards the number that we're looking for now in 2020. The next one was balance sheet leverage. There are no plans for shares, by the way, no adjustments to shares in that calculation. I think -- well, clearly, free cash flow growth will be a key guide as we're looking at leverage and profit growth. We have announced the sale of L'Orange, which, of course, helps the balance sheet. I'm sure there will be a question later on, on commercial marine and where we are with that one, and we've got the potential proceeds coming from that as well. So I'm not concerned about the balance sheet leverage. We are -- rating agencies completely take into account those lease obligations that you referenced. And like ourselves, they're very focused on free cash flow, looking at the balance sheet and the strength of the balance sheet. Warren, do you want to do that final question?

D. Warren A. East

CEO & Executive Director

Yes. So the -- and the third question was about market environment, generally, narrowbody encroaching on widebody space with trans-Atlantic routes and so on. I mean, yes, of course, we can see that happening. And it's been a topic of some discussion for a while. When I've asked around about that amongst the customer base, it seems that there's always a trend to experiment and differentiate offerings and so on. But numeric -- when you set sit back and look at the numbers, then the potential narrowbody encroachment on these long-range routes is pretty much balanced by the widebody adoption on much shorter routes in populous parts of the world. If anything, probably more so in that direction at the moment, but that doesn't mean to say that it'll always exist like that. As for NMA, then, obviously, it's a hot topic of debate. And probably one question that you ought to address to Boeing rather than to us. My slightly guarded view about these things is that when you have a market in a couple of sectors and there seems to be a hole in the market, quite often there's a reason for the hole to be in the market, but that doesn't mean to say that things can't evolve. I think we need to go to this side, yes.

Andrew Edward Humphrey
Morgan Stanley, Research Division

It's Andrew Humphrey at Morgan Stanley. Just a couple, if I may. One is probably an extension on the NMA question, but framed in terms of the midterm guidance. So if we're talking about 5 to 6 years from now in terms of how you're framing that mid-term, we're talking about a phase where, as you say, you've come off the back of a significant surge in investment. You should be at a point where the majority of your installed engine base is relatively mature and operating in a steady state. And you may or may not be at the point where you're about to kind of go into another round of investment into the middle and end of the next decade. With that in mind, should we be thinking about the source of numbers you're targeting in terms of that midterm guidance, in terms of the cost to sales ratio as being mid-cycle type of targets? Or is that a kind of, this is how we think things should look when the business is actually operating pretty maturely and we've been able to optimize those cost ratios fully? And then I just have one more, if I may. The -- was just kind of a shorter-term thing, you've clearly talked about huge increases in terms of capacity to handle things like Trent 1000 and the compressor blades. I think you also talked about traveling workshop capacity and a 50% increase in blade capacity. Those clearly are things that happened, but you can't build another fab overnight, so clearly, there's a lot going on in terms of processes there. Could you maybe talk a little bit about how you're instilling those sorts of practices and the kind of things that allow you to engage in that sort of very effective crisis management into the rest of the business?

D. Warren A. East
CEO & Executive Director

Okay. So just on the sort of, long term, how much R&D and what's the effect on NMA in the middle of the next decade and so on. Clearly, if we don't do any new engine development, then the number is going to be a lot less than the target that Stephen had on the slide. We anticipate doing some new engine development. Whether it's NMA or whether it's larger engines based on our UltraFan architecture for widebody jets in the latter part of the decade, it's a combination of those. And many times we've debated the question in this sort of forum, and we've said, yes, specific NMA involvement will add GBP 1 billion to GBP 2 billion over a period of 6 to 7 years to the development. Now whether that constitutes actually an upturn compared with what we've just been through on -- or whether it is sort of sitting still within the range, I think it's probably more within the range. But having talked -- Stephen's had a chance, I'm thinking he can answer that through-cycle question. Before he does comment on the crisis management and the blade capacity and so on, 2 things. The blade capacity is something that we need anyway. What we've had to do is pull forward and accelerate a little bit some of the extra blade capacity that we need because of the size of the installed base, the size of the fleet that's out there that was on Stephen's slides, shows clearly the normal MRO. We need more blade capacity, that's the plan. It's been pulled forward a little bit because of the Trent 1000 issue. On MRO capacity, a similar thing exists, except that to deal with the extraordinary peak of activity around the Trent 1000 issue, we have had to go for some more temporary measures in terms of MRO capacity. And that's why we've been able to triple specifically the lines available to deal with the Trent 1000 issue. So this isn't -- we haven't suddenly tripled our overall MRO capacity, what we've tripled is the ability to deal with Trent 1000. It has surfaced some fantastic behaviors. In fact, I got a picture last night from our head of engineering in Civil Aerospace of a new engine stand that has been developed, approved, manufactured and sorted out all within the space of a

matter of tens of days, about 6 weeks. And this has been driven by the crisis, obviously. But in terms of being able -- looking forward and utilizing that sort of lesson, then we can develop from that because this engine stand can not only be manufactured in a very short period of time compared with normal engine stands. Compared with a huge cost of a normal engine stand, it's a fraction of that cost. And it's basically applying the principle of switching from heavy bespoke furniture to IKEA flat pack. And one of the other advantages of the IKEA flat pack is that you can ship it around the world quite easily and get this stand to airline home hubs, and there, they can do on-wing activity on the new stand. That would not have happened without the Trent 1000 issue that we're dealing with now. It's a lesson that we can build into our normal activity. So that's that. Do you want to comment on mid-cycle R&D?

Stephen Wayne Daintith

CFO & Executive Director

Yes, sure. So we have included within our modeling and our statements an NMA scenario in there. And what that does is it just means sort of, at most, R&D will be flat. And if it declines, well, it just declines at a slightly lower trajectory of decline than it would otherwise do without the NMA. An important couple of points there. We will be looking for about 15% cash return on invested capital from the program, so there will be rigor around this investment program. Having just brought a lot of MPis to the market, clearly, we want to have some rigor around this one. Another key important point, we've already spent around GBP 500 million developing the way we've got to the UltraFan so far, which will be a key part of the architecture for any solution for the NMA should we choose to pursue it, that particular program. So it's not as though we have a standing start today in respect to this particular investment.

D. Warren A. East

CEO & Executive Director

Okay. So I think we're over this side. Microphone coming up, yes. Look, let's go to the front and then we'll work back, if that's all right.

Nick Cunningham

Agency Partners LLP

It's Nick Cunningham from Agency Partners. I wanted to ask about some of the potential consequential risks from the restructuring process. It seems that you're doing 2 things. One is taking quite a lot of people out or a lot of people out, and the other is going from quite a large HQ to a very small one with the lost resources spun out into the divisions. And so 2 obvious risks arise. One is you've got a lot of commitments that you still have to fulfill in terms of development, production ramp, fixing the Trent issues and so on. So would you have enough overall resources to deal with contingencies? And then the second one, which is probably a bit less obvious, but if you go to a very small HQ with powerful divisions, is it a risk that the pattern that we see in many companies in the past, BAE, Airbus, Leonardo, Leidos, whatever, developed where you get barons running the divisions, taking on risks which HQ can't control and which have adverse consequences in the end?

D. Warren A. East

CEO & Executive Director

Okay. Harry, you're going to go with...

Harry Holt

Chief People Officer

Yes, I should do the people, the first part of the question. So the key thing to, I think, stress upfront is that we're not actually taking any jobs out, of people that are manufacturing the current products or supporting the current fleet. So all the resources we actually need to deliver to our customers in support of the fleet will be untouched. But I think we're pretty confident about being able to reduce the number of sort of functional resource, largely for the reasons that I explained. That in the old structure, we had considerable resource in the center driving activity in the businesses that the businesses didn't really need. And by stopping that, you can actually considerably reduce the number of functional people required.

D. Warren A. East*CEO & Executive Director*

And in terms of the barons, then I have taken a lot of care in developing the leadership team that we have. And I take a lot of care over stressing the importance of the fact that these people are executives of Rolls-Royce who happened to be assigned to be doing this job or that job, and they work very much as a team. Their characters are chosen to fit in with that mold. Of course, it's a risk, but that is how we mitigate the risk, and that -- it's my responsibility to deal with it. Now we're over this side, Richard and...

Celine Fornaro*UBS Investment Bank, Research Division*

Celine Fornaro from UBS. I've got 3 questions, if I may. The first one would be on Power Systems. And I just would like to -- clarity for a change. And I'd just like to clarify, in terms of your progression, so you are including the Civil Nuclear business in your performance progression. So are you tackling the business as well? Or does it just mean that the nonnuclear business is outstanding performance? And secondly, if you can comment on your Defense, to only 3% CAGR growth. When you look at some of the contracts or order book, Rheinmetall seems a bit more ambitious than that. My second question would be on the business jet engine development. And any lesson learned from that development and how you did it that you could share with us to show that maybe something has changed in the Civil Aerospace business? The first thing we noticed is that it was kept top secret for 6 years. And finally would be on the working capital, which we haven't discussed very much. But if you could share with us the impact potentially of the culture change, yes on support functions, but into working capital elements that you can control. So here, I'm really talking about the inventories at group and Aerospace level.

D. Warren A. East*CEO & Executive Director*

Okay. So Andreas is going to kick off with the Power Systems question.

Andreas A. Schell*Chief Executive Officer - Rolls-Royce Power Systems AG*

Well, let me talk first about Civil Nuclear. Most of the progression in Power Systems is driven by the nonnuclear part, by the majority of the business in off-highway engine applications. We have started to look at the Civil Nuclear business and the opportunities because Power Systems before already did make up power generation for nuclear power plants. And we're looking at synergies there on the sales side, but also kind of internally. And we'll progress on that as we go forward. Your question on defense. We are -- the defense market for us is wider. And the 3% CAGR applies to the wider range of application, so that's wider than just Rheinmetall, which would be the tank business, the battle tank business. And so the 3% is an aggregate number and really reflects a reasonable assumption about market growth and defense for the products we can serve.

D. Warren A. East*CEO & Executive Director*

Okay. So the second question was lessons from the recent business jet development and business jet launch. It's a market where you have to keep these things secret. The customers are very, very careful about not talking about their new generations until they're absolutely ready to go, contrast with the large airframers who talk about it for years. So if you want to supply and partner with those people, then you have to make sure you can keep that pretty secret as well. I think we were lucky that the world didn't find out about that 3 or 4 months ago when actually, it was certified and the record was available for anybody who looked hard enough to find it. But fortunately, they didn't, and so it was a bit of a secret with the big reveal a few weeks ago. Lessons for us. Small teams, very focused, compared with our large civil engine programs which are very dispersed. And really, the same sort of a complexity disease that Harry was talking about more generally, some of those large civil engine programs have suffered from that. Whereas the corporate jet program is done essentially in one location with a smaller team, very, very focused. They've incorporated new technology in it in much the same way as we incorporate new technology in the large engines, and so I don't think there's much to be learned from that part. And one thing we have

learned to improve generally on the business jet engines is, going forward, we have just appointed the head of business jets onto the leadership team of the Civil Aerospace business. That person wasn't there before. That person was reporting in through all the programs. And I think we do need to apply a little bit more focus on the business jet programs at that leadership level because that development was a little starved of resource, which led to some program slippages. And so looking forward, we won't be suffering from that in the business jet programs. And Stephen, the third question?

Stephen Wayne Daintith

CFO & Executive Director

Yes, working capital. Working capital is often all regarded as bad cholesterol, but there are elements of good cholesterol in working capital. And when I look around sort of Rolls-Royce, there are plenty of opportunities to go for. But let me just run through those in sort of simple terms. So I won't quote specific numbers because they are material. But I -- in terms of the opportunities, if you consider trade debtors, for example, we have a large balance of old disputed trade debtors to go for. That's a material number. We now have a team on the case in Civil Aerospace, a dedicated team chasing these down. We actually have trade debtors right now today as we're approaching the half year that have gone beyond their payment terms. So that's a good one to chase clearly, but attention to detail there. Trade creditors, we actually paid a reasonably material number of our suppliers early last year, at the end of 2017. And so getting consistent payment terms around our suppliers is an opportunity that we're getting into the detail of. And most material there was in inventory. When you adjust -- look at our balance sheet inventory from a gross perspective, the number that you see on the balance sheet is net of provisions. We have almost GBP 4 billion of inventory, gross inventory on our balance sheet, and well in excess of 100 days. And what we've done now is, by business, break this down by type of inventory, moving all the way through from raw material, work in progress, finished goods, all the way through, and spare parts. So we have by business -- number of days of inventory by type, by business. And there is a project team led by an individual, naturally, who is driving this through and working across the businesses to address the -- our efficiency around inventory. So lots to go for on inventory. It's not all bad cholesterol. There's some very good cholesterol around working capital as well that we have dedicated teams working on. And your point about the culture of cash flow as well. I mean, we have this one of the 4 priorities that I have within projects, that I have within the finance community generally, is attention to working capital and attention to free cash flow. And there's a dedicated team just generally working on that, educating the businesses around the group on the importance of free cash flow, but also the other ways of looking at it through the balance sheet and not just through revenue and margins.

D. Warren A. East

CEO & Executive Director

Okay. I think we're on this side. So [Allen] is working from the front to the back on this one.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami from Investec. Two questions. One, you've talked a lot about the cost base and the improved cash. Can you also talk a little bit about the revenue line going forward, particularly around how you're working with the sales team to actually start and fill up the order book? Order intake for a lot of your large engines hasn't been particularly strong over the last few years, and how you're working internally with your partners to fill up the hopper so when we get to 2023, you don't come off a cliff. And the second one is around digitization. And the Power Systems presentation was very useful. But can you talk about it from a broader group perspective in terms of investment, how much you're spending, how many additional people you are adding for that effort? And how the negotiations with the OEMs on who collects the data, who manages the data, who utilizes the data is actually progressing, given there's a lot of your peers investing in that.

D. Warren A. East

CEO & Executive Director

Yes. So I mean, on the backlog, and in particular around the large engines, we are following a product cycle effectively. And from around the middle of last year, then, definitely, activity has come off quite a bit. And I've asked -- been asked this question quite a bit and I've delved into that quite a bit as well. It does appear to be a product cycle thing or orders did get ahead. And what we're seeing is activity in terms of rescheduling rather than ordering new airplanes. In terms of what can we do about that, well, of course, we -- each major airline customer has a team within our Civil Aerospace business, small sales team with technical people sat behind, that are engaged in a constant dialogue of reviewing peoples' fleet requirements and how they're changing their fleet requirements going forward. So there's no rocket science in it. It's classic key account management and we do it the same as everybody else does. I don't think we can do anything particularly different about that, except perhaps develop some of those relationships, building on the second half of your question, around the engine health monitoring, where we introduced the activity quite a long time ago, with the newer engines got vastly more sensors collecting data on the engines than used to be the case. And so we have invested in digital capability to do something with that. And we've probably been a bit tardy about making that investment. But certainly, over the last 18 months, we've ramped it up significantly. It's proved incredibly useful in terms of assisting with classic engineering and diagnosing the Trent 1000 issues. And at the same time, we're doing sort of business development activity with a handful of airlines at the moment. And I think that helps develop lock-in with the airlines, which helps with the ordering process and the order intake in due course. End of the day, of course, it's pretty competitive. And we design on certain airframes, our competitors design onto other airframes, you take part in the sales down at both levels really. The airframe and, in the case of 787s then, engine against engine. And as I say no rocket science, except perhaps for developing that customer relationship around the data. We've -- you asked a question specifically about resource. I don't want to spend a lot of time now on resource. We can deal with that off-line. So this side, yes? Okay.

Robert Alan Stallard*Vertical Research Partners, LLC*

It's Rob Stallard from Vertical. Andreas, a quick question for you. Power, what's the current sort of cash conversion, cash margin you're seeing? And do you see the same opportunity for that cash margin to progress in line with the operating margin target that you set out? And then, secondly, Stephen, for you, you talked about the rating agencies and trying to get your credit rating back up. Will they be using the same adjusted free cash flow number that you're using? Or will they be including the cost of the redundancies?

D. Warren A. East*CEO & Executive Director*

Okay. Andreas?

Andreas A. Schell*Chief Executive Officer - Rolls-Royce Power Systems AG*

I don't have the specific cash conversion number for 2017 right at my hands, but it's very high. There were a couple of effects last year on, for instance, kind of doing a proper job on invoicing, completing project work. So there were some one-timers, especially in the second quarter last year, that really helped us. Now very comparable to what Stephen said before, continue to work net working capital, especially the bad cholesterol part of the net working capital, is clearly a focus going forward. We still -- and I gave you an example today how many parts we keep in our parts inventory. And as we go through this, I think we're still seeing opportunities on net working capital. But let's be very clear, this is not going to work over the course of a quarter, this will take a little bit of time to do this proper.

Stephen Wayne Daintith*CFO & Executive Director*

Yes. And just to add to that number, the cash conversion in Power Systems in '17 was well over 100%, driven by the attention to detail that Andreas talked about in that second quarter on working capital and cash flow. And that was a big contributor to cash flow improvement for Rolls-Royce generally on working capital. On the restructuring costs and the credit rating agencies, I have no doubt that they will look at the

picture in its entirety. And I know we have Moody's in the room today, hello. So I know you'll be looking at it. And quite rightly, too, because it is the real sort of really reported number and so on. But I think the route through to free cash flow growth, and the savings that come from the restructuring and the pace of the payback from this restructuring are all good indicators that I would hope that we could encourage the rating agencies to see the world that way as well. So that's where we are on that one.

D. Warren A. East

CEO & Executive Director

Okay, thanks. It's over this side, and it's working back. Well, we're going to finish working back. And then the newer questions will come -- taking one.

David Howard Perry

JP Morgan Chase & Co, Research Division

Yes, back here. David Perry from JPMorgan. Also 3 from me. The first 2 are just factual clarifications, please. The first one, the GBP 500 million cash cost, is that a post-tax number? And if it is, just what will the EBIT number be that you treat as exceptional? But just as a factual clarification. The second one, also sort of factual, has a bit of forecasting in it. But I'm not getting into the rights and wrongs of anyone's ROIC definition, everyone's got their own. But you leave the TotalCare creditor out of it. What will that number actually be in 2024? Just to kind of help us think about that. And then the third one, which is about guidance, and you may not want to go there. But I struggle, me personally anyway, with the lack of any earnings guidance to back up the free cash flow guidance. Can you give us any help at all in terms of 2022, 2024? Whether it's EBITA or whether it's EPS, just to help us try and triangulate the free cash flow guidance, please.

Stephen Wayne Daintith

CFO & Executive Director

Okay. So the GBP 500 million is -- well, the cost of the GBP 500 million is the gross redundancy cost, in very simple terms, plus the cost of investment in technology systems, with finance being a key part of that, in fact, to deliver the savings that we have in mind. So that's how we've got to the calculation. The TotalCare cash -- sorry?

David Howard Perry

JP Morgan Chase & Co, Research Division

Just maybe -- maybe I asked the question badly. I mean, that GBP 500 million in EBIT, would you treat it as exceptional? And GBP 500 million in cash. Or will the EBIT and the cash number will be different? That was all I was...

Stephen Wayne Daintith

CFO & Executive Director

They shouldn't be different. They shouldn't be repeatedly different. The -- I would say the one thing is that the investment spend will be a capital item rather than a P&L item, the investment spend, if that makes sense. Is that what you're getting at?

David Howard Perry

JP Morgan Chase & Co, Research Division

Yes. Really, I'm just saying is there no tax spend applied to that?

Stephen Wayne Daintith

CFO & Executive Director

Well, then, yes, clearly, there will be. There'll be -- that's an EBIT number, so there will be a tax benefit from the costs of those restructuring. Yes, there will in that respect.

David Howard Perry

JP Morgan Chase & Co, Research Division

So the EBIT is not going to be GBP 700 million that you treat as exceptional?

Stephen Wayne Daintith

CFO & Executive Director

No.

David Howard Perry

JP Morgan Chase & Co, Research Division

All right, fine. Okay, sorry.

Stephen Wayne Daintith

CFO & Executive Director

Okay. The TotalCare creditor. So I think the chart that we showed a little earlier should have showed the business model for Civil Aerospace and how it works, and how we include within our cash flow the aftermarket cash that we get in from engine flying hours after incurring the OE cash losses as part of the business model when we sell the engines into the airframers in the first instance. I don't have that number right now on 2024. We will have a think about it. So I'm afraid I can't give you that. But clearly, it's going to grow significantly. And I think a key part of our balance sheet over the next few years, you will see a large deferred income balance grow, we talked about this before, on our balance sheet in advance of our recognition of the profits attached to shop visits when they actually take place. So in the first 4 to -- 4, 5 years or so of the new engine, we'd hope that there's not going to be a shop visit, therefore, you're collecting cash all the time, building that up on your balance sheet as deferred income and putting it in your bank -- in the bank accounts. That's going to be a large credit balance on the balance sheet on a go-forward basis. But I don't have the 2024 number to hand. And finally, on earnings guidance, too early to give you that. The earnings, as we pointed out at the full year, under an IFRS 15 regime, are a lot more difficult to model because they are -- you model them around sort of frequency of shop visit, and costs of shop visit and so on. So it's something that we are getting to. Very much at the moment, our focus is on cash, and we've driven the model on that basis. At some point, I'd like to be able to share those numbers with you, but we're not ready yet.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from...

D. Warren A. East

CEO & Executive Director

Oh, I think -- okay. Go on. Go on, Christian. Sorry. We were trying to alternate like a game of tennis, but never mind.

Yes, go ahead. Go ahead now. You've got it, yes.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Just a couple of questions, one starting at the high level. You've talked a lot about the restructuring kind of focusing on taking out layers of -- redundant layers of management and the personnel, and how you found various pockets of opportunities on that. But so far, you seemed to have ring-fenced the factory floor with respect to both personnel and also to -- so I was wondering if you can address that. If that's a future phase or are you happy with the headcount or personnel deployment in the factories relating to direct manufacturing costs? And then, additionally, around where you see additional investments with respect to tooling, maybe automation down the road. Automation was alluded to, but maybe some more detail on that. So I guess my overall question is, is there sort of like a next gear or a next phase in this restructuring as we look down the road that more directly deals with direct manufacturing costs? And then the second more tactical question is, with respect to the recent issues on the Trent 1000 in particular, how confident are you that you won't see similar issues crop up later with the

XWB family or this Trent 7000 family, assuming that you've run these programs to ground to look at this potential risk?

Harry Holt

Chief People Officer

Yes. I'll pick up the first part of that on sort of possible reductions on the shop floor. So over the duration of this restructuring program, which is the next 18 to 24 months, I think we've got sufficient visibility of the load on our factories to be very clear on what headcount we need to deliver that load, those products to our customers. So we're comfortable that the number of people we've currently got is actually what we need to deliver our commitments to our customers. And in certain areas, Derby, for example, we have agreements with our employee representatives to protect against redundancies over the next sort of 12 to 18 months, and we'll make sure that we honor those. So for the next, as I say, period of the restructuring program, we feel that we've got the right level of resource to deliver on our current commitments to customers.

D. Warren A. East

CEO & Executive Director

Okay. And in terms of where that goes in future with potential investments in new manufacturing technology and so on, then, of course, we're doing that. And of course, at some stage in future, we may have significantly more automation in our facilities and that may mean that we can free up some of the people. I would stress, however, that because of the installed base growing, the demand, particularly for the components, is going to increase over the coming years rather than decrease. And so it could be that you'll see our headcount be fairly flat in that part of the business, but our actual output continue to rise as we benefit from more automation. Question on XWB and Trent 7000, and what about the risk of the issues we've seen on Trent 1000. Well, we cannot be sure about XWB and its sort of -- and the durability of all the components until 20 to 30 engines or so get to the first shop visit. And it's simply too new. We've probably got about another 15 to 18 months to go before we reach that stage. So it would be foolhardy to sort of say yes. However, if I look at the issues that are prevalent on Trent 1000 at the moment, then we see no evidence at the moment of the turbine issues occurring on XWB. If I look at the design that went into XWB, it was a different design flow. It was more modern tools that we used. And obviously, because of the issues on Trent 1000, we're doing an awful lot more inspection of XWB engines now, which is giving us still a lot of confidence that we're not seeing early signs of the turbine issues. As for the compressor issues, then basically, we've checked the arithmetic and the issues are not going to occur, as we've seen on Trent 1000. On Trent 7000, then, as you know, it is derived from Trent 1000. And so what we will be doing is making very certain, when we start making volumes of Trent 7000, which we haven't started yet, that any modifications that -- and design improvements that we can take from the Trent 1000 will be incorporated into the Trent 7000. However, from the testing that we've done on Trent 7000 so far, we're not seeing a potential for those issues, but we will make absolutely certain. Trent 7000 will enter into service later this year, towards the end of Q3. And the volumes of Trent 7000 that will be manufactured before such time as the final fixes in Trent 1000 are available, are very small. So if there is an issue, it will be a very small contained issue. So hopefully, that's enough of an answer. Now we must do 2 questions on this side. Thanks.

Zafar Khan

Societe Generale Cross Asset Research

It's Zafar Khan from Soc Gen. I have 3 questions, please, if I may. And first one is just on the engine OE deficit, Stephen, that you were sharing. And it's very encouraging to see that on the XWB-84, you're talking about breakeven in 2020. Yet for the portfolio, you're talking about a GBP 400,000 deficit in '22. So where is the -- so if I'm averaging, because that's an average you've given, that means something is losing a lot more than that. So could you help us understand that, please? That's the first one. The second one is just on this CROIC. By the way, I think a WACC of 10% seems a little bit high, but I don't want to argue that, just noting that as I ask the question. The 15% number that you've got to, how did you get to that number? Is it a peer group comparison? Is it some benchmarking you've done? So if you could help us understand that. And then I have a question for Andreas, if I may. The 100,000 units that you want

to connect, the digitalization, how much is it going to cost to connect, say, one unit? Who bears the cost? And how do you account for that?

Stephen Wayne Daintith

CFO & Executive Director

Thank you. So the OE deficit going to GBP 400,000 per engine. So yes, your XWB-84, correct, going to break even, and a large proportion of what the mix will look like at that point. But we also have new engines that are part of that. So this -- and we tend to find that new engines, launch pricing tends to be less keen than a mature, a more mature engine. So the -- and the 7000 and the XWB-97 are the 2 most significant examples of that. So it's that feature that allows us to only get to GBP 400,000. I say only get to, but if you look at the context of the mix and the volume, that still -- for the other 2 engines, would still be an improvement on where it is today and certainly, I think, getting around about or close below the 1.6 average in any event, so making progress there. There's a lot -- it's really all about launch pricing of the younger engines. The cash return on invested capital. So we have a group WACC of 10%. And we arrived at this by looking at our cost of capital, the beta of Rolls-Royce. And we have quite a high beta as it stands today when you look around the risk that's been attached to the business in recent years in terms of our profit predictability, so to speak. We have a 15% -- we are comfortable with it. I think it gives us -- it's a good risk management tool. We've approached it that way. I should make the point as well that we actually have different working -- weighted average cost of capitals for different sectors. So for example, the short-cycle businesses have a lower weighted average cost of capital than the long-cycle businesses. So for example, Power Systems might be sort of, let's say, 8% weighted average cost of capital. The cost-plus businesses like defense, where we're on a contract, it's cost plus, but it's quite a small margin, cost of capital there might be 6.5% or so. With Civil Aerospace, a longer-cycle business, 12.5% cost of capital seems more appropriate. So the 5% is a good guide, a good -- we believe it's a good risk metric, particularly when we look at previous experience of our investments and have gone very well, 1 or 2 have gone not so well. And I think the 15% is the appropriate hurdle rate we ought to be aspiring for, for Rolls-Royce. So that's how we got to 15%.

D. Warren A. East

CEO & Executive Director

Andreas?

Andreas A. Schell

Chief Executive Officer - Rolls-Royce Power Systems AG

To the connection of the fleet. First of all, I said it's greater than 100,000 units in the field, but not all of them need to be connected. There are some of these applications that have very low utilization. There are some Marine applications where engines get a few hundred hours per year. There are some back-up power generators that only get a double-digit number of hours per year. So you really don't need to focus on those applications. But we focus, as I said before, in Industrial, for instance, on high-utilization assets. The cost to connect such an asset is actually threefold. It's the technical connection, so a technical unit, that ranges anywhere from EUR 80 per unit up to EUR 500, up to EUR 800 per unit for a very complex marine application that you need to make seawater-proof and ready for the ambient conditions over there, that we would need to include in the costs for future engines and that's already kind of planned in. Then there is the cost to really kind of transmit the data. That ranges all the way from very simple [UDEC] protocols that cost you about EUR 1 per month, but it can be also a bit more expensive. And then the third bucket is basically to host and analyze the data. And we will kind of work with our customers. Some of it will be borne by the customers, some of it we will bore -- bear because we actually kind of both have benefits on this when we talk in terms of long-term service agreements. What's really important to note is long-term service agreements have actually 2 winners. It really kind of actually gives a shared benefit, and therefore, I think it's fair. And I've seen, so far, a very positive reaction from the marketplace.

D. Warren A. East

CEO & Executive Director

Great. Thanks, Andreas. We've actually got a couple of questions coming in online, so we'll take those. And then we'll have to move to the final questions because we're going to run out of time.

Ross Hawley

Just a couple online, one from a large shareholder. Some of your GBP 11 billion of R&D since 2010 will have been on concepts with no real revenue attached to date. Do you sort of have a sense as to how much? But importantly, are there any concepts coming out of the R&D which you look to have exciting addressable markets coming from? And secondly, do you see any material risk to your aftermarket revenue expectations from airframe as own ambitions in this space?

D. Warren A. East

CEO & Executive Director

Okay. So if I look at the GBP 11 billion and take the sort of rather rule of thumb that Stephen mentioned a little while ago about roughly half of the R&D expense coming from large Civil Aerospace NPI for the last several years, so we've got half of the remainder -- or sorry, we've got -- half of it as a remainder. I actually don't know the answer to know how much of it is concepts that haven't gone everywhere, but I suspect it's probably no more than 20% of the remainder. So about 1/10 probably of that number in total over the last however many years for the GBP 11 billion will have gone on concepts where, frankly, we haven't got much of a return. We may get some return in future. And an example might be, for instance, our fuel-cell joint venture, where, frankly, right now, I can't tell you what sort of return we're going to make on that. It seemed like a good idea when the original investments were made, and it may materialize and turn into a good thing in future. Sorry, Ross, what was the second half of that question?

Ross Hawley

Any coming out which excites you?

D. Warren A. East

CEO & Executive Director

Any...

Ross Hawley

And in terms of concepts which you can see are of interest to the market?

D. Warren A. East

CEO & Executive Director

Oh, yes. So I think we've been fairly open. Some of the more exciting concepts are probably around the advent of electrification. And you saw us sign an agreement with Airbus shortly before the end of last year. We -- that program's on track. We still, with Airbus, hope to fly the hybrid demonstrator in 2020. That sort of thing is exciting. I mentioned fuel cells a moment or 2 ago. There's all sorts of other interesting alternative fuel cell type technologies that could be used for the storage medium in the hybrid systems in the microgrids that Andreas talked about earlier.

So we've got one -- I think we've got 2 over here, if you don't mind, Tony. And then we'll come back. So we got 2 here, and then these are the final 3 questions. We'll try and be quick.

Derek Johnson

I'm Derek Johnson, Nitorum Capital. I wanted to talk a bit about the cash return on invested capital metric. So you have that going from 9% to 15% through the cycle. My question is, that's an increase of like 60%, 70%, but yet you have cash flow per share increasing 7x from last year to your midterm goal. So just trying to reconcile those 2 metrics. And also, what is the cash flow per share goal throughout the cycle? Because I think your slides said, in '15, that metric was 14% and cash flow per share was significantly less than GBP 1 per share. So just trying to better understand through-the-cycle numbers on cash flow per share.

Stephen Wayne Daintith

CFO & Executive Director

Okay, Derek. So right, so cash return on invested capital. Sorry, could you just go back to the part of first part of the question again? I was thinking more about the cash flow number there, but the first part of the question?

Derek Johnson

So the metrics going from 9% to 15%, so roughly speaking, that's increasing 60%, 70%. I would actually think the denominator would be going down as you exit this investment cycle, so I think it could actually be higher. I mean, it's pretty comparable to the number in 2015 when I think the slides showed 14%.

Stephen Wayne Daintith

CFO & Executive Director

Yes. We have worked hard to ensure that these 2 are, as you might imagine, in tandem with each other. And it can be quite sensitive to any assumptions around the base of the invested capital. So I can assure you that we've got the model correct so that they, the 2 do sync up with each other. And the next...

D. Warren A. East

CEO & Executive Director

We might have to come back to you on that and [indiscernible].

Stephen Wayne Daintith

CFO & Executive Director

Just show you the maths on that.

Derek Johnson

And then in terms of mid-cycle capital per share versus medium-term?

Stephen Wayne Daintith

CFO & Executive Director

You mean sort of in the period, in between sort of where we are today and where we get to?

Derek Johnson

Well, the slide show 15%, it says through the cycle, but the cash flow per share just says medium term, not through the cycle.

Stephen Wayne Daintith

CFO & Executive Director

Oh, it's not. Right.

Derek Johnson

So is there a difference between the 2?

Stephen Wayne Daintith

CFO & Executive Director

Well, I guess the cash flow per share is more sort of a point in time to exceed GBP 1 per share of free cash flow. We would expect that to grow free cash flow. We'd expect to see continued growth in the business. The cash return on invested capital, 15% through the cycle, what we're trying get across here is that's sort of on a steady-state rolling basis. That's the sort of cash return on invested capital you ought to see out of Rolls-Royce, that sort of 15% number. We get to that number by midterm, that's sort of 5, 6 years from now. And then the sort of the average ought to move in that direction as well, to 15%. I'd look at it that way. That's what we mean by through the cycle.

D. Warren A. East*CEO & Executive Director*

So our penultimate question on this side, and then we're going over to that side for the last one.

Andrew Paul Gollan*Joh. Berenberg, Gossler & Co. KG, Research Division*

Andrew Gollan from Berenberg. Penultimate question [with it]. So the first one is on the Pearl engine and what was keeping it secret for so long. Opportunities there. Are you targeting, for example, the Hemisphere, which is facing a similar issue to Dassault last year in terms of delay into service? And if not, what other opportunities if -- of course, that you don't have to keep a secret? That's the first one. And the second one to Stephen, just to reconcile -- I keep going back to this working capital thing, reconcile a couple of statements you made. You've answered some questions just now that indicate big opportunities within working capital. But I think in your slide presentation, you kind of implied that there were no -- I think it was no material impact from working capital changes in the assumptions in the guidance you're giving today. So can you just help us understand what you're telling us?

D. Warren A. East*CEO & Executive Director*

Sure. So on the Pearl engine, when we launched that in conjunction with Bombardier the other day, we launched the Pearl [blur] and talked about a Pearl family. And we deliberately talked about a Pearl family to imply that the engine which is being launched is not the only one that we hope in the family. However, as I said, it's a sector which is characterized by secrecy. And therefore, we can't talk about other family members that may or may not exist in future because they tend to be in conjunction with one of the corporate jet airframers. It is our ambition to more than recover the position that we lost in market share in large cabin business jets. So as far as I'm concerned, any of these large cabin opportunities are up for grabs, subject to, as we've talked about this morning, if that means developing an engine with a business plan that doesn't make sense according to the rigor that we are intending to treat these projects with, then we'll find other ways of doing it. But yes, definitely, the opportunities are there, and we're going to go after them.

Stephen Wayne Daintith*CFO & Executive Director*

And on the cash flow, so working capital. So what we've done, we've normalized free cash flow to exclude the benefits or negatives -- the positives or negatives of material working capital movements because, in our view, it would be wrong to include a number that's a target that includes a significant working capital benefit in that year. Because, of course, you can only do working capital once, you can't do it year after year after year. It becomes much, much harder. So we've taken out that distortion. Clearly, we're not going to leave working capital on the balance sheet. And where we do see opportunities to get more efficient on our asset base, and I've talked about it, whether it would be inventory days, trade debtors, supplies and so on, we will pursue those opportunities. But we've purposefully normalized our cash flows so we don't get any distortion from those impacts. That's what we've done.

D. Warren A. East*CEO & Executive Director*

Thank you. Sandy, would you like to ask the last question?

Sandy Morris*Jefferies LLC, Research Division*

Yes, so it'll be swift. Just really asking, just out of a squabble that's evolving over here. If any member of the finance team had inadvertently said free cash flow to exceed GBP 1.2 billion in 2020, that was a slip of the tongue rather than him reading the budget there.

Stephen Wayne Daintith*CFO & Executive Director*

I think I know what you're getting at here. I mean, I think with GBP 400 million of savings delivered by the end of 2020, I mean, clearly, it will be hard to dispute GBP 1.2 billion in 2020. And that -- if pushed, that will be a kind of sensible guide, the way to be thinking around that sort of number now that we've said that we do expect to exceed GBP 1 billion. But clearly, there's a lot of puts and takes along the way. We're in the middle of managing pretty significant issues on the Trent 900 and 1000 and how that evolves, that's the risk around the business. So don't treat that as a sort of hard and fast number. We've made the point there that we do now expect to exceed GBP 1 billion in 2020.

Sandy Morris

Jefferies LLC, Research Division

Okay. And I'll follow off with Harry if he doesn't mind on how you avoid these rationalization people. If I can just...

Harry Holt

Chief People Officer

They screened you out. [indiscernible].

D. Warren A. East

CEO & Executive Director

Great. Okay. All right. With that, we're done. So thank you all very much for coming this morning. We appreciate the support. And we'll be back with our half year results at the very end of July or the beginning of August. I'm not quite sure now, but thanks for coming.

Presentation

Ian Edward Lamert Davis*Chairman*

Well, good morning everyone and welcome to the Rolls-Royce Annual General Meeting. I'm Ian Davis, I'm your Chairman and I'm joined on stage by Warren East, Chief Executive; Stephen Daintith, Chief Financial Officer and the Chairs of our board committees; Ruth Cairnie, Chair of the Remuneration Committee; Lewis Booth, Chair of the Audit committee; Kevin Smith, Chair of Science and Technology Committee and also our Senior Independent Director; and Frank Chapman, Chair of the Safety and Ethics Committee.

You will shortly hear from Warren who'll provide a view of 2017, but I'd like to highlight personally a few key developments. There's been great progress in building this active leadership team. We've refreshed our strategy and long-term vision, we've refined our capital allocation process, we've delivered financial results ahead of budget and expectations, and we have ramped up production in our civil aerospace business. We have initiated a simplification of the group into 3 businesses and are embarking upon a fundamental restructuring. This will make for a more simplified and more focused business.

At the same time, we have some significant ongoing operational challenges, particularly with some in-service fleet issues. This has created challenges to some of our customers and there will be some more to come. Our absolute priority -- our absolute priority -- is to overcome these. Customer trust and confidence has to be our #1 goal. Nevertheless, after a very few challenging few years, I believe that Rolls-Royce is building real and sustainable momentum. Progress will not be smooth, given the nature of the industry and the number of new products we are in the process of introducing into the market. And I do not want to underestimate the risks. But the medium-term prospects look increasingly bright and the long-term opportunities for us remain significant.

During 2017, there have been a number of changes to the board. In April, Stephen Daintith was appointed to the board in his role as our new Chief Financial Officer. And following the departures of 3 non-executive directors in 2017, we are delighted to welcome to 2 new faces; Beverly Goulet, most recently as Senior Executive with American Airlines Group joined us in July. We announced 2 months ago the appointment of Nick Luff, Chief Financial Officer of RELX Group, who joins the board from today, subject to shareholder approval. Welcome Nick.

This time last year, I talked about the extraordinary change, including political change that we had seen in 2016. The U.K. referendum decision to leave the European Union provides a number of challenges for us as a business. Europe is really important to us, as it is a large market, but also of course, much of our operations in our supply chain is in Europe, as is much of the regulatory framework that ensures that our products and service is fully compliant with international standards. As you can imagine, we are actively engaged with the government as it continues its negotiations.

We are a long-term business with very long investment cycles. We've continued our commitment to, and investment in, next-generation technologies and facilities that will be crucial to competitiveness and value creation. I would draw attention to the fact that we have sustained investment in capital expenditure and R&D, notwithstanding short-term financial pressures. We are putting increased emphasis on strategic partnerships and collaborations. These collaborations range across electronics, composite materials, gearbox technology, digital technologies and services. We are determined to be at the forefront of the next technology revolution, built around artificial intelligence, data analytics, machine learning and digital. This will be crucial to our future competitiveness, as well as to our ability to attract and retain exceptional talent.

So we thought it would be appropriate to show a film outlining some thoughts on the future path. And then I've asked Paul Stein, our Chief Technology Officer to give us an insight into the next-generation technologies that we are working on right now. Paul will be followed by Warren and then I will conduct the business of the meeting.

Paul Stein

Good morning, everyone. So this morning, we'd like to share with you some of the pioneering technologies in Rolls-Royce, some of which we just showcased on the video, and really show you the great things that our people do. This is going to be a brief run through how we're developing the jet engines to keep pace with our customers' demands about the exciting impact that electrification is having across our business and the opportunities it creates, how we are using digital technology to change the way we do things, how we're using technology to support our responsibility to the environment and how developments in manufacturing technology are having a great impact on us.

Since its invention in the 1940s, the jet engine has changed immeasurably as we've introduced continuous improvements in fuel efficiency, in noise and reliability. And this has led us to the world's most fuel-efficient jet engine, the Trent XWB, powering the Airbus A350. This engine uses 15% less fuel than the first generation of Trents, the Trent 700 that powers the A330. And to provide a context, a full A350 uses about the same fuel per person as a Ford Focus, except it goes a bit faster, except the RS. All of this comes through advances in materials, to allow engines to run hotter and so more -- be more efficient through the ever-better use of design in the computer, ever-better design of turbo machinery and the use of digital technology to monitor our products while in service.

Materials in the hot end of our engines need to work now in gas temperatures of around 2,000 Kelvin; that's half the temperature of the surface of the sun and to-date, nickel super alloys have been the only solution. New ceramic materials, able to operate 250 centigrade hotter than metal parts, but at 1/3 of the weight, are now beginning to mature and we are now starting to test these materials. We can now analyze gas turbine performance, like never before, using high-performance computer. For example, the image on the bottom left of this slide here shows a fan blade-out stimulation, which is now so accurate that the regulator allows us to reduce testing, instead of -- and use analysis instead.

Despite the incredible performance of the XWB engine, we can't rely on the Trent family forever. And so now we're developing UltraFan, a brand-new engine core, the first change since the RB211, will drive a huge composite fan via a gearbox, which is the picture you see on the bottom right. It's going to be ready to fly as a demonstrator in a few years. An UltraFan represents a leap in fuel efficiency through this pioneering technology. The gearbox itself is a marvel of design, 70,000 horsepower, yet small enough to fit behind the fan. We've had 7 universities, 3 German and 4 U.K. universities, have been helping with the design of this amazing piece of technology. And the result is the UltraFan will be a 25% improvement compared with the first Trents.

But the journey doesn't even end there. As the earlier graphic showed, electrification is now changing the face of aviation, at least in smaller aircraft. The Boeing 787 was the first step in electrifying passenger aviation. In fact that has 1.5 megawatts of power generation on a 787. Just to contextualize that's about enough to power 100 houses, and that made it the world's first more-electric aircraft. But for smaller aircraft, we're now developing hybrid-electric propulsion. This is pioneering new designs, such as quiet regional city hoppers, which is set to rival intercity rail for cost and convenience in mass transportation. It is seen as a game changer.

Our E-Fan X demonstrator, which we're doing jointly with Airbus and Siemens, will be the world's first demonstration of this technology. Powered by Rolls-Royce AE 2100 engine, it will be generating 2.5 megawatts of electrical power, all designed by us, and this will exceed any previous record for aviation power generation. And this electrical power is also needed by defense customers, who need it for advanced sensors and for other purchases.

On land, our MTU engines are now being sold as micro-grids. Reciprocating engines linked to generators in multiple units are now seen as a better way to match renewables for power generation. A hybrid rail is great technology for suburban railways, silent in stations, 25% less fuel and no infrastructure change to the railway system. And our Power Systems technologies are ahead of the game here in demonstrating its potential to customers. To create the capability and skills and the technology we need in electrical, we've created a new team, Rolls-Royce Electrical, so we can move forward with the right pace to respond to this market.

Digitization is another game-changing technology, impacting design, manufacture and service and support. Individually, the application areas bring significant value. But as we chain them together into a digital thread, they are helping the designer connect with the product in service. And in aerospace it's a concept we call the intelligent engine.

And then new technology is constantly being developed and we're adopting it with pace. For example, the Internet of Things, which we are now deploying for tracking assets, such as our engine stands. virtual reality is being used for prototyping the assembly of our power gearbox that I showed you earlier on. And as Ian said earlier, artificial intelligence, a ubiquitous technology, which we are already using across our business, from applications as varied as examining in-service data sets to, to even verifying suppliers have been invoiced correctly.

Monitoring products in service has been done in aerospace since the 1990s, and now Rolls-Royce Power Systems [indiscernible] application uses exactly the same service model of monitoring assets, then dispatching service interventions accordingly. So as with electrical, we formed a new team R2 Data Labs, to bring together this key digital know-how and to build a digital ecosystem, which can be tapped into across the group, such as our recently published link to The Alan Turing Institute in London.

We are very sensitive to the impact of our products and operations on the environment. So while representing only 2% of man-made CO₂, aviation must do its bit. The industry agreed, back in 2000, to targets, which broadly reduce engine CO₂ by 1% per year and we are on track. UltraFan, though, may be the last step using pure gas turbine technology before we need the electrification technology, I spoke of earlier, to drive down towards a 30% CO₂ reduction, which is seen as the place we need to be.

The petrochemical industry is also doing its bit and we're working more closely with them to credit fuels, which are sustainable, scalable and compatible. Shell, BP and Virgin are all sponsoring scalable biofuel processes, which can turn any organic biomass into a jet fuel compatible form and we hope to see these scaling over the next decade. But the built environment produces over 40% of man-made CO₂ and this is where our technology could have the greatest impact. As we said, the full Rolls-Royce Power Systems' micro-grids, burning biofuels or gas, to match wind and solar intermittency, are seen as much better solutions now than large gas-fired stations. But for 0 carbon baseload electricity, we have using our unique nuclear expertise to develop a small modular reactor. Our 440 megawatt SMR design has now been accredited to produce electricity at GBP 60 a megawatt hour, making it competitive with wind power, and we are now in discussions with the U.K. Government about how we can drive this technology forwards.

Then, of course, the way we run our business is also important to the environment and our target to reduce energy by 30% from 2014 to 2020 has already been met and we're delighted at that. And one great example of reducing fossil fuel dependency is our solar array at Seletar in Singapore, which now supplies 11% of the plant's needs.

Manufacturing technology is also the key to lowering cost and enabling new designs. The robotic tape-laying machine, you see here, laying out a composite fan case, enables designs barely possible with manual processes. On the right of the picture is our advanced factory in Washington, which produces fan disks. Here a digital process controller measures the feature dimensions after every single cutting process, enabling constant correction of the cutting tool. And the result has been a 300% increase in productivity compared to the previous facility and a 99.9% right first-time rate on fan disk, which is just world-class. And, of course, 3D printing allows us to create complex geometries, such as fuel spray nozzles in a single piece. All of these Industry 4.0 techniques, so-called robotics, digital closed loop control, 3D printing and making our entire manufacturing systems for our suppliers is helping us unlock 25% productivity gains, which have been calculated to stem from this revolution. We really are in the forefront of this change in manufacturing.

We invest significantly to create underpinning capabilities in technologies, in demonstrators to mature our technology and in new products and services to create new business options. We received significant contributions to our R&D through third-parties, such as the U.K.'s Aerospace Technology Institute and the E.U. Clean Sky program, as well as through defense programs. We're very inventive and we protect our intellectual property through patents. And last year, 704 patents were approved for filing and that's more than any other U.K. company.

We have an exciting career development scheme for our technologies with our fellows representing the pinnacle of technical expertise and they have now an international reputation across the industry. And the net result across all of our businesses is a substantial flow of technology to keep our products competitive, our services profitable and our business options open for the future. Rolls-Royce is a technology-rich company, pioneering the power that matters and our new strategy to remain strong in our core capabilities while building electrical and digital is opening a great future for us.

Thank you for listening. I'm now going to pass it to our Chief Executive, Warren East.

D. Warren A. East
CEO & Executive Director

Thank you very much Paul and that's a fantastic introduction to what I was going to say. So we could sort of shorten the AGM a bit at this point, if you like. Now, I've got a few other things to say as well. First of all, thank you all very much for coming along and for your support of our company. And when I sit here a year ago, I talked about the company in transition, and Paul has clearly signposted in the presentation that he just did some of the transitions that we are embarking upon as far as technology is concerned. And that's absolutely fundamental to how we transition our company and position it to be successful for the next several decades, as it has been in the past.

So I'm going to talk about wider company transition. But I'll start with that strategy to which Paul just alluded. We are all about power and we have a lot of domain expertise. We have a huge amount of domain expertise in aerospace, and through -- and in the world of defense and through our Power Systems business in several other sectors. But the common thread which joins it all up is power, and it's not just any old power, it's about power that we -- as we say that really matters. So that's the common thread.

But how do you turn that into a sustainable business going forward? Well, the underpin on the slide there is the balanced portfolio. And this is a balanced portfolio, when you look at it from a financial point of view, with different parts of the business having different cycle times, different levels of capital intensity and different -- whole sort of product cycles. Also exposure to different sectors, because recognizing that some markets are quite cyclical, some go up and down, and it's all about balancing risk.

So that's from a technical -- that's from a financial point of view. But, of course, we also want a balanced portfolio from a technical point of view. So that technologies, which develop in one part of the business or in some market sectors, which are clearly going to transfer to other sectors in future, we can develop in a sensible way with customers, with real applications to spread our risk and to create fundamentally better solutions going forward.

So building on top of the balanced portfolio, we first of all need to look after the technology we have today and make it ever-more competitive. And the journey that Paul talked about with the UltraFan demonstrator is a fine example of that, fine example about how we continue to squeeze more cleanliness and more efficiency out of the gas turbines, which are fundamental to more than half of our business.

But looking ahead and moving now to the left hand side of the slide, the electrification message is very clear. Electrification is happening across all industrial sectors to a greater or lesser extent and will gradually spread across all industrial sectors as we look forward. It's an inexorable trend and through our Power Systems business with applications like micro-grids, with the hybrid train which is effectively a mobile micro-grid, then we can develop those vital technologies, the components we need for when electrification moves into some of the other areas, so we can merge that expertise in technology with the expertise that we have, the domain knowledge that we have [in here] looking forward. So that's an example of technology moving across our business.

And, obviously, we're more than products. We're products and services. It is important for our customers that we provide service to -- as -- the power that we're providing them is power that really matters. We need to keep it available and a good example of that is, is where we are now taking the service that we provide in our civil aerospace business, the Power-by-the-Hour, the Engine Health Monitoring that we pioneered some 20 or more years ago, and transferring that to the customers for our Power Systems business. And some of the underpinning technology that enables that to happen, as Paul said, is digital

technology. And we absolutely need to embrace digital technology to remain competitive, because frankly, everybody else is. And it's good news, because our designers tomorrow will have at their fingertips tools and technologies that their predecessors, many of whom who are in this room, could only dream about 10 to 15 years ago. So absolutely employing the digital thread throughout our business, from design right through to service, making it easier for us to interact with our customers and with our suppliers. And on the far right-hand side of the slide is the picture there, which is illustrating how we're taking some of that digital technology and applying it in the manufacturing environment as well, to ensure that as we manufacture these designs, we also maintain our competitiveness.

So let me move on from fundamental strategy and step back a bit now to see about how the business is performing and this business in transition. So a few years ago, yes, business as a business was in a difficult place. And over the last couple of years we've worked hard, in particular, to reduce some of our fundamental costs. And we set out a fairly modest target of a couple of hundred million pounds, reported on it regularly over the last couple of years and by the end of 2017, achieved what we set out to achieve, which was a reduction of about GBP 200 million versus the end of 2015.

But it wasn't really just about cost reduction, it is about simplifying our business and making it easier for our people to do their day-to-day jobs, is making it easier for our customers to interact with us and making it easier for our suppliers to interact with us. And I've been quoted talking about pace and simplicity, so that we are simplicity always and we were a little bit more responsive. And the good news is that over the last couple of years, we've made some progress on that, but there's definitely more to follow.

So at the start of this year, we announced in January, how we were going to be simplifying the structure of our business, As we describe it, we talk about, while 50% of the business is in civil aerospace, approximately 1/4 of our business is in defense, with applications in the air, applications on land and applications in the sea. And the other 1/4 of our business, roughly, is our Power Systems business. So that's how we describe it, why not organize it that way. And so we've restructured the way in which we group our businesses together, and we've taken pieces from our marine business or what was historically our marine business. And we've taken the defense pieces, merged with a new defense business, to achieve essentially customers synergy, because it's the same government customers that buy all of these products. And then we've taken some of the other parts of our business and our nuclear business and put part of that into defense, a big chunk of it which is actually defense, and the same customers. And the other piece into our Power Systems business, where we can enjoy synergies from a technical point of view from our customer service point of view and also some operational synergies as well. So this is the first step to -- on the journey that we're making this year towards a leaner, smaller, crisper headquarters and much more in powered businesses.

Other things that we announced in January, or during the first quarter of this year, a strategic review of our commercial marine business. So if you look at what was remaining in our commercial marine business, it's a collection of system products and components, really optimized for the oil and gas exploration sector. And over the last couple of years, as that sector has suffered a lot of downturn, our marine folks have done a fantastic job in trying to right-size our marine business. And even as they have done so, we find that actually we can't sensibly afford to invest in that business to make those system components sufficiently competitive for the future. And so, right now, we are examining whether it's possible that another owner could do a better job at that and hope we'll be able to update you on the progress of that strategic review quite soon.

A few years ago, there were lot of questions about our portfolio makeup and this review of commercial marine business, or part of the commercial marine business is one answer to that. Another answer is to think about how we're deploying our capital. And a few weeks ago, we announced the sale of L'Orange, which is part of our Power Systems business, to Woodward. And that's all about deploying our capital on products and services and technologies, which are truly differentiating. And as far as the L'Orange product portfolio is concerned, once upon a time it was truly differentiating and good use of capital. Looking forward, we see it becoming a little bit more commoditized and therefore, frankly, probably not the best use of our capital. And that led to a sale of L'Orange.

So how does this translate into numbers? Well, a couple of weeks ago, we put our full year results for 2017 out and it was an encouraging set of results. Revenue up, profit up, cash flow up and so, generally encouraging set of results. And what I was pleased about was there were good contributions from all around the business that made that happen. One of the key drivers of the increased revenue was an increased volume from our large civil engines and that was also very encouraging, because over the last several years, we've had a steep hill to climb, moving from just over 300 large engines per annum, to this year, where we hope to deliver more than 600 large engines per annum. And the good news was that in the fourth quarter of 2017 the run rate supported that volume for this year. And about 40% of those large engines were XWBs, assembled here in Derby.

Our Power Systems business made -- was probably the standout performer really from a business point of view for the year. And that made a significant contribution to the growth in both profit and cash generation. So encouraging results, but actually quite a lot more to go. And in particular, if I pick on that cash generation number, GBP 273 million was a great result and 3x more than market expectations. But actually in comparison with the GBP 15 billion revenue number at the top, still a very, very small number. And that's clearly where we need to do a bit more work over the coming years. For a leading industrial technology company, we need to be generating repeatable, sustainable and really meaningful cash flow, so that we can continue to invest in all the exciting technologies that Paul was talking about a few moments ago.

So here is a slide that shows the key building blocks for future cash generation that we can see over the next several years. And the medium-term milestone, if you like, of approximately GBP 1 billion of free cash flow around about 2020 is a very useful medium-term milestone for us to focus on as an organization. But it is just a milestone, it's a step on the way and we absolutely expect and need this business to generate even more sustainable, repeatable, cash looking forward beyond that.

So here's a summary of the building blocks. And clearly the growth in market share in large civil engines and the more than doubling of the installed base is going to contribute a lot in terms of flying hour revenue. We're looking at an increased contribution from our non-aerospace business, continued good performance from Power Systems and from defense. The folks in Derby and elsewhere around the Rolls-Royce world are working very hard on reducing the cash deficit that we currently have on our large civil engines. And whilst we absolutely expect increasing costs from service visits, since we have a larger installed fleet, then the efficiency of those service visits we're working very hard on. And throughout that there will be some underpin of looking very carefully at our costs in terms of CapEx, general and administrative expenditures and our indirect expenditure.

Now this was a good set of results as far as 2017 is concerned and you can see that we have more to do looking forward. Actually, news flow at the beginning of March and in the weeks since, has been dominated by some in-service issues that we have, particularly around our Trent 1000 engine. And I have to just talk about that for a moment. So our Trent 1000 engine powers the 787 and we have about a 40% share of the 787 market today and that's about 11% of the total Rolls-Royce fleet for large wide body aircraft. But whilst this is an excellent engine for the 787 and our airline customers are very happy with it, they are not very happy with the fact that it only works for a much shorter period of time than they expected it to work, because we have some durability issues with essentially 3 of the components. And I should really start by apologizing to our customers, because these things don't last as long as they are expected to last. It is hugely disrupting for our airline customers, because we have to inspect these engines, even when the parts are starting to fail and that means the customers can't be flying those aircraft and it is hugely disruptive for them.

So what are we doing about it? Well, we are redesigning the components, to make sure that they last as long as they should last and we're working very closely with each of our airline customers on a case-by-case basis to work through their fleets. And we will, over a period of several years, replace those components in all of those engines. There are about 380 engines that are affected in this way and gradually we will replace them. At the moment, we don't have all of those new designs fully certified and available. So some of the overhauls that are happening today are happening with the existing standard of components, but at least this is keeping our airline customers flying in the meantime. And it's that changeover of components, which is why this issue is going to go on for several years, I'm afraid. We

have a reasonably clear idea of the costs of this exercise and at the beginning of March, we talked about the costs, we talked about the cash costs roughly doubling in 2018 compared with 2017. So about [GBP 315 million] this year, falling next year as we finish those designs of the new components and falling still further as we grind through those overhaul visits. So that's the story on Trent 1000.

On one of those issues within the Trent 1000, we have since the beginning of March in our results, decided it's necessary to do more frequent inspections in order to ascertain exactly when one of these components starts to fail. And for that reason, in consultation with the airworthiness

authorities, we have implemented this much more regular inspection. And that is causing, and we talked about it a couple of weeks ago with a press release -- a separate press release, that will cause an incremental cost in 2018 and probably a little bit of an incremental cost in 2019 as well. And it's causing additional disruption to our customers, for which of course we are sorry. But we absolutely prioritize issues like safety and therefore, we have to go on and do this.

The good news is that we looked very hard at how much this incremental cost is likely to be and how we could address it and we are confident that we can address the incremental cost in 2018. And so, we were able to say a couple of weeks ago and again in our statement this morning that we are maintaining guidance for 2018 and we are maintaining our guidance for our mid-term ambition of around GBP 1 billion of cash by 2020. So that's all I'll say for now on the Trent 1000 issue.

Closing out our results, we issued some guidance -- rough guidance for 2018. And we can see revenue growing a little bit, profit continuing to grow and we anticipate a growth in free cash flow, a growth in operating profit. And down at the bottom of the slide, during -- or at the very end of 2017, we assumed full ownership of ITP. ITP numbers are not in the numbers at the top of the slide, which is essentially a comparison with 2017. They will become more relevant looking forward.

So to summarize, encouraging set of results for 2017. 2018 is a year of significant progress, notwithstanding the Trent 1000 issues that I talked about. Inside the business, we have some very clear priorities for the team and we remain optimistic about the future via embracing the exciting technologies that Paul talked about and being a very important leading company as the world transitions to that cleaner and more efficient world of power.

Presentation

Operator

Welcome to the Woodward, Inc. call to announce the acquisition of L'Orange. [Operator Instructions] Following the presentation, you'll be invited to participate in the question and answer session.

Joining us today from the company are Mr. Tom Gendron, Chairman and Chief Executive Officer; Mr. Bob Weber, Vice Chairman, Chief Financial Officer and Treasurer; and Mr. Don Guzzardo, Corporate Director of Investor Relations and Treasury.

I would now like to turn the call over to Mr. Guzzardo.

Don Guzzardo

VP of Investor Relations & Treasurer

Thank you, operator. We would like to welcome all of you to today's call.

Earlier this morning, we issued a press release announcing that we entered into a definitive agreement to acquire L'Orange from MTU, a world-class engine manufacturer and a wholly-owned subsidiary of Rolls-Royce PLC.

A copy of the release and related presentation materials can be found on our corporate website at woodward.com. During today's call, Tom will comment on the strategies driving this acquisition and then Bob will discuss the financial aspects of the transaction. At the end of our presentation, we will take questions.

An audio replay of this call will be available by phone or on our website through May 9, 2018. The phone number for the audio replay is on the press release announcing this call as well as our website and will be repeated by the operator at the end of the call.

Before we begin, I would like to refer to and highlight our cautionary statement as shown on Slide 2. As always, elements of this presentation are forward-looking or based on our outlook and assumptions for the transaction, global economy and our businesses more specifically. Those elements and the other assumptions underlying our statements can and do frequently change.

Please consider our comments in light of the risks and uncertainties surrounding those elements and assumptions, including the risk we identify in our SEC filings.

On Slide 3, we have summarized the key elements of the transaction. We will generally speak to the financial information of the transaction in euros, given that it is a European transaction and there has been a significant change in the euro exchange rate to the U.S. dollar between 2017 and 2018. Total purchase price is EUR 700 million. L'Orange 2017 pro forma sales were EUR 244 million, but pro forma EBITDA of EUR 74 million.

We anticipate closing in our fiscal third quarter. Now I will turn the call over to Tom to comment further on this significant acquisition.

Thomas A. Gendron

Chairman, CEO & President

Thank you, Don. Welcome to those joining us today. As Don mentioned, we signed a definitive agreement to acquire L'Orange, one of the world's leading suppliers of electronically-controlled high-pressure fuel injection systems for industrial engines.

This is an exciting transition -- transaction for us, and it positions Woodward as the premier engine-control technology and system provider to the global industrial engine market. L'Orange is a leader in fuel injection technology for diesel, heavy fuel oil and dual-fuel engines used in a wide range of industrial

applications, including marine power and propulsion systems, power generation, oil and gas processing, locomotives and other industrial vehicles.

This transaction is an excellent strategic fit for Woodward as it delivers many of the key aspects that we look for in an acquisition, such as a partnership with a world-class OEM, excellent technology and innovation and a large installed base enhancing profitability.

L'Orange brings an ongoing strategic relationship with Rolls-Royce Power Systems, predominantly through MTU. We have entered into a long-term technology and supply agreement with MTU that creates a joint interest in the long-term success of our relationship. The initial term of the agreement is 15 years.

L'Orange enjoys well-established relationships with its key customers and there is minimum overlap with Woodward's customer base, offering significant opportunities to deepen relationships, cross-sell products, diversify our business. Our complementary geographic footprint will enable both Woodward and L'Orange to leverage future revenue opportunities. L'Orange is also a world-class fuel injection technology leader offering proprietary products anchored by strong intellectual property protections.

The team brings innovation and a strong patent portfolio, both active and pending. L'Orange offers a highly complementary product suite and a large engine space. Together, we have a broader portfolio of engine control products, both systems and components that will strengthen our presence in the markets we currently serve, while expanding our customer reach into new and attractive markets and geographies.

Our customers will benefit not only from an expanded platform or capabilities, but also from enhanced research and development. L'Orange has been delivering fuel system components for almost a century, many of these components operate in the harsh environment of the combustion chamber. They now have a very large installed base, which provides a consistent and profitable aftermarket during periods of both market strength and weakness.

Rounding out the strategic rationale supporting this acquisition, we anticipate that the transaction will immediately enhance our industrial segment earnings and be significantly accretive to Woodward earnings in fiscal year 2019.

Bob will discuss this in greater detail later. So from a number of perspectives, we believe the acquisition of L'Orange by Woodward contributes significantly to total shareholder return, strengthen our industrial business and strengthen Woodward.

Let me know get into some specifics related to this deal. So why fossil fuel? Large diesel engines are responsible for powering a significant portion of the work in the world that is performed every day that is projected to continue into the foreseeable future. Transportation, infrastructure construction, resource extraction and distributed power generation, all are powered by diesel or natural gas with no feasible alternatives. While electric vehicles will have their place in the -- on highway market, diesel and natural gas will continue to carry the heavy loads off-highway. Only fossil fuels can deliver the power torque required with the energy density to work over long periods of time with heavy payloads.

Maximizing efficiency and minimizing emissions in the use of fossil fuels is a primary focus for both Woodward and L'Orange. We believe this acquisition enhances our competitive position in this important space as we go forward.

More specifically, L'Orange develops and produces fuel injectors, pumps and related fuel system equipment for large diesel and natural gas engines used in marine, Powergen, rail, oil and gas and a variety of other applications. Together, Woodward and L'Orange will also provide electronics and software, air and exhaust management, and modeling and sensing capabilities to virtually all the major engine manufacturers.

Similar to Woodward, L'Orange has a long history they are -- as a pioneer in advanced fuel injection equipment. Company founder Prosper L'Orange, invented the pre-combustion chamber principle in 1909 and the company has continued to innovate and expand its technology. L'Orange developed the first large engine common rail fuel injection system in 1996 and remains a leader in this space.

With respect to our combined global footprint, we believe we have opportunity to leverage L'Orange's strength in Europe and Woodward's regional balance. Both L'Orange and Woodward have operations in China, where we share our common strategic initiative to significantly expand our partnership with large and growing Chinese engine manufacturers. Together, the Woodward and L'Orange team will be almost 8,500 members strong across the globe.

L'Orange brings a world-class team with excellent depth of industry knowledge, product expertise and operational capabilities. We share a common commitment to drive quality, innovation and continuous improvement in everything we do. We look forward to welcoming them into the Woodward family.

Turning to end markets. L'Orange serves a broad range of end markets and plays in all 3 of our market segments: power generation, transportation, and oil and gas. Taking a look at these in more detail.

Overall, strong secular trends towards reducing emissions, improving fuel efficiency and the growing demand for fuel flexibility remain strong demand drivers for all of these segments, while global macroeconomic indicators continue to improve.

Within Powergen, while the market for large gas-turbine systems is soft, demand for backup and prime power diesel and natural gas generators has been recovering. Utilization of existing engine-driven power plants, predominantly in developing countries, is also supporting aftermarket strength.

Within transportation, global trade volumes continue to expand and the utilization of both cargo and passenger ships is driving a strong aftermarket for service and replacement parts. This is an area where L'Orange is particularly strong. Although new shipbuilding has been depressed, it is showing signs of life as emission requirements come into play nearshore. Similarly, locomotive activity is picking up as global industrial momentum accelerates and countries adopt more restrictive emission requirements.

Oil and gas has been extremely strong as oil prices have stabilized, which has led to increased capital investment, utilization of existing rigs and the drilling of new wells. Higher utilization is driving demand for aftermarket parts and services.

From initiation of combustion to the after-treatment of exhaust, Woodward and L'Orange together will be able to offer our customers complete fuel system solution, large gas and diesel engines. L'Orange's strength in fuel injection and common rail pumps complements Woodward's broad range of capabilities, including electronic controls, valves, sensing and actuation.

Bob will now give you some important details of the transaction. But I would like to close by saying, I believe this is a compelling long-term opportunity for Woodward from both a strategic and financial perspective. We are confident that this transaction positions us well to drive future growth, enhance our margin and unlock significant value creation for our shareholders.

Now let me turn over to Bob.

Robert F. Weber
Vice Chairman, CFO & Treasurer

Thanks, Don. As Don mentioned, Woodward will acquire L'Orange for a total consideration of EUR 700 million. L'Orange had 2017 pro forma sales of EUR 244 million and pro forma EBITDA of EUR 74 million.

Looking forward, we anticipate L'Orange 2018 pro forma sales to be approximately EUR 255 million to EUR 265 million and pro forma EBITDA of EUR 80 million to EUR 85 million based on our estimates.

At closing, we anticipate utilizing a combination of cash on hand and our available revolving credit line to finance the deal. At a later date, we anticipate converting our financing to a combination of our revolving credit line and long-term fixed rate debt. This will allow us to take advantage of both Woodward and L'Orange's strong projected cash flows to retire prepayable floating debt while also taking advantage of historically low long-term interest rates.

We anticipate the transaction will close in our fiscal third quarter and only requires German antitrust clearance. In addition to the strategic benefits of this acquisition that Tom discussed, this combination is

highly attractive from a financial standpoint. We believe Woodward and L'Orange combined will allow us to realize a number of valuable sales synergies such as L'Orange as an independent fuel system supplier will be able to expand its revenue base beyond its current scope; our combined OEM customer base and geographic footprint will allow for cross-selling opportunities, particularly in growing regions such as China; the combination of our aftermarket channels will allow for considerable leverage; and finally, our complementary product portfolios will allow us to broaden and deepen our fuel systems offerings.

Given the complementary nature of our operations and product portfolios and the increased scale of the combined businesses, we believe we will be able to realize significant cost synergies in the areas of productivity, supply chain and infrastructure. We anticipate that these synergies will reach approximately \$20 million of annual savings by 2021.

Turning to our anticipated capital structure and deployment. Debt leverage at closing is anticipated to be approximately 3.2x, based on combined pro forma EBITDA. Given our projected cash flows, we expect to rapidly reduce debt leverage to 2x EBITDA by the end of fiscal 2019. Our leverage projection assumes that we will focus cash flow on the reduction of acquisition-related debt in the near term and defer further share repurchases until the latter half of fiscal 2019.

We intend to continue growing our dividend at an annual rate of 10% to 15%. Our overall capital deployment strategy remains in line with what we announced at our most recent Investor Day. Consistent with our long-term strategic philosophy, we intend to maintain our focus on innovation and growth through investments in R&D and capital expenditures.

Turning to earnings. Based upon our preliminary analysis of the impacts of the transaction and assuming closing in our third fiscal quarter, we believe that there will be no material impact on fiscal 2018's Woodward earnings, excluding purchase accounting adjustments. This analysis would be significantly impacted by a change in the closing date of the transaction.

Looking forward, we anticipate the transaction to be accretive in fiscal 2019 and to add approximately EUR 0.35 per diluted share, excluding purchase accounting impacts.

Before taking questions on this transaction, I would also like to take a moment to discuss the Duarte announcement that also went out this morning. In our February 1 press release, we announced the relocation of the Duarte, California operations to our newly renovated Drake Campus in Fort Collins, Colorado. As a result of this decision to move, we have recorded specific charges totaling \$12.5 million pretax for workforce management impacts associated with this relocation in the second quarter of fiscal 2018.

Additionally, we anticipate incurring certain move-related costs such as expenses associated with moving equipment, employee training, accelerated depreciation and increased labor expenses over the coming year. These expenses will vary by quarter but are expected to be approximately \$12 million in total. We anticipate approximately a 2-year payback on the Duarte relocation project based on cost savings.

Additionally, we are exploring various options with respect to our Duarte property, and we believe that a substantial gain will be realized upon its disposition. Also included in our announcement are specific charges of approximately \$4.5 million of workforce management costs to align our industrial turbomachinery business with current market conditions. Although we have already taken considerable actions to redeploy our workforce and reduce costs, underlying market conditions have continued to deteriorate and further action is necessary.

The specific charges totaled \$17 million pretax or \$0.20 per diluted share. Beginning with the earnings release for our second quarter of this fiscal year, we will report adjusted earnings in addition to earnings reported -- earnings as reported under U.S. GAAP. Adjusted earnings will exclude the specific charges and the incremental costs associated with the Duarte relocation as well as the transaction costs, purchase accounting and other one-time costs related to the L'Orange acquisition.

With that, I'd like to turn it back to Tom for some closing comments.

Thomas A. Gendron

Chairman, CEO & President

Thanks, Bob. I'd like to emphasize how impactful this acquisition will be to Woodward. It enhances our position with major OEMs, strengthens our fuel systems control technologies and product offerings and with a substantial aftermarket and related installed base, it enhances Woodward's profitability. We believe this transaction will drive growth and profitability, which will enhance long-term shareholder returns beyond other short-term capital deployment opportunities.

This concludes our comments. Operator, we are now ready to open the call for questions.

Question and Answer

Operator

[Operator Instructions] And the first question will come from Greg [indiscernible] of Jefferies.

Unknown Analyst

Just when I look at the margins of the acquired business versus your current industrial business, they are higher by quite a large multiple. I mean, do you view that as sustainable? Or are there other opportunities, maybe, within industrial to move closer to the acquired business?

D. Warren A. East

CEO & Executive Director

Yes, both questions. L'Orange enjoys many, many more years of product in the field than Woodward currently has. We are relatively new in the fuel injection side of the equation. So they have a very strong aftermarket with a very large installed base and that contributes to that profitability. We believe that is sustainable. And in addition, we believe as time goes on, Woodward's industrial margins will also rise related to having that very large installed base out there as we go forward.

Unknown Analyst

And is there any way to quantify the percentage of aftermarket versus OE mix?

D. Warren A. East

CEO & Executive Director

We've had this discussion on the Woodward side as well. And -- because in many cases, our customers own the aftermarket, a lot of times it's very hard for us to actually determine what the actual percentage is, so it's very difficult.

Unknown Analyst

And I'm sorry, just to throw in one more. I mean, you talked about broad diversification across your 3 end markets. I mean, but it sounds like maybe it's a little bit heavier on transportation. And I think your transportation was something like 28% last quarter -- or sorry, last year. Do you expect that to move up, I mean, when we think about the acquired business mix versus where you are at?

D. Warren A. East

CEO & Executive Director

We do believe that will improve over time. And I think both the combined entities will be able to take advantage of that combination.

Operator

The next question is from Gautam Khanna.

Gautam J. Khanna

Cowen and Company, LLC, Research Division

Just wanted to follow-up on the last question on mix. You showed the pie charts at Powergen at L'Orange. And how much of that is gas turbines? And then more broadly, can you talk about the LTM sales, how does that compare to what do you think the next 12-month sales will be at L'Orange? I just wonder, have they already suffered through the gas turbine downturn? Or is their business potentially going to decline over the next 12 months?

D. Warren A. East

CEO & Executive Director

Yes, sure. One, for clarity, they do not do anything in gas turbines. It's all reciprocating engine. So it's diesel and some dual fuel and natural gas reciprocating engines. So the market has been recovering. Utilization rates are high, which is driving the aftermarket revenue. And we're looking at a 4% to 8% growth rate in 2018 from 2017. So it kind of gives you an idea that it is on the recovery. They made it through the industrial downturn quite well on the back of aftermarket sales. And we anticipate that it's on a positive trajectory right now.

Gautam J. Khanna

Cowen and Company, LLC, Research Division

Okay. That's helpful. And Bob, you made a comment about EUR 0.35 accretive prior to purchase accounting. Can you give us any ballpark sense on what purchase -- the intangibles amortization might be annually?

Robert F. Weber

Vice Chairman, CFO & Treasurer

Yes. That's why it's definitely a ballpark. We will really not be able to get a good view of that until around closing, shortly thereafter. So at this point, that is the biggest unknown. We mentioned that you can kind of work out between earnings and our estimate, current estimate of intangible amortization and the accretion number. You can kind of work out what we are thinking there as a very rough and that is very dependent upon the timing of the closing. If that moves, there is a significant impact as well as we don't have good details yet on some of the components with respect to work in process and the backlog.

Gautam J. Khanna

Cowen and Company, LLC, Research Division

Okay. And last question, just could you remind us of the rate of borrowing? What is the rate on the revolver? And eventually, if you term some of that out, what do you anticipate the cost of funds to be?

Robert F. Weber

Vice Chairman, CFO & Treasurer

The revolver is currently a little over 2.5%. And we will use that initially. The long-term rates, you can kind of see where they're falling at, European long-term rates are a little bit lower. So we anticipate we will be able to take advantage of that. So we haven't finalized our long-term financing, but we'd be surprised if it extends much over 3%.

Operator

The next question is from the line of Pete Skibitski.

Peter John Skibitski

Drexel Hamilton, LLC, Research Division

Kind of a top-level question guys. Given the great visibility and growth you guys have on the aerospace side, that's probably 80% of EBIDTA or so. What kind of compelled you to this deal? Because I think we -- most of us were expecting we'd see maybe tuck-ins in the next couple of years. And I felt, like, this is definitely bigger than a tuck-in, I would say. Was it -- it was obviously somewhat opportunistic, but it was just too good a deal to pass up or some other reason you would call out?

Thomas A. Gendron

Chairman, CEO & President

Well, Pete, what I would highlight is, we've had some difficulties in our industrial markets, but we've tried to communicate all along. We still think our industrial businesses are world-class businesses. And over the years, we keep an eye on assets that we like in both aerospace and industrial. We've had conversations for more than 3 years regarding L'Orange with Rolls-Royce. And timing and alignment of their desires and our thoughts for the business came together. So it's a business we like. We've known it for years and it's one that, as we've talked about in the past, Woodward is very patient. We have a look at asset that we

think would be a great fit for Woodward over the long-term. We keep focused on those. We try to build the relationships. And when those opportunities arise, we tried to jump on them and that's kind of what happened here. And we think it's very favorable to Woodward, favorable to our industrial business and it really will have long-term shareholder value creation. It doesn't take our eye off aerospace. Our aerospace business is really robust. We will continue to look there. I think you know our history on that, Pete. We've had discussions with on some of the acquisitions we've made that went on for more than 10 years. So it's really knowing what fits with the company, be patient and wait for the opportunity to arise. And that's what happened here.

Peter John Skibitski

Drexel Hamilton, LLC, Research Division

Okay. Makes sense. L'Orange, is it coming with any debt at all? Because just looking at the valuation, it looks like 11.6x EBITDA, but I'm not sure if they're bringing any debt with them or not?

Robert F. Weber

Vice Chairman, CFO & Treasurer

No. There is a pension liability -- long-term pension liability. That is the only real difference. We believe it's about 9.5x the 2017 EBITA and about 8.3x at the midpoint of the range we gave on 2018 EBITDA.

Operator

The next question is from Julie Yates.

Julie Ann Yates Stewart

Crédit Suisse AG, Research Division

Congratulations on the deal. So on L'Orange, I'm guessing they're facing the same oil and gas headwinds that you've seen since 2014 and your industrial sales are down almost 20% from that time frame. How does L'Orange compare over the same time frame? Or maybe how should we think about the most recent peak sales here? And what did the margin profile look like on that base?

Thomas A. Gendron

Chairman, CEO & President

Well, first, in oil and gas right now, in particular where these types of products are used in the recent -- and the [reset] engines are used in the extraction, it's actually very favorable at the moment. So we're seeing increased sales in Woodward's portfolio and L'Orange has seen increased sales in that area. So they're doing quite well in oil and gas at the moment. What we would say is that, over the last 3 years, L'Orange has been able to do quite well at holding their margins and through what was the downturn, but now we're seeing things turn. They had growth -- nice growth in '17. And as I was mentioning earlier, Woodward is projecting for them 4% to 8% growth going into '18. So we think it's on a quite good path. The markets are strengthening and utilization, which is really critical, utilization is up. Utilization is driving aftermarket. And these type of products being that they're part of the combustion process, they have high wear which drives a solid aftermarket. So those are all coming together and we think they managed with their installed base the downturn really well. And right now, we are looking at growth going forward.

Julie Ann Yates Stewart

Crédit Suisse AG, Research Division

Okay. And has L'Orange experienced the same strength in the China truck market over the last 12 months that you've seen? What's their exposure there? And any kind of thoughts on the sustainability of that market?

Robert F. Weber

Vice Chairman, CFO & Treasurer

Yes, actually, they don't play in the truck market. If you look at, I'm trying to remember which slide, in our slide deck, we highlight which class of engines that they provide hardware for. And that class, which is --

it's Page 8. And if you take a look at that, they play in engines above the on highway market size. So they don't have exposure to on highway.

Julie Ann Yates Stewart

Crédit Suisse AG, Research Division

Okay. That's helpful. And then just last one from me, with the incremental \$4.5 million restructuring charge tied to IGT? Where are we in terms of volumes in Powergen, given they've taken incremental step down. How much visibility do you have there? And how confident are you on that kind of flat to down slight outlook for overall industrial just excluding the L'Orange business?

Thomas A. Gendron

Chairman, CEO & President

Yes. What I would say in terms of the industrial gas turbine market and what we have said in the past is, we believe we are near the bottom. We can't say for sure it's bottom, but we don't anticipate real growth coming until 2020. So this year, and next fiscal year are going to be still tough on the IGT business.

Operator

And the next question is from David Strauss.

Thomas A. Gendron

Chairman, CEO & President

Back on the aftermarket versus OE, I know you said you couldn't really detail what the overall mix is there for L'Orange. But any color you can give on the margin differential, new equipment versus aftermarket for the business?

D. Warren A. East

CEO & Executive Director

There is no doubt just like Woodward's business, our aftermarket carries higher margins. And in this field, definitely the aftermarket is at higher margin than the OE. And as I said, they have a very large installed base which does bring a very healthy aftermarket.

Thomas A. Gendron

Chairman, CEO & President

One statistic, if you will, or a financial fact that is kind of comes out. When you take the operating profit for '17 on the sales, you can see a very healthy operating profit would approximate segment earnings from our perspective. So you can kind of see the impact of that margin differential vis-à-vis our industrial business.

David Egon Strauss

Barclays Bank PLC, Research Division

Right. And, Bob, the currency impact here. Obviously, a lot more exposure to the euro. How would you -- how do you plan on handling that going forward?

Robert F. Weber

Vice Chairman, CFO & Treasurer

Well, the plan is. So we've already been long euro, this will make us longer euro, but we'll be using euro-based debt. So we do believe there will be a natural hedge. And in addition, I shouldn't say natural, there will be a debt-related hedge. In addition, a good portion, as you can see on one of the slides in the deck, is euro related. So the revenues are largely euro. So there is a built-in natural hedge as well.

Operator

The next question is from George Godfrey.

George James Godfrey*CL King & Associates, Inc., Research Division*

I'll add my congratulations on the acquisition as well. I just wanted to ask about, again, beat the dead horse here, the operating profit margin, EUR 64 million for L'Orange on EUR 244 million. That comes out to like 26%. If I look at your industrial margin of 11%, is that an apples-to-oranges comparison? Or is their business just structurally much more profitable in diesel versus yours in gas?

Robert F. Weber*Vice Chairman, CFO & Treasurer*

What I would say is, what you're seeing as the major difference is they have an enormous installed base in the diesel fuel injection market. That market has, once again I would say, high wear and a lot of aftermarket. And as such, you are seeing the benefit of higher margin aftermarket coming through. So it's more, what I'd say, correlates kind of what's like our aerospace business, very proprietary product, high aftermarket, good margins. As Bob highlighted earlier, we expect some of our other fuel injection type equipment as installed base grows and the utilization grows, over the years, that will also enhance margins. And we do believe combined as we go forward, the Woodward industrial businesses are capable and will be top quartile earnings type business in the industrial market. So we think they're really solid businesses, and it is a great example of what they can be.

George James Godfrey*CL King & Associates, Inc., Research Division*

Okay. Because if I start -- I will use the dollar conversion. If I take their business of \$300 million and what the margins appear to be now and add the \$20 million of synergies that you're targeting, I think, call it say in 2 years, it looks like the margins will be north of 30%. And so, it would seem like not only the aftermarket but their OEM, of course, with products are extremely profitable as well?

Thomas A. Gendron*Chairman, CEO & President*

Yes. When you -- when we look at that synergy that's combining across all of Woodward, and how we're going to get to that. But, George, the business is profitable, and we think we can drive those cost synergies. But on the other -- on the -- what also excites us and we highlighted it there in the prepared remarks, what really excites us is they are now -- and they will now as part of Woodward to be an independent fuel injection systems supplier. I think that will open doors to other engine OEMs that were not opened to them, and we think we're going to be able to grow the business combined with Woodward substantially. So that's the sales synergy side that we did not try to put or quantify on the amount of future revenue. But we do believe that, that is now opened to L'Orange and as part of Woodward we would be able to expand them worldwide.

Operator

[Operator Instructions] The next question will come from Michael Ciarmoli.

Michael Frank Ciarmoli*SunTrust Robinson Humphrey, Inc., Research Division*

Just maybe to stay on George's line of questioning there. On the \$20 million in synergies, can you just give maybe a little bit more detail? I mean, I see productivity supply chain but maybe the timing of those synergies, if there is any sort of natural facility consolidation, maybe just give us a frame of reference here for how we should think about those layering in.

Thomas A. Gendron*Chairman, CEO & President*

Yes. I think you got to look at -- we said we'd achieve those by 2021. They're going to be more back-end loaded. We do see as we look at supply chain, internal or external, there's real opportunities there. It takes time to adjust supply chain. There is -- we're going to look at leverage opportunities using

Woodward infrastructure and the like. So we see those happening, but a little more back-end loaded just due to the nature and the timing of implementing that type of activity. But we've got a lot of confidence that we will deliver that over time.

Michael Frank Ciarmoli

SunTrust Robinson Humphrey, Inc., Research Division

Okay. And then just back to the aftermarket. I mean, maybe aftermarket and in general the business, how predictable is this? How much visibility do you guys have if you look out over the next 3, 6, 9 months? Is this typically an intraquarter where you book ship? Or do you build up a backlog where you know sort of what you're working with, and I think you even said some of those aftermarkets go to the OEM. So it's a little bit unclear. So just how do you get comfortable with it from a visibility standpoint?

Robert F. Weber

Vice Chairman, CFO & Treasurer

One way we get comfortable with a lot of the fuel injection equipment. You can correlate the aftermarket to the amount of hours the engine is running, and there is service intervals on these larger diesel engines. And at those service intervals we can have high confidence that there would be replacement parts, and that's how we calculate -- we will calculate it. And we've looked -- that also applies to the Woodward fuel injection business but L'Orange, like I said, is much larger. So you can look at that, look at service intervals. So the real key there is our -- it's not necessarily new machines going into the market, it's existing machines running. And so that's the key factor. And as we look at that factor, you can then correlate that to aftermarket revenue.

Michael Frank Ciarmoli

SunTrust Robinson Humphrey, Inc., Research Division

Got it. And then last one from me. I think it looks as though this business does spit out a pretty good amount of free cash flow. I think you called out EUR 51 million. What sort of the trajectory there? Does that cash generation change with bringing this now under the Woodward umbrella with any of the tax law changes in the U.S.?

Robert F. Weber

Vice Chairman, CFO & Treasurer

No. It remains very robust. The tax law changes in the U.S. were we to bring it back will have a positive impact in terms of the tax rate, but we have lots of potential uses also in the European region and elsewhere for the cash. So we don't envision any change in the trajectory. It's very strong. And we have plenty of use for it.

Operator

There are no further questions at this time. I'll turn the call back over to Tom for closing remarks.

Thomas A. Gendron

Chairman, CEO & President

Okay. Well, thank you, everyone, for joining us today. One thing I would like to add at the end of the call here is, my thanks to the Rolls-Royce Power Systems team. Whenever you go through an acquisition, it's a tremendous amount of work and they had to put a lot of work into it, and I also want to thank our team who've put a lot of work into it and to bring us to a signing yesterday. So thanks go out to both teams, we appreciate everybody being on the call. We look forward to talk to you in a couple of weeks at our second quarter earnings release.

With that, I'll turn it back to the operator. Thank you.

Operator

Thank you. Ladies and gentlemen, that concludes the conference call for today. If you would like to listen to our rebroadcast of this conference call, it will be available today at 3:00 p.m. Eastern daylight

savings time by dialing 1(855) 859-2056 for U.S. callers or 1 (404) 537-3406 for non-U.S. callers and by entering the access code of 5589466. A rebroadcast will be also be available at the company's website at www.woodward.com for 30 days. We thank you for your participation on today's conference call and ask that you please disconnect your lines.

Hello, and welcome to the Rolls-Royce 2017 Full Year Results Fixed Income Call. [Operator Instructions] I'll now hand you over to Stephen Daintith, CFO. Please begin.

Stephen Wayne Daintith

CFO & Executive Director

Thank you very much. Good afternoon, everybody. My name is Stephen Daintith. I'm the Chief Financial Officer of Rolls-Royce. Thank you for joining us this afternoon for a run-through of our 2017 results. I'm sure you've read the release already and maybe 1 or 2 of you actually checked into the analyst presentation this morning, but let me just give you 1 or 2 highlights and then I'll take care of your questions.

So I think it's an encouraging set of results that we've presented today. Good operational progress and milestones achieved. If you look at the financial highlights, I think revenue is growing at 6%, is always a very good start. Profit is up 25% and free cash flow has tripled to GBP 273 million, ahead of expectations and reflecting the progress that we're making across the group, but particularly in Power Systems during the course of the year. Civil Aerospace delivered a record 483 engines, up 35%, and also achieved a 37% reduction in the cash deficit on the XWB-84, which will be one of our most significant engines over the next few years. Service revenues were strong, which is the aftermarket revenues. They grew by 12%, similar to the widebody flying-hour growth, and will be the key driver of improving cash flow as we grow our installed base. And great visibility around that cash flow as well and reliability of the margins attached to it. You'll also see, we had good transitions this year, a record 67 aircraft versus 46 in 2016. So our aircraft are transitioning better than our competition. So a good year in Civil Aerospace.

And you'll see that we have, however, experienced some issues on -- in Civil Aerospace during the year with respect to the 900 and the 1000 and essentially parts not lasting as long as we first anticipated and wearing out more quickly in both instances, the 900 intermediate pressure turbine blade, and in the 1000, the ITP high-pressure blade and also the compressor rotor 1 and 2. So a number of issues on the Trent 1000. The cumulative cash costs of that -- those 2 engine issues in 2017 was GBP 170 million. And we guided today that that's going to double to around GBP 340 million in 2018. But I think the encouraging news is that we're still able to give the guidance at GBP 450 million of free cash flow in '18 despite digesting that GBP 340 million of cash outflow that we're anticipating on those 2 issues.

I think Power Systems had a standout year, growing its revenues nicely, particularly with service revenues growing at 6%, and their profit is growing by over 60%. So really good profit growth in Power Systems and very good cash conversion as well, converting all their profits into cash and then even working capital contributions as well benefiting Power Systems.

Defense had another steady performance, good margins, albeit slightly declining and operating against some tough export markets, with a slightly dampened U.K. market, as we're aware. Sudden long-term contracts are starting to come or have come to the end of their lives, including the Tornado, the Typhoon and the Sea King Helicopter. And we commented today on the restructuring program that we announced back in January. I think on the Capital Markets Day in June, we're going to tell you a little bit more about that and the progress that we're making there. The theme, though, for the restructuring program is to have a lean corporate center and empowered businesses, so to take some of the heat away from the corporate center activities and then give our businesses a bit more autonomy to decide how to run and operate the businesses, but within a corporate control and governance framework still.

We reported our numbers on IFRS 15 as well for the first time for 2017. I think the market has been very well educated along the way as to what the likely impact is going to be, broadly, an GBP 800 million reduction in our profits. And that's almost entirely due to our recognition of the cash losses on original equipment sales in Civil Aerospace immediately, i.e. as soon as the delivery takes place, rather than putting the loss on our balance sheet and then amortizing that loss, so to speak, over the life of the

contract. And so that is in very simple terms around a GBP 700 million hit to our income statement, which you can see makes up the absolute -- the vast majority of the overall impact to our P&L account.

We've given some good guidance, I think, some good sort of granular guidance today around our expectations for 2018. In short order, we're looking at GBP 450 million of free cash flow versus today's GBP 273 million for 2017. And for profits, we're looking at moving the profit from GBP 321 million of profit under IFRS 15 basis to GBP 400 million profit in 2018 on that new basis. And just to point out that the one key variable that is more freaky to model is the number of shop visits that take place when -- I've explained how the accounting treatment for the OE cash loss is being recognized immediately, but in the aftermarket, we only recognize the revenues and profits when the shop visit take place. But a key point here is that we collect the cash throughout on a flying-hour basis. So what you're going to see over the next 5 to 10 years is a big deferred income balance growing on our balance sheet as we collect the cash, so we debit cash and credit the deferred income and put that on the balance sheet. So you'll see that liability growing. So that's a sort of quick run-through of our numbers.

I think an encouraging set of results, good to see cash flow growing and moving nicely towards that GBP 1 billion by 2020 goal that we have, so to speak. And making -- and again, sort of reaffirming our confidence around that -- today's results, and that's notwithstanding the headwind that we have -- the temporary headwind of the 900 and the 1000. We reiterated today the importance of a strong balance sheet and the return to an A grade rating in the near term. That remains an absolute priority for us. And I think we've signaled that intent by indicating that, notwithstanding the growth in free cash flow, we're holding the dividend for now and we will not be revisiting it until 2019. And free cash flow will be the guide for us on the appropriateness of increasing the dividend or not. So I think, that's the -- a quick run-through. Sorry for taking a little bit longer on that than you might have hoped, but I'm happy to take any questions now that you might have.

Question and Answer

Operator

[Operator Instructions] And it seems we have no questions on the telephone lines at this time. So I'll hand the call back to you, Stephen.

Stephen Wayne Daintith

CFO & Executive Director

Well, thank you very much. And I hope that somebody out there is still listening, but thank you very much for your time. And I look forward to talking to you at the half year. Thank you. Bye-bye.

Operator

This concludes our call. Thank you for attending. Participants, you may disconnect your lines.

Jennifer Ramsey

Okay, all right. We're just a couple of minutes past 9:00, and it's time to start.

So thank you for joining us here at London Stock Exchange, and for those of you joining online. My name is Jennifer Ramsey, and I lead the investor relations team at Rolls-Royce. I want to welcome you to our full year results presentation for 2017.

The agenda for today will be Warren East, our Chief Executive, will share his perspectives on the progress we've made and the challenges we faced in 2017. Then Stephen Daintith, our Chief Financial Officer, will talk through our financial results in more detail and with reference to both current accounting and IFRS 15. And Warren will then round up with his outlook for the year ahead. In terms of the presentation, the presentation should take roughly 45 minutes. We do have a lot to cover, though. And then we will be taking questions. If you want to take a question online, please access the webcast service via our webpage. And we'll endeavor to answer those questions, if we haven't already answered them in the room. And finally, if I could ask you to switch off your mobile phones so that there's no interruption during the presentation. We're not expecting any emergencies. If the alarm does go off, please make an orderly exit to the front of the building and to Paternoster Square.

And with that, I'll hand over to Warren.

D. Warren A. East

CEO & Executive Director

Great. Thank you very much, Jennifer. Morning, everybody. Thank you all for coming. And I hope I can drive the projector this morning.

I'm going to start with a few highlights. I'll then do a quick run around the business, step back and review the priorities we set a year ago for 2017 and reflect a little bit on the progress there. Stephen will add some significant color to the numbers before we summarize and do questions.

So I think the summary on this morning is we say this is an encouraging set of results. And I actually feel it's good progress to be standing here reporting record revenues, a growth in profit, an almost tripling of free cash flow after absorbing some significant costs, reasons for which we will talk about in a moment; and to know that that's actually generated from underlying improvements in the business right across our group. So it's a pretty encouraging set of numbers.

Just to pick on some of the highlights there. Obviously a big driver, pretty big driver of the improvement in cash flow is the growth in our installed base and in particular our fleet of large engines on wide-body aircraft. And halfway through the year, our in-service flying hours were up by some 15% in Trents at the end of the year. That's up by 22% year-on-year, continued momentum. And it's quite good momentum picture. Some years ago, we were facing a large ramp in volume productions. And how were we going to do that with large engines? Well, this is the third consecutive year that we're able to report a significant growth in production of large engines. And I'm particularly encouraged with our over 35% in actual engines delivered, to nearly 500 engines; over 500 engines produced; and the run rate of production during Q4 setting us up in the right place for the growth we expect in volume production as we go through 2018. So I'm feeling quite encouraged about that. At the same time, of course, we all know that when we produce an engine and stick it on an airplane wing, then we make a cash loss. And we've been fairly transparent about that, but the good news is that we are squeezing down on that. And in the year, 40% of the large engines were Trent XWB. And on Trent XWB, we made significant progress at squeezing down on the cash deficit. And we're still on track to get to our break-even goal on that by around about 2020.

The standout performance probably among across the group was in Power Systems, where under new leadership in Power Systems we saw a really good recovery in numbers. And I'll talk about that in a little

bit more detail in a moment, but this is really driven by rigor and discipline and an execution mindset that is now starting to become prevalent in that business, which is very encouraging.

Looking ahead to the future. Our future is all about new technology. And clearly, we need to be working today on the new technology that's going to enable us to win in the future. And we had a good year with our new big-engine architecture, the UltraFan architecture; and both the core engine and the gearbox that is required to create that architecture going forward. So that was encouraging. Of course, it's all about the people. And it seems like it's been a very long time, but actually just reflecting on it, 2017 was the first year in which we've had a new executive leadership team. And so that team has actually only been out on the pitch for 12 months. In fact, 12 months ago, Stephen was sat on that side of this platform rather than on this side of the platform. And a lot happens in 12 months.

Of course, it's not all been glorious. And particularly, recently there's been quite a lot written about the issues that we're facing with some of our customers on Trent 1000. And I'll start with that issue. So this is a very important issue for us. First of all, let's just get it in perspective. These engines are mechanical beasts. The engines themselves are perfectly healthy, but mechanical things wear out. And what's happening is that some of the components on the Trent 1000 are wearing out sooner than we and our customers expected. That is causing a lot of disruption for our customers, and obviously we are very sorry. And we work quite closely with all of our customers to minimize the operational disruption, but we have been taking significant steps to do that over the last 12 months. We've almost tripled our repair and overhaul capacity to deal with the Trent 1000. We've tripled our capacity to provide the vital components that are necessary. And it obviously takes some time for that capacity to come on stream and be effective, which is why we've seen this issue escalate. It is a dynamic situation, and whilst we are managing it on a day-to-day basis, we have not only put that extra capacity in place. We're addressing the issues by redesigning components, and we have plans in place to get all those redesign components in the engines over the next several years. This will be costly. And we are putting in our earnings release this morning the latest estimates of that cost. And the good news is that, even though it escalated in 2017, we absorbed that full cost in 2017. And the latest estimate of our costs are completely encompassed in the outlook that we've come out with today for 2018 and indeed beyond into our medium-term free cash flow ambitions.

Now it wasn't all challenges in our Civil Aerospace business. Actually, not only did the team, I think, did a fantastic job of dealing with those challenges, but they also delivered on some really great achievements. So the ramp-up in deliveries, I already spoke about. The growth of 12% in invoiced flying hours, that is the business model working. We have been working hard over many years to gain the design wins, and now we're delivering on those design wins and growing the size of our fleet. And when you or I get on an airplane and go from A to B, there's now a larger possibility -- larger probability, rather, that, that is powered by a Rolls-Royce engine. And that is the business model working. And that is why we have a 12% increase in invoiced flying hours. At the same time, we're not just sitting there and counting the extra flying hours. We're working hard on reducing the costs, the amount of money it costs for us to install the engines and continue to grow the size of that fleet. And as we look forward and think about how the business develops in the future and we grow that competitive position even more, then new engines. And during 2018, of course, we've had a peak of new large engines coming into service. And we're very pleased with, over a 12-month period, 3 of the large new engines, the Trent 1000 TEN version, the XWB-97K version and the Trent 7000 for the new Airbus A330neo, they all had their first flights on their airframes. 2 of them are now in service, and the third one will be in service later this year. And looking even further ahead, then, good work on new technologies.

As I said, the standout performance around the group was really from Power Systems. And that delivered an underlying profit improvement of over 60%, which is really encouraging. Actually it's more than encouraging momentum, which is what it says on the slide. Last year, I talked about linearization in this business and how it was very back-end loaded historically and how we couldn't make it linear in 1 year, but actually in 2018 we made -- 2017, sorry, we made significant progress at that linearization. And that has contributed significantly to the performance but not at expense of revenue. So revenue has grown by 3% in the business. And that new leadership team are really making significant changes. One of the changes they're making is simplifying, so we've had a significant reduction in the number of products in the portfolio. And that has all led to this meaningful improvement in profitability and cash flow.

I think there is great potential here. There's a massive installed base, and that installed base is of approximately 140,000 engines. It's growing by approximately 20,000 engines every year, and that's a fantastic service opportunity. Now we add some digital technology to that, and we can address that opportunity. Looking forward to the underlying products themselves, of course, this is -- these play in markets which people are focusing a lot on making the engines cleaner and less damaging to the environment. That is a great opportunity for us to deploy better technology and secure our market share with competitive solutions. And I'll come back to that when we're discussing the strategy after Stephen's been talking.

So in our Defence business, a solid year. Defence business really is characterized by long periods being dominated by service whilst you're tracking new opportunities for OE design wins. Those windows for OE design wins don't open very often, and you need to track and keep on top of them. So quite a lot of this activity is around service and about squeezing more out of the installed base that we have. One of the ways we do that is by getting closer to our customers. So that access box up there is all about extending an agreement that we've had for many years with Aviall, which is now a Boeing company incidentally. And that, they effectively act as a distributor, particularly in the U.S. for us, with the significant presence that we have there, getting spare parts on the site to make those airplanes available for the U.S. customer as soon as possible. And so having had a little agreement with them for many years, we've extended that agreement this year across quite a lot of the fleet. At the same time, we look at the costs of what it takes to manage our business. And we made significant progress there in reduction of costs of our operations. Obviously, some of these contracts, they are quite long-term contracts. They cover a lot of engines. And there's obviously nervousness when those contracts come towards the end, and so it's very pleasing to be able to report such a significant renewal of some of those long-term contracts.

I talked about staying on top of the opportunities for new OE. And the good news is that, looking beyond the [indiscernible] home countries of the U.S. and the U.K. for our Defence business, encouraging to see some export orders. And it is -- and the service piece again, in the bottom corner there, isn't just about signing up deals with distributors. Sometimes, we have to get close to our customers as well. And 2 new service centers there for the U.K. MoD.

Progress in some of our other businesses. Well, I'll take Nuclear, at the top of the slide. This business is there's a small piece of civil nuclear, and that's around control systems and service. And good news is we secured some significant contracts in that business, but most of the Nuclear activity is -- it is dominated, in fact, by some unique contracts with the U.K. MoD for propulsion systems for their nuclear submarines. And we've been making good operational progress on that, notwithstanding some of the or in fact completely reversing some of the headlines that you might have read a few years ago in terms of operational improvement. And that makes it much easier for us and also makes the activity a little bit more profitable for us. We've been investing some of that profit in future capability, increasing both capacity and capability for the new generations of nuclear submarines for which the U.K. Ministry of Defense relies upon us.

In Marine, we have -- notwithstanding the difficulties which everybody knows about in that sector and for our business, we have actually during the course of 2017 established quite a leadership position in ship intelligence, autonomous and remotely operated vessels. As most of the people in this room know, we've also been facing serious downward pressure from the -- in fact, the disappearance of the market in offshore for us. And that's caused us to do a lot of work rightsizing the business. And we completed the rightsizing exercise during 2017 with a further 13% reduction in some of our G&A costs. After all that, we still believe that the right thing to do is actually have a strategic review of the commercial Marine operations.

Our Naval Marine activity is good and has been good and has been profitable. And I'll talk about that in a moment when we talk about the restructuring that we're proposing, but consistent with the 4-box model that I put in front of people in November 2015 when considering the portfolio and looking at the activities that go on within some of our businesses, then not all of those activities are where we offer a true competitive advantage into a truly attractive and growing market. And there are limits to how much we want to be able to invest in to improve the competitive position, and that's why we're having a strategic review of our Marine business right now.

Just before Christmas, we completed on the acquisition of ITP. So this is a long-term joint venture with Rolls-Royce, and we took over full ownership just before the end of December. So I think, more on this as we go forward. Significant point to note: I'll just remind everybody, when the put option was announced, one of the advantages that this means is that they're a risk and revenue-sharing partner for us. And we've been through a lot of the risks on XWB and the development that they've done on XWB. We're now coming into the revenue bit. And so this is a great opportunity to actually capture 100% of that revenue flowing through that risk and revenue partnership rather than just 50% of it, which is where we were before. So I think that's the sort of the good news part about acquiring ITP. Meanwhile, we're working through getting our heads around the rest of their business. It will be continued to be reported at slightly arm's lengths like that. That's a contractual obligation. The business does actually do a certain amount of activity for our competitors, and for that reason, we won't be integrating it fully with the rest of the group.

Now I want to step back, change gear for a moment or 2 and talk about group-level priorities. These are the priorities that we set 12 months ago, and I'm just going to quickly whiz across the chart here. Of course, there are actually 6 priorities, not 4, because the box on the left is a cheat box containing 3, where we strengthen our focus on engineering, operational and service excellence.
