Switching to the first of these boxes, engineering excellence. So there are 3 stages, right? You have science, technology and then engineering because engineering is all about taming science for our benefit. And the good news is we're making significant progress in all of those 3 areas. During the year, we did a bit of restructuring with our engineering and technology organization; and pushed engineering, the right-hand side of the chart, much closer into our businesses. So we took away some of the central engineering, put it closer in the businesses, closer to the customers, closer to the projects and programs that really matter. That's the engineering end of it. Meanwhile, coming back towards the left of the chart, the technology piece, we actually created a Chief Technology Officer. And that has enabled us to get a lot more focus on future technologies and addressing things like the change in mix of skills that we need over the next decade or so; adjusting the balance between thermal and mechanical, pretty much thermal and mechanical only, and a little electrical; and tilting that balance; and getting our skill set a bit more aligned to the future.

Operational excellence. Well, clearly, we continued the modernization of Rolls-Royce production facilities, more investment going on there, more use of up-to-date technology. And that enables us to do things, like deliver on the promised production ramp. We need to worry about how much it costs us to produce all those more things, and so clearly we have a lot of activity focused on how we improve productivity. And there are all sorts of examples such as the ones shown on the slide, where some of them are incremental improvements in productivity. Some of them are like the example on the slide which is completely transformational, a task which was done in one way and has been done in that way for many years now being done in a completely different and modern way. And when we roll out more of those sorts of things around the business, we'll see more productivity improvement. In terms of operational excellence, it isn't all about manufacturing. Some of it is just rigor and discipline and an execution mindset in managing the operation. And that's delivered the excellent increase in profitability in our Power Systems business, shown on the right of the slide there.

Service excellence. This business is about installing engines, whether they're on airplanes or whether they're in other pieces of kit. And then they go into environments where it's absolutely necessary for that engine to perform and generate useful power. And so there's a -- this is where the service opportunity comes from. So clearly we've been active in doing things like Power by the Hour in our Civil Aerospace for many years. And one of the things we've done recently is put geographically or put in region close to our customers some of these service centers. And in fact, I opened the latest -- or the final move in that sequence in the Middle East last week.

In terms of the focus on providing that service, we also need to worry about how much it costs us to provide the service, not just to be very nice to our customers. And so we continue progressing on reducing the costs there.

And then if you look across our business. We can actually take some of the lessons that we've learned over many years in Civil Aerospace and apply it to other parts of our business. So in Power Systems where

we have that massive installed base of 140,000 engines, growing by a significant number each year. And so what we've done is actually take some people out of the Civil Aerospace business and replicate the model in our Power Systems business. I mentioned 12 months ago that we were going to do that. We've done it, and we've secured the first really significant long-term contract deploying that approach.

We obviously talked quite a lot over recent years about a transformation program and saving GBP 200 million of costs at an annual run rate by the end of 2017. There were progress reports underway. That's now behind us, and it's done. It wasn't all about cost reduction. It was a little bit about simplicity as well. And the good news is that we have achieved some progress on simplicity, but we have a lot more to go. There is more complexity in the business. And that is why we've announced the next piece of restructuring and simplification around our business.

The next priority was around building trust and -- rebuilding trust and confidence. And I think there it's a matter of -- I'm very pleased that in the main we have either delivered on what we said we will deliver, green boxes. Or at least we've been transparent when some of the delivery has been delayed, orange boxes on the slide. And I don't think I need to go into more detail than that at this stage.

Another builder of trust and confidence is really, okay, so that's all glorious, but show me the money. And we have been consistent about talking about growing cash generation in this business. And then when we presented our results 12 months ago, we first talked about, well, yes, GBP 1 billion -- about GBP 1 billion of free cash flow by about 2020. We're still on track to do that, and the building blocks which enable that to happen are still absolutely in place. And very simply, it's about making more money come into the business and stop money leaking out of the business or reduce the amount of money leaking out of the business. And so yes, we are seeing the business model work, increase in engine flying hours. Good news, we are seeing an increase in cash from improving performance in non-aero businesses. Yes, we are seeing reductions in cash outflows right across through whether it's the cash we spend on delivering engines or whether it's the cash we spend on indirect costs elsewhere around the business. It's all very well to talk about a fantastic service opportunity, but of course this is also an opportunity for money to go out of the door, and so we need to focus on reducing the cost of delivering on all of that service. And it's very easy to spend an awful lot of money in this type of business on investing in technology and R&D, so we pay careful attention to the allocation of capital there. And I think the goal that we have set out before about that being broadly flat over the coming years is absolutely intact.

The final priority I had last year was about developing our long-term vision and strategy, and I'll talk more about this after Stephen has added some color to the numbers. I will return to that very slide.

So I think, to summarize on this section. I think we have demonstrated good progress in at least 3 out of the 4 boxes. And probably, the fourth one there with the question mark, it's not really for us to judge. That's more for you. But I'm quite pleased with the progress in 2017.

Now over to Stephen.

Stephen Wayne Daintith
CFO & Executive Director

Great. Thank you very much. Thanks, Warren.

Morning, everybody. Apologies in advance for the large number of finance slides, but as a relative newcomer -- and there's a lot of really interesting things to talk about at Rolls-Royce, so if you'll forgive me that. And I'll go through, but we're trying to add a bit more granularity and transparency to our numbers as well to try and sort of lift the fog a little and bring the business to life. So hopefully, you'll appreciate the extra slides that we've slotted in.

So there's the order.

The full year results. I think the first number I always look at is revenue growth. Warren talked about momentum, good momentum within the business. I'll go into the revenue in a bit more detail on the next slide. A little bit of gross margin compression due to the OE mix as a proportion of revenues. That's the

big driver there. But encouragingly, growth in free cash flow as we head towards that around GBP 1 billion by around 2020. So I think encouraging results all around.

Looking at the revenue growth. And the way I sort of look at the business is sort of 3 core revenue streams. We've got the OE revenue; the long-term service -- agreement service revenue; and then the other service revenue, the time-and-material type service revenue. And again, what I think is to be liked about on Rolls-Royce is the visibility, the very good visibility in particular, about the first 2 revenue streams. The OE revenue, we've got good visibility of the order book and pricing on the order book and so on. Long-term service agreements, 4,400 installed engines, growing to over 6,000 engines over the next few years, good visibility around that. And still good visibility on the other service revenue, less so than the first 2 but still good visibility there as well. So there's good visibility of revenues, strong growth across all 3 revenue streams and the gross margin compression that I talked about, just running through those numbers. Good growth across all 3.

Moving into the next line in the income statement, research and development. Our gross research and development actually increased by a little bit year-on-year. After third-party contributions, our net R&D spend, that's that GBP 1,035 million number that Warren showed on his earlier slide, up 7%. Amortization, we add that back on. And then we -- as a cost; and then the amount that we capitalized up on last year, which I'll come to in a second; and then the risk and revenue sharing partner contributions, getting us down to a charge that is somewhat lower than last year on an income statement basis but clearly at the gross level and on a net level higher than last year. The increased investment is largely in Civil Aerospace, 3 wide-body engines entering or engines in service, the Advance development programs that Warren mentioned and then the UltraFan making up the key components of that increase and the key part of the GBP 1 billion in total.

In 2018, we expect net research and development to increase by around GBP 50 million year-on-year. And so those are key numbers there.

So looking at Civil Aerospace research and development in a little more detail. And the UltraFan is targeting 25% fuel efficiency. And we've also taken the opportunity to look at the application of our research and development policy; and bring it in line with our peers, particularly MTU and Safran. And what we've done is we've started capitalization a little bit earlier in the process, and we're ending capitalization a little bit later in the process. And the impact there in 2017 was GBP 83 million, taking it up to total capitalization of GBP 342 million in the year, rising to around GBP 400 million in 2018. It's this is around better alignment with industry practice.

Looking on to commercial and administrative costs. We have around GBP 1.2 billion of C&A costs in our income statement. And I put on the right-hand side there what the key lines of expenditure are: general management, comms, finance and so on. And I will say that, the initial phase of the restructuring program that Warren mentioned, the focus will be here. There'll be several waves to the program. And we'll tell you more about this and share more with you at our Capital Markets Day in mid-June, but the strapline that we're using is a "lean corporate center and empowered businesses." And so the first phase of attention will be very much on C&A costs of the GBP 1.2 billion that we're highlighting today, which is pretty much flat year-on-year.

Looking at our group cash flow. So what are the material drivers of the GBP 173 million growth in free cash flow? Well, first of all, we have cash outflows from the high installed engine production in civil. So whilst we continue to make progress on engines like the XWB-84, the average cash margin, as we'll see shortly, is flat year-on-year at GBP 1.6 million. And we're actually building and delivering more than the previous year, than in 2016, so there is an increase in the cash outflow as a consequence of that. On the other hand, though, we get increased cash revenues from the aftermarket growth. We'll see that in a little while in the Civil Aerospace cash slide. The Trent 900, 1000 engine issues, GBP 170 million of cash outflow in 2017; doubling to around GBP 340 million therefore in 2018, as we've highlighted today. That's a drag on cash flow. The strong Power Systems margin improvement, good cash flow improvement in Power Systems in both profit and in working capital management, as we'll see later. A little more increase in CapEx on facility modernization to cope with the ramp-up in production and to deal with the engine issues that we've talked about a little while ago. Higher future program R&D investment, again mainly in civil, but

improved working capital management, which is a part of doing business within Rolls-Royce and then a feature of our business, which we'll talk about later. A little bit more tax largely due to the change in mix of -- the geographical mix of profits but then slightly reduced pension payments, getting us down to the GBP 173 million increase in free cash flow.

We're guiding today to around GBP 150 million, plus or minus GBP 100 million, in 2018. That excludes ITP. We completed that on the 19th of December. That is looking at a cash outflow in 2018 of around GBP 50 million, but then we have indicated moving to around a break-even position in 2019, so that's a short-term cash outflow for that business.

So business unit review, going through the businesses one by one.

Civil Aerospace, 12% growth in OE delivered, of course, by that large growth in engine deliveries; long-term service agreements, 10% growth. The flying hour growth there, Warren mentioned the 12% growth; and the in-production Trent fleet growing at 22%. So very good growth for that business. 17% growth in the time and material revenues, so good growth across all 3 revenue streams giving you that 12% overall, but a gross margin compression driven again by that OE mix change and the impacts therefore within the numbers on Civil Aerospace because we do sell our engines at a deficit and make the profits then in the aftermarket on those long-term contracts.

Trading cash flow is flat year-on-year. And I will show you a breakdown in a little while of just how that moves, all the various moving parts to get you to that flat performance year-on-year.

Looking at those drivers then. Underlying revenue growth, and I've run through many of these already, deliveries up 35%, 12% growth in flying hours. The wide-body fleet is now 4,400. And business aviation services, we don't talk an awful lot about our business aviation services, but it was a very strong aftermarket here, up 18%, 18% revenue growth. The gross margin reduction driven by the OE mix, growth in wide-body and business aviation services. And within the gross margin as well, of course, is the GBP 170 million of cash costs in respect of the Trent 900 and 1000 that I'm sure there'll be quite a few questions on later in this session. So the operating margin: A slight improvement reflects the gross margin decline but it also increasing benefits from, of course, the capitalization treatment and that extra GBP 83 million as a consequence of doing that. And C&A costs were a little bit higher due to some restructuring provisions that had been taken in the year.

Looking at -- then at the cash drivers in civil, and this is a -- building on a slide that we shared with you back at the half year. So the 3 key drivers are, first of all, the OE economics, the cash margin per engine sold. A key driver here to watch out for is the Trent XWB-84. Why are we highlighting the XWB? When we see the order book in a little while and the size of the order book and the profile of it, the significance of the XWB to that future order book highlights the significance of this particular measure. Service value will be driven by the growth in the installed engine base, growth in flying hours, the efficiencies of shop visits. And then cost management and capital, focus on operations, C&A costs. This is the cost base getting our overheads under control, putting rigor into our capital allocation decisions and continued working capital management.

So looking at our engine deliveries, 35% growth. We're guiding today to around 550 engines delivered. And these are engines delivered, that's invoiced. We build -- we built just over 500 engines in 2017. And I think, in 2018, we'll be heading towards building around 600 engines or so to deliver those 550. So record levels of wide-body deliveries, 483 moving to 550 next year.

Looking at the economics then, the XWB. We highlighted in 2016 a 7% compression of the deficit; and 37% in 2017, largely price driven rather than cost driven. Of course, we would rather it be more cost driven than price driven, but we will take the benefit. And we do see the route through to the break-even position by 2020, and this chart here just sort of highlights that in a very simple way. And what causes the drag, therefore, on the margin, staying flat at GBP 1.6 million? So notwithstanding the progress on the 84, the Trent 900 has some temporary pricing impact that's dragging the gross margin down. And the Trent 700 has had a good year of sales as it enters its final 1 or 2 years of -- a couple of years of its OE experience, so to speak, of its selling experience. And there's some pricing discounting going on in its final

couple of years as it heads towards the becoming a sole aftermarket product. And there's a bit of price going on there to compress the margin as well. So those are the 2 drivers to flat year-on-year.

Looking at the fleet performance. So the in-service fleet, large engines 7% growth. And the Trent fleet is 11%, to 3,300. The flying hours 12% across the wide-body fleet. And the in-production fleet growth is 22%. That's up on the 15% of last year and the 15% that we reported at the half year, so good momentum within the Trent in-production fleet.

Overhauls. This is -- [and it's repeated] data. And as we look forward, we'll get familiar with this and how sensitive our cash trajectory is to the number of shop visits that take place in the year. And just for absolute sake of clarity, these are the overhauls, the scheduled long-term service agreement overhauls that take place every sort of 5, 6 years or so. So flat year-on-year at 240 and despite the growth in the installed fleet. I should point out, though, there's a number down here at the bottom left, that 350 -- sorry. We'll go back to this one. And which is the -- there you go. 350 check and repair overhauls, and that includes hospital visits as well. So for example, the Trent 1000 shop visits will be within that 350. The 240 is more the regularized schedules, long-term service agreement shop visits that we anticipate. And the bit in the bottom left, there'll be very small check and repair overhauls, but there will be a bundle in there that are the Trent 1000 and 900 shop visits, just for the sake of clarity.

So trading cash flow. So this is the 2017-versus-2016 comparative. How do we get to that flat performance year-on-year? So the 443 -- 444 original equipment at GBP 1.6 million gets you to 0.7. The spare engines gets you to the 483 in total. 12.6 million flying hours gets you to GBP 1.3 billion of aftermarket cash compared to the -- aftermarket cash margin compared to the GBP 1 million -- GBP 1 billion, I should say, in 2016, so you can see the wide-body cash margin growing from GBP 700 million to GBP 800 million. Business and regional, flat year-on-year at GBP 700 million; V2500 around \$300 million; and then certain operations and engineering costs taking us down to a cash gross margin of GBP 1.1 billion. C&A, GBP 0.3 billion, GBP 300 million. R&D, rising a little bit to GBP 700 million. CapEx, up a little bit to GBP 500 million. Working capital benefits, which we'll talk about a little later, gets you to that trading cash flow performance.

So you can start to see the key drivers of free cash flow very much around those top 2 or 3 lines that get you to the wide-body cash margin. So let's look at those in a little bit more detail.

There's the R&D and the CapEx.

What we've tried to do with this slide is show some of the likely trends over the next 5 years. And again, I would emphasize the point that it will not be linear, so we just shouldn't next be looking for these sorts of growth rates exactly on a linear basis. They will be lumpy, but we're pointing to around 5 years from now what might the world look like. And just for -- just before we get into the chart, looking at the bottom left there as well. We've indicated the -- what the order book looks like. So to put it in context: Again, the significance of the Trent XWB; and 2,500 engines on order, so good visibility, going back to that point about the visibility of revenues. And 1,400 of that 2,500 is the XWB. And so -- and that visibility helps us therefore when thinking about over the next 5 years what the growth rates might be.

So installed engine deliveries, 444 in '17. 39 gets you to that 483. We're looking at around 5% compound annual growth rate over the next 5 years for those two. Cash deficit per engine, currently an average of GBP 1.6 million. We're aiming to get towards GBP 0.4 million cash deficit per engine by 2022 or over the next 5 years or so. The in-service fleet, 4,400, we think, is going to be growing at around 8% on a compound annual growth rate over the next 5 years. Invoiced flying hours, in line with the growth in the installed fleets and our projections on traffic and so on, growing at around 10%. And then the shop visits will grow in line with the growth of the installed base. And these are the long-term service agreement shop visits, going back to that 240 comparable that I ran through a second ago. R&D and CapEx and commercial and admin costs, broadly stable R&D and CapEx. And commercial and admin costs, we put stable. If anything, we'd hope to see reductions here, stable if not reducing on commercial and admin costs.

So these are the key drivers for Civil Aerospace over the next 5 years.

Very quickly running through the programs. And Warren did make the point as well. There is -- we talk and with very good reason around the 900 and 1000, but over 80% of the fleet is flying very well; the Trent 700 in particular, 1,600 engines in service, 9% flying hour growth in the year and a very good dispatch reliability. The Trent 800, good performance there, smaller part of the fleet, 13 aircraft transitions in 2017. We had a high point of transitions in 2017 than ever before. We've been pretty successful in transitions during the year. Trent 7000 came into service during 2018. And then the XWB-84 total cumulative flight fleet hours have now gone past 1.2 million flying hours on the Trent XWB-84.

We have, however, had significant issues on the 1000 and the 900. And I'm sure we'll go through this in some detail in the Q&A. And we are highlighting today a GBP 170 million cash cost across both engines. About GBP 120 million of that is in the 1000, and GBP 50 million of that is in the 90 (sic) [900]. And we highlighted also the in-service cost issues, the GBP 179 million and GBP 48 million. I will talk about that, I'm sure, during the Q&A.

Power Systems, the standout performance, I think as Warren said, across the group; and good revenue growth, 3%, particularly in service revenue; and a terrific improvement in profitability. And that flowed through to cash flow performance as well and not just through profit growth but also -- it's also through working capital management.

The key drivers of that. The chart on the left here just puts the performance of Power Systems in 2017 into very stark numbers; and 11.3% return on sales; and revenue, record revenues, and profits for Power Systems in 2017. So a relatively new leadership, a reinvigorated leadership team at Power Systems and, as we'll see in a second, tackling the business on a variety of fronts. So good revenue growth, a better H1-H2 mix in the business, helping improve both margins but also factory utilization. R&D spend, down 6%; real focus and rigor around R&D spend and on C&A costs as well. So a really good knockout performance in Power Systems across a variety of fronts.

I won't dwell on the details here, but these are some of the details of the performance improvements on a performance push but also structural cost reduction as well. Over the last 2 years, a 30% reduction in product variants in Power Systems. So these comparatives are '15 v '17, just in case you're looking for numbers consistent with the rest of the pack. And the focus across a variety of fronts, at the bottom there.

Defence, a resilient performance, reporting revenue down just 1%, so a pretty solid performance. Operating profit, a little bit down on last year; a little bit of margin compression there. Largely impacted by lower long-term service agreement life cycle cost reductions; the 2 or 3 big programs in the U.K. defense fleet coming towards maturity, the Sea King, which retired, the Typhoon, Tornado, dampening profits there to an extent. As we go through those drivers, OE revenue is up. Transport petroleum, the U.S. in particular, have done well, partly offset by lower combat sales; and then growing combat services in the F-35 LiftSystem. But then I've mentioned the Sea King fleet retirement hitting the export market. The gross margin, adverse mix there, lower legacy spares volumes and lower one-off long-term service agreement releases than previously. We do, however, benefit from the nonrepeat of the last year's TP400 charges, GBP 31 million, in there. R&D costs are up 10% as well as we developed the future transport program spend, and that's around the Advance program that Warren mentioned.

Looking at an overview of Defence and the markets. We have a strong position in the U.S.; renewed that GBP 1.4 billion contract that Warren alluded to. The U.K. is a -- and there are some headwinds in the U.S., the growing impact to the U.S. Department of Defense pricing regulations. The U.K. is a similar market, and it has those single-source pricing regulations, the tightening of the Ministry of Defence budget in 2010, Tornado retirement, a Typhoon contract ending shortly. So the U.K. markets is a little tougher market.

And the export market has been a tough market for the Defence business as well in 2017. And we saw it continuing to an extent in 2018, but there are some good export opportunities, and I'm sure we'll get through those in the Q&A.

Marine and Nuclear, I won't dwell on these numbers. Marine continuing to operate in tough markets, down 9%; but costs are down by 13%, delivering that flat year-on-year performance. And you'll have read

about and we'll be talking more about our strategic review. In Nuclear, revenue is up 4% but high spend on SMRs in 2017.

IFRS 15, quick word on this. Just a reminder, no change to cash flow from IFRS 15. We welcome this new accounting standard. I think it makes it easier to understand our business without the distortion of the -- of capitalizing the OE losses. And we understand exact -- and there's, as you might expect, a greater connection between profits and cash flow as a consequence.

I'll highlight down here in the box at the bottom right, the greater forecasting challenge in the civil aftermarket around not the revenue scene but around sort of the profits and the -- in its own way, the number of shop visits that are going to take place each year. So rather than, under old accounting, on a flying hour basis, revenues and profits will only be recognized when a shop visit takes place. So that would be the big difference in the sensitivity of the phasing of the overhauls but also the mix and the workscope of the overhauls as well, the type of work overhauls to take place. So it's the first year of adoption. We're still learning, but it will be much greater transparency to our business.

The impact in 2017. So 2017 number, operating profit of GBP 1,175 million goes to -- the reduction is GBP 854 million, getting us to GBP 321 million of profits in 2017 on a new basis. And that is the basis now that we're working towards as we give our guidance for 2018 profits of around GBP 400 million or so. And the key driver of the difference in store, in very simple terms, the absolute material key driver is that 0 -- GBP 700 million widebody cash deficit, which now flows through our numbers immediately on sale rather than being capitalized and amortized over the life of the contracts.

Here are the major drivers: the volumes, costs and so on. Sorry, [Warren,] a little bit longer on that. And then the service revenue and margins, well, these are the key items that we will make profit and revenue flex according to actual performance.

One thing that we should make clear, long-term contract accounting doesn't go away completely because in the aftermarket, we still have to take a view on the long-term contract percentage, margin percentage of each contract. So that still comes into play. So there will still be that element there. We don't completely lose that aspect of long-term contract accounting.

A couple of other accounting issues on the horizon. IFRS 9, no material impact. This is around just simplified accounting for financial instruments but no real material impact for Rolls-Royce. IFRS 16, with effect from the 1st of January next year, will be bringing all of our leases onto our balance sheet. And at the half year, we'll share more details with you on how that impacts our numbers.

The rating agencies, in case the question comes up, are already familiar with this and look at free cash flow and take this number into account in any event as they assess the health of our business.

Outlook and guidance. We put this table in the pack this morning. We thought it's helpful just to summarize it all in one place. We are looking at mid-single-digit revenue growth for the group. Group operating profit of GBP 400 million, plus or minus GBP 100 million, building from the GBP 321 million. And we've gone through each of the divisions line-by-line there just to explain how we get broadly to that GBP 400 million. And free cash flow, at GBP 400 million plus or minus GBP 100 million. And all of these numbers accommodate the known issues on the Trent 900 and 1000 that we've talked about in our release today.

We have excluded ITP from the numbers below just so that you can see a comparison with the business that you're familiar with today. Just throwing ITP into the mix will reduce cash flow by about GBP 50 million, but it'll increase profit by about GBP 50 million. So just to put context around that as we look into 2018.

Commentary -- I won't repeat the commentary. This is what's all in the pack for each of the businesses, and this is the format that we'll be using at the half year when you'll see the business under the new 3 divisions set up, ITP in there, and then whatever we do with the other and eliminations to get us to a group continuing basis. And that's the shape of the portfolio.

Key drivers to get us to the GBP 450 million, and Warren has pretty much gone through these, so I won't dwell on them. But the large driver there, increased cash revenues from the aftermarket growth. And we will continue to see further working capital improvements.

Dividend is held steady at the same level as 2016. It's part of our overall capital allocation considerations. Our Capital Markets Day in the middle of June, we'll look at capital allocation, returns on capital as well as looking at our progress on our restructuring program. When we look at our dividend, we're making the conscious linkage to free cash flow. And the growth in free cash flow will be the guide for us to the appropriate time to review our dividend policy and revisit that.

So in summary, good performance, encouraging results. These are the priorities that I sort of set myself when I highlighted at the half year, areas that I'd be looking at. I think just a couple of things on this. Costs, restructuring has been announced. Cash, I hope you'll see some enhanced analysis of cash flow. We've changed the internal language as well. We went through our budget process, medium-term plan process, recently. And what absolutely delighted me, I didn't realize it that at the end of the process, we didn't talk profit once throughout the whole process. The whole senior management team had a slight crack, "we should -- maybe we should have thought about the profit number." But it was cash, which is the internal language.

And the incentive schemes as well. We've now moved 75% of the weighting of our management bonus schemes to cash flow, which I think is an encouraging sign. Clearing the fog, hopefully, the drivers of performance that I've highlighted there are helpful there.

Balance sheet and capital allocation. We've introduced the new investment approval process. We're looking at return on capital targets that's for the Capital Markets Day. And then the finance team, 4 clear priorities for us to 2018. And one of those that I'm somewhat embarrassingly very excited about is value-based modeling, which is a rolling 5-year forecast, a real-time rolling 5-year forecast across the group on a driver basis. And I'm told that, that -- that we're going to see some very exciting results in 2 weeks' time as to where we've got to on that one with a whole bunch of metrics that drive a 5-year view of the business. So working on that.

So in summary, delivering priorities, improving financial performance, our focus on cash running throughout the organization, and the restructuring program will help drive further pace and simplification and efficiency.

Thank you very much.

D. Warren A. East
CEO & Executive Director

Thanks, Stephen. Just to a few slides of summary here before we do questions.

First of all, returning to the vision and strategy. So we said we'd address this during last year, and we did. And if you look at Rolls-Royce, well, a lot of our business is about aerospace. And what that means is that we have great domain knowledge in the aerospace world, but it doesn't necessarily make us an aerospace company. In fact, when I go around and talked when I first joined the business, I talked to lots of people around Rolls-Royce and asked them about what's Rolls-Royce really all about. And the answer is about power. And it's about, basically, I express it as converting stored energy into useful power. And that's what we do across all of the applications that we serve through all the different types of engine that we produce. And historically, a lot of that has been around better performance and better costs. And increasingly, as we look forward, it's around more efficiency and cleanliness and attention to the environment.

And so we rephrased our vision as around pioneering the power that matters. And that's because if I look at how we've done that historically, it's always been around using the cutting-edge technologies of the time. And actually, there's no reason why that shouldn't continue going forward. In fact, as we address issues like creating cleaner, safer, more-efficient engines, then we have to embrace the best cutting-edge technology. So that's the summary.

So how do we go about doing that? Well, down at the bottom of the slide, we talk about a balanced portfolio. And you've heard this from Rolls-Royce before, and we've talked about long-cycle businesses and short-cycle businesses, and that's kind of business 101, financial common sense. But actually, each of these businesses uses slightly different technologies, and the technologies flow through. And what is important to one type of business and [turn] market sector at one stage perhaps applies at a different stage, a different time in another sector.

And so included in the balance, as far as I'm concerned, is flowing of technologies through the different markets and businesses that we serve and exchange in both directions and exchange of the way in which we go about to execution as well. So for example, in our Power Systems business, there is an awful lot of electrification. Electrification is an inescapable trend in industrial markets today. And that includes in Aerospace, in due course, but it's actually present today in many of the markets that we serve through our Power Systems business. And so there's a clear flow of taking the electrical systems expertise that we developed and practice with real customers and real applications and tough environments in our Power Systems business. We take that system expertise in one direction, and we map it into a domain expertise from aerospace in the other direction. And so that's what championing electrification is all about.

At the same time, of course, electrification is not going to hit widebody airplanes in the mainstream for many years. And so it's absolutely essential that we remain cutting-edge in terms of our gas turbine capability. And that's what vitalizing our existing capabilities is all about.

And then how do we go about delivering all that? Well, it's about embracing things like more digital technology today. And a lot of that isn't just in the service end. Some of it is in the design end of our operations, linking our designs with our suppliers and with our customers. So that's what reinventing with digital is all about. And a good example of that applied in service and an example of applying that to the balanced portfolio is the way I talked earlier about taking the service model out of our Civil Aerospace piece and moving it into our Power Systems business.

And then generally transforming our business and modernizing it and making it fit for the 20th century -- 21st century rather. This is what the box on the right-hand side of the chart is all about, and there's a picture of applying optical measurements instead of mechanical measurements in our production process.

So the other sort of big picture thing that we've done is talk about restructuring our business from 5 to 3, and I just wanted to a little bit more depth on what we've done there. So if you look at the 2 -- at the top line, our 5 businesses; and the 2 on the right-hand side, Nuclear and Marine.

Well, we've taken the submarines part out of our Nuclear business, and we've put that into Defence, the customer is the same, and so it's an alignment with customer. And we've taken the services and control systems piece and plugged that into the services and control systems pieces within our Power Systems business because it's a similar type of activity on the one hand and a similar type of technology and product on the other hand.

And in our Marine business, then we've moved the Naval Marine piece, a profitable cash-generative piece, into Defence. Again, customers are the same, and so alignment with customers. And we do have a strategic review on other parts of the Commercial Marine operation. But be under no doubt that we will continue to operate in the Marine sector. In fact, through our Power Systems business, that includes a lot of marine applications, a lot of marine customers and a lot of electrification opportunity in the marine sector.

We set ourselves some priorities for 2018, and we'll go through them all now, but clearly oriented, you should read this chart like a clock, starting with customers because they are people that actually pay us the money. And if it wasn't for customers, then we wouldn't have any business. But we do need to focus on that cutting-edge technology so that we develop the best solutions for our customers, and that technology has always been the foundation of our business and will continue to be so. Of course, it's a business, and so financial progress is really important not only so that you guys can feel happy but also so that we can generate enough cash to invest in the future of our business, make it more resilient in that resilient box as well as the output from the financial piece. We have the people piece because the people are the key differentiator around our business, and it's all about values and behaviors.

So summarizing. In 2017, encouraging; 2018, we think it's going to be a year of significant progress. We've got some clear priorities for the team. And as we look forward, we remain pretty optimistic about the future, growing market share into growing markets and growing profitability. And with that, we'll deal with whatever questions you may have.

Question and Answer

D. Warren A. East

CEO & Executive Director

Right then. Where are we going to start? Let's -- I think let's start here. Microphone. And then -- and we'll go along this second row.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Warren, I have a 2-part question about cash flow actually. So kind of starting more tactically, versus last year, ostensibly, things look a lot better given that you're giving an outlook for positive trajectory in cash flow in 2018 whilst absorbing several hundred million of what was presumably unanticipated costs last year this time relating to 1000 and 900. So if you could talk a little bit specifically about what are the positive offsets within that guidance, particularly in this coming year; and then more broadly, over the next several years, from just a higher level, how the restructuring progress has impacted the building blocks you've previously talked about towards about GBP 1 billion cash flow or so target in 2020. And apologies, maybe this is in Stephen's lane right now.

D. Warren A. East

CEO & Executive Director

Okay. So Stephen's going to answer the first bit.

Stephen Wayne Daintith

CFO & Executive Director

Yes. So just to clarify all the numbers, we've highlighted GBP 170 million in '17 on 900 and 1000 doubling to the peak year next year of around GBP 340 million. And notwithstanding that, we're reporting GBP 450 million free cash flow. So one might do the sums and think, "Well, if it weren't for that." I think a couple of things. We carry within our guidance and, indeed, within our business plans around GBP 100 million of cash contingency within our numbers for engine issues in any event. So that's -- that automatically brings the number down a little bit. What are the positive contributors? Well, I think we've pointed to it really, I think, in the slides that the aftermarket growth is a big driver of the cash flow performance. And also, at the same time, it is the reduced OE losses is another key driver and working capital benefits, as we've reported today, around GBP 550 million of working capital. It is the nature of our industry, the negative working capital aspects of particularly Rolls-Royce as an OE manufacturer, that there are customer deposits we take in advance. And when we invoice our customers, the airframe, as we invoice on a gross basis and we pay the concession fee, later, the discount fee to the operator; and after a couple 2 or 3 months later when the engine is in service, so you will get -- in a growing business, you'll get that benefit over a cutoff period at the year-end, for example. And the growing business, you'll get a year-on-year benefit there as well. So those are the big drivers, those positive contributors. And the next question was around the GBP 1 billion, wasn't it?

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Well, basically, just kind of from a higher-level perspective, and it's something Warren's talked about a lot over the last 18 months, building blocks towards a -- the target of around GBP 1 billion around 2020 or so. So just in tying that into the progress you've made just in the last year and the restructuring, how that ties into the specific building blocks, if that makes sense.

D. Warren A. East

CEO & Executive Director

Okay. So I mean, I think over the last year, it's been pretty much according to plan. I mean, arguably, yes, we probably didn't have quite as much in our own minds as contingency, as Stephen just spoke

about, for the engine issues, so we -- arguably, we could be a little bit ahead of, perhaps, the plan. But we always did say about GBP 1 billion by about 2020. And a lot of good things could happen, and we'd be ahead; and a lot of bad things could happen, and we'd be behind. So I think we're broadly on track. In terms of restructuring, well, 5 units to 3 units is undoubtedly less complex to manage. And simplicity is a fundamental plank of what we need to do to modernize this business and make it competitive. I think in terms of restructuring, how does it affect the fundamental building blocks? Well, anything we can do on simplicity can improve cost, and that is helping us achieve the closing of the cost deficit -- of the cash deficit on OE sales, and that's a key plank of the driver to GBP 1 billion. It's going to help improve the cost of service, and that's also a key plank on the driver to GBP 1 billion. Difference between '17 and '20 is roughly 2/3 of it is Civil Aerospace, those 2 blocks. It's clearly going to help us also with the other piece, which is group-wide general costs, G&A expenditure. And it enables us to put more focus on technology, and so delivering better into the future. And one of the other things that we hope to achieve through the restructuring isn't just moving pieces around our organization chart, it's actually changing what it is that people do on a day-to-day basis to make it easier for them to do their jobs on a day-to-day basis and inject, perhaps, group-wide some of the rigor, discipline and execution mindset that we've seen so strongly in our Power Systems business in 2018.

We've got one behind there, and then we're going along the row that way.

Jaime Bann Rowbotham

Deutsche Bank AG, Research Division

Jaime Rowbotham from Deutsche Bank. Two from me: one on trading cash in Civil; and the other on XWB. Stephen, looking at Slide 40, the way you've presented the trading cash from Civil, that's very helpful. Just thinking about the dynamics going into 2018, I think you've guided elsewhere that the cash loss on OE probably steps up again in 2018. Clearly, aftermarket underlying should also go up in a positive way but offset by the in-service cost step-up on Trent 1000. Do you actually see a positive delta on Civil trading cash flow in 2018 contributing to the step-up in group free cash flow to GBP 450 million?

Stephen Wayne Daintith

CFO & Executive Director

You touched on a good point. Yes but not materially for the very fact of the OE. The OE margin reduction will take time to flow through. So that's why we're using sort of 2020 sort of breakeven. So it's a good point. And yes, it will grow, but you shouldn't be expecting material growth in cash flow in Civil on the year, yes.

Jaime Bann Rowbotham

Deutsche Bank AG, Research Division

Okay. And just on XWB, could I ask how the ramp-up is going on the -97K compared to 87K? I think we've seen some airlines switching their orders from the -1000 to the -900 of the A350, United and Cathay, I think, just at the end of last year. Presumably that's -- whilst that's a boost to you achieving that breakeven on 84K by 2020 that you showed on the slide, it's perhaps a slight hindrance to achieving breakeven maybe a couple of years later on the 97K. Anything you can say on that would be helpful.

D. Warren A. East

CEO & Executive Director

Yes, well, we've seen a small amount of that sort of order shifting. And frankly, I sat here before and talked about small changes in the order book are inevitable after a period of such exuberant ordering. But now that the 97K is in service, then we don't actually see any issues as far as ramp-up is concerned. Volumes will continue to be dominated by 84K. But I don't see any signs on the horizon of a material change in the shape of the 97K backlog.

Robert Alan Stallard

Vertical Research Partners, LLC

Rob Stallard from Vertical. A couple of questions. In your slides, you noted that the shop visits are expected to roughly double over the next 5 years. I was wondering if you could give us some idea of the profile, how that's likely to pan out over the next 5 years and the likely cash implications. And then maybe, Warren, one for you. Boeing, talking about the NMA, a lot of talk about that potentially entering service in the middle of the next decade. What's Rolls-Royce's latest position with regards to that potential program and your interest of being on that plane?

D. Warren A. East

CEO & Executive Director

Okay, thanks. Do you want to do shop visits?

Stephen Wayne Daintith

CFO & Executive Director

Yes, so on shop visits, so the 240 rising to around 600 or so, and that is a reflection of the in-store fleet. I think you'll see it more sort of start to accelerate in the later of those years rather than in the earlier of those years. We have a relatively high proportion of young engines, so to speak, and that will therefore lead to -- but then it will pick up as they start approaching their first shop visit, as you would expect, after sort of 5 years or so. So that's that. And as it comes to the sort of the cash implications of that, well, we're investing hard in our services space generally to better understand engine performance. And a large part of our digital drive is, in fact, looking at engine health performance and then being able to better anticipate having the right parts in the right locations when the shop visits take place. So we'd hope to see some improved economics there. But net-net, whilst one might see around the time of the shop visits a reduced cash margin as you might expect, in absolute terms, you're going to see very good growth just driven by that growth in flying hours to that high number from the 12.5 million flying hours today.

D. Warren A. East

CEO & Executive Director

Yes. And the second question on Boeing and the NMA, well, right now, this -- there continues to be a lot of discussion about that, but there's no committed program. We're in the business of selling engines, and so naturally, we would want to go after that opportunity. Now if it makes commercial sense as an individual opportunity to pursue that, strategically, it makes perfect sense for us to go after that, and that's what we're doing.

Let's walk back up that side and then -- we'll do that one, and then we'll do that one, and then we'll go over there.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami Myerson from Investec. Two questions. The first question is around the order book. The slide you put up, you got 2,500 engines in order. And based on your planned production rates, you will probably exhaust that order book or a similar amount within the next 5 years. And order intake for Trents has not been particularly strong in recent years. So yes, how do you think about order intake momentum or book-to-bill over the next few years would be the first question?

D. Warren A. East

CEO & Executive Director

Yes. So I think, actually, over the last 18 months or so, book-to-bill has held up remarkably well. And a bit like the answer to the previous question, after the exuberant period of ordering, we would absolutely expect to see the absolute size of our backlog decline. But as we look at airline customers and their plans to modernize their fleet, then subject to what happens in the competitions, we don't see a problem with replenishing our order book, obviously, subject to what the happens with the competitions and no competitive situations between different airframes as well. Unfortunately, we can't sort of control all of that.

Rami Yehuda Myerson

spglobal.com/marketintelligence

Investec Bank plc, Research Division

And second question, maybe more for Stephen, around the transition from TotalCare to the SelectCare and other models, it was an interesting comment around Singapore Air moving some of its fleet into new TotalCare long-term service agreement business models. How should we think about that transition, of actually quite a large number of aircraft moving into those models impacting the cash generation from your services business?

Stephen Wayne Daintith

CFO & Executive Director

Well, relatively immaterial impact. I mean, TotalCare is the -- in a vast proportion -- a vast majority of the fleet. Well over 90% is on TotalCare. And that's the model of choice, and that's what customers prefer, so a small impact.

Celine Fornaro

UBS Investment Bank, Research Division

Celine Fornaro from UBS. I've got 2 questions, if I may. The first one would be on the IAE contribution for 2017 and what we're looking at for 2018 and how you're thinking about that over your 5-year chart. And my second question is looking at some of the focus you had on the customer and how you are delivering for the customer in Aerospace. So if we look at the A330neo, if you could just comment on the delays that you've had on the engine side there and what are the issues related to; similarly, on the XWB larger engine. And what I'm getting at is, are we sure that the issues that we've encountered on the Trent 1000 and 900 are not going to come up in 2 years' time on the XWB? And how much are you investing in simulation tools if we are going to go for NMA engine?

Stephen Wayne Daintith

CFO & Executive Director

Okay. So the V2500 question, yes, we are expecting that to continue at around GBP 250 million, GBP 300 million for each of the next 5 years. So -- then you can use that assumption.

D. Warren A. East

CEO & Executive Director

Okay. And talking about the 97K and the Trent 7000, and the probability of issues such as we have seen on the 1000 appearing on newer engines, first of all, yes, the A330neo will be delayed in terms of its entry into service versus the original time plan. And that was actually the case with 97K and the A350-1000 as well. It's not all about engines. The airplanes are complex bit of kit, and there's a lot that goes into it. And the engine is one of those complex bits of kit. We have undoubtedly played our part in the delay for A330neo. However, our delivery schedule for Trent 7000 has been stable now for about the last 6 months or so since -- well, since around the Farnborough Air Show last year, and -- sorry, the Paris Air Show last year. And so I'm reasonably confident that we will be there or thereabouts and not be the issue that's holding up that launch when it happens. As for whether -- and so what you should read from that is that everything you've seen on Trent 1000 has nothing whatsoever to do with any sort of program schedule shifting on the new engines. Obviously, we can't guarantee that there won't be issues with those new engines. It's a complex system, and there's all sorts of interaction between how the thing is used and how it's been designed. What I would say, however, is that the Trent 900 was designed around 2001, and the Trent 1000 was derived -- designed around 2005. And yes, we use different design tools as we move forward, and I'd ask you to consider what's Moore's Law done since 2001 in terms of the compute power that we're able to deploy to design these things. Answer: quite a lot. And that doesn't give me total confidence because you cannot be totally confident in these things, but it gives me a very reassuring feeling. And in terms of pointers in that direction, then it's very encouraging to see the XWB initial performance and compare that with the early years of Trent 1000. And the new design flows and the new design tools that are being used are definitely seen to be having an impact.

Yes, thanks. I think we had one over that side, and then we're going to come across the middle.

Andrew Paul Gollan*Joh. Berenberg, Gossler & Co. KG, Research Division*

Andrew Gollan from Berenberg. Two questions, please. Firstly, on cash flows, traditionally, Rolls-Royce has had very lumpy cash flows throughout the year. So 2 questions around that. Is that profile verticals improving and smoothing? And was there anything within the last month or so that -- or around the year-end that we should know about that have come out in the numbers today? And the second question is on ITP. I think that the first installment was through shares. What do you anticipate the structure of the next payments in the coming year or so, shares or cash?

Stephen Wayne Daintith*CFO & Executive Director*

Can I do that?

D. Warren A. East*CEO & Executive Director*

Yes.

Stephen Wayne Daintith*CFO & Executive Director*

Let me do that. So yes, lumpy cash, we do. We have really lumpy cash flows, and it's sort of struck me that it's coming in -- relatively, it's quite difficult to decipher sort of operational cash flows from -- there's concession payments. There's risk of revenue sharing, partner payments. There's participation fees. There's R&D contributions. And we have big, large, lumpy cash flows. In its own way, I often reflect that giving sort of guidance on hundreds of millions of pounds on a GBP 15 billion revenue business in itself is a little bit sort of difficult. Having said all of that, it is an area that we're paying a lot of attention to, to get -- improve visibility of it and management and planning of it as well. In an ideal world I'd like to systemize it, so we take out that sort of rollercoaster ride that we have, and that's what we're trying to achieve. We're not going to get there overnight. There's a lot to do in this space. But as a -- that whole sort of cash flow, working capital management, as I think there's a very good opportunity within the [Rolls-Royce] to get a much even profile of flows. So we're not there yet. We're focusing on it, but there's still a lot to do. And Warren, ITP?

D. Warren A. East*CEO & Executive Director*

Well, yes -- I mean, yes, the first payment was in shares. We have an agreement where we decide on a quarter-by-quarter basis. And we'll make those decisions subject to very short-term cash requirements. And if I look at a sort of worst case, then a worst case would be in the 3% to 4% dilution range if we -- even if we had to pay for the whole thing in shares. And so that's kind of boundary condition, but we would -- this is over several years. And you can see that we absolutely expect to see our cash flows improve over that period, and therefore, I wouldn't expect the shares to continue right throughout the period.

Stephen Wayne Daintith*CFO & Executive Director*

I didn't mean to skip your questions here about -- around the year-end. If anything, I think it's concession payments that we pay after the engine service to the operator, and yet we bill our -- the airframe on a gross basis. But that's something we get every year, and the impact, therefore, is just -- is the growth year-on-year that, [the what you see] that, it's a driver of our working capital growth.

D. Warren A. East*CEO & Executive Director*

Okay, I think we have to move there. Well, since he's right next to you, why don't you just pass the microphone.

Jeremy David Bragg*Redburn (Europe) Limited, Research Division*

Jeremy Bragg from Redburn. Two questions, one on middle of the market again. Do you think you could hold R&D flat in 2022, i.e. in 5 years' time, if you have to accelerate UltraFan for middle of the market? So conceptual question, i.e. what's it going to cost? And question 2, can you comment on the sort of revenues per engine or per pound of thrust for a new engine versus an old one, i.e. do you see materially higher power by the hour revenues for a similar thrust output engine for an XWB versus an old one? And also, do you see a different overhaul pattern on those engines, please? I'm struggling simplistically to take 3,300 engines divide once every 5 years to get to 260 -- 240 overhaul. So can you help with those things, please?

Stephen Wayne Daintith*CFO & Executive Director*

Yes, right. Let me start with NMA and the R&D cost profile. I mean, the answer is that if we're engaged in that program, it's likely to cost somewhere between GBP 1 billion and GBP 2 billion over a period of probably about 5 years. And what we will endeavor to do is make as much of that cost as possible overlap with the underlying architecture development, which is the UltraFan program. We need to do that new architecture because we need to be competitive for larger engines in the back end of the next decade. If there's an opportunity to take some of that investment, convert it into an NMA program and start to monetize that investment a few years sooner than we would otherwise be monetizing it, then it sounds like a pretty sensible thing to do. But it isn't going to come completely free of charge. We understand that. And so in terms of absolute, would we be spending absolutely the same amount of money in 2022 as with or without NMA? No, we -- it is bound to cost us a little more. But in the scheme of how much we spend on R&D in total, how much we intend to spend on R&D in total, it's going to be a small perturbation rather than a massive change. With regards to are we getting much more out of newer engines, the answer is it depends. The pricing matrix is complex, and we try to secure on a basic principle, more value to the customer means more money to Rolls-Royce. So the -- if it's a bigger thrust engine and I can lift more people into the air, then I pay more. And that is consistent, and that works, and people understand it. If I can do that and, at the same time, spend less on the fuel that is required to do it, then part of that value is actually just competed away. It's -- these newer engines are cleaner, they're more efficient, but they need to be in order to maintain our competitive position. If we can secure some -- extract some of that extra benefit that we're giving to the customer, then we do. But I wouldn't sort of bank on us achieving 100% success there. I don't know of any technology sector in the world that the businesses actually achieve that because we'll compete the benefits away.

D. Warren A. East*CEO & Executive Director*

Let's -- I think we need to come this side and at least sort of bring the changes, so the microphone people can get there. Thanks.

Nick Cunningham*Agency Partners LLP*

Nick Cunningham, Agency Partners. A quick question about IFRS 15, and I apologize for asking about profit, which is obviously somewhat *déclassé* nowadays. But there's some -- and as well, it is the starting point for cash flow. The IFRS 15, I think you've indicated in the past that there'll be about GBP 100 million...

Stephen Wayne Daintith*CFO & Executive Director*

Yes.

Nick Cunningham*Agency Partners LLP*

Annual convergence per year towards, if you like, old GAAP...

Stephen Wayne Daintith

CFO & Executive Director

Yes.

Nick Cunningham

Agency Partners LLP

Forecasts, which is a quite helpful sanity check for us when we're doing -- or adopting the IFRS 15 forecast. Obviously, that didn't happen this year. But we can clearly see maybe some of the reasons for that. Is that still a reasonable rule of thumb? That's my first question. And then on R&D, the movement that you indicated, I was wondering if you could expand that a little bit and just, if you like, the important lines of the R&D, what leads to the net R&D? And is it all falling into Civil, is all the delta in Civil, or is there anything else going on there?

Stephen Wayne Daintith

CFO & Executive Director

Right, okay. So IFRS 15, yes, slightly larger impact of just over GBP 100 million or so. And it's actually a good news story that actually explains that sort of GBP 100 million, so more than we expected because we sold more Trent 700s linked profit accounted for in 2017 than we'd anticipated, which is, of course, good news. But there's a GBP 200 million delta because of that, and that's an impact there. Also, a GBP 200 million impact because the Trent 700 sales [are larger], so that was the key delta on it, but your original view is the correct one. And then R&D, yes, just going through the slides, and I'll just get my slide back in front of me again. We started for around GBP 1.4 billion, and then we have contributions from third parties of around GBP 400 million. And the U.K. is the significant contributor, but it's across Germany, the U.S. and other European countries and so on. And that gets us down to our GBP 1 billion. And then we've got the capitalization, amortization of the number that we highlighted there in the pack, but then a capitalization of that spend of around GBP 400 million or so. And the policy application that we've put in is in respect of the -- starting at the preliminary design review rather than engine certification. So once we prove the economics of the engine, we start capitalizing it. And then rather than engine in service for stopping capitalizing, we often carry out some performance enhancements to the engine in the first 1 or 2 years of its life to get it up to full spec. And that might be oil -- sorry, fuel burn or whatever. So it's 1 or 2 years later after engines in service, it's a slightly longer capitalization period that gets you to the extra GBP 83 million that we've highlighted this morning. And that gets you to the net R&D. And when you look at the buckets, I think of the net, let's say, GBP 900 million that you're left with then, often, we talk about Civil Aerospace, GBP 200 million of that is in Power Systems; and then about GBP 100 million of that is in digital and electrification, around the electrification initiatives that we're working on, and that's combined, by the way, that's not each. And also enhancing our service offerings in the aftermarket, so that's in there. And then in Civil, you've got around sort of, let's say, GBP 300 million across those 3 engines that were just brought into service over the last 12 months. And then the balance is a whole variety of aerospace technologies, whether it be around turbines, combustion, fuel efficiency, emissions and so on, is the bulk of the spend. That's a broad mix of the R&D when you get down to that GBP 900 million.

D. Warren A. East

CEO & Executive Director

I'm afraid I'm not living up to the rigor discipline and execution mentality here because we're overrunning on time. So if we just have to make this the last question, I'm afraid. Can we go in the middle there for the last question? I'm very sorry.

David Howard Perry

JP Morgan Chase & Co, Research Division

It's David Perry at JPMorgan. Maybe one for Stephen and one for Warren. Stephen, on this capitalized R&D issue, you talk a lot about the GBP 83 million accounting policy, but the much bigger jump seems to be a more discretionary decision to just capitalize way, way more R&D than has been done, I think, ever

and there is going to be even more going forward. So can you just explain why you've decided to do that because I think it's sort of GBP 400 million that you're talking about is all going to Civil Aero? And then for you, Warren, I don't know whether you were misquoted by a journalist the other day, but in The Times, they were talking about this huge push into electrification, but it hasn't really been discussed much in this meeting. I mean, just sort of can you talk a little bit to the cost of that and the payback on it, please?

Stephen Wayne Daintith

CFO & Executive Director

Okay. So on the capitalization, I don't think it's sort of a more than ever. I think it's more around the fact that we are in the middle -- the -- basically, the 3 large engines that we've brought to the market in the last 12 months with their first -- in the 12-months period, in their first flight, the capital spend on that is significant. And the capitalization of that is ongoing until they reach full spec, which will be a little while after [engine] in to service. The GBP 83 million is very much around the policy application. It's very much around aligning with our European peers. MTU and Safran are the 2 examples that I quoted, and it is consistent with that. And we think it best reflects the economics of the capitalization phase when it's appropriate to do so. So that's where we are on that particular treatment.

D. Warren A. East

CEO & Executive Director

And on electrification then, as I said when presenting a moment or 2 ago, now this is an inexorable trend in industrial technology markets. Actually, whilst it makes quite good stories, in terms of actual financial impact today, it's relatively small. We're probably going to be spending about GBP 50 million on transferring electrical capability into the Aerospace domain during 2018. But most of the activity happens in our Power Systems business, and as I say, that is absolutely deliberate. This is servicing applications, where electrification is prevalent today. And it enables us to develop systems expertise, capability in that area but, at the same time, have a revenue stream to back it. So it's kind of absorbed in our Power Systems business.

David Howard Perry

JP Morgan Chase & Co, Research Division

So can I just be cheeky and ask one more? This is more a request.

D. Warren A. East

CEO & Executive Director

Yes, it's cheeky, yes.

David Howard Perry

JP Morgan Chase & Co, Research Division

In your presentation, Stephen, you said you were really pleased that in your planning discussion, there was no discussion of profit; it was all about cash. So in the guidance you give us, can you just guide us to cash by division because it seems incongruous that we get guidance on profit, but you yourself plan around cash?

Stephen Wayne Daintith

CFO & Executive Director

And I'd like to get there and I think in good time, not ready just yet. I think we've added a lot of extra guidance this year, and there'll be more to come, I'm sure. But at this stage, we're giving just group cash guidance. And let's see where we get to in 6 months', 12 months' time.

D. Warren A. East

CEO & Executive Director

Thank you. Thank you all for coming along and taking an interest. We'll be back in 6 months.

Operator

Hello, and welcome to today's Rolls-Royce Holdings plc 2017 Half Year Results Fixed Income Conference Call. [Operator Instructions] I'll now hand you over to Stephen Daintith, CFO. Please begin, Stephen.

Stephen Wayne Daintith

CFO & Executive Director

Thank you, [Hugh], and afternoon, everybody. Now I'll just spend 2 or 3 minutes running through the highlights of the numbers, then I'm very happy to take your questions. And I think how I would summarize the first half is it's very much in line with our plans, a very solid performance first 6 months of the year. We are also, at the same time, confirming that our outlook for the year is unchanged. And just as a reminder of that, we have guided to a modest growth in profit in '17 over '16 and about the same for the level of free cash flow in '17 over '16, which last year was about GBP 100 million and the same [indiscernible] again this year. And that free cash flow is against a backdrop of making more engines than ever and as you know, we sell our engines, Civil Aerospace, at a loss, so we're able to offset that drag on the business through improvements elsewhere, which we are very happy with.

So looking through the numbers, headline numbers, revenue [indiscernible] by 6% across the group half year-on-half year, and the 2 big drivers of that are in Civil Aerospace, which grew very nicely over the year and double-digit revenue growth in Civil Aerospace, and Power Systems, which grew by 3% over the -- half year-over-half year.

Nuclear grew by 8%, but that number's off a relatively small base. I think it's the Civil Aerospace and Power Systems which are the most, sort of pleasing numbers for the first half of the year. At the same time, gross margin improved quite nicely, a 13% growth in gross margin, driven by growth in Power Systems as [indiscernible] improvement in the economics of the XWB engines, which we are reducing the loss on the sale, the cash loss on the sale of those engines. And we are, as again, we confirmed a couple of days ago, expecting that number to get to the breakeven position by 2020.

And we almost doubled our profit number to GBP 345 million for the half year, [indiscernible] what was GBP 158 million last year, so a nice growth in our, in operating profit with the gross margin improvements coming through, but also with some good savings in commercial and administration costs with a GBP 38 million savings year-on-year.

On that note, operating margin increased to 5%, which is an improvement from [indiscernible] of last year, which is 2.6%, but we wouldn't want to pretend at all that we're pleased with a 5% margin and there's still a long way to go to get to sort of the double-digit margin that we aspire to over the next few years.

Free cash flow saw a GBP 75 million improvement year-on-year. So despite the fact that we're making 500 engines -- sorry, 200 engines in the first half of the year, [indiscernible] a loss of about GBP 1.6 million each, and this time last year, that number was closer to 150, 140. So 60 more engines at the loss of GBP 1.6 million, but despite that, we are still generating GBP 75 million more cash, and that's despite also generating -- sorry, spending another GBP 19 million more on CapEx and depreciation if we compare year-on-year. So good operational cash generation and improvement there, which we are encouraged by.

We have decided to keep our dividend flat for the time being at 4.6p per share. We will revisit the dividend when we start to see growth in free cash flow that we are anticipating. So a solid start to the year. No change in the outlook on a full year basis, [indiscernible] just described. And we took the opportunity on Tuesday earlier this week to confirm to the market that we're very comfortable with the GBP 1 billion of free cash flow that's being talked about in the [indiscernible] market and in the media. We don't have this as a formal target, but it is very much a sort of ambition that we are working towards, and in fact, we would hope to go beyond that as well around 2020, and [indiscernible] and then grow from there into '21, '22. And really acknowledging that this is the sort of cash generation that a GBP 15 billion revenue

business ought to have in any event, not just the sort of a nice-to-have [indiscernible], but it's almost a financial imperative for us to have this level of free cash flow, given our long-term investments that we have to make where we were developing engine programs for engines that may not be on the plane for another 10 or 15 years or so.

So I would say, the half time update is good progress so far. Lots to do in the second half of the year, but we are quietly confident around the outlook that we've set the market and also we believe we're well placed for 2018 to 2019 and, moving toward, flat GBP 1 billion of free cash flow by the end of the decade which was the internal target and very much become something that we are looking at as a very useful rallying cry [indiscernible] of where we ought to be in the business.

So that's my sort of broad overview. I'm happy to take any questions that you might have.

Question and Answer

Operator

[Operator Instructions] One is now coming through, and that's from the line of [indiscernible] with [indiscernible].

Unknown Analyst

Just a quick one on the ITP acquisition. If you could confirm the timing of completion for this deal and your preferred option to pay for the acquisition. I think Moody's, for example, assumes that you will pay, mostly in shares, for this [transaction]. If you could clarify what you intend to do.

Stephen Wayne Daintith

CFO & Executive Director

Okay, so the completion now which is just dependent on the final single approval from the Spanish government, and -- but we are anticipating that will be before the end of the calendar year. So given that we're now entering the [indiscernible] summer holidays and so on, I would expect that it's probably going to be in the fourth quarter of this calendar year, maybe in September, but the fourth quarter of this calendar year, so that's the sort of timing issue we're thinking about. And then as a reminder, the payment phasing for the EUR 720 million transaction is -- would be paid over 8 quarters, and we have the option of using either equity or cash. Our choice with each payment will very much depend on the share price and our balance sheet and cash flow. And so as you might imagine, I would expect that the first payment will probably be in equity just to get the ball rolling on using equity so that [indiscernible] . But I think after that, no firm decisions made at this stage. I think we keep our options open and [indiscernible] equity and then take it from there. We're very much dependent on how -- what are the share prices. I think where the share price is now, it's a lot more attractive to use equity than it would have been 12 months ago when we were down to [indiscernible] share at [indiscernible] and the equity becomes far more attractive. So can't [indiscernible] too much into that but we will start with equity and take it from there.

Operator

[Operator Instructions] Okay, well back to you for any closing comments.

Stephen Wayne Daintith

CFO & Executive Director

Well, thank you for your time, everybody, and I look forward to talking to you shortly after our full year results, which will be in March of 2018. Thank you very much. Bye bye.

Operator

This does now conclude today's call. Thank you all very much for attending. You can now disconnect your line.

John Dawson

Former Director of Investor Relations

Okay, I think we're ready to kick off. It's just going up to 9:00.

So thank you all very much for joining us here at the London Stock Exchange and for those of you joining us online.

My name is John Dawson. I'm the Head of Investor Relations at Rolls-Royce. It's my pleasure to welcome you here to our half year results presentation for 2017.

The agenda for today's presentation is as follows. Warren East, our Chief Executive, will share his perspectives on the first half from an operational point of view. Stephen Daintith, our new CFO, will then run through the financial results in a little more detail and share some of his perspectives on the business in his first 6 months. Warren will then return to give you some perspectives on the second half of the year and our challenges going forward. Our presentation should last around 45 minutes. We will then take questions from the audience and also online, so if you wish to ask a question online, please submit that through the webcast service on the webpage. And we will endeavor to answer those if they haven't -- answer those questions if they haven't already been answered in the room.

Finally, if I can ask you all to please turn off your mobile phones and make sure there's no interference in the presentation. We aren't expecting any emergencies this morning, so if the alarms do go, then we just need to exit in the normal way out to the front and Paternoster Square.

Thank you, and I'll now hand you over to Warren.

D. Warren A. East

CEO & Executive Director

Good. Thank you, John. Good morning, everyone. And as John said, I'll just make some initial comments, and then we'll have Stephen go through the numbers in some detail. And good news, clicker works.

So it was -- I think, for the first half of '17, it's a good set of results. There are clearly positive trends year-on-year in our financial performance, and it's always good to be standing here with that context; and a good performance in terms of revenue and margin, leading to profit growth. I think, for me, what's encouraging is that set behind these numbers are some genuine, encouraging operational progress in all parts of our business. And obviously, there are some significant movements, but some of that is the law of small numbers. And for the time being, our board has decided to hold the dividend where it is.

Now let's look at some of the highlights from my perspective, sort of standouts in the first half.

Clearly we're in the midst of, and we've been talking about for some time, a period when we are ramping our volumes of large engines that we deliver. And clearly this has been a question mark: Are we going to be able to ramp up sufficiently, or not? Last year, we grew volumes year-on-year from the previous year. This year, we have a big step-up to do. We're halfway through the year. We are achieving a step-up, volume production's up -- volumes produced up 37%, deliveries up 27%, so I think we're addressing that question. Importantly, behind that, and we've been fairly open, the new engines are still -- or from an OE perspective, we lose cash every time we ship one of those engines out of the door, but there has been good progress, in particular on XWB around the economics there. And that is driven not just by the effect of launch pricing running out, as we said would happen during this year and during next year, but also there are cost-reduction initiatives and cost-reduction results coming through behind that general improvement.

It's particularly encouraging for me to see a strong first half in Power Systems. The new leadership there is addressing some of the issues that we've had and in particular addressing things like the rather skewed seasonality that's been happening in that business over recent years. And that, amongst other things, has

led to a strong first half for Power Systems. And at group level, our transformation program continues. And we are 3/4 now of the way through the 2 years that we set out at the end of 2015, and we're still ahead of plan on that.

Shifting the balance of technology and engineering was important for me. And in the first half of this year, we did some organization change which shifts that balance so that, as we look to the future, we're feeding our excellent engineering with the best technology. And that's a change which we've made. I'm putting on the slide successful organization changes, very, very early days at the moment, but I can already see a change in emphasis inside the company, which is quite encouraging. That said, of course, we are continuing to concentrate on engineering delivery and delivering important milestones on our future programs around Ultrafan, the big gearbox. And later this month, yes, it's August 1, so later this month, we'll be testing our Advance 3, which is the engine that sits behind Ultrafan.

Now it's not all glorious. We do have some challenges. And certainly some of the challenges that the Marine business faces are still very evident in the numbers that we talk about today. And there it's a sort of balance between restructuring and market conditions I'll talk about in a moment. And I think a big issue for us right now is the in-service challenges that we are facing in our Civil Aerospace business. Now this is a scheduled program of maintenance, particularly around our Trent 1000 engine which is powering the Dreamliner, causing some problems for us and for our customers at the moment. And of course, we regret the problems that that's causing to our customers. You will see some of that in the press, but we are working very hard to minimize any operational disruption that our customers face there with our scheduled program of maintenance.

So a very, very quick summary now looking around the business.

I'll start with Civil Aerospace. Clearly, good to see both OE and particularly aftermarket revenue increasing year-on-year. We've got a long way to go in terms of profit, but it's good to see some improvement. Some of the things that are driving that, of course, is the growing size of the installed base, the fleet that's in operation. And as we grow that with our new engines faster than the older engines that are retiring, we get a growth in the size of the overall fleet, and that's fueling our aftermarket growth. I mentioned before the production ramp in terms of volume. That's very important to us. We'll do more in the second half of the year, but it's been a good start. Balancing that volume production, of course, we've got new engines that we have to get through the final stages of development. And as I look into the second half of this year, the good news is that, the XWB-97 and the Trent 1000 TEN, both on schedule for entry into service before the end of this year. The Trent 1000 TEN, now that was witnessed on its first flight on a 787 by President Trump. And then later in the year, we saw XWB flying at the Paris Air Show, and that was witnessed by president -- new President Macron, so kind of very sort of presidential first half for our new engines. And the Trent 7000, which will enter into service halfway through next year on the new A330, the Trent 7000 engines have now been delivered -- or were delivered in the first half, i.e., before the end of June, to Airbus. And we're expecting the first flight on a new A330 happening in the next month or so.

So switching to Defence Aerospace, revenue down a little bit. Stephen will summarize the detail there, but notice that profit is up. And that's really due to an emphasis in our Defence business on innovation in the aftermarket because this business is all about attending to customers' needs at the moment. And you can see that with some of our new Service Delivery Centres where we're getting closer to the customers in operation, where we're concentrating on making sure that the deliveries that we do make to our customers come through right on time. One of the things that's helping us in the aftermarket is we, in the first half of this year, also extended a very -- a long-term agreement that we've had with Aviall. Aviall is now actually part of Boeing, but we've had an agreement with them for a long time on spares. And we've extended that now to cover literally thousands of defense engines, and we are benefiting from their extensive network.

Power Systems. I said that it was good to see an encouraging first half there. The new management really is revitalizing our business. There's an emphasis that you will see come through in the numbers eventually on taking the service model from our aerospace business and applying that to the large installed base that our Power Systems group has. And so there's been quite a bit of effort on that, and I hope we'll have some news on that in the second half of the year. There's also been progress with joint ventures. It's good

to see in the numbers some of the -- some market recovery coming through, so OE sales up 5%. And that results in overall revenue increase, but it's good to see a greater profit increase coming through from some of the cost-reduction initiatives actually bearing fruit. In terms of orders and looking forward to future business, it's been a good first half for orders, as multiple sectors have enjoyed some recovery. I mentioned at the start we're putting quite a bit of effort into trying to address the continued seasonality skew that's been happening over the last few years, obviously the question mark in the right-hand bar on the histogram there because it depends how well we do in the second half, but we absolutely expect to have addressed that skew somewhat.

And looking further ahead to costs. One of the things we've been talking about for some time, in the bottom right hand of the chart there, this is sort of demonstrating the 80-20 nature of the product portfolio where 80% of the revenue has come from 20% of the products. And so we're going to make significant steps in reducing the number of product variants, and that is now under way. We're aiming for a number significantly more than 25%, but we're 25% so far.

Switching to Marine. As I said, the story is one of balance really. As far as the present is concerned, we're trying to balance the continued depression in the offshore market versus the restructuring that we're doing. And hopefully, we'll get fairly close to a break-even situation. Obviously, we're consuming cash still at the moment in that business. And then as I look forward, we look forward at trends around electrification, autonomous shipping, more stringent environmental controls, more stringent safety standards. And so the investments that we're making there are around technologies relevant to those trends in the Marine business, also particularly relevant to some of those trends that apply to other parts of the group.

And in Nuclear, it's been a steady first half to the year; revenue up a little, with increased activity in our submarines business; profit down because we're maintaining R&D investment. And that's been offset by some of the sort of positive transformation benefits, but some of that R&D investment particularly around our small modular reactor initiative in the civil space. The submarine business, we continue to develop that for the future engaging with our U.K. government customer. The focus has very much been on improving the performance for that submarine customer, performance coming out of our components operation. And that's a very, very significant performance improvement versus the first half of 2016, and the challenge now is to sustain and improve on that level of performance. And in the civil space, we've had some good headlines with some orders and achieving preferred bidder status on various projects.

Transformation across the group. We've had a go here at representing graphically the difference between our run rates and achieved savings in the year. We are on track to deliver at the top end of the expectation, i.e. at least GBP 200 million of annualized cost savings versus 2015 -- versus the end of 2015, where the chart starts, by the end of this year.

So I think, first half, good start, focusing on the things that we said we were going to focus on, delivering the things we said we were going to deliver, transformation program on track.

With that, I'll hand over to Stephen to talk through the numbers in a little bit more detail. Thank you.

Stephen Wayne Daintith

CFO & Executive Director

Okay, well, morning, everybody. There's 1 or 2 familiar faces in the room, but I think I'm getting to know many of you for the first time. So I look forward to working with you over the next few years and getting to know you better.

Stephen Daintith. Just joined in early April, so just over or around 4 months or so into Rolls-Royce. I think I've joined the company at a very exciting time actually. Warren has alluded to this in his opening comments, but there's a massive amount of work going on across Rolls-Royce that struck me a lot in my first few months, lots of good energy as well and real ambition across the organization. And I think we can see a big opportunity ahead. There's lots to do, as Warren has highlighted, but it's all doable, so it's very much around our effective execution. So it's an exciting time to join. And I first got to know the company late last year. And I met Warren sort of around sort of August, September, early August; and then various

members of the team. And I started to jot down then what I thought were my priorities were likely to be over the -- over my first sort of 6, 12, 24 months in Rolls-Royce, and so I'm starting the agenda today with just an outline of those priorities. Then I'll move on to the results. And I've got 1 or 2 accounting changes to talk about.

So looking at the priorities. Interesting enough, these 5 priorities I'm about to outline haven't changed since those first early months when I first started gathering my thoughts and hearing what the various executives and board members and so on and management across Rolls-Royce were saying to me, and indeed the external people that I met as well, around the sort of challenges that Rolls-Royce faces and the issues that it needs to tackle. So here are the priorities that we're working on right now: Number one is cash. I'll talk about all of these in a -- separately one by one. Two is costs. Three is balance sheet and capital allocation. Number four is clearing the fog, using Warren's terminology there. And five is a strong finance team as well. So going through these one by one.

So cash, first of all. I think it is the best indicator of economic performance. There has been a historic disconnect with profits. And the table down the bottom shows cumulative profit and cumulative cash over a 10-year period, and what it highlights is the stark difference between the two. And I think it's been we've been reminded that, I think, GBP 781 million was our sort of record achievement of cash generation in a single year. And I put there understanding and managing the key drivers as well, which I'll get on to in a second on a couple of other slides, but really understanding what's driving cash flow across Rolls-Royce, across all of our divisions, an understanding of that, and then allowing us to think about where and how cash flow might develop over the next few years. There's been a lot of media and market commentary on the GBP 1 billion of free cash flow by the end of the decade. Just to clarify that: It's not an internal target, but we really do like the focus on cash. We think it's right and appropriate. And indeed we would hope that we can go beyond that number over the next few years. There is a road map to a free cash flow that looks like that and beyond it, but of course, there are lots of operational issues along the way to manage it. What I'm going to try and do here is show you some of those building blocks to a growing free cash flow; and over the course of the next couple of results releases, add a bit more detail to -- detail to how that is developing and our progression towards a growing free cash flow. But we do welcome the focus on free cash flow, and we're very comfortable with that GBP 1 billion that's being talked about.

So the road map to a growing civil free cash flow. First key driver is the economics around OE. As Warren mentioned in his opening comments, we do sell our engines at a loss. So the cash margin per engine sold, an improvement of that cash margin, in other words a smaller loss, ultimately leading to breakeven for 1 or 2 of our engines, remains incredibly important. The XWB progress in particular is a key indicator for us given the size of the ramp-up that we anticipate in the XWB over the next few years. And again as Warren has mentioned, we've made good progress over the first half of the year. And we see the route to further progress over the second half of the year as well on the XWB.

The aftermarket value and the growth of the aftermarket margin. The growth in the installed engine base, right now just over around 3,000 or so wide-body jet engines, we'd hope to push that beyond that over the next few years as we increase our production ramp-up and deliver around 500 engines or so a year. Growth in flying hours goes with the growth in the installed base but also passenger hour growth as well; and then shop visit efficiencies, how often are shop visits taking place and what is the cost of each shop visit as well. These are key drivers to a growing free cash flow. I'm using civil here as the key example because it is acknowledged, and we acknowledge it too not only externally but also internally, that the civil cash flow is the one that will be the biggest driver of all the drivers to a growing free cash flow for Rolls-Royce.

And then finally, cost management and capital allocation. This is transformation across various buckets. So a focused improvement on operations and commercial and administration costs. We're seeing some of that coming through already in our half year numbers. Disciplined capital allocation on CapEx and R&D, I'm going to talk about this subject in a little more detail in a few slides going forward. And then working capital management, always a key part of good financial management across an organization.

So looking at Civil Aerospace. This is the trading cash flow for 2016, as previously presented in a traditional format for reconciling profit with trading cash flow, with various entries in between. And I am hoping that we can move to looking at cash flow under a different lens by looking at those key drivers that I've just run through on that previous slide. So an alternative view of free cash flow for civil, and I'll take a little while on this slide because there's a lot happening in here, is to get to the same outcome of basically a break-even business but to show what's happening across the various lines. And don't take this as any sort of audited, precise set of numbers. I'm trying to give you a shape and a direction and a feel for how the model currently works. And we -- and then going forward, back -- in March next year, I can add a bit more precision to this when we talk about the 2017 numbers and the outcome there.

So looking at the OE economics, 320 engines delivered last year on wide-body at an average margin loss of around GBP 1.6 million cash each, getting us to an outflow of GBP 500 million; 11 million engine flying hours, generating an aftermarket cash margin of GBP 1 billion. So the -- looking at the top number, the original equipment, clearly we're hoping for progress on the GBP 1.6 million over the next few years, XWB in particular. And then the 11 million engine flying hours ought to grow as well as we grow the installed engine base, as Warren has mentioned in his opening comments. The sale of some spare engines on the wide-body fleet, they go in as well. And they get us to a wide-body cash margin of GBP 0.7 billion. And we add in then the cash flows for the business and regional engines of GBP 600 million, the V2500 royalty around GBP 300 million; gets us to a gross cash margin of GBP 1.6 billion. You may be wondering where the additional factory costs and the sales-related costs, the AFCs and the SRCs, have gone. We've allocated that GBP 1 billion that you might be familiar with across 3 buckets. GBP 300 million of it is amortization, depreciation, which is noncash. So then you're down to GBP 700 million. And then operations and engineering is -- makes up the balance of the GBP 700 million of what is -- we called AFCs and SRCs. GBP 300 million of commercial and admin costs takes us down to an operating cash margin of GBP 600 million. And then we're spending around GBP 600 million in R&D and CapEx in the civil business, a bit of working capital improvement. And we get to the [unit] that we see today.

So I'm showing this model to show you where we think the dynamics -- or the key dynamics are going to be over the next few years, largely in the OE economics and the AM value line. There's some good progress also on cost management and capital allocation, developing the building blocks to that GBP 1 billion of free cash flow over the next few years.

Costs, a relentless focus on costs across Rolls-Royce. And this is one of the areas that struck me most in my first few months. It's how much activity is taking place in every division across Rolls-Royce and across all the functions in Rolls-Royce as well.

Just highlighting a couple of specific examples across these areas: The XWB-84, we have stated before and we are -- we repeat this ambition to be breakeven by 2020, good progress in the first half of this year and anticipated progress in the second half as well. I think we'd be more explicit about the progress that we've made here in March next year.

Footprint and factory utilization, we are targeting a 20% reduction in footprint by 2020. And at the same time, we're looking for factory utilization of at least 80% by 2020. Right now, it's about 65%, so good improvements in factory utilization. That's on a 24/7 basis.

Life cycle cost reductions, we continue to look at how we can make our shop visits more efficient across our fleet, targeted engineering to reduce costs over the life of a contract. And then process efficiency, simplification, a lot of simplification opportunities across Rolls-Royce being pursued. And this this does free up time. Theoretically, productivity will improve. Rolls-Royce likes its processes. And we have enjoyed making what ought to be simple things quite complex and complicated. And I think there is, as have been mentioned previously, a lot of opportunities to improve and simplify the way we look at and manage the business.

And finally, commercial and administration management of those costs, tight headcount control in particular. We put in place a headcount freeze, I think, around 6 weeks or so ago. That's working well across the business. And we do see in the first half results, as I'll show in a second, some good improvement on commercial and administration costs over the half year.

Balance sheet and capital allocation. Rolls-Royce, as you know, is a long-term business. We build engines for the long term. We enter long-term contracts. Delivering a strong free cash flow is not just important in its own sake as a successful, growing business, but it's with disciplined capital allocation gives us then flexibility for investments. And it will be good to have a sort of business where we have a strong free cash flow and disciplined capital allocation so that we are -- we do have a position whereby we can invest for the future and place some of the biggest stakes where we see opportunities for growing cash flows in the future in new engine programs. That disciplined capital allocation is very important: that we are sensible and disciplined around setting return on capital targets, cash return on capital targets over not short-term cycles but medium, long-term cycles, so 5-, 10-, 15-year cycles; and being public about what those expectations are and what those targets are.

So we would hope that putting all of these three together will lead us to be secure as investment grade and ultimately delivering a pathway to a sustainable A rating. And indeed, in my meetings with Moody's and with S&P, they too are looking at a free cash flow, a growing free cash flow, as the key indicator that they will be looking for to secure our investment grade and then return to an A-rating status.

Return on capital targets, I've talked about but taking that long-term perspective.

Clearing the fog. I think there's an opportunity. This is not just an external but also an internal focus as well. I think we can help ourselves and improve the way internally we look at the business and the drivers of performance on what all of those key performance indicators and where the accountability lies and having clear measures that we're measuring and managing ourselves against. So understanding and explaining the performance of the business internally, I think we can improve but also externally as well. I think we're very strong on financial accounting. And I think we can probably get a bit better on the old-fashioned management accounting.

Clear metrics and accountability, including group KPIs, we'd hope to develop those over the balance of this year, and in March next year, share with you some ideas around what sort of group KPIs we ought to be looking at. Greater clarity on cash flow, I've talked about that. So rather than reconcile a profit number with a cash flow number, try and explain cash flow on a driver basis not just for civil but our -- for our other businesses as well. And then IFRS 15 helps enormously. We welcome IFRS 15. I think it will allow for a purer and clearer view of the business. And whilst long-term contracts accounting adjustments have been the way we have accounted appropriately over the years, I think the removal of those and moving to IFRS 15 will help enormously, all giving greater transparency.

Group KPIs, possible items that are under review: return on capital employed that I've talked about, free cash flow per share, cash conversion and cash margin, a strong focus on cash. And I think it's a language that is growing across Rolls-Royce, becoming increasingly part of our language of success. A growing free cash flow very much sort of matches our ambitions.

I just had a specific topic on clearing the fog. There was quite a bit of commentary and indeed questions from the market around our hedge book. And so over the next couple of slides, I'm trying to shed a little bit of light on why we have in place what we have in place and explaining a little bit about our hedge book that we have today and the shape of our hedge book and therefore the likely trajectory of the achieved rates over the next few years.

So the headline statement, the -- our hedging policy is to reduce FX volatility on cash and profit. We're a long-term business, take a long-term view. We have long-term contracts. And moving down to the final 2 bullets, we receive about \$6 billion a year to offset our sterling and euro costs. So to be sure about what we're going to be translating those dollars out, we sell those \$6 billion forward over the next few years. And what these 2 lines show are the policy that defines, effectively defines our maximum hedge book, so these are maximum and minimum bands for the flows that we anticipate in each year. The purpose of the hedge book is not to be precise within these bands. It's to determine the maximum size of the hedge book. And then we allocate the hedges broadly in those lines, but this is more around determining the size of the hedge book rather than the actual shape of the hedge book itself.

Having said that, this is what our hedge book looks like over the next few years. So the dark blue-shaded bits show the hedged portion on a percentage basis of our anticipated dollar flows. And then the forward

rate shows if we were to buy today for hedges in those years, selling our dollars at the rate that we would purchase at. And then the blue line in the middle there, the sky blue line that's sloping down, shows the likely trajectory of our achieved rates over the next few years. So 2017, around \$1.54. And then moving down, you can see through to around sort of around just above \$1.40 or so, \$1.40, \$1.44, in that range, over the next few years, depending of course how the forward rate moves and at what rate we replace the hedges that we use in 2017 with new hedges in the outer-years.

So these policies work very well for us. We -- when you look at these rates over the next few years, they are comfortably below our long-term planning rates. So we're very comfortable with this policy. We think it's sensible. It's worked well for us; and just to repeat as well, below our long-term planning rates.

The finance team helping drive the change, 2 recent additions that's worth highlighting in respect of the strengthening the finance team. Sarah joined us in September. Sarah is sitting here in the middle of the room. Sarah has joined from Shell; with just over 25 years or so with Shell, in various countries, in Finance Director roles and Regional Finance Director roles and various operations roles as well. Delighted to have Sarah on board and currently our group Financial Controller and Deputy CFO. And Sarah is doing a cracking job, so far. Thanks, Sarah. And then we have Ben Fiddler joining us in early September. You all know Ben. What we are looking for in Rolls-Royce is to face up to the sort of the brutal facts around the performance of the business in recent years and the area that we need to improve. And we do need rigor and we do need challenge within the organization, and we think Brett -- Ben will bring that rigor, that challenge but also that industry expertise as well; and will help us not just in sort of financial planning and analysis in the sort of short term but also thinking about capital allocation and strategic planning and so on as well. So we're delighted to have Ben on board, that -- and we think he's going to be a great addition to the team.

And I expect there'll be 1 or 2 more changes on the horizon as well, but getting a strong finance team to really drive the outcome across Rolls-Royce rather than report the outcome, I think that's the key thing that we're looking for from a strong finance team in Rolls-Royce, providing that insight and analysis but helping us all make better decision-making across the group.

So the half year results, running through the numbers.

It's been a solid start to the year. It's always good to see revenue growth in a business and civil growing 14%, underlying growth rate; Power Systems up 3%; Marine, operating though in tough markets, down 15%; but overall a 6% revenue growth for the group and a solid start to the year. Profit, again decent start on profit. Group revenue, we've highlighted. Commercial and admin costs are GBP 38 million lower than this time last year. GBP 16 million or so of that is down to the normal piece of legal costs associated with the Deferred Prosecution Agreements, but putting all that together, we have an improved operating profit, GBP 345 million over GBP 158 million last year; and an improved margin, although I wouldn't want to boast at all around the 5% margin. There is still a lot, lot to do on improving our operating profit margin. But a solid start to the year.

I'm going to run through all the divisions one by one now -- putting all that together, you can see the profits there, civil and Power Systems the big driver, Marine operating in tough markets and a GBP 17 million decline half year on half year.

Free cash flow -- sorry. I forgot the free cash flow slide. Free cash flow GBP 75 million better than last year. We have pointed out that there's a lot happening in working capital, around GBP 180 million in receivables in particular which I'll talk about later. I'm sure we'll do as we go through the Q&A. And that's been the driver of a free cash flow performance that's slightly higher than last year's number. We are not changing our outlook on free cash flow. Indeed, I should have said, neither on profits either, just to repeat Warren's comments. At this stage, we're very comfortable where the outlook is, our outlook for the full year that we gave back in February of last -- of earlier this year.

So looking at operating cash, cash outflows from a higher installed engine production. We invoiced 202 wide-body engines during the first half of the year, so a good ramp-up from last year's numbers. That was offset by increased cash revenues from the aftermarket growth which, as you saw, grew nicely. Free cash flow was an increased level of capital investment; higher level of working capital management, that GBP

180 million that I talked about, principally in receivables. Other than this, the cash flow performance was largely as expected.

So running through our divisions one by one.

Civil Aerospace, 12% growth in OE driven by that 202 growth in the civil wide-body engines. That's excluding the leased engines that we sold. And there are 7 or so there. Aftermarket revenues growing by 15% year-on-year. And -- whoopsie-daisy. Sorry. And then you see that translating down to a nice healthy growth in operating profit from -- GBP 173 million this year, sorry, and GBP 31 million in the first half of 2016. To make the point, there is a benefit there in those numbers of long-term contract accounting adjustments that does help about -- there's a net GBP 33 million gain, but it's about GBP 56 million higher than it was this time last year where there was a GBP 23 million loss. I think this next slide goes into that in a little bit more detail.

So underlying revenues. 85 Trent XWB engines were produced -- sorry, was -- were invoiced in the first half of the year, 41 in the prior year. Aftermarket growth, led by flying hours were -- which were up 15% for the in-production Trent fleet, so good growth in the in-production Trent fleet half year on half year; and the business aviation market as well, 21% growth in that, reflecting the success of CorporateCare.

Gross margin improvement, highlighting there that positive benefit of GBP 33 million from the contract accounting adjustments. And that included a one-off GBP 77 million credit risk assessment benefit in respect of one of our customers, where we have taken a view, after we provided -- several years ago, in respect of that customer, when their trading was in some -- let's say, some choppy waters, improved trading have allowed us to remove this provision that we took in earlier years. Our outlook for the year is unchanged, and we're comfortable where it stands. Just for a couple of other bullet points there, we're expecting further improvements on the XWB, higher costs related to increased maintenance activity in respect of the Trent 1000, which Warren talked about in his opening comments.

Defence Aerospace, 4% revenue decline, as expected. We expect that to pick up in the second half of the year. And then the aftermarket, down slightly as well. Second half production will grow in the second half, and that will drive some OE growth we anticipate in the second half as well.

Looking at the underlying revenue. The lower EJ200 OE sales following completion of the Saudi contract is a key driver of the underlying revenue decline half year on half year. Gross margin, we benefited from the nonrepeat of the TP400 charges that you may recall this time last year of around GBP 31 million. And we have lower C&A costs in Defence, a key driver of the 7 -- a small but a GBP 7 million improvement in operating profit for our Defence business half year on half year. The outlook remains solid, with -- full year expectations are unchanged. And just pointing to there the second half growth in the AE engine production. But margins and profits are expected to soften from last year's numbers.

Power Systems. I think Power Systems is the one business that's recovered, and its markets have recovered at -- or earlier than we anticipated when we put our outlook together. What -- it doesn't change our overall group outlook, but I think Power Systems is the one business that's performed a little better than we expected in the first half of the year, growing at 5% on its OE business and 3% when you put its services business together. Operating profit, up nicely to GBP 66 million. So it's an encouraging start to the year in a slowly improving market, but as you recall from last year, Q4 is a big quarter for Power Systems in respect of its services revenue, so there's still a lot to be done in the balance of the year on Power Systems.

Looking at the drivers and the outlook for Power Systems. Underlying revenue, good OE growth. The rapidly expanding Chinese telecoms market, particularly data centers, is leading to some good OE sales into China for Power Systems, but also signs of recovery in several industrial markets, including construction and rail; lower though, half on half year government and marine activity.

Operating margin, GBP 6 million lower C&A costs, again lots of transformation activity going on in Power Systems, but also there, final bullet point, strong working capital management. Power Systems is one of the key contributors to that outperformance in working capital in the first half of the year. The outlook for

Power Systems remains cautiously positive. Q4, just to highlight that again, is key for the service revenue growth, as it was indeed in 2016.

Marine. Marine continues to operate in a very tough offshore market, 15% decline for the division, with 22% decline in OE and 6% in services; operating profits suffering accordingly. It's a tough offshore market. Having said that, a lot of restructuring taking place in Marine, as indeed it has been over the last couple of years. And you'll see in the statement today talking about further headcount reductions planned for the second half of the year.

So certain other key drivers and the outlook. Revenue declines reflect the lower OE order intake and the tough offshore market. We are not anticipating a recovery or a rebound in any event, and we continue to take costs out of the business. C&A costs are GBP 12 million lower. We expect the second half reported loss to be similar to the second half in 2016. So Marine, tough markets and no reasons for optimism at this stage. We do believe, though, the amount of costs that we've taken out of the business, we are well placed when the offshore markets eventually start to recover, as we expect them to at some point.

Nuclear, good revenue growth, as we've managed our submarines contracts particularly well; underlying revenue growing at 8%; operating profits slightly down on last year. And that is largely driven by the GBP 10 million investment in small modular reactors, which you'll see in our numbers. So solid performance across both the submarine and the civil nuclear activities, as Warren mentioned in his opening comments. Operating margin impacted by the investment in the small modular reactors, GBP 10 million or so in there. The outlook for the year, the long-term outlook is unchanged. And there's no reason to change the outlook that we have in place in our models for 2017.

Accounting changes, a couple of items that are on the horizon. As you know, with effect from the 1st of January 2018, we move to IFRS 15. And indeed, we are hoping that for the March results next year we can show you the '17 results on a current basis but also the full results on an IFRS 15 basis as well so you can see that fair comparison, probably spend quite a lot of time on that. And that will then allow you to think about how you want to think about 2018 on an IFRS 15 basis.

Looking at the numbers, you -- back in November of last year, we gave you an early view, and we stressed at the time that it was an early view, on 2015. We've settled down now on the numbers for 2015, which show an underlying operating profit adjustment restatement of GBP 933 million. The number for 2016 is a little lower. I think we guided that we expected it to be a little lower on the 2015 number, GBP 823 million. Just to repeat again, there's no cash impact. Cash remains the same. This is a restatement of accounting numbers. For 2017, we'll share the detail of that with you in March, but if anything, we're expecting the 2017 number to be again slightly lower on the 2016 number.

Sorry. Skipped one area there. IFRS 16 comes into play on the 1st of January 2019, and we'll be taking operating losses onto the balance sheet. Again, no impacts on cash. That's around GBP 1 billion of operating losses. These principles are already used by our rating agencies in the way that they assess the health of Rolls-Royce. So just as a flag that that's on the horizon. And again, we'll share more with that with -- more of that with you in March next year.

So to summarize. Clear priorities for the way ahead, a particular focus and emphasis on cash. It's been a solid first half. There is much to do in the second half, Power Systems, civil, Defence. Around our divisions, there's much to do in the second half. So it could be tempting to get carried away with the first half numbers, but there's a lot to do in the second half of the year, and I would -- really would reinforce that point. And accordingly, our outlook for the full year is unchanged.

Thanks very much. Over to Warren.

D. Warren A. East
CEO & Executive Director

Thanks, Stephen.

A few comments just to close, and then we'll move to Q&A.

I was chatting with the board last week because I've actually been doing this for a couple of years now. Sometimes, it feels like 5 minutes. Sometimes, it seems like about 22 years, but some of you who've been following me doing this for a while will note that, in days of yore, I didn't need to use glasses to look at the slides. Anyway, the slide sort of breaks into 2 halves. There's what we're really concentrating on in the short term versus what we're building, on the right-hand side of the slide, for the longer term. And I think, in 2016, I was really concentrated around some of the structural changes that we're making with what I called operational hardware back in 2015. And we're really seeing the positive effects of that now, particularly the direct line of sight of the senior team right into the businesses. It's -- it feels a lot easier to get a grip on what's really happening in the businesses. But as we've moved into 2017 on the operational hardware, then it's really encouraging to see we now have a new, balanced senior team around the table. And I think you can see in the energy that Stephen is bringing to the finance function a measure of the changes that are happening at that level in Rolls-Royce.

I'm also encouraged by the changes that we're making around engineering and technology. That's the most recent change we've made. That's very much a 2017 change, but that puts us in a great place for the future. You will see technology appearing in a couple of the other boxes as well. Stephen talked about the fact that we love our processes and complexity, and you've heard me talk about this before. I suppose, if there was one area that we're on reflection after 2 years, I do need to -- it's part of my job to be more impatient. And I think we can always move a bit faster here in terms of improving the simplicity of our organization. However, I would say that, in 2017, particularly now as we're getting that team established, I can see a pickup and a building in the momentum which is happening in that direction. And I'm confident that we will deliver on what I'd previously called the operational software in due course.

But looking forward, events happen in business all the time. And the important thing for Rolls-Royce is to establish some resilience so that we can really achieve sustainability. And behind that resilience, that's why it's so important that we deliver on the operational software side of our transformation so that we can really strengthen the balance sheet, so that we can establish some breadth and depth in the technology that sits behind our portfolio. And that's what we're concentrated on right now, and I can see that we are starting to make progress there. But to make it stick: Stephen talked about disciplined capital allocation. And that's what's really necessary to be able to sustain the expenditure, the investment in R&D for the future; and to create a winning platform so that, when we've got this real execution machine, it's built on a winning platform. But I think we're making reasonable progress in all of those 4 boxes actually, and so after 2 years, I'm quite satisfied with where we are.

Coming back to the present, though. The priorities for the second half of the year are really very, very simple. We need to deliver what we say we're going to deliver. And in 2017, as Stephen just mentioned, there is no change this morning to our expectations in terms of financial results. We've got a lot to do in the second half, but I believe that we're well positioned to do just that. From a day-to-day point of view, very much concentrated on engineering, on operational matters and on looking after the aftermarket. And it's a balance. And the balance is -- a good example, good place to see that is in our civil business. We clearly have a balance from an engineering point of view in terms of delivering the new products to large new engines' entry into service before the end of this year, another one coming along 6 months behind, balance that against -- or from the operational point of view, the ramp-up that we need to do. Just over 200 engines invoiced in the first half of the year, we need to get that up towards 500 engines for the end of the year, and we're reasonably placed to do that. And I mentioned at the start of the presentation how we're working hard with our civil customers to minimize disruptions caused by the in-service support that we're doing with a scheduled maintenance program in particular on our Trent 1000.

So there's quite a lot of challenges there in the second half of the year. Behind all those challenges, I've talked for quite a while about the future; and the need -- whilst we are focusing on the present, the need to consider the future and make sure we have a thorough review of our vision, the strategy and the technology that sits behind that. And we do hope to share that view before the end of the year. So with that, I'll hand over to Q&A and leave you with that summary. So we've got the first one in the middle there. The microphone is coming around. Stephen and I will share the Q&A.

Question and Answer

Charles J Armitage

Citigroup Inc, Research Division

Charles Armitage, Citi. Three questions. First of all, 320 engines delivered last year, going to, I don't know, 480, 490 excluding spares. There are quite a lot of -- and minus GBP 1.6 million each. There are quite a lot of moving parts. You've got bigger losses in the XWB. You've got more of those coming through. You've got presumably the overall cost per engine coming down, but you're delivering more engines as well. So presumably the losses will probably get bigger this year, but at one -- some point it'll flip when the losses coming down will be faster than the number of engines going up. Can you just sort of talk through that dynamic, please?

D. Warren A. East

CEO & Executive Director

Yes, well, I think you've talked through it actually. It's, in terms of what we're actually delivering, we're delivering to meet customer requirements. And so that's the airlines that have scheduled deliveries. And you are right. You mentioned XWB. We pulled out. We're very encouraged by the first half performance. That's where it's the biggest loss at the moment, but it's also the biggest improvement in terms of closing the gap. So exactly when that transition happens, we've been fairly clear it's not happening this year. The absolute cash loss is going to be bigger this year because the volume increase is more significant than the closings of the gap, but as we look forward beyond this year, then we're certainly going to come to that point. I don't know if...

Stephen Wayne Daintith

CFO & Executive Director

Yes, yes, I think you're right there to highlight a key inflection point for us will be when we get that to start going the other way when we're making as many, if not more, but the cash drag on the business, so to speak, moves in a positive direction. So it'll be -- that will be a key inflection point for some time over the next few years, but that will become obvious, I guess, as we'll -- as the -- as we make progress on -- particularly on the XWB.

Charles J Armitage

Citigroup Inc, Research Division

Next question. Thank you for Slide 28. That's very useful, the FX one. Can we just try and make so I understand the -- I'm color blind, the pale blue band, I think? The -- if you just look in, I don't know, 2022, so I can see the numbers, 60% is hedged, the forward rate's quite a lot lower than that. Could one assume that, if one hedged at the current rate, you would be towards the bottom of that band but you're not so there's a degree of uncertainty?

Stephen Wayne Daintith

CFO & Executive Director

Yes, you kind of could. I mean I wouldn't want to be precise about the answer because you just don't know how the rates are going to move and so on, but that math is broadly right, your -- that assumption, but it will depend, of course, on how the forward rate curve changes and spot rates develop over the next couple of years.

Charles J Armitage

Citigroup Inc, Research Division

Perfect. And the final question, long-term accounting changes and particularly that GBP 59 million of technical costs. Could -- what is that? And secondly, how on earth can I forecast this? Or do I just forget about it because it disappears in under IFRS 15?

Stephen Wayne Daintith*CFO & Executive Director*

That is the single largest component there is the Trent 1000 issues that Warren covered in his opening slides. It is essentially provisions around increased costs that we're anticipating across our engine programs and the Trent 1000 being the largest. On a go-forward basis, we'll clearly have those costs. And we will still be providing the most appropriate for in-year provisions and so on, in -- is the short answer to your question.

Charles J Armitage*Citigroup Inc, Research Division*

Does it get less under IFRS 15?

Stephen Wayne Daintith*CFO & Executive Director*

Well, no. They will vary, of course, depending on what issues take place in respect of our engine programs. Clearly, we would hope for a small increase or negligible or even declining provision every year, but -- so it will really just depend on how those operational issues unfold over the next few years.

D. Warren A. East*CEO & Executive Director*

We've got one in the middle here -- or sorry. The microphone at the back.

Unknown Analyst

[indiscernible] from Fiske. It might be a question for your new head of technology. GE have got problems with the TP400, Pratt with the geared fan. And you seem to have no problems with the F-35 gearbox and, hopefully, not with the Ultrafan. Is it because you use this technology called curvic coupling?

D. Warren A. East*CEO & Executive Director*

I don't actually think it is either. I mean, the challenges that were faced around the TP400, I think there was a significant volume ramp-up and that one facility was required to produce gearboxes for lots and lots of different engines. The geared turbofan from Pratt & Whitney, we can't really comment on other people's business, but these things are very difficult things to do. And of course, we will try to learn from other people's experience, but I -- and we believe that we have a design of gearbox that is going to be successful. But we're very, very early. We only just started testing it under power. And I would really hesitate for any of our spokespeople to comment on it's going to be glorious because we've got a program over the next several years of extensive testing. And I'd stress that, all of us companies, this is difficult stuff, particularly to make it safe and reliable. So I really can't comment on other people's challenges.

Christian A. Laughlin*Sanford C. Bernstein & Co., LLC., Research Division*

Christian Laughlin from Bernstein. Two questions from me. Both are related actually in a way, I guess. So firstly, Warren, if you think about 2 years ago or even 18 months ago, how has your confidence evolved with respect to confidence in the visibility of what you see and the quality of data that's being presented to you and how deep that goes into the organization or the divisions? And what has been driving that? Has it been changes in people and processes? Or also, have you started to see some fruits of some of the system updates initiatives that you talked about previously? And then secondly, related to that too, if you could clarify some of the comments that were reported into the press over the weekend about the GBP 1 billion in free cash flow around 2020 or so just with respect to how you actually are thinking about that in terms of defining that as an internal objective or as a marker on a trajectory over the next few years and how that shape of improvement from 2016 looks.

D. Warren A. East*CEO & Executive Director*

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Okay, let me just sort of comment on improved confidence. I am a lot more confident in the quality of information that I'm seeing today versus where we were 2 years ago or even 18 months ago. Part of that is in the delayering that we did in 2016 and getting closer to the businesses. Part of it is in the reengineering of the finance function that Stephen is spearheading and which is the sort of #1 goal. And I think in some of Stephen's slides, hopefully, you saw clear business-driven derivatives of the numbers. And so Stephen, you may want to comment on where it's going in the future. Before you do, I'll just talk about the weekend press and the GBP 1 billion. So speaking with a colleague about this, this morning, he had a great analogy for me. He said, "You know, I can have a target to have 1 -- sorry. He might have a target for that but GBP 1 million of cash in his deposit account. And that might be a target, but exactly when or if ever it's going to be achieved is debatable. So this is a very healthy objective for us to have. And Stephen calls it a great rallying cry within the organization. We sincerely believe and hope that this business will generate a lot more than GBP 1 billion of cash in a year at some stage in the future. We think it'll be around about GBP 1 billion around about 2020. And whether that GBP 1 billion threshold happens before 2020 or after 2020 depends on a myriad of different events. It depends on the level of flying hours that are done, the rate at which we grow our fleet, the number of in-service issues we have. If all of that moves in the right direction, we'll probably get to GBP 1 billion before 2020. If some of those turn into headwinds rather than tailwinds, then it'll probably be a little bit later, which is why we're really not going to get hung up on fixing actual target quantum of money to a particular point in time. But it's a very, very realistic number to be talking about in that sort of time frame.

Stephen Wayne Daintith

CFO & Executive Director

I've used it a lot in presentations that I have given internally because it's very useful just to get that focus on cash. And in fact, we're going through a little bit of an education process because most business managers in most businesses talk about sort of revenues and profits, but understanding your cash flow and drivers of cash flow, it sounds strange but it's true, is not often that great. So there's that. There's the education around it, but then there's also the drivers of that cash flow, going back to sort of the first part of your question. And I would hope that we can start talking in our releases around those drivers and those building blocks, particularly in the aftermarket cash margin because that's the big cash driver. And when you think about it, it's not hugely dissimilar from a subscription business once you get -- and how subscription businesses report their cash flows in terms of sort of yield and ARPU growth or revenue per -- well, revenue-per-customer growth, that sort of thing. And that then becomes very helpful because you've got a very reliable, dependable and strong cash flow which is an increasing proportion of our group revenues. So I would hope that we can move in that direction and really get that good understanding of those drivers of aftermarket cash margins.

D. Warren A. East

CEO & Executive Director

I don't -- the microphone must be over that side now. And we need to remember the microphones to the middle.

Robert Alan Stallard

Vertical Research Partners, LLC

It's Rob Stallard from Vertical Research. A couple of questions. Maybe to follow up on Charles' question on large aircraft, large engine OE cash margins. The loss of GBP 1.6 million per engine last year -- sorry, what we might be expecting for this year per engine. And then secondly, there's been a lot of conversation about whether Boeing will or won't launch a middle-market aircraft. Is this a platform that Rolls-Royce might be interested in powering? And if you were successful in achieving that position, what the sort of costs and timing could be.

D. Warren A. East

CEO & Executive Director

Yes. Do you want to talk about GBP 1.6 million?

Stephen Wayne Daintith

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

CFO & Executive Director

Yes, I'll do the cash losses, yes. I wouldn't expect a number significantly different from last year's number. And the very early question is -- guided as why that is. It's in that the XWB production is significantly higher in '17 than it was in '16. And we know that, that carries an initial larger cash than the average of all the others, but again we expect that to come down. In March, we'll be more explicit about the progress that we're making on the XWB, but it is good progress. And we have that ambition by 2020 to get to breakeven, which will only help the average margin going forward. So GBP 1.6 million, I expect to be pretty much flat in '17, but then '18, hopefully, we'll see improvements on that.

D. Warren A. East

CEO & Executive Director

Okay. And on the MMA, well, we're in the business of supplying large engines. And so if there's a sensible commercial opportunity around MMA, then of course, we're interested in going after it. We're developing new architectures at the moment. Our Advance engine is about getting greater efficiency out of the engine. Our Ultrafan is about making that engine propel the aircraft more efficiently. And we're developing those new architectures for new wide-body applications at the back end of the decade. If there's an opportunity to create from that architecture another engine variant that we can do economically and start having some return on all the investment that we're making in that architecture development a few years earlier, because that might be the timing for MMA, then that sounds like a good idea, but it will be dependent on whether we can get a sensible business case on the individual project. And that depends on where Boeing end up with the specifications for their aircraft and the requirements for the engine and where we are with our architecture developments at the time. All right. And we have to go to the middle now. I'm afraid we're sort of getting the microphone -- thanks. Thank you, yes.

Nick Cunningham

Agency Partners LLP

[indiscernible] sat in the wrong place. Nick Cunningham from Agency Partners. I wanted to ask about Trent 1000 because you're talking about sort of headwinds, if you like, potential headwinds. And it's difficult for us to see, I think, the Trent 1000 impact because it gets lost in warranty provisions or within long-term service agreements and so on in the P&L, so I was wondering if you could give us an idea of what the scale of cash issue has been; and also, beyond that, whether you now have a permanent fix and how much that fix is going to cost. In other words, how much is it going to cost in cash terms to close it out? And then final part of that: Is there any systemic issue around the sulfidation which is going to apply to other engines like XWB or Trent 7000 or whatever?

D. Warren A. East

CEO & Executive Director

Do you want to talk about cash? And then I'll come back.

Stephen Wayne Daintith

CFO & Executive Director

So, yes, on the -- there is a GBP 59 million technical provision in respect of a variety of engine programs. The 1000 is the single largest. And you should be thinking around sort of just less than half or so of the total is the 1000. That's what we provided for and that we think is sufficient at this stage. And it will depend on how the operational issues unfold over the balance of this year, but right now, we think we're adequately provided. So that's the answer on the 1000.

D. Warren A. East

CEO & Executive Director

Yes. And on the 1000 and getting it under control and tying it down, there are a handful of issues with the current Trent 1000. There are about 400 to 500 engines affected. And basically, some parts of the engine are turning out not to last as long in service as their original design lives. It's, as with any mechanical components, they wear out. And you have a design life and you expect to replace those components, and

it turns out on inspection that we had to replace them sooner rather than later. And that's what causes the extra costs. It's the extra cost of physically the parts and also the operational cost of putting them in. We understand the issues. We have a scheduled program for the fleet of engines that's out there. And we believe that, with the Trent 1000 TEN, the one that is coming into service at the end of this year, then -- we have addressed all the issues that have been identified. But if you look across our fleet of large gas turbines, there are issues with pretty much all of them. And this is a bit like the question I was answering on the gearbox. This is difficult stuff. And you start off and you have a design life and you have in-service experience, and you change the design or you change the life-ing that you're putting on particular components. And over the course of years, we get better at making these things last longer in the air. So instead of having to have engines that typically would return every sort of 2,000 cycles, now it's sort of 5,000 cycles or even 7,000 cycles. And the sulfidation issue you mentioned is something that all of these products are prone to. And we experiment with different cooling, different materials, different coatings to try to create an optimum balance of performance out of the engine versus life, but I'm afraid it's just a feature of how these things work, that you're always going to have those issues. And what you try and do is steer away from the bumpy boundary conditions where you run into operational problems. Sometimes, in trying to achieve better performance, we bump into one of those boundaries, and that's what's happening with Trent 1000 at the moment.

Nick Cunningham*Agency Partners LLP*

Can I just ask a quick follow-up on that perhaps? The circa GBP 25 million, I guess it is, the half of the adjustment, does that actually encompass cash costs? Or is other...

Stephen Wayne Daintith*CFO & Executive Director*

Yes, it does.

Nick Cunningham*Agency Partners LLP*

Right, so there's no warranty utilization or whatever going through.

Stephen Wayne Daintith*CFO & Executive Director*

No. I believe that covers the cash costs, yes. I will get back to you if not, but I believe that's the case.

D. Warren A. East*CEO & Executive Director*

Yes. I think we've got some more in the middle here.

Do you want to just pass it along and then we nip up the back?

Tristan Sanson*Exane BNP Paribas, Research Division*

So it's Tristan Sanson from Exane BNP Paribas. Three questions. The first one, I wondered whether, Stephen, you could give us a bit more details on working capital evolution than the GBP 180 million balance that you mentioned earlier? Second, you increased the CapEx guidance for this year by GBP 100 million, I think, but not changing the overall free cash flow guidance. Can you tell us where this extra GBP 100 million will be spent or what type of project, which division? And the third one is on TotalCare transitions. You transitioned a number of A330s over the past 12 months. Can you give us a feel for what should be the average contribution per hour flown of these new TCAs compared to initial TCAs, including the life-limited parts? So if you calculate the kind of all-inclusive contribution, these extended TCAs are traditionally acquired. Will they bring the same, less, materially less than initial TCAs?

D. Warren A. East*CEO & Executive Director*

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Okay, if I do the TCA one, do you want to do the working -- the -- yes.

Stephen Wayne Daintith

CFO & Executive Director

Yes, I'll do it, yes.

D. Warren A. East

CEO & Executive Director

Okay, if you kick off on the first one...

Stephen Wayne Daintith

CFO & Executive Director

So working capital. So GBP 180 million in -- largely in receivables, it's a real mixed bag of activities. I mean, first of all, it's good, old-fashioned improved cash collections and reduced debtor days. Particularly in Power Systems, there's been a sterling purse of -- piece of work in the first half of the year. Timing and phasing of customer deposits, the timing of concession payments when they follow the original engine sale. There will be times where we -- contract payments get restructured with our customers as well. That can cause an inflow of cash. And then a key component there is also the Aviall deal that we announced earlier this year where we're outsourcing logistics and supply of spare parts to the AE engines to Aviall. That had about 5 -- GBP 55 million or so that was part of the GBP 180 million. So it's a real mixed bag of items. I think I would make the point that I wouldn't regard all of this as permanent. And indeed, most of it is sort of AE-timing related, hence our keeping our outlook for cash unchanged year-on-year. And then CapEx, a slight increase in CapEx, this is kind of a noncash item, but effectively, we're capitalizing certain engines that go into our spare engines for our customers, and that's a key driver in what we're doing there. So that's the CapEx explanation. And then Warren, TotalCare [indiscernible]?

D. Warren A. East

CEO & Executive Director

So on TotalCare, there isn't really a material difference between TotalCare rates sort of the second and third time around versus first time around. If there is a rule, then actually we typically achieve a higher rate for a second contract than we do for an initial contract. When you get into TotalCare Flex and TotalCare select, these are the sort of towards the end-of-life variants, then you can think about that as if TotalCare is a kind of insurance policy. Then these variants are where you choose particular things, like on an insurance policy you might choose to pay a higher level of excess and a lower premium. And there's this -- that type of impact, so you will find a lower premium effectively because customers are choosing pieces out of the menu. However, none of that really affects the rule of thumb that we talk about, which is a large engine is going to generate \$1 million or so of flying hour revenue per annum. That's a combination of the flying hours and the rate. And it's a rule of thumb based on the size of fleet and where we are at the moment. Hopefully, that's enough color. We've got an -- we've got some online ones that we need to cover as well.

John Dawson

Former Director of Investor Relations

Yes. Conscious of time, so I just wanted to make sure that the online questions had a chance to be asked. Really the 2 questions that have come in focus really on cash flow outlook for this year based on the increased CapEx outlook, working capital and also the increased level of shop visits. Do we expect to be changing our free cash flow guidance this year and also next year? If we're not changing them, what are the moving parts to leave it all pretty much staying the same?

D. Warren A. East

CEO & Executive Director

[indiscernible]...

Stephen Wayne Daintith

CFO & Executive Director

The same answer really, yes, unchanged. I mean, coming in new, sort of looking at Rolls, one of the things that struck me is a GBP 15 billion revenue business and a -- and a GBP 100 million cash flow. It's sort of that is very, very precise, that degree of magnitude. And I would hope we can get to the days where that sort of number becomes -- varies around a much larger number then becomes less relative and material. So this is a fine art, and so -- but having said that, I pointed to the fact there were 1 or 2 quite lumpy items in our working capital which impacted the improvement half year on half year. I wouldn't read too much into that. Outlook unchanged on a full year basis is where we are when we put -- run all our maths together. And so that's the short answer to the question.

John Dawson

Former Director of Investor Relations

We've probably got time for one more question from the audience before we...

David Howard Perry

JP Morgan Chase & Co, Research Division

I -- can I take it? Because we can't be seen here at the back.

D. Warren A. East

CEO & Executive Director

All right.

David Howard Perry

JP Morgan Chase & Co, Research Division

Yes, David Perry at JPMorgan. A few questions, please, one on FX and then just a series of mini questions on the aftermarket. Just on the Slide 28 that you've given us, which is new, it's somewhat different to how in the past Rolls has explained its FX cover. I mean this looks like a very conventional FX strategy almost identical to, say, Airbus would use. And it implies that your hedging is with forwards; and that you have pretty much locked in rates for '17, '18 and '19, whereas previously we were always told Rolls used swaps with multiple fixing dates and that it had a lot of flexibility to sort of smooth the rates over time. So can you just talk to that? I mean, is this as rigid as it looks?

Stephen Wayne Daintith

CFO & Executive Director

Yes, I will talk to that. I mean I should -- probably should have highlighted that the hedged, the dark blue is a mixture of fixed and flexible. What I'm showing is what I think is how I think this is likely to evolve. I mean it may change but by degrees, so you're correct in -- your assumption was the right one.

David Howard Perry

JP Morgan Chase & Co, Research Division

So there is potential for the actual rates in '18, '19, even '20 to be better than you're showing here, or...

Stephen Wayne Daintith

CFO & Executive Director

I would doubt it. I don't think -- when you think about it, sort of why would -- if we were to do that, we'd -- effectively we'd be pushing hedges out into outer-years. And then the consequence of that would be then you'd start to move up in outer-years because you've moved those hedges further forward, which I don't think will be a good thing to do. So I would doubt that. Look, it remains a possibility, but I would doubt it. I think this is a good shape actually. So when I say good shape, I think this is a reliable shape for the next few years.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay. And then just a series of questions on the aftermarket. They're all related and quite quick. The 15% growth that you reported was very strong. Can I just check? Is that a genuinely -- in your view a genuinely organic number? Or are there some one-off items? And perhaps another way of asking is, if IFRS 15 existed today, would it have been 15%?

D. Warren A. East

CEO & Executive Director

Well, I mean the -- embedded in that aftermarket, some of it is the size of the fleet and more hours. And some of it is long-term cost reduction that we anticipate because of changes that we make to how we're servicing the engines and intend to service those engines going forward. So have we got the number on the slide of how much is the long-term adjustment?

Stephen Wayne Daintith

CFO & Executive Director

Yes, but -- there is some detail later on in the pack. And I won't get into those details specifically, but if you look at sort of '15, there was a GBP 208 million revenue adjustment for civil aftermarket. And 2016, it's GBP 474 million, so you can see there's a GBP 266 million difference. So that explains a fair chunk of it, but that is well explained in the detail in the appendixes that you have, that have been handed out.

David Howard Perry

JP Morgan Chase & Co, Research Division

So does that imply it wouldn't be 15% under IFRS 15?

Stephen Wayne Daintith

CFO & Executive Director

It would be a lower number, clearly, because you've got that GBP 266 million adjustment going forward.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay. And any chance of guidance for the full year on the aftermarket growth perhaps on both bases?

Stephen Wayne Daintith

CFO & Executive Director

No. We're not giving specific guidance line by line at this stage. We're just giving group guidance, as we have done previously; and modestly ahead of last year in cash flow, in line with last year.

D. Warren A. East

CEO & Executive Director

Yes. With that, I think we're out of time, so we're going to have to finish the Q&A, but thank you all very much for coming along. And thank you for your questions.

Presentation

John Dawson

Former Director of Investor Relations

Okay. I think we're ready to kick off, so thank you very much. And good morning, ladies and gentlemen, and welcome to the London Stock Exchange. My name is John Dawson, I'm the Head of Investor Relations of Rolls-Royce, and it's my pleasure to welcome you to our 2016 full year results presentation, both to those of you joining us here but also joining us online.

The agenda for today's presentation is as follows: Warren will kick off and give you some highlights of 2016, and then David will take you through the financial results in a little bit more detail, and then Warren will come back with some closing remarks looking to the future. The presentation should last around 45 minutes, but we've got plenty of time at the end for questions, so we expect to finish at about 10:15. We will take questions online as well, so if you are joining us through the web and you wish to submit a question, please do. And a member of the Investor Relations team will read it out if it hasn't already been asked already. Finally, before we kick off, could I ask everybody just to turn off their mobile phones or put them on silent just to make sure they don't disturb the presentation over the next 1.25 hours.

Thank you, and I'll now hand you over to Warren.

D. Warren A. East

CEO & Executive Director

Thank you, John. Good morning, everybody, and I won't bother doing the introduction that John's just -- let's kick off.

Now recent news flow around Rolls-Royce has been dominated by the announcements that we made in conjunction with the Serious Fraud Office a couple of weeks ago, and so we wanted to get this out and address this upfront in the discussion. And I think the best way of describing it is actually summarized in these 2 quotes. A quote from me talking about the business, what we think about what's happened; and there's another quote from me elsewhere about how Rolls-Royce is a completely different business. But it's all very well for me to say that. I think it's much better to refer to the quote from the judge who actually said that. So with that, I'm not going to talk anymore in this presentation about those events which have dominated the news flow over the last few weeks, but I want you all to be under no doubt whatsoever that it is front and center in our minds as a management team and making sure that such things don't happen again is very much a priority.

So now a quick snapshot of the results, and David is going to talk about these in a lot more detail. But basically, revenue's approximately in line with what we and everybody else expected. People across the business have worked very hard during 2016, so the net outcome is that cash and profit is a lot better than expected. Yes, indeed, there are some one-offs behind some of those numbers, but by the way, there are one-offs in both directions. We encountered quite a lot of operational challenges, some of which you read about in the newspapers during the year. And the fact is that underlying all that, there's some sustained improvement, which means that when those one-offs go in both directions, then we still come in better than expected, and David will go into a bit more depth on that.

Now a reminder of what I said 12 months ago when standing here in terms of setting some goals for 2016 -- 3 goals: one, about focusing on engineering and operational excellence and making sure that we allow our business model to really work, leveraging the installed base; two, make sure we got off to a really good start with our transformation program; and three, understanding that we have a job in hand to rebuild trust and confidence in this business. So that was the goals that we set out. And now I'm going to step through a few scorecards to illustrate how we've got on in 2016 addressing those objectives.

Referring to the first goal about focusing on engineering excellence, operational excellence and aftermarket. So in terms of R&D, record expenditure in R&D in 2016, even though times are tough, we recognize this is an engineering- and technology-led business. And it's very important that we spend that

money, because that money is going into new products that we are bringing to market. We are readying during this year now 3 large engines for our Civil business for entry into service very, very soon. And so it's very important that we bring those products to market for our future. But it's also important if we're spending all that money on engineering, that we spend it wisely and we keep getting better at how we spend it. And some examples on the right-hand side of the slide there about the impact of some of those efficiency improvements that we're making. And yes, as far as that digital product definition example is concerned, it will take a few years for the full benefit of this to show through in the results, but the underlying improvements have been initiated, and actually, a lot of work has taken place.

Switching to operational excellence, because it's all very well to engineer some great products, but we need to make some money out of delivering them. That also doesn't come for free. So now about 1/3 of our CapEx in 2016 spent on new capital equipment to make sure that we can make these things as effectively and competitively as possible. The payback, however, for that capital investment, left-hand side of the slide, is that we will achieve increased volume in a reduced footprint, and we will be able to do more with less. And during the year, we've communicated a bit and we've highlighted some of the improvement, and there are some improvements on the right-hand side of the slide. And I'd like to stress, it's not just about how we spend the money, it's about how we actually do the work that leads to significant improvements in things like assembly lead time. And it's also important to say that this isn't just a Civil Aerospace activity. Now yes, we're making some fantastic improvements in how we build our large engines for airplanes, but we're also addressing some other really significant opportunities to make a big difference in other parts of our business.

The third part of the focus is about leveraging the business model and making the aftermarket work for us. And now the important thing is that now this is a big chunk of our revenues. And as we look forward, now it's a very significant driver of profit and cash, and it's very important that we keep that asset base working out in the field. And as we look at our fleet of large engines, then we do have a young fleet. The flip side of being a young fleet is it's getting older. And as it gets older, then the transitions which are natural between the first owner and second owner of these things become much more normal. And because we want to keep that -- those assets operational as much as possible, then it's important that we're able to minimize that transition time. And so we have introduced a dedicated transition team. That dedicated transition team has managed twice as many transitions in 2016 as in '15 as we seek to minimize the transition time. And we're -- also numerous other examples of what we're doing to leverage our installed base.

So our second goal was to get off to a really good start on a transformation program. And I am pleased that we're announcing this morning that the in-year savings for 2016 was GBP 60 million against our original estimate of GBP 30 million to GBP 50 million. And so that's a very good start. But more importantly, some of the activities and changes that we undertook during 2016 feed into 2017, which is why we're confident that we can deliver an annualized run rate at the very top end of those GBP 150 million to GBP 200 million expectations for our run rate at the end of 2017. And as we go into 2018, there'll be a little bit of continued momentum in those activities that we've already done so far.

Now I'm quickly going to step through what's been going on around the business using some scorecards here. Now in Civil Aerospace, which is 50% of our business, there or thereabouts, we overcame some pretty clear headwinds, and these were the headwinds that were identified as early as 18 months ago when I joined the business. And they did indeed come to pass. And we overcame some other challenges as well. And so in terms of numbers, and David will go through the numbers shortly, then results slightly ahead of expectations but pretty much where we expected them to be. And a lot of that is caused by the transition from older engines into newer engines. And you can see the effect of that is happening both at the OE stage but also at the aftermarket end as well, where we have new engines growing, but actually, the aftermarket revenue from those new engines not really coming through and completely dominating but being held back a little by the older engines with high-margin spares-type activity falling off. It's important that we recognize that we've got a big step-up to do in 2017, and I'll come on to that in a moment. But our new product introductions are going quite well, and it's important that, that engineering -- we keep looking at that engineering pipeline and making sure it's in good shape.

Two examples, and it's worth dwelling a little bit on our Civil business, because that is half of the total. So the 2 key drivers of cash over the next 10 years are probably the XWB and the Trent 700. And these are at very different stages in their life cycles, and so we'll look at XWB first and then at Trent 700. So on XWB, deliveries in 2016 more or less doubled. At the bottom of the slide there, on the bottom left, you will see, however, we've still got this big step-up to do in 2017. And so it's absolutely essential that in 2016, we achieve the essential improvements in things like lead times to make that volume step-up in 2017 possible. We clearly have some more work to do on cost, and we will, in time, benefit from better pricing as we move away from the launch pricing in this engine.

Switching to the installed base. Obviously, from a standing start, more or less massive change in the size of the installed base for XWB in 2016. I think the important thing to note are the 6x increase in installed base by the time we get to 2020. And if we look at the backlog of future orders, we've got 8x the current installed base out there in the backlog. So this is clearly going to be a very important product for us.

Trent 700 is the other big generator. Now this engine was launched into service 20 years ago. And so clearly, we are approaching the end as far as getting these engines installed new onto airplanes are concerned. Interesting to note, however, that we are still working on improving things like the lead time and how long it takes us to build one of these things. And in '17, we will actually enjoy a little bit more volume as we move into this installing effectively the tail end of the Trent 700 program. But the big focus, looking forward, is about how this engine works in the aftermarket, actually in use. And after 20 years, of course, the installed base is still growing. And the other point to note is that even though this has been a 20-year program, it's been a much slower rate of installation than XWB, and so this is still a relatively young fleet with a very, very long way to go.

Defence Aerospace, generally a solid year. I think we'll talk a bit more about the fact that it's driving profit, but fundamentally, we saw a product mix putting downward pressure on profit, and we saw a reduction in part sales. But importantly, what we concentrate our effort on in Defence is really getting close to our customers and strengthening the service support because it's very important, with essentially a large installed base, that we work that as hard as possible.

Our Power Systems business. This outperformed our competitors. And I remember just being sat here a year ago listening to -- or receiving lots of questions about how we were going to perform in this business during the year when our competitors were forecasting massive drops. Well, it was broadly flat for the year. The answer is broadly what we gave a year ago. Revenue's flat because volumes in some of the growth areas that we're exposed to are higher than the volume downward pressure in some of those areas, particularly in oil, gas and commodities that our competitors are exposed to. And yes, because of that, then there is a product mix effect and our -- because volume came down a little and the mix changed, then our profits are down a little. But we still outperformed the peer group.

I'm very pleased with the excellent start that our new leader in that part of the business has made. He's really started injecting some pace and energy into the business in the 6 to 8 weeks that he has been with us, and I look forward to much more from that business as we go forward.

Now Marine. The offshore market, we know, is very, very weak. There are laid up vessels everywhere, and that has a knock-on effect into the Merchant space as well. There is really very, very little demand, and lots of the overhauls are being deferred, and so it's affecting our service business as well. We have been, however, addressing the operation, and gross margin has actually improved in percentage terms. In absolute terms, it's down because the size of the business is down. But we have seen improvements in gross margin because our cost-reduction activities are bearing some fruit. And what we're seeking to do, if you look at the graph on the right-hand side, is say this is a cyclical business. It's always been a cyclical business. And we have, over recent years, become a little bit overexposed to offshore, and we have become a little bit larger in terms of fixed cost base than we should ideally be. And so we are resizing the business and positioning it for the trough of the cycle, and we are tilting activity towards new technologies and new adjacent applications. So we will benefit from the cycle improving, and we will continue to win business as, indeed, we are winning business today in adjacent applications and particularly around new technologies such as all-electric ships. And just a measure of the rightsizing is there on the bottom, where, essentially, we will have reduced the headcount by about 1/3 in rationalized facilities.

In our Nuclear business, it's been a story of a little bit of increased revenue, because more submarine work. But submarines are actually a lower-margin activity, and we have seen the need to invest in operational improvements. Some of you may remember some pretty nasty headlines from about 12 to 14 months ago around that program. I think we've addressed a lot of those issues, but addressing those issues hasn't come free, and we've had to invest a little to fix things. And we're continuing to invest in new designs for new opportunities, and things like the small modular reactors represent those opportunities.

So overall, I'd say it's a year of stabilizing. We've made significant progress in simplifying the structure. We are investing for the future. We have to have an eye on the future in terms of the technologies and the applications. We also have to keep addressing the operational issues. I think as we look to 2017, then it's challenging, but we're on track. We're delivering at volume run rates that allow us to achieve the required volumes in 2017. And our new big programs, we're focused on those new engines for entry into service over the next year or so.

Longer term. Longer term, we're talking about transformation towards a better-performing, simpler and more resilient business, and so we absolutely need to continue working on that.

So briefly summarizing at this point, I think we've done a good job at addressing the goals set for 2016, both the key goals in terms of strengthening our focus and getting our transformation program off to a good start. Our hope as well -- alongside that, we're doing a reasonable job at rebuilding confidence and trust in the outside world, but that's for you folks to judge, not us.

And with that, I'll hand over to David to take us through the numbers in a bit more detail.

David Miles Smith

Former Chief Financial Officer and Executive Director

So thank you, Warren. I'm going to take you now through a review of each business, the group cash flow and balance sheet and provide our outlook for 2017. And before I do that, let me just summarize the key elements of group performance. And remember, our percentage change comparisons will be on a constant currency basis, unless stated otherwise.

So starting with group revenue and profit. Underlying group revenue of GBP 13.8 billion was 2% lower in 2016, reflecting declines in both original equipment revenue and services. By business, Civil and Defence Aerospace and Power Systems revenues were steady, while Marine decreased 24% and Nuclear actually increased by 11%. Our underlying profit before financing of GBP 915 million was 45% lower, largely driven by a reduction in Civil Aerospace profit to GBP 367 million, broadly reflecting the headwinds we've previously communicated. And profit in Defence Aerospace, at GBP 384 million, was 8% lower, and that was mainly due to TP400-related program support costs. Power Systems was down 14% year-on-year at GBP 191 million, largely as a result of adverse product mix. And the Marine loss of GBP 27 million was driven by continuing weakness in offshore markets but was actually better than we originally expected due to additional cost actions. Nuclear profit was down 37% to GBP 45 million due to margin mix in submarines but also pretty significant non-repeat of the R&D credit we had last year.

So turning now to look at the businesses individually and first starting with Civil. If we start with revenue, overall, our underlying original equipment revenue for Civil Aerospace was flat on a constant currency basis. Revenue from linked and other engine was actually up 2%, with increased volumes of Trent 900s and a higher number of spare Trent XWB engines sold. Of this, sales of spare engines to joint ventures generated a revenue of about GBP 277 million. This was partly offset by lower Trent 700 volume and also the price reductions on those engines, ahead of the introduction of the Trent 7000 on the A330neo. Unlinked revenues increased by 47%, and that was largely, obviously, led by the higher volumes of Trent XWBs. Business aviation engine sales were 25% down, reflecting both general market weakness and the transition to newer non-Rolls-Royce-powered platforms from our BR710 engines. Volumes of our newer BR725 engine, which powers the Gulfstream 650s, were pretty stable. Finally, the V2500 module revenues did decline by about 10% as production slowed, obviously, again, as Airbus transitions to the A320neo.

And turning to aftermarket. In the aftermarket, the overall result was down 1%. Service revenue from large engines would have actually been up by about 2% but was down 4% after we adjust for contract

accounting effects, which were, however, significantly lower than the prior year. Within this, we saw double-digit growth in revenue from our in-production engines, but that was more than offset by a reduction from the older engines. This included the expected lower utilization of Trent 500 and Trent 800. Time and materials revenue also reduced with fewer engine overhauls across the out-of-production fleet. The business aviation aftermarket was slightly down, and regional jets were down 14% as a result of reduced utilization primarily by North American operators. However, V2500 service revenues were actually 21% higher, and that reflected a combination of price escalation built into contracts on flying hour payments, together with some increased overhaul activity.

Turning now to gross margins. Overall, gross margins for Civil Aerospace were GBP 1.1 billion or about 16.8% of revenue, which was down GBP 397 million from 2015. Within that, trading margin was down GBP 248 million, with the main revenue and margin headwinds, as I've just highlighted, being as we forecasted at the start of the year. We also saw some additional program charges of around GBP 30 million incurred for engines still in development. The lower margin was partially offset by releases of accruals related to the termination in prior years of intermediary services, which totaled about GBP 53 million. And remember, 2015 also benefited from a couple of things: a one-off GBP 65 million release of Trent 1000 CARs impairment, write-back and provision release. As you can see from the slide, the in-year net benefit when we look at all of the long-term contract accounting adjustments totaled GBP 90 million, so that was down from GBP 222 million in 2015, a reduction of GBP 132 million. But remember that last year, we had that GBP 189 million benefit from the risk methodology adjustment.

Technical costs for large engines was GBP 74 million higher, at an absolute of GBP 98 million, and that included Trent 900 costs and upgrades to the Trent 700 engine management system. This was offset by a GBP 77 million higher contribution from the life-cycle cost improvements, an absolute of GBP 217 million for the year compared to GBP 140 million in 2015. And as we discussed at the half year, we also recognized a GBP 35 million benefit from a change to our long-term U.S. dollar planning rate.

So turning to the rest of the profit waterfall [ph]. Costs below gross margin were GBP 89 million higher than the previous year. Underlying C&A costs were GBP 43 million higher, and that was primarily due to higher employee incentive costs. Net R&D charges were GBP 34 million higher, reflecting higher spend on key programs, particularly the Trent 7000. And also, development cost contributions were also lower, but those were partly offset by some increased R&D capitalization on the -TEN Trent 1000. As a result, overall profit before financing and tax was GBP 326 million and GBP 367 million after positive FX.

So turning now to Civil's trading cash flow. Civil trading cash flow of GBP 43 million positive actually compares to breakeven in 2015. Within that trading cash flow and before working capital movements, the main change year-on-year was obviously the GBP 445 million reduction in underlying profit. We saw CARs additions at 280 -- sorry, GBP 208 million, which was up GBP 47 million from the prior year. In addition, there was an incremental GBP 237 million spent on PPE and intangibles, primarily certification costs on the XWB-97K and also, as I've mentioned, the R&D capitalization on the Trent 1000. Net long-term contract debtor additions were GBP 160 million lower than in the previous year, and that reflected in part the lower profits on Trent 700 and the lower net long-term accounting adjustments. So overall, trading cash flow also benefited from better-than-expected working capital improvements of GBP 345 million, and that was really principally around customer collections and deposits. And I'd say that, that was really the outperformance that you saw both in Civil and at group level, that outperformance on working capital.

So turning now just a little bit into the detail of TCA and CARs. TotalCare net assets actually increased by GBP 230 million to GBP 2.44 billion, and this reflects both linked profits and cash losses on the new engine sales plus the catch-up adjustments, offset in part by the cumulative amortization charge. And to preempt any questions, that's slightly different from the GBP 230 million you see in -- sorry, from the GBP 246 million in the trading cash flow, and that's simply an FX difference within the TotalCare balance. New linked engines of GBP 432 million and contract accounting adjustment of GBP 90 million were offset by cash inflows and other net adjustments of GBP 292 million. So we ended up, as I said, at GBP 2.44 billion at the end of the year. And we still expect this to peak at our previously guided range of between GBP 2.5 billion and GBP 2.7 billion. The CARs balance increased by GBP 169 million, reflecting higher sales of unlinked Trent XWBs.

Turning now to Defence. So starting again with revenue. Underlying revenue of GBP 2.2 billion was slightly up on the prior year on a constant currency basis. OE revenues were helped by higher volumes of both the TP400 and also increased Adour engine with deliveries. Service revenues were stable, with lower demand for spare parts offset by some increased revenues from Typhoon and C130J contracts.

In terms of the gross margin, the gross margin actually declined by GBP 49 million to GBP 530 million, and that reflected a combination of some of those volume effects and adverse product mix, together with the GBP 26 million additional costs we booked for the TP400. Long-term contract releases of GBP 82 million were down GBP 5 million from the previous year but actually higher than we had expected earlier in the year. And that was principally due to the benefit of locking in some significant cost savings on the U.K. Typhoon contract, which is now in its last couple of years, including a cost-saving incentive award.

So outside of gross margin, for Defence profit, R&D and restructuring costs were lower than the prior year, and that was mainly due on restructuring due to lower severance costs around the Indianapolis program. Overall, profit before financing of GBP 384 million was 8% lower than 2015, driven primarily by the lower gross margin I discussed.

So moving on now to Power Systems. Underlying revenue of GBP 2.7 billion was slightly down, excluding FX. And I think that was a pretty good result given the market conditions. OE revenue declined by only 1%. And we saw growth in power generation and industrial sales, which partially offset the weaker commodity-related markets and some reduced activity in our Naval business. Service revenue was 2% lower, and that largely reflected again some of the fleet utilization issues we're seeing in the marine medium-speed market.

Power Systems gross margin reduced by 28% in absolute terms to GBP 628 million, primarily mix effects there, adverse mix. But it did include some good progression on cost reduction, which offsets some of the volume and mix effects.

So on overall profit, underlying profit declined GBP 27 million, that's 14%, and that was led by the reduction in gross margin. But I have to say RRPS are starting to get some benefits from product streamlining as well.

Turning now to Marine. I've just got a single slide here. Underlying revenue of GBP 1.1 billion was 24% lower, with some continued weakness in offshore also seen in a declining order book. Our gross margin was, therefore, GBP 44 million lower as a result but actually 170 basis points higher in percentage terms, partly through our cost-reduction activities and also some lower warranty and contract charges. The resulting net loss was GBP 27 million. The December announcement of further organizational changes and headcount reduction led to an additional GBP 5 million restructuring charge, with the remainder due to be taken in 2017. And we also took a GBP 200 million impairment charge against goodwill, reflecting the ongoing tough trough [ph] conditions and reshaping of the business.

Finally, to Nuclear. Our underlying revenue for Nuclear increased by 11%, largely within the submarine programs. Volume on key civil programs in both France and Finland were also strong. But our gross margin was lower by 80 basis points, and that really reflected a greater weighting in the overall mix towards the lower-margin submarine programs.

Below gross margin, we took some additional costs to support the higher volumes and to improve delivery performance in submarines. And we're also investing modestly on the initial design phase of small modular reactors. We have, in the year, a GBP 7 million R&D credit but no repeats of its 2015 catch-up that we saw. And we expect the GBP 7 million credit to decline to near 0 in 2017. As a result, underlying profit before financing was 35 -- GBP 45 million, or GBP 38 million if you exclude the R&D credit.

So turning back now to the group as a whole again. Net finance charges in our underlying result were GBP 102 million, and tax was GBP 261 million, reflecting an underlying tax charge of 32%. And as a result, underlying earnings were GBP 552 million or 30.1p per share. The underlying tax rate rise was higher and was due to a combination of a decision to de-recognize deferred tax assets on our losses in Norway and a greater proportion of our profits coming from higher corporate tax countries.

Turning to look at the reconciliations for our reported result, there are clearly a number of very key differences I'd like to highlight this year. Firstly, as I've already mentioned, we had impaired goodwill associated with a number of the acquisitions, but principally that GBP 200 million within Marine. In addition, we recognized a GBP 671 million charge related to the agreements reached recently on the legacy investigations. Exceptional restructuring totaled GBP 129 million for the year, up around GBP 80 million, and the majority of that was for the transformation program. We're sorry, the -- this included the costs for that program, which delivered the in-year benefits of GBP 60 million that Warren has already mentioned.

Also, as we've previously announced in November, Legal & General acquired the assets and liabilities of the Vickers pension scheme, the largest deal of its kind in 2016. The significant pension risk transfer also resulted in us reducing by GBP 300 million our book surplus on pensions as that effectively transferred to L&G.

And of course, we had the GBP 4.4 billion cumulative mark-to-market adjustments during the year of our hedge book. As you've heard from me many times before, we've never believed that, that mark-to-market valuation adjustment is particularly relevant for the ongoing business given that those underlying hedge cash flows will provide corresponding benefits in the future.

Turning then to the profit-to-cash flow walk [ph]. Our free cash flow of GBP 100 million was GBP 79 million lower than the prior year but well ahead of our original guided expectations for GBP 102 million minus GBP 300 million. And that overall change reflected the stronger working capital performance in Civil than in 2015, which helped offset the lower profit and higher expenditure on PPE and intangibles. This is our usual bridge slide from profit to cash flow. On an absolute basis, we saw a GBP 55 million outflow from net working capital, including GBP 230 million higher TotalCare net assets and higher inventories related to the production ramp, but these were offset by higher payables and deposits. We have GBP 570 million of CapEx, that included some payments against 2015 invoices; and GBP 631 million of intangibles, including the GBP 208 million that came from CARs. And the rest of that would have been the higher R&D capitalization, mainly on the Trent 1000, plus higher certification costs on the XWB-97K.

In 2017, despite the increased investment in installed engines as we increase our large engine production to around 500 units, we should be able to keep some of this working capital performance we saw in 2017. As a result, we're now expecting to be able to deliver another year of slightly better than breakeven free cash flow, similar to 2016, so that is an improvement from what we've been saying over the last year.

As you know, we value a very robust balance sheet with a healthy investment-grade rating. We believe this is commercially important when offering products and support contracts, so we'll be in operation for decades. After the SFO announcement, you'll be aware that Standard & Poor's did update their rating to BBB+ stable from A- negative outlook, although Moody's have maintained their rating at A3 stable, as have Fitch. We will continue a very close dialogue with the agencies so that they can best see the progress we're making, particularly in terms of transformation and our profit and long-term cash generation. During 2016, the group's net debt position did increase to GBP 225 million, but leverage remains at a comfortable level although, clearly, we do have some additional cash calls during this year with the DPA. We have no significant refinancing, however, until 2019. And remember that last April, we increased our revolving credit facilities by GBP 500 million to provide additional liquidity.

So turning now to payments to shareholders. Our stated objective in the long term is to progressively rebuild our payments to shareholders to an appropriate level, subject, obviously, to short-term cash needs. And this reflects the board's long-standing confidence in the strong future cash generation of Rolls-Royce. At this stage, however, the investment needs of the business remain high, reflected in the low level of free cash flow in 2016 and again in 2017. In addition, the board sees the need to retain a degree of balance sheet flexibility. As a result, we have decided to keep the final payment to shareholders at the same level as last year, in other words, 7.1p per share. This means that the cash cost of the payments to shareholders during 2017 will be about GBP 215 million, including what we've already paid.

Turning now to hedging. As I explained in November, our hedge book has a fairly simple purpose. We're trying to match our future customer and supply commitments, which are very long-lasting, thereby mitigating risk to our reported margins over time. In any year, we will take advantage of attractive rates

in the market if they're available, but this isn't the primary consideration. More importantly is to be sufficiently flexible to keep the rate relatively stable over time even if our dollar revenue or cost profile changes. The 2016 movement in the average achieved rate was worth about \$0.025 cents. And net of some translation effects, that gave us a group benefit of about GBP 20 million. Clearly, market conditions have enabled us to reduce the rate really quite rapidly whilst expanding the size of the book from \$29 billion up to \$38 billion at the year-end, with an average rate on that book of 1.55. We have delivered there from the core purpose of this program, smoothing the effect of rate. And I believe the rate will remain relatively stable over the coming couple of years. So after a big increase in 2016 in the size of the book, we're unlikely to be growing the book much further, and we'll look to utilize the hedges in a way which keeps the achieved rate relatively steady. Even actually at current rates, replacement hedges won't achieve rapid reduction in the average rate of the hedge book unless the spot rate sustains at this level for quite a long time.

So turning now to outlook. Business by business, our outlook is mixed. For Civil Aerospace, on a constant currency basis, we should see some modest growth in revenue and profit in 2017. Within this, our large engine business will continue our OE production ramp, which will consume cash, although this will be partially offset by growth in engine flying hours on the new Trents. We'll also capitalize more R&D and continue to take out costs. Business aviation OE demand is expected to weaken further and will demand -- and as will them in the regional aircraft aftermarket. And as I said, we need to continue to work both on costs and also on inventory, with further improvements. So overall, we'd expect cash flow to be marginally ahead as well, despite a strong performance at the close of 2016. Our updated 5-year revenue outlook for Civil actually has only changed in one respect in the near term. We now see a bit more positive business aviation aftermarket for 2017, so the arrow there is now flat rather than down previously.

Switching now to cash flow, turning to the outlook. Nothing has changed again directionally, and we expect 2017 to be broadly the same as 2016. We've also just added a column for 2021 now that we finished 2016. Looking out further, clearly, the important thing is to roll out the new engines with an exclusive position on the A330neo, for the Trent 7000 and on the A350 for the XWB. And that will significantly grow our installed base. And as we previously said, the resulting installed base is the thing that will deliver strong aftermarket revenues and cash flows for decades to come.

Turning now to Defence outlook. While revenues should remain relatively steady, we are still expecting margins to come under some pressure. We saw about a 2-point decline last year. And we're continuing to make investments, particularly in Indianapolis as well as the lower contract performance incentives that are available to us on key programs this year. As a result, margins and profits are expected to soften a bit further from recent levels.

For Power Systems, the outlook for Power Systems remain steady, that's a positive, as we continue the transformation of that business. The business finished last year with a strong order book for several of its key markets. And although some commodity-related markets remain difficult, we expect the business to deliver some modest growth in revenue and profit in 2017.

For Marine overall, the outlook has to remain very cautious, with revenue down further in 2017 and losses at a similar sort of level. We expect the market will continue to feel the impact of lower oil prices for some time, and the general overcapacity in several segments will take time to reach equilibrium. So we're continuing to sustain our cost-reduction programs focused on manufacturing, supply chain and overhead costs in order to deliver a more competitive business.

Finally, for Nuclear, the long-term outlook remains positive, supported by the confirmation from the U.K. government of its ongoing investment in the Dreadnought class submarines. We've renewed activities in the civil market. Particularly in the U.K. and China, there are also some encouraging growth opportunities. However, shorter term, our impact -- our results will be impacted by a couple of factors: the absence of R&D credits; and also some lower margins on our submarine business; and further increases in our investment in SMR technology and other initiatives. So as a result, we believe our profit is likely to be around half that achieved in 2016, reflecting these investments.

Turning now to group technical guidance as a whole. I'll just focus on a couple of points here. Firstly, changes to the XF (sic) [FX] environment over the last 12 months clearly have continued to have a

benefit to our reported underlying results in 2017. Should rates remain unchanged from where they were at year-end, it would provide us some further translation-related improvement, obviously, as we translate foreign profits and revenues of about GBP 400 million on revenue and about GBP 50 million on profit before tax, comparing to GBP 725 million and GBP 80 million last year. Secondly, net R&D spend is expected to be at a similar level in 2016, although the charge to profits will come down because we'll have some higher capitalization by about GBP 60 million to GBP 100 million, close to GBP 800 million in total. As I said, that really reflects higher R&D capitalizations for the new engine programs. Finally, free cash flow for 2017 at group level is expected to be at a similar level, and this result will clearly -- this -- but clearly, any review is vulnerable to relatively small movements on what are extremely large balances at year-end.

So in conclusion. We have had a good year -- end to the year and delivered on expectations, but there's clearly plenty of work to do with a significant operational execution challenge. The outlook is biased to positive across the 5 businesses, and we'll still be very focused on our transformation program, delivering cost efficiencies and improving cash flow.

Finally, as this is my last results announcement for Rolls-Royce, I did want to thank you for all your patience and support. When I started as the CFO in November 2014, we faced a pretty challenging and difficult situation. And clearly, we also had to significantly recalibrate expectations about the performance of the business during 2015 and take some difficult decisions around the balance sheet and shareholder payments. But after delivering a good set of results this year and also, actually, last year, we outperformed expectations as well, I hope that we're also developing some track record and consistency. And it's good to have such a track record, and obviously, Warren and the team's commitment is to do further performance improvements in 2017. So I'm hoping that's going to give you continued confidence on your view about Rolls-Royce's long-term future.

Thank you, and I'd like to hand back to Warren.

D. Warren A. East
CEO & Executive Director

Thanks, David. Thank you. Right. Briefly, I'm going to conclude the presentation section with a little bit of a look forward. So just over a year ago, I talked about building a new leadership team, and I talked about roughly 1/3 of new people coming onto the team from inside the business with knowledge of the business, 1/3 continuity candidates, and we would get in some people from outside to give some fresh, external perspective. Last November, I said we were a little bit behind in terms of how I had hoped to get that done in the time I hoped to get it done. But now the team is pretty much there and in place and starting to deliver. So as I said before, David came up, now we can do a little bit of focusing on looking forward. And in November, I put this slide up saying, looking forward, we need to take into account the 4 areas of analysis: long-term outlook; how we are positioned competitively; and how we can go to continue to improve our operational performance; and importantly, what are our resources available and how do we allocate the capital. And now the new team is in place, we are doing that.

Alongside, as David just said, we've got a lot of work to do on delivering in the meantime and improving the operational performance. So I haven't got a big reveal for you this morning. We will talk about how we take the business forward as we go later into the year.

But just by way of emerging framework here, how we're starting to think about this, it's fundamentally an engineering- and technology-led business, and we have some great leadership technologies. And so that's where we start, at the top of the slide. Then we need to go about engineering and think perhaps a little more broadly about the ecosystem in which we operate, and so hence the term dynamic engineering, where we think about acquiring technology, we think about developing technology, we think about manufacturing, actually securing the best value way of doing that from our ecosystem, including our own supply chain and the activities in the outside world. So leveraging our university relationships would be one example, but continuing to take very careful account for how we manage our intellectual property and how we map our intellectual property looking forward.

Then with that great technology and optimal engineering, of course, we need to continue to work very closely with our customers and our partners to make sure that we translate that into really compelling offerings that provide solutions for our customers, and that's the bottom gray box.

The crucial piece is how we link that to financial performance in the business, and that's what we're calling the value bridge, converting these compelling customer offerings based on leadership technology and sound engineering into money. And that's what our transformation program is all about, driving competitive levels of performance so that we can get sensible returns, so that we can generate cash, so that we can make the business sustainable, we can invest in building competitive barriers around our business, and so that we can continue to invest and acquire new technology. So that's the sort of emerging framework that we're using.

If I translate that into the priorities of our leadership team in 2017, then I'm afraid it's a little bit boring. The left-hand side of this slide is pretty similar to what you saw in 2016. We have to really focus on getting our engineering and operational performance right, so we can leverage the amazingly powerful business model that we have. We must keep doing that to keep a simpler -- or to develop a simpler and more resilient business. But at the same time, on the right-hand side of the slide, we do need to start to tilt a little bit to the future, look ahead, to think about new disruptive technologies and ways in which we can improve the competitiveness of our business from a strategic point of view to disrupt and to win. So that's a little glimpse of the future.

My summary. 2016, year of stabilization, meeting expectations. I look at 2017 and it's very clear for me what we have to do in 2017 in terms of operational focus and ramp-up, and that translates into some very clear priorities for me and for the team. But we do that in an environment where, actually, we're pretty well positioned, with growing market share in growing markets. And provided we can concentrate on growing the profitability and the competitiveness of the business, then that's a pretty good outlook for the future.

So with that, I'll hand over, and we'll take your questions.

Question and Answer

D. Warren A. East

CEO & Executive Director

All right. Let's go. Microphones are coming around. We'll start there, and then next one is going to be over here.

Nick Cunningham

Agency Partners LLP

It's Nick Cunningham from Agency Partners. I hope it's not inappropriate to say thank you to David, actually, for having helped the analysts so much in what, actually for us, has been rather a complicated time, and then perhaps to go on to asking for some more help. The particular point I -- the question I wanted to raise was around, naturally, I'm afraid, IFRS 15, a rough idea perhaps of what the delta might have been in 2016 and maybe '17 relative to your guidance and how that tapers, if you like, as we go forward over the next, say, 5 years or so.

David Miles Smith

Former Chief Financial Officer and Executive Director

And Nick, it's a fair question. We really want to be more precise so -- for '16 because it will be a comparative year as -- and we did take the time over '15. So Stephen is going to do that a little bit later in the year. If you remember, I had a chart with some sort of cartoony sort of lines up in November. And I think you can take from that, that we don't see the 2016 number being significantly less than the GBP 900 million that we ended up in '15. I think it might be a bit lower, but I would rather that we did data work and just go through that. But it's going to be in that kind of ballpark, I think, and then we'll progressively improve. But don't expect it to be significantly different from the GBP 900 million or so.

Nick Cunningham

Agency Partners LLP

And in terms of, perhaps, some vague indication, if you like, of how the difference diminishes as we go forward?

David Miles Smith

Former Chief Financial Officer and Executive Director

Well, I think that line -- sorry, I don't have the chart in front of me, but clearly, there's a different timing on aftermarket and OE effects, and we try to sort of lay it out on that line. And the crossover point is sort of somewhere between 2020 and 2025 on that line. I think that's still our best estimate, but we are doing a lot of further work on this. It may not sound like a difficult problem, but it is an intensely hard amount of accounting work that's going on around this at the moment. And it's not worth giving you numbers that we're going to change later. We'd rather get the numbers right. And so Stephen, I know, is committed to come back as soon as we can really to give you an update on that.

D. Warren A. East

CEO & Executive Director

Someone over this side of the room. One, two and then you a few rows back.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Just a few questions on Civil Aerospace, if I may, Warren. Basically, from -- starting from the back end of 2016 and looking into how things are trending and setting up for 2017, how are unit costs progressing for the XWB-84? And as a corollary to that, how do you feel about schedule in terms of meeting the schedule requirements from Airbus? Still under a lot of pressure or better than it was, say, H1 last year, et cetera? Some sort of qualitative characterization would be helpful.

And then secondly, just kind of thinking about your development portfolio, if you could just sort of update where we are on your expectations for meeting the schedule for the Trent 1000-TEN, the XWB-97 and the Trent 7000 in terms of performance and cost expectations and then, of course, schedule.

D. Warren A. East

CEO & Executive Director

Yes. Okay, so how do I feel about costs on XWB? I think we're in reasonable shape. It is going to take a few years to achieve where we want to get to on cost, but we are absolutely sort of on track with that. In terms of the cash loss per engine, I'd also draw your attention to the fact that, particularly as we come into the back half of '17 and into '18, then we lose the deliveries that are attached to launch pricing, and so we go up a couple of notches in terms of achieved pricing. So we're actually attacking the cash loss from both ends, from the cost reduction, which is 7% in '16, and there'll be more to come in '17, we're on track. But also, we get a little bit of assistance from improved pricing. How do I feel about that from a delivery point of view compared with, say, 12 months ago in meeting the Airbus schedules? Well, 12 months ago, we weren't in as good a position as we are today. We are in good shape today, but most of the volume ramp in XWB was delivered from us in the second half of the year. That was fortunate because as far as we're concerned, because Airbus had some other issues with, and so at no stage have we actually been the pacing item in terms of delivery of the airplane. And we don't intend to be a pacing item as we look forward. We've already delivered in the first 6 weeks of this year, and we're absolutely sort of on track with Airbus and their plans. And they'll talk about their volumes, I'm sure, when they do their results next week. As for the new -- the 3 large new ones, then the Trent 1000-TEN is flying. We have a 787 flying with 2 Trent-TEN engines, and so they're going through the flight testing -- extended flight testing ahead of certification now. And we're on schedule for that to go into service in the second half of the year. Similarly, similar position on the A350-1000 with the 97K engine, where the -- they have 3 airplanes now on extended flight testing, and that's sort of scheduled for service entry in the second half of the year. And on the new A330 with the 7000 engine, that is about 6 months behind, but it's on a similar trajectory. And that airplane will fly with its new engine for the first time over the coming months.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

It's Ben Fidler from Deutsche. I had 3 questions, please. First one, just on FX, just to make sure I've understood the messaging on your Slide 42, which you showed to us, David. So...

David Miles Smith

Former Chief Financial Officer and Executive Director

[indiscernible]

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes. The -- so am I right, it now seems that the currency sensitivity because of the balance sheet movements within Civil Aerospace is kind of in the -- and my mistake, but it sounds like it's kind of 1/2 to 1/3 of what I previously had assumed is your FX sensitivity once you take into account the balance sheet effects. Is that right?

David Miles Smith

Former Chief Financial Officer and Executive Director

I think the transactional side of it is exactly as you'd expect because we did also get some movements on the revaluation of foreign currencies for our payables, receivables, whatever. That diluted that a little bit. That's really going to -- well it is, but it could be the other way, depending on exactly balance sheet to balance sheet rate changes. So it happened to be a slightly dilutive effect this time. The transactional calculation is still going to be about right.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

And then related to that is also that slide, your comment, again to check I haven't misinterpreted it, you're saying you don't expect any average effective rate change in '17, or you also mentioned in '18, for the next couple of years. So is that the message?

David Miles Smith

Former Chief Financial Officer and Executive Director

So the message is I don't think we're going to be net increasing that GBP 38 billion, so it's more likely that we'll stay at a similar level. So we will replace some hedges as they roll off clearly with new ones. We -- but that's over the whole of the hedge book. So what we will continue to try and do is try and keep the average rate year-by-year fairly flat. So I don't -- we may get some, but I don't think you can -- I wouldn't bet on a lot of additional benefit in the near term from just that -- the rollout. The reason that we've got the bigger benefit over the last year is that, actually, because we've increased the size of the hedge book as well, so it's diluted the average bundle [ph]. Does that make sense?

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes, that does. My next question was just on the IAE earn-out, whether you're able to let us know and give us an indication of what the IAE earn-out was that you received in calendar 2016 embedded in these numbers.

David Miles Smith

Former Chief Financial Officer and Executive Director

So as you know, those are the 3 areas that we get the modular revenues obviously come down a little bit and it's disappearing. But actually, the license income is about the same, and we saw a bit of an increase in aftermarket revenue, both from pricing and from volumes. So overall, I think we probably saw about the same level of total IAE, which I think is about 250, something like that. So it's about the same number. I don't think it's changed radically year to year.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

And the third question is just as I'm trying to understand more about modeling your Civil Aerospace cash flows. How many shop visits did you do in 2016 and the direction of how that compared with 2015?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. And it's quite a -- it is a bit -- unfortunately, it's something that you have to go a little bit deeper because they're clearly different levels of shop visit, from a major overhaul to a smaller intervention. I think in absolute numbers, actually, the numbers weren't that different in '16 and '15. And I don't think we expect it to be that different in '17, maybe a modest increase in '17. But we're clearly seeing less activity on the -- on some of the legacy programs. So that's really why some of the legacy aftermarket, particularly the time and materials, has come down a bit. So in absolute terms, the numbers haven't changed very much. But what we're really seeing is this mix change continuing to go on between aftermarket sort of legacy programs on both engine flying hours and T&M, and then a pickup on -- and stronger double-digit pickup on the engine flying hours on the new stuff.

D. Warren A. East

CEO & Executive Director

I think we need to just go up there first and take these sort of slightly in order. There's one sort of middle to this side, and then we'll come down to the front. And I'm looking to see if there's some on that side towards the back.

Tristan Sanson

Exane BNP Paribas, Research Division

It's Tristan Sanson from Exane BNP Paribas. I have 2 questions. The first one is on large engine aftermarket in 2016. So organic, the large engine aftermarket was down 4%. Can you give us a bit of color on what was the trend between the erosion of time and material on RB211? What is the evolution on the normal Trent engine TotalCare agreement? And what is the impact of engine transition that you may have felt impacting, I don't know, the number of Trent in service and, as a consequence, reflected in that 4%, not in precise number but to understand the various movements, and how these 3 factors are expected to develop in 2017? That's the first question. And the second one, I'm a bit confused by the fact that in Civil Aerospace, you're releasing profits based on the revaluation of life-cycle costs on your engine under long-term maintenance agreements. And at the same time, in 2016, you have GBP 98 million of technical costs that you say are related to a need for increased shop visits in short term for Trent 900 and the upgrade of engine management system for Trent 700. So it's a more philosophical question about how predictable do you think are the costs of your engine under long-term maintenance agreements, and so how do you bake this into your assumptions?

D. Warren A. East

CEO & Executive Director

This is a very detailed question, and I'm going to take the whole of the morning on this, I have to say. The aftermarket trends, the trends are pretty clear. Our older engines, time and materials, these RB211 engines are being retired, and that's what's contributing the downward pressure. Those time and materials contracts are high margin. That's being offset by newer engines, and newer engines tend to be long-term service agreements, and that exerts upward pressure. And then -- and the net is the net. We can look at the numbers. You asked how the trend is set over the next year or so, and we're going to see a continuation of that. With some of our sort of mid-age transitions, then we are seeing a little bit of demand. Maybe there'll be a little bit of turning some things which have been under a long-term service agreement into one of the new models, the TotalCare Flex and those types of model, which will have slightly different implications. But listening to your question and Ben's question earlier, I think we could probably do with a slide that, that summarizes it without going into every single detail, but a little bit more than the big plus and minus. Do you want to do on the last bit?

David Miles Smith

Former Chief Financial Officer and Executive Director

So the last bit is actually just a factor of the way that we do the accounting. So we -- eventually, those costs will end up in the contract margin, but we book them in the first instance through this technical provision as we then update the contract pacts. Later on, we'll probably move that money from that provision into the contract pacts. It's a bit of a holding place. But you're right, that overall, in terms of the absolute level of life-cycle cost improvement on Civil, which I said was GBP 217 million, that was better than last year of GBP 148 million. But the GBP 98 million of absolute booking into technical things will eventually get into long-term contract margin as well. So there's a plus and a minus there.

D. Warren A. East

CEO & Executive Director

Yes. And there always will be pluses and minuses because we have, on an ongoing basis, an effort to reduce the cost of servicing these things in the long term, and then we take individual issues as they come. So you're always going to see some effect like that. Thank you. I think we -- who has the microphone down here? We got 1, 2, and then I think we need to do a few there. So 1, 2, 3.

Gordon Hunting

Gordon Hunting from Fiske. Two quick conceptual questions. The troubles that Toshiba and Westinghouse are having, is this is a benefit or a negative? And secondly, have you got to make a big provision from -- for the Type 45 Destroyers conking out regularly?

D. Warren A. East

CEO & Executive Director

Yes. The conceptual question about the nuclear reactors, I mean, clearly, Toshiba is a potential partner, a potential customer for our civil business in Nuclear. And if they're not active, they're pulling out of that, then we'll have to see if that project goes ahead perhaps with somebody else, the opportunity will still be there. I think if you back off it a little bit and say, actually, these really big nuclear projects are quite challenging, and they're quite challenging to finance. And this is one of the reasons why we are keen to promote this small modular alternative. Yes, there's the technology piece, which is a little bit different and -- but the consequence of that from a commercial point of view, and because we can make these things, by definition, in the factory instead of on-site, is that they eventually become more cost effective and, in particular, more bite-size chunks, so you don't get this sort of big volatility around the big decisions. And so conceptually, it's an opportunity for us, because we can play a larger role there than we can with just our instrumentation and control and waste management systems around the big reactors. As for the Type 45, I'm afraid that's a specific contract, specific issues, and we can't really comment on it other than to say that we're supporting the Navy with their efforts, and we'll continue to support the Navy to make sure that the thing is reliable. One there, and then we have to go to that side towards the back.

Zafar Khan

Societe Generale Cross Asset Research

It's Zafar Khan from SocGen. I've got a couple of questions, please. One's on cash flow and one is on costs. If I can take the costs one first, and I'm looking at Slide 13 in the supplementary slides that you've kindly provided. You've been talking about transformation, how you're taking out the costs and making good progress on that. But if I look at Slide 13, I note that the commercial and admin costs in '16 have gone up from 1,004 -- or I should say GBP 1.4 billion to GBP 1.163 billion, so it's a major reversal there. Is there some one-off cost in that line? Or what has actually happened there? Could you help me understand that, please?

David Miles Smith

Former Chief Financial Officer and Executive Director

So one of the biggest things is that we're paying a bonus this year, so there was no bonus in the 2015 numbers, so that will come through C&A. So that's one of the biggest charges.

Zafar Khan

Societe Generale Cross Asset Research

David, it's GBP 163 million.

David Miles Smith

Former Chief Financial Officer and Executive Director

But there are other effects.

Zafar Khan

Societe Generale Cross Asset Research

David, it's a GBP 163 million increase.

David Miles Smith

Former Chief Financial Officer and Executive Director

It is on an adjusted basis after you take out currency effects.

Zafar Khan

Societe Generale Cross Asset Research

So I should be thinking it's FX and not Warren's bonus?

David Miles Smith

Former Chief Financial Officer and Executive Director

There's -- no, there's an element of bonuses. Some of the group bonus goes through C&A. Obviously, some will go through gross margin and a little bit through engineering but...

D. Warren A. East

CEO & Executive Director

Did you say 30, by the way, or 13?

Zafar Khan

Societe Generale Cross Asset Research

13, 1-3.

D. Warren A. East

CEO & Executive Director

Oh, yes, yes, got it.

David Miles Smith

Former Chief Financial Officer and Executive Director

We'll give you a bit more help with that, but it's -- that's the biggest performance-related issue. The rest will be around economics.

Zafar Khan

Societe Generale Cross Asset Research

Okay. And then if I just go to the earlier slide, just one before Slide 12, and you've kindly given quite good historical data there. I remember and this reinforces this, that the free cash flow, the record, I think, the group has ever achieved, is that GBP 781 million, you just see it in 2013. Now we've got problems on the earnings front because IFRS comes in, it's going to be pretty difficult to understand what happens there. So I guess many of us are looking at the promise of cash flow, Warren, and I wonder if, in your idle time, you kind of blue sky these things. And when do you think we might get to that kind of GBP 781 million again? Is it going to be in my working life, do you think? Or...

D. Warren A. East

CEO & Executive Director

Yes, yes. Well, I certainly hope it's early in my tenure, so let's put it like that. Actually, no change for what we said -- from what we said in November when we talked about IFRS and we talked about the cash as well because it was important to do so. This year, obviously, we had a slightly better-than-expected outcome last year. And so rather than talking about an improvement this year, we're talking about roughly flat performance. And you have to understand that law of small -- relatively small numbers. Cash at the year-end is a little bit volatile, and so we are quoting a range. But notwithstanding the better performance in '16, 2017 is exactly what we thought it was going to be. And we talked about getting towards GBP 1 billion plus towards the end of the decade, and it's a reasonably linear sort of journey from here to there. It's a little bit more back-end loaded than linear. But if you sketch that, and I think you can expect it in the next few years. And that's no change to what we've said before.

Zafar Khan

Societe Generale Cross Asset Research

Is GBP 1 billion the aspiration? Or...

D. Warren A. East

CEO & Executive Director

No, goodness me, of course, we can go beyond that based on the size of the opportunity we have. But let's just think about the journey to translate the current business that we have into that cash-generating world, and it's in that time line.

Zafar Khan

Societe Generale Cross Asset Research

And just a supplementary on the -- on the A380, Airbus put out a statement suggesting that some of the deliveries on the A380 to Emirates were going to be deferred, and it was to do with your agreement with them on the engine. Can you just tell us what's actually happened there, what was going on?

D. Warren A. East

CEO & Executive Director

Yes, well -- fine.

Zafar Khan

Societe Generale Cross Asset Research

Does it mean that there's an issue in terms of overhead recovery?

D. Warren A. East

CEO & Executive Director

I don't think -- I don't -- I think there's been enough negotiating in the media around this issue, and I don't want to perpetuate then that negotiation in the outside world. Suffice to say that we did reach an agreement with Emirates at the end of last year, and that is around the service life of the high-pressure turbine blades in our Trent 900 engine. We're pleased with that agreement. They're pleased with that agreement. Airbus is pleased with that agreement. We have a way of working forward. Separately, Emirates have their own issues around how many planes they want to buy and when they want to receive them from Airbus, and that's a matter for Emirates and Airbus, between them, and so I'm afraid you'll have to take that one either to Emirates or to Airbus. Now I think we have a couple of questions towards the back there. And John's got some from online, so let's have the questions at the back and then move to the online.

Celine Fornaro

UBS Investment Bank, Research Division

Celine Fornaro from UBS. My first question would be on the group cash and how -- when I think about your long-term incentive plan for '16, '17 and '18, which was about GBP 350 million cash cumulatively, how does it look like after the better cash flow in 2016 and the guidance that you've given in '17? Because basically, this implies very small improvement for 2018 as well, so how should we think about that? And my 2 other questions would be on the Civil divisions. The first one is if you could give us a little bit of color of the in-service behavior of the Trent XWB and the fleet that is out there after 2 years and how the engines are performing, how are the shop visits or any changes that you have to make to those engines, if any. And secondly, if I think about the lead time transfer improvement that you've made on the Trent 1000, which is really good, shall I think for the Trent XWB, that this only happens when production flattens? Or actually, this is something that you can also start doing earlier? And on the Trent 1000, does the lead times change when we start introducing the Trent 1000-TEN or we actually keep them?

D. Warren A. East

CEO & Executive Director

Okay. As for the cash and the long-term incentive program, I'd just draw your attention to what I said a moment ago on the general trajectory, and that's exactly the same. But during that period, don't forget, we have the law of relatively small numbers and year-end volatility. So it's by no means, in terms of the absolute numbers and the absolute years, there is this variability that we see of plus or minus GBP 100 million to GBP 150 million or so. And so that's going to be there. When we get into the realm of GBP 781 million and GBP 1 billion, then that volatility becomes much less significant and so would affect our long-term incentive plan like that a lot less. XWB in-service behavior, well, it is early in the life of XWB as a complete fleet. And obviously, the fleet has grown a lot in the last 12 months in relative terms. But however, the first engine has been in service for over 2 years now, and the early signs from XWB are very good. Yes, we have had a few maintenance issues that are sort of perfectly normal, but we haven't had any serious issues. And we have been pulling these engines in for inspection as a sort of early -- because

it's early in its life cycle, we've been pulling them in a little bit more regularly than we will be doing when they're in normal service. And so if there was anything untoward, I'm sure we would be spotting it. Life -- sorry, lead time improvements on Trent 1000, when we switch over to TEN, I'm sure there -- in practice, there will be some degradation in lead time for a short period of time, but we don't anticipate a big material change. And as for whether those -- we have to wait on XWB for those lead time improvements to happen, no, we don't, and they are happening. And when we first started on XWB and supplied a few in 2015, then the assembly lead time was quite long, of the order of 40 days. And we are targeting getting the thing down to closer to 20 days. And the production engineering team are very highly motivated to get there. I think that's it. So I think -- was there another question towards the back there? No. In that case, can we go to the online now, and then we'll come back the middle. So online questions?

John Dawson

Former Director of Investor Relations

Thank you, Warren. One of them has just been answered actually on FX, so I'm not going to pick that one up. But Rob Stallard asks, should we expect CapEx and R&D spending to ease in 2018? And if so, by what sort of amount? So building on the guidance for '17, what's the trend into '18 and beyond, and what would be the expected delta?

D. Warren A. East

CEO & Executive Director

Yes. The short answer on that is that we need to continue to invest in R&D. We're going through a little bit of a peak at the moment, but I think you will see in the 2017-2018 period a significant investment in the Advance and Ultrafan engines. And don't forget I said Civil is essentially the lion's share of our R&D expenditures, so that's going to be the key driver there. And as for CapEx, then it's going to be flattish over that period. We are investing quite a lot at the moment in modernizing facilities. A lot of those modernization activities will have taken place, and so there will be some downward pressure, in the -- those factories won't need to be updated in the short term. But then we will be into the next wave, so I'm sure it will be flattish. And we'll actually manage it, by the way, in terms of -- we don't just operate with an open checkbook. We'll be managing that capital expenditure and phasing it in the normal project approval process.

John Dawson

Former Director of Investor Relations

So one additional question from the online guests. Do you intend to pay for ITP in shares? And if so, have you discussed with the vendor what they intend to do with that stock?

D. Warren A. East

CEO & Executive Director

Well, as everybody knows, we have an agreement with the vendor that we can pay any one or more of the 8 quarterly installments, after the transaction closes, in shares rather than cash. And as far as the vendor is concerned, that is the option that we have, and that is up to us, and it is our decision. As to what the vendor does with those shares, we don't have an influence over what the vendor does. But we will take those decisions as they come on a quarter-by-quarter basis. We have no intent at the moment to drive specifically down the share route or specifically down the cash route. We'll be managing the cash as we go through that period. And we'll be always keeping an eye to other requirements for cash, what's going on with the share price and long-term shareholder value. So it's a decision that will be taken in the round, and the board will be involved every quarter. David, in the middle, yes, and then -- yes.

David Howard Perry

JP Morgan Chase & Co, Research Division

It's David Perry at JPMorgan. So one high-level question in two parts, I think. The strategic review, I'm sure you want to keep some of your powder dry, but maybe it's taking a bit longer than we thought. Just can I ask, is it going to be more biased to the operational or more biased to portfolio? And then the second part is related to it, does the possibility of a border tax adjustment impact the strategic review in

your thinking? At this stage, have you got any thoughts of the positives and negatives that might have on Rolls-Royce?

D. Warren A. East

CEO & Executive Director

Yes. To answer the high-level piece first, in terms of where we are today, as I said when I was presenting, I would have liked to have been a bit further ahead. But it isn't that this is a difficult problem that's taking us longer, it's more a question of getting started. And what actually took a little bit longer was to assemble the team. But I think we had to make some difficult calls, and it would not have been right for me to have been concentrating on long-term vision while the short-term performance of the business was not improving. And even as we go through 2017, we've got a lot of work to do as a team to make sure that we continue to improve the operational performance of the business. Will it be more operational or will it be more portfolio oriented? The answer is that you can't ignore the operational piece. That's got to happen anyway. And so I think when we talk about strategic review, it'll be more, what does the shape of our business look like out into the future? And what do we need to do in 2017, '18, '19, '20 to get there? And it's a given that in that time period, we need to keep improving the operational performance.

David Miles Smith

Former Chief Financial Officer and Executive Director

I think on the -- I think -- I assume on border tax, you're referring to the U.S. proposals.

David Howard Perry

JP Morgan Chase & Co, Research Division

Yes.

David Miles Smith

Former Chief Financial Officer and Executive Director

I mean, clearly, maybe you've got more detail than I have. I haven't seen a lot of detail around those proposals yet, and I assume that they're going to take a lot of filling out. And we already have enough Brexit duty and custom things to think about as well. But I think the key for us, like any sort of company that needs to trade over borders is just to retain flexibility. So we have a site in Indianapolis that we are reinvesting in, which is very capable of producing engines or other parts, that we have our own component facilities. So we'll just have to see, David, where all of that comes out. But as an international company that trades across borders, we will have to retain flexibility if we see changes in duty or border tax regimes to make sure that we can do that as efficient as possible.

D. Warren A. East

CEO & Executive Director

I mean, we already do a little bit of civil work in that facility, and so work can move around the organization as required. Yes, okay, so I think we need to move to the penultimate question.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami Myerson from Investec. 3 -- F-35B, how many modules did you deliver in '16? And how many do you plan to deliver in '17? And is that a headwind to profitability, or is that already profitable?

D. Warren A. East

CEO & Executive Director

Yes. I don't have the answer off the top of my head, I'm afraid, to the number of F-35B modules.

David Miles Smith

Former Chief Financial Officer and Executive Director

Why don't you ask your second question.

D. Warren A. East

CEO & Executive Director

Yes.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Second one is on SSRO. What is the percentage of revenues of the group that could be subject to SSRO regulation and standard Astute Boat 5 is going to be -- also are they going to liaise with the SSRO on that boat? And you talked about accelerating Ultrafan R&D. Is that for a middle of the market aircraft?

D. Warren A. East

CEO & Executive Director

Okay. So on the SSRO, it's roughly 10% of our business that is potentially exposed. But this is a ongoing dialogue at the moment. And the SSRO is consulting with companies such as Rolls-Royce around how they move forward. Sorry, your second -- your auxiliary bit, I missed.

Rami Yehuda Myerson

Investec Bank plc, Research Division

So just asking about the middle of the market aircraft?

D. Warren A. East

CEO & Executive Director

Middle of the market aircraft, okay. It's a paper airplane at the moment, and there is potentially an opportunity for about 5% of the traffic maybe to be taken by that sort of airplane, but we're a long way away from any sort of decision there. If it makes business sense and if that airplane goes ahead, then we'll be very keen to power it. And Boeing, I'm sure, will make a decision based on sound business principles. And they understand that if we're going to put an engine on that plane, it has to make business sense for us as well. Sorry, [indiscernible]

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, it looks like it was actually pretty flat in '15, '16 and will be again in '17, a dozen, something like that.

D. Warren A. East

CEO & Executive Director

So was there a final question? It doesn't -- oh, there's one final question from up there. This is the last one.

Unknown Attendee

This is Robbie Becker [ph] from OSMG [ph]. Just -- if we could just ask what is your relationship with the UK Export Finance Agency, just regarding the press release is saying that they may request some funding or may not support your contract in the future. And the second question, just on the FX hedges, do you expect any cash impact in the medium term as some of the hedges matures or just continue to roll over the hedge book at the same rate as you said?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, so quickly, we actually work really closely with the UKEF on a number of projects each year. We -- I think we have an excellent relationship, and I think they'd say that as well. Clearly, there were a couple of the contracts that were mentioned in the DPA that had financing originally. That was quite a long time ago, so they are doing some additional diligence around that. But the ongoing relationship is actually really strong, and they're very supportive of the business. On FX, sorry, I've just forgotten the question here.

D. Warren A. East

CEO & Executive Director

It's on cash impact.

David Miles Smith

Former Chief Financial Officer and Executive Director

Oh, cash impact. There's absolutely no cash collateralization requirement, if that was your question. In terms of as those mature, clearly, they will either be positive or negative. But then the underlying transaction that they're hedging will be positive or negative, the other way around. So it's basically, those hedges give us an effective rate of 1.55 at the moment, and that's the end result of those transactions.

D. Warren A. East

CEO & Executive Director

Okay. So that concludes the question and answers. And before we break, I'd just like to -- this is David's swan song, so I'd like to thank him as well for being a great support.

Presentation

John Dawson

Former Director of Investor Relations

Good morning. Good morning, ladies and gentlemen, and welcome to Rolls-Royce's Capital Markets Day for 2016. My name is John Dawson, Director of Investor Relations of Rolls-Royce. It's my pleasure to be the master of ceremonies for today. We have a pretty busy schedule, so hopefully enough to keep you all engaged here, but also online for those of you joining us through the Internet. All the materials on today's presentations and the breakouts will be available later on today, either live or later on today as downloads from our websites or accessible on the website. So please, if you miss anything during the course of today, you'll find it later on and you'll be able to access it at your leisure.

With a busy day, we're going to try and stick to a fairly packed agenda. Our Chairman's going to welcome you in a couple of minutes and then hand over to Warren, who will go through an operational and strategic update. He will then hand over to David, who will take you through a financial update and some thoughts on IFRS 15, the topic du jour. We're then going to have a break, and then hand over to a session with our business leaders and different members of their team, who will take you through some fairly thoughtful, I hope, presentations and discussions on what they're doing to implement our strategic priorities during the course of this year and onwards. So that will cover us through including lunch till about 2:00 when we'll all come back into this room and we will have a plenary question-and-answer session, and then hopefully, be wrapping up at around 3:00 this afternoon.

So a fairly busy day, lots to get on with. So without further ado, I will hand you -- I'll just mention a couple of safety notices, sorry. Mobile phones, if I could ask you all to just please make sure they're on mute just for the benefit of the speakers. All our comments are covered by safe harbor statements, which you'll find in the pack. And from a safety point of view, you'll find the exit doors clearly labeled from this room and the other rooms, and the assembly point is the car park out front.

Now I will hand over, without further ado, to Chairman. Thank you.

Ian Edward Lamert Davis

Chairman

Well, thanks, John, and good morning, everyone. 12 months ago, I was in front of a number of you at a particularly difficult time for the company. And at that point, I highlighted some of the priorities and focuses of what we were going to do during the next 12 months and beyond. Since then, I'm very, very pleased to report that we found the board, they're very satisfied with the progress we've made. I say very satisfied with some caution because there's nothing to be very satisfied about it in terms of our absolute performance, and we're very, very aware of that as a board and a company. But what we've achieved and what we've managed to get going under Warren's leadership has -- is something that we feel very good about.

Now it's been a difficult environment, as you know as well as I do, some of our markets, for example, in marine and in the business jet area have been extremely challenging. And internally, we've also had an awful lot on our plate. We highlighted this last year, a number of new product introductions which, in this industry, in the civil aerospace industry, is a very, very challenging thing and a huge ramp-up in production, which is something we anticipated and which is going to seed corn for our future prosperity. So a tough internal and external environment, but the progress has, in my and the board's judgment, been real. And I hope you be get a better sense of that over today and in the discussions that follow.

Let me just give some highlights. Firstly, the top-level management restructuring has gone very well. This is never a pleasant thing to do. It's never an easy thing to do, but we've made real progress on restructuring the top management from which will come subsequent restructurings.

The transformation program, which Warren has talked about and will talk about later today as will the management team, is really underway. This is a year, a multiyear journey, you know that as well as I do,

but this is really, really picking up momentum. And I think it is confirmed, if it needed confirming, it's absolutely confirmed the opportunities that we have to improve our efficiencies, reduce our costs and most importantly, to improve the speed and responsiveness with which we do things, so real progress there.

Thirdly, appointments. Warren talked about his plans for a new team, and I think we have got that in place. It's for Warren to talk about this, but getting together a new team, and we've recruited a number of people from externally as well as internally. It's something that's happened within a year, and I'm very, very excited, as the board and as the Chairman, about the potential for that new team.

And then finally and less glamorously and this is very, very much work in progress, has been real, real progress on the development for our strategy. You'll hear more about that in the months ahead and next year; and also on the crucial -- rather mundane topic of systems and controls, a huge task for the company, but again, very, very real progress there. So I think over the last 12 months, there's been very, very real progress. The board and I are very aware of it. We know there's an awful lot more to do, we'll talk about that. But I do want to hopefully give you this sense of momentum that I and the board share.

Let me be clear about our priorities. They are the same as last year. The overwhelming priority for the company is financial and operational performance improvement. They are very, very closely linked in this company. Finance and operations are the twin pillars. Lots of other things we could be worrying about as a board, but we're not. This is our laserlike focus, financial and operational performance. At the same time, we know we need to improve our speed and responsiveness. And again, that's linked. Time is a very, very important factor of cost and performance. So I just want to absolutely emphasize to you, our investors, the owners of our company, that this is what we're really going to be focusing on over the next couple of years in particular.

So we've made real progress, a lot more to do. And our hope is that over today and the future, you'll get a better understanding of what we need to do, what we plan to do. This day is part of our continuing journey that I committed to last year to improve transparency and improve communications. I know that some of the messages we've been delivering in recent times haven't been as good as they should be and as they will be, but I hope you won't confuse that with any lack of desire in our part to be open with you to improve the understanding of our company, of the problems, the risks as well as the enormous opportunities. And today is all about that. I hope, we all hope as a management team, as a board, that you will leave understanding the company better, knowing some of the people on the management team better and appreciating the upsides and the huge value creation potential, which I just absolutely know and I think many of you know, exists in the company.

So with those words of introduction, I'll hand over to Warren, who sits in the management dais. And I look forward to seeing more of you over the forthcoming [indiscernible]

D. Warren A. East

CEO & Executive Director

Thank you very much, Ian. Good morning, everybody, and thank you for joining us today. And for those of you who were here last evening, thank you for joining us last evening as well. I hope you enjoyed the discussions, both the formal presentation bit and the discussions we had around the table.

So I'm going to just sort of outline where we are as far as today is concerned. I'll start by talking about progress that we've made over the last 12 months, going to a little bit more detail than Ian just covered, and talk a little bit about going forward in the next 12 months. David's then going to give us an update on the actual business for this year and a little bit about the direction of travel going into 2017.

One of the things that we talked about 12 months ago was additional disclosure. We produced a little more disclosure in February, and we're going to produce a little bit more disclosure today. After the break, the breakout sessions will be an opportunity, as Ian said, to meet some of the people who are actually doing the work, rather than people like me who just talk about it. And I hope those breakout sessions will be informative. We'll be using material from what's going on in the businesses to bring to life some of what I talk about when I talk about transformation and improving our performance.

So a year ago, we presented a slide like this. And I hope over the last 12 months, we've delivered on the commitments that we made in that slide, they're all they are about. A year ago, I stood in front of you and talked about some serious challenges that we had, some serious challenges around costs, fixed costs and product costs. I talked about challenges in terms of information, information flow within the business, the systems that we have to work with that information and how it was really very challenging for the management to get hands-on information. And I talked about some of the behaviors within the business and all the changes and improvements that we need to make there.

I'm pleased to report actually, as Ian said, if you step back from it, there has actually been some quite good progress. Now it has taken longer than I expected to make some of the progress that we've made, and I can't hide my slight tinge of disappointment around that. But if I step back from it and think realistically, then I'm pretty pleased with the progress that we have locked in and made. And I'm very pleased with the platform we've developed within the business for further improvement. And we have a lot of further improvement to go.

So last, last year, from those challenges, we sort of extracted some priorities, things to focus on, and they became the goals for 2016. And in February, I presented this slide and talked about how we were going to strengthen our focus on some key priorities around engineering excellence, operational excellence and concentrating on the aftermarket, allowing the business model to perform, and then transformation, and then as Ian just alluded to, building trust with our external stakeholders. And those external stakeholders now are the investment committee but also our customers, suppliers, our other industry partners and actually moving inside the company to internal stakeholders as well. We need to improve trust. And so I'm just going to reprise on those goals for 2016 and the progress that we've made since then.

Start with the transformation, I realize that was the middle bit on the slide, and maybe, logically, I should have started at the left-hand end, but we'll start off with the transformation. And a year ago, I talked about this concept of organizational hardware and organizational software, where the hardware is like the structure of the organization and the software is what people are actually doing. And we made some good progress on early wins with the structure. And actually, the good news is that, as I said in February, we're on track to delivering the top end of expectations for 2016 in terms of the financial impact of that. We've actually made good progress since July. But now the focus is switching very much on to the organizational software, the things that we do to sustain these improvements and the key sort of issues indicated on the right-hand side of this slide, the key things that we need to change. And there's a theme that runs through the changes that we're making, and the theme is about injecting more simplicity into everything we do. I'll come back to some of that in a moment.

Graphically, the hardware change, the big hardware change that we made early on in the year was to say we're changing the structure, the divisional structure of the business. We're removing a layer of management. And we're targeting a reduction of 20% in the management population. Now we've created a good platform for structural change. In that, we have reduced the management population. We haven't reduced the management population by 20%. We're still aiming to go a bit further, so there's a bit more work to be done on that.

But the important thing is that this hardware change has actually started to yield some software benefits as well. So we have got a clearer line of sight from the center of the business out towards actually going on with customers and how we translate from customer engagement through to, eventually, money in the P&L. We've got stronger accountability as a result of that clearer line of sight. We've got and we're already starting to achieve a big sort of reduction in the number of interactions that are going on in committees and so on. There's still a lot of complexity and there's still work to be done on responsiveness because we believe that world-class products deserve a world-class operation, but I'm pleased with the progress that's happening.

So where does that leave us in terms of financial impact? Well, at the half year, I said for 2016, we're going to deliver at the top end of the expected GBP 30 million to GBP 50 million benefit. We certainly are. And since July, we've had further progress on that. And so now we are expecting the run rate going out to the end of 2017 to be much closer to the GBP 200 million end of the range, in other words, the top end of the range by the time we roll through to 2017 as well.

Obviously, these savings are essential to improve the performance of our business. They're also, in some ways, delivering in terms of additional resource, and we've got plenty of areas in which to apply that additional resource.

So that's transformation. I now want to talk about the 3 sort of success factors that we've been focusing on: engineering, operational excellence, leveraging the aftermarket and letting the business model work.

To start with on engineering excellence. I think you're going to see some examples in the breakout sessions. And what we've tried to do is to take these 3 themes and use examples from across our different businesses. And it's not as easy as sort of the example you see is the only example of engineering excellence. Clearly, these examples of engineering excellence in bits of the business that we're using to demonstrate operational excellence as well, but we have been focusing on that.

The operational excellence piece -- sorry, the slide and click -- the operational excellence piece, that's a lot about manufacturing transformation, getting higher margins, lower costs. It's about delivering reliability and repeatability in what we do. We've made good progress over the last 12 months. And I wouldn't want to claim a huge amount of credit for this because a lot of this is work that's been in progress not just over the last 12 months, but over the last multiple years where we've made huge strides in the improvement in the quality of our products. And that is translating into a better reliability and operational excellence.

I'll talk a bit about capturing value, better value in the aftermarket, developing new value-added services. And I'd encourage you in the breakout, particularly around the Civil Aerospace piece, to look at that leveraging the aftermarket examples and the progress that we've made there.

But really, the emphasis has been on changing the mindset, on focusing on what we absolutely need to do and getting people inside the business to say, "I'm coming to work today and this is what I have to do. Can I do it in a simpler way? Am I doing it fast enough? And if I can think of a simpler way of doing it, then let's start doing it in a simpler way." And then making sure that as a business, we're only asking people to do what is necessary for them to do. And there are a few examples there where we've made good progress.

Now in July, I said -- sorry, this isn't really clicking on very easily. In July, I said progress is going to be the sum of lots and lots a little improvements, and that's the graphic we used. I talked about a few examples of this.

Operational improvement, I used a this slide in July, but the number I had in July was a different number because we've made further progress since then. This example comes -- is about reducing the time it takes just to assemble a Trent 1000 engine. Now I visited Singapore where we assemble our engines, Trent 1000s, in February. And I have to say wandering around the final assembly line there, there wasn't a huge amount of activity. And there wasn't a huge amount of activity because it took us a long time to assemble an engine. So everything took a long time to go through. And you've got a real sense of the fact that this thing could go quite a bit faster. When I visited a few weeks ago, and I had a group of people with me a few weeks ago, it was hive of activity. And you could feel the increased tempo that is relating to a 30% improvement or getting on to 30% improvement in the cycle time. And by the way, July, the number there was 24%, not 27%, but we intend to go further. And when you attend the breakout session, please talk to the folks who are driving this in detail and understand how we've done that and the lessons that we're taking from that and moving around to other locations. There's more work to do, but I'm really pleased, too, when going and meeting the people who are actually doing this, that the level of engagement we have amongst our people to really make these improvements happen and to, in fact, exceed the goals that we're setting.

So that example was about building engines in the first place. Of course, we also have to worry about the aftermarket and execution in the aftermarket. And here's an example, hit the newspaper headlines a bit in the summer. Because as you're probably all aware, ANA had some issues with some of our turbine blades. And basically, these blades were not lasting as long as the design life and we need to change them. And we have redesigned the blade, and we will be introducing the new design in due course, and the aerospace people can you fill you in on the detail.

But meanwhile, we have to keep our customers flying their airplanes. Because the punters who want to fly from A to B aren't going to sit there and wait because we haven't got some turbine blades working properly. So we have to come up with a replacement program that doesn't interfere with our airlines' operations and so on. And when we looked at the task involved, then it was going to take a long time. Such a long time, in fact, that it would create some operational challenges and would also create quite a huge cost for us.

And so the behavior of that drove this improvement was a behavior that said, "No, I'm not going to tolerate the status quo, how long it takes. We need to work hard to come up with a dramatic improvement." And a dramatic improvement materialized, and the leadership in that part of the business said, "No, I'm still not satisfied. That's still not enough. We need to make a bigger improvement." And so over a couple of iterations, the team worked out an alternative way of changing these blades that resulted in an 80% reduction in the time that it took. And we could extol the virtues of the engineering analysis that went into what we actually need to do, and that was clearly part of it. But the thing that gave me most encouragement was the change in mindset that said, "No, I'm not going to be happy with the status quo. I want something a lot better," and that mindset was there and that's what drove that improvement.

And clearly, that was a real life service example. But since the aftermarket is an important, such an important part of our business, it's worth noting that these improvements that we talk about aren't just in getting engines out of the door. Because the engines spend 25 years or so in active service, and we need to look after our customers and make money out of that throughout the 25 years.

Another example from the aftermarket -- sorry, I think the battery might be getting a bit little low in this clicker or am I not pointing it at the right place? There we go.

We pointed out at the half year that our fleet is gradually getting older. And that means that there are going to be more aircraft transitions. And if an aircraft is on the ground for 12 months instead of 3 months, then we're clearly going to forgo a lot of aftermarket revenue. And the team in the breakout session, again, there's an example here that I'd encourage you to talk to them about how creating a team to work with the leasing companies, to work with the airlines who are retiring airplanes, to work with the airlines who are going to buy secondhand airplanes, we can minimize the time that, that aircraft is on the ground, and therefore minimize the aftermarket revenue that we forgo with that transition. So an example of how we're working on that aftermarket. There are other examples from our defense group, and they're going to talk about how they're working the aftermarket more as well.

So enough of the anecdotes around the 3 priorities.

I think it's me rather than the clicker, by the way, that's causing the problem.

So progress on focusing around the 3 success factors. Encourage you to use the breakouts to explore the detail on that, and to point out that it's not just civil aero applications where we're making the progress.

I'd now like to switch to the third goal here, which is around rebuilding trust. Clearly, now this is going to be bad because this is the build slide. I know it isn't. The build slide's coming soon. So additional disclosures, the ways in which we decided to talk about getting more trust was to be more open and share more information with you and then actually make sure that we deliver on what we say we're going to deliver. And so I think we've made good progress on disclosure. You will see some more detailed disclosure in David's presentation today.

Another example in July, we talked about IFRS 15. We're talking again today in more depth about IFRS 15. We're bringing executives from within the company, so that you can talk and exchange information freely with these people. I hope that's an indication of good additional disclosure. And we'll be showing you, we put this slide up, we're actually going to fill in some of the blanks on this slide in David's presentation later today. So that is more disclosure.

In terms of delivering on what we said we were going to deliver, then we -- this morning, we confirmed our expectations as far as 2016 is concerned, that is delivering in line. We've talked about transformation program and the transformation program is delivering. And that, as I said, it looks like it's going to deliver the top end of expectations.

And on operational excellence, this is a graph that you're familiar with hopefully in the bottom corner there of the -- showing the ramp-up of our large civil engines. Dealing with that volume ramp, you've all told us, it's a big challenge. We didn't actually need you to tell us that. We know it's quite a big challenge. And the good news is that if I look at the run rates coming out of our facilities today, then the run rates support that ramp-up. 12 months ago, the run rate that we achieved in Q4 '15 supported the volume requirements for 2016. And as we are going at the moment halfway through the -- a little bit more than halfway through Q4 '16, the run rate support the volume ramp, the volume that we need to do for 2017. So I'm very pleased with the way that the business has actually been delivering on the commitments.

A little bit of a reminder, and those of you in the U.K. may have seen the Panorama program a week or 2 ago. So that is a reminder that we do have some legacy issues, but as far as the investigation is concerned, we are fully cooperating. We can't talk about the detail of that investigation. But within the business, I can assure you that the huge changes that we set in, in progress a couple of years ago around this are happening, and behavior is changing. We have an absolute standard of zero tolerance to any misconduct here. And so in spite of the legacy issues, we just have to accept that and we're dealing with them.

So now let's look ahead. And as Ian said, one of the first things we've been doing is rebuilding the leadership team. So 2 key appointments, and I talked about some of this a year ago and we talked throughout the year, 2 key appointments we've been able to announce. So Simon Kirby is joining us as Chief Operating Officer, and Stephen Daintith, joining us as Chief Financial Officer. Simon and Stephen are in the room. They're just over here, so they're just going to wave and say hello.

Unknown Executive

Hi, good morning.

Unknown Executive

Hi.

D. Warren A. East

CEO & Executive Director

Okay. And Simon and Stephen aren't the only appointments. So Ben Story joined us as new Head of Strategic Marketing about a month ago. And Andreas Schell will join us as the new President of Rolls-Royce Power Systems. And he'll be joining us at the beginning of December and he'll be taking over with effect from the beginning of January.

So if I take those 4 external appointments and combine them with the promotions that we made, then the leadership team that I sort of was talking about in aspirational terms a year ago, where I was looking for a blend of about 1/3 of new people and about 1/3 of people from within Rolls-Royce promoted and 1/3 of people that representing continuity, then I think we're just about there. So we've got a team, a leadership team.

One of the first things the leadership team need to start working on, however, is looking forward at our vision and our strategy. We know we've made progress on the operational performance, and we know we still have a long way to go on improving operational performance. A year ago, I said we were going to make those improvements in operational performance, and then we were going to get on to updating strategic priorities and so on. Well, as I said, it's taken a little bit longer than planned. And so the really eagle-eyed ones of you in the room will notice that in the bottom arrow there, in the right-hand corner, we've sort of slipped the Q1 '17 in, which reflects a little bit of a slip. But the purpose of talking this morning about this is to say that we certainly haven't forgotten that we need to attend to looking forwards.

And when we do look forwards, we'll see -- now it's a very long-term business. The operational improvements we're making are improving the platform, and the platform on in which we can build, but we now have to think about the next several decades. A new engine that is going out to the door today is going to be flying in 20, 25 years. That's actually nearly 20 -- well it is, it is 2040, which sounds like a

heck of a long way into the future. I'd be delighted if I'm alive in 2040. So we do need to think quite long-term here.

So framework, the framework that we'll be using is this framework. We'll be thinking about long-term trends in the industries in which we operate. And the presentation that you had over dinner from Paul Stein last night, that was no sort of coincidence. We do need to take account of the technology changes which are happening in the world. And by the way, I come from the technology space. And I've seen lots and lots of companies wither on the vine through not embracing new technologies in time. I've also seen lots of companies wither on the vine because they enthusiastically invest in all sorts of fancy new technologies that no hope and the market doesn't want them just yet. So no, it is a challenge and it is a balance but that's an area in which we needed to focus.

Then if you recall the matrix that we talked about, with having market attractiveness and competitiveness. We need to review that in a little bit more depth. And we mustn't forget the effects of the transformation program that we're having on our business. We need to continue to drive the improvements, continue to improve the performance of our business, but take into account that we are going to do that when we make our plans. And we need to consider all of that in the context of the capital that we have available to allocate and how we're going to allocate that capital and how we're going to allocate the capabilities that we have around the business.

A reminder. Each part of our business does actually have attractive growth opportunities. Yes, there's some investment required in all of these sectors. And there's certainly some steps forward, which are evolutionary steps. And there are some steps forward that are perhaps a little bit more revolutionary, a bit more radical. We need to think about all of that, think about the competitive opportunities and the competitive threats. And Paul presented these slides probably a lot better than I can when he talked about them last night and he explained both of these pictures.

If I just take the top one here where the 2 sort of internal boxes, applying digital to what we do internally, I'll remind you what he talked about there. I think there is significant scope in box 1 in terms of digital services and systems outward looking to our customers. And some people are a little bit skeptical about the fourth box, the Internet of Things. And my only comment on that would be, I used to work in communications in the late '80s and early '90s, and there was a thing around called ISDN. And the sort of cynical amongst us used to talk about ISDN standing for it still does nothing. And it still did nothing for a long, long period of time. And then sufficient infrastructure became available. And it wasn't actually ISDN, but the whole world that we enjoy today of the Internet, smartphones, connectivity and so on is a realization of the dream that was ISDN.

So the new technologies that we talked about today, the glimpses that we see, things like Paul talked about last night, and the hype around Internet of Things, I would caution people being over cynical about the Internet of Things. Because people have been plenty cynical before about these sorts of technologies that offer great hope. The actual manifestation tends to be a little bit different from the number you first thought of, but the reality and the impact on society comes through sooner than you think.

And Paul talked through the second slide on the bottom of this chart as well. And all I'm saying this morning is that we will pay attention to these technology trends. It's a similar story that he outlined behind the enabling technologies in these boxes, technology reaching tipping point. So I'll remind those of you who are at the dinner last night, the slides that he showed about the tipping points. I'll remind you of the Bill Gates comment about things always taking longer, or not as much happening in the 5 years that people expect, but a lot more happening in the 10 years. And that's the sort of time horizons, of course, in which our business operates on a much longer time horizon. So we really need to pay attention to that. That's a scenario that will achieve significantly more focus.

Now as far as our current portfolio is concerned, we need to update this slide from last year. I have no radical news for you on this, this morning. I'd point out that about 80% of our activity sits in the top right-hand box, i.e. we think it's playing into markets that are quite attractive and we think believe we've got a pretty competitive position. But we will be casting a critical eye across all quadrants. And I'll also remind you that the transformation activity that we're doing is lifting our performance in all of those boxes.

The cost challenge remains. The cost challenge remains, we've started. We've made progress, and we will make further progress beyond the GBP 200 million, of that I'm sure. There's a lot more to do. We will have to spend some money. There's some systems enablement activity. There's investment, some of the technology investments I just talked about. And this will all cost, but we haven't lost sight of the fact that we have any other cost challenge.

So if I put that together, and this chart has a rather sort of nebulous vertical axis of goodness, okay. I'm not sure how to -- otherwise to describe it, but that's what we came up with.

And so here we are at level 1, and how do we get to level 2 at the other side? Well, clearly, the cost activities, there's a lot of

[Audio Gap]

and creating a greater efficiency within the business. And when we get into growth and mix, we're talking about the mix of products and the challenges of product costs and getting a greater proportion of products that are competitively costed within the mix of what we do and taking advantage of the growth that is available in all parts of our business. A lot of that is unlocking the order book that already exists in our Civil Aerospace business and making sure that as we unlock that and deliver those engines, then we make significant progress on the costs and experience tells us that we can make progress on those costs and we have funds to make progress. And right now we are tracking those funds pretty well. So if you look forward to a world of twice the installed base and large civil engines, then I think you will see quite a transformational effect on the cost base. If you add all those 3 things and you move up the nebulous vertical axis of goodness from where we are to a much better place.

In summary, it's been a year of pretty good progress, really, on the transformation program. I wouldn't be doing my job properly if I wasn't a little bit dissatisfied with the speed and I wasn't continually trying to push and encourage us to do even better, but I am actually quite pleased with the progress that we've made on operating performance. And I've talked a little bit about the fact that we haven't forgotten moving forwards. We've laid out some areas in which we are going to apply our efforts looking forwards, and there'll be more updates on that in 2017 as we go.

But for now, I'll hand over to David to talk about our financial progress and looking forward, a little glimpse of the IFRS 15 update. David?

David Miles Smith

Former Chief Financial Officer and Executive Director

Good morning, everyone. There are a few things I'd like to cover in the course of the next 30 minutes or so. Firstly, as we're nearing the end of the year, I'll provide a brief update on 2016 performance and set out some of the market developments that may play into 2017.

It's also time we gave you an update on our Transformation Programme. In addition, as Warren has already said, I'll give you some additional revenue and cash flow disclosures as we set out last year. And as some of you will no doubt be pleased to hear, these will include revenue and trading cash flow direction and analysis through to 2020 for our Civil Aerospace business as well as near-term directional guidance.

I should emphasize this directional guidance will reflect our current accounting. We're also going to walk -- use today to walk you through the assessment of the differences between our current accounting and IFRS 15 for the 2015 financial year and likely future trends in order to help you think further about how to model the impacts of IFRS 15 moving forwards. And I'll talk to you about the key figures in this session, and then we'll be running more detailed workshops as part of the breakouts, the first of which will also be webcast live.

So turning first to 2016. Around this time last year, we set out the main headwinds we saw affecting our business in 2016. Majority of them were in the Civil Aerospace business. As we moved through this year, they've mostly materialized at around the levels we forecast. In addition, there have been a number of other developments, which have mostly netted off with other changes, and these include some

foreign exchange benefits in Civil, which we expect will at least offset some of the incremental market, operational, engineering and program costs we've incurred this year.

At a group level, we expect to act and therefore, broadly in line with overall expectations despite some of those mixed market conditions affecting some of our businesses. And for cash flow, we maintained our range of minus GBP 100 million to minus GBP 300 million.

Our transformation -- on transformation, sorry, our Legacy programs are largely complete now, providing the benefits we expected. And as Warren has touched on, we've made further progress on the additional transformation and you'll hear about this in our breakouts.

We previously told you that we expect to bank up to GBP 50 million of savings in 2016, and I believe we'll exit the year at an annualized run rate higher than this implies at around GBP 120 million. We're working through the potential benefits for 2017 right now, and we'll not announce these until we've passed a key review stage where we can review them as banked and sustainable. The majority of our identified savings to date have come from the management restructuring activity together with a number of efficiency savings, particularly in engineering and purchasing. Making these savings has been essential to help offset the investments we've made to support our manufacturing and engineering activities as we ramp up production in the new facilities around the world.

Just want actually to touch on transformation in Finance as well. All business areas have made transformation commitments and within group finance, we've also sought to deliver meaningful savings as well as making solid progress in improving and simplifying our reporting and forecasting processes.

One example, we recently consolidated 4 of our U.K. defined benefit schemes, simplifying both the administration and governance. We'll now have only 10 trustees whereas before we needed 40. We'll also benefit from scale, reduced advisory costs, more efficient asset management to generate annual savings of GBP 2 million to GBP 3 million a year. And we've also taken a number of actions to control the future costs of benefits accrual in consultation with our employees, so the overall impact on pension cost charged through the P&L will be around GBP 5 million a year.

In addition, you'll have seen that last week, we signed an agreement with Legal & General to take over our Vickers defined-benefit scheme with over 10,000 members. And this will remove risk from Rolls-Royce and also reduces our global pension liabilities by around 6%. On a technical point, we'll, therefore, have to recognize a settlement charge of about GBP 300 million due to the rules under ISF 19 to discount liabilities using AA bonds as a reference, and we'll exclude that from our underlying results. In other words, the surplus for that scheme that's on our balance sheet will no longer be there.

Turning to current market developments. The picture is mixed. In Civil Aerospace, we've seen a slower year for new orders as expected, but deferrals and cancellations have also been very modest and with a substantial backlog of orders, we feel well protected for the next few years.

At the same time, the outlook for our aftermarket business has remained solid. Looking at our large engines, parking levels are stable. We've seen a handful of older Trent-powered planes such as the Airbus A340s being removed from service, along with some of our more legacy RB211 fleets but at the same time, we've had good success now with our Trent 800 transitions on the 777, with 11 year-to-date compared to 1 last year.

From an OE point of view, the underlying business jet market has continued to weaken. And as a result, taken with the loss of some key platforms, we continue to expect revenues to fall over the next few years on an OE basis.

Tuning to Defense. The market looks, okay roughly in line with our expectations. And in Power Systems, the picture remains mixed. We aren't immune to the weakness in end markets such as industrial or oil and gas, but we also continue to do well in some of our strongest areas such as Power Generation and Marine and believe therefore we are gaining some market share.

Within our Marine business, there is really no sign of recovery in offshore markets and order intake remains very weak, particularly now also in services. You will hear from the team later about the efforts

they're putting into cost management and seeking opportunities in adjacent markets. But we must, therefore, remain very cautious about 2017 as the prospects for the year and expect revenues to be lower next year.

And finally, the nuclear business continues to focus on delivery against our long-term contracts within the submarine business and build out the capability within the civil nuclear business. We're pleased with some of the market developments but they won't have an immediate effect on results.

So looking forward, we'll probably divide our first detailed -- provide, sorry, our first detailed view on 2017 at our full year's presentation in February. And Warren and I think it's only fair that Steven and Simon, assuming they're on board by then, have a chance to review our plans before they're finally approved.

So moving now to some of our new disclosures. The next slides are intended to help you understand how we see the Civil Aerospace business developing over the next few years. The first covers revenue and is prepared, as I said, on a basis of current accounting.

The arrows themselves signal the direction of change year-on-year. And the key message here is that we expect overall OE revenues to grow year-on-year through to the end of the decade. This is underpinned by our order backlog of large engines. Whilst the absolute value of our linked and other sales should continue to rise as we deliver more Trent 1000 and 900 engines, the more fundamental revenue driver comes from unlinked sales, with the XWB engine, in particular, the significant contributor. But of course, these come with a negative cash flow. Based on current projections by 2020, broadly, we're expecting to deliver the same number of XWBs as our total large engine deliveries last year.

It's a different picture across our other engine programs, with deliveries of the V2500 modules dropping off quite sharply after 2017, although we are currently enjoying a bit of an uplift to revenues because of issues elsewhere in the A320 supply chain. I've already mentioned the weakness with the business jet OE market, which will be compounded by a number of new airframes entering into service replacing our BR710 Power predecessors. So consequently, OE revenues from our business jet will continue to decline over the next few years. We still regard the top end of the business jet sector as strategically important and are targeting opportunities there to regain our market share over time.

Turning now to the aftermarket. We expect revenues to grow modestly at first and will significantly as revenues from the installed base of the newer engine programs build. We're anticipating a slowdown in revenues from some of our mature large engine products like the Trent 7 -- Trent 500, sorry. But the important thing to note is that we continue to see double-digit growth in our new Trent aftermarket revenues and flying hours.

Aftermarket revenues from regional aircraft will decline year-over-year over the next few years as aircraft that we power are replaced by larger cabin alternatives, while the V2500 and business jets should remain reasonably stable.

Right. So turning now to cash flow again. Again, this slide is on a current accounting basis for all years. And as before, the arrows reflect year-on-year changes, with an upward arrow indicating an improvement from this factor on the year before. There's quite a lot going on, on this slide, and I don't propose to take you through it arrow by arrow. The main areas I'd encourage you to focus on are the developments of profit, the movement in Contractual Aftermarket Rights, or the CARS additions and the movements in the TotalCare net asset.

So taking these in turn. On profit, we're expecting modest improvements as we move through the next few years, and those will accelerate as we get closer to the end of the decade. And this reflects the growth in the large engine mark-to-market plus the production efficiencies from the increased volumes and the benefits of our Transformation Programme. Offsetting these will be reductions in our business jet and V2500 OE sales and reductions in our regional aftermarket.

Let me perhaps use the CARs additions line to explain a little bit more how we are using the arrows in this chart. As you know, CARs additions represent the aggregate cash loss in the year from unlinked OE contracts. In 2015, our CARs additions were GBP 161 million. As we moved through 2016 and 2017, our engine deliveries of unlinked contracts will grow, and the aggregate cash loss, therefore, rises year-on-

year. And this is illustrated by the downward arrow within 2016 and '17, i.e., indicating that total cash losses for CARs additions are increasing and therefore negative for cash flow.

In 2018, we have an upward arrow to show an improvement on 2017. Although we're still actually increasing our volumes at that point, we're managing down the average loss per engine, are expecting therefore that the total value of cash losses from unlinked engines to be lower than the year before. So this doesn't mean that the CARs balance has peaked but that the rate of growth has slowed.

Finally, let's look at the TotalCare net asset. We expect this to peak in the next few quarters and then start to decrease as previously pull forward -- sorry, as previously pulled forward profits on linked sales are unwound against linked aftermarket contracts.

So now I'm going to move into IFRS 15. But before I go into detail on the numbers, I think it's worth reminding you that the implementation, firstly, is still a year off. But given its likely significance to our underlying results, I think it's appropriate that we keep you informed of our progress.

Overall revenue recognition will now be linked more to the actual timing of costs incurred in providing goods and services rather than smoothed over the lifetime of service contracts. And for fear of repeating myself, although I think it's important that I do, the one clear and firm constant is that it does not change the cash flow profile and therefore the embedded value of the business.

Let's quickly recap on the high-level principles we shared back in July. Firstly, the CARs concept would no longer be applied to our contracting arrangements, so we'd recognize any cash loss upfront on engine sale at the point-of-sale. We would no longer do linked accounting and pull forward some of the profit from our aftermarket contracts on the sale of the engine. And for the aftermarket itself, the timing of revenue recognition on offsetting concessions would be -- would change to an input or cost basis, with the consequences having very different profit and loss timing effects.

I probably described the introduction of this standard as a painful but welcome step on a journey to increased transparency for our OE revenue at least. By removing our CARs and linked accounting, some of the accounting for will be lifted. Our accounting for a portion of the aftermarket's profits goes away and any loss we make on engine sales will be more apparent. Therefore, as we ramp up our large engine production over the next few years, a switch to IFRS 15 is going to have a negative effect on our OE revenue and profit relative to today's accounting. And this will continue until we've made progress on our program of cost reduction and have traded through the launch pricing of our new engines.

On the aftermarket side, I'm afraid it's not quite so straightforward. In fact, for business jets and even for our large engines, in a way, it lacks some logic and leads to some counterintuitive outcomes, both of which I will explain later. IFRS 15 defines the timing of revenue and profit recognition during the course of a contract. It doesn't change the overall level of profit from the contract itself. And of course, as I said, it has no impact on contract cash flows at all.

So over the next few hours, you will have a couple of chances -- we'll have a couple of chances to explain these changes to you. I'll share the high-level principles and outcomes now. And then in the breakouts later, Andrew Dickinson, the Civil Aerospace CFO and myself will give you a more in-depth analysis and answer any questions you may have.

But before I do that, let me first explain the legend on the right-hand side of this slide, which you'll see used again on the subsequent pages with the numbers. Where you see a fully-colored block on the right, this is intended to show you where we've already disclosed the principles, and the quantification of the impact has been largely available to you from our prior year results. For example, where CARs additions represent the cash loss we incurred from our unlinked engine sales. The second half-colored block is where the principle has also been clear but not all the financial information has been available before now or was only partially clear from our statements. A good example would be catch-up adjustments.

The uncolored block represents a new disclosure as we've developed the detailed understanding of implementation of the principle. For instance, the quantification of the impact of the change from recognizing long-term contract revenue on a flying-hours basis to a short-visit basis or the impact on the business jet aftermarket.

And then before we go through the number as well, let me just explain which parts of our Civil business are affected by this change. Looking first to OE, the elements that are cash positive today, such as business jets and V2500 modules as well as profitable spare engine sales, are within Civil large engine revenue. These will be largely unaffected by IFRS 15. Where we will see the difference is in our negative cash margin installed engines.

Unlike with current accounting where we capitalize those cash losses either as a CAR or by linking with an aftermarket contract, under IFRS 15, we'll recognize a cash loss when we sell the engine. Our range of cash losses today on engine is typically and broadly a GBP 1 million to GBP 2 million range, but we expect this to reduce quite dramatically over the next few years as we execute on the program of cost reduction and benefits from pricing on some of our new programs.

Turning to the aftermarket. It's a pay-as-you-go long-term service contract so they're most affected by IFRS 15. On a Time & Materials base -- basis, royalties on the V2500, for instance, will be the same as today. So overall, around half of the Civil OE business and about 1/3 of the aftermarket revenues are unaffected by this change.

So turning to the Civil OE effects. The total effect on 2015 full year results would have been around GBP 700 million for OE. OE is most significantly affected because of the removal of linked accounting and the removal of the CARs. All of the changes here affect both revenue and profit apart from amortization of CARs, which only affects profit, and that's because on the current accounting when we amortize the CARs, it flows through cost of sales, not revenue.

While we can no longer capitalize losses and pull forward profit from the aftermarket under linked accounting, we won't also have the unwindedness on the aftermarket revenue in the future, which is a positive that you'll see on the next slide.

So all the items, apart from the treatment of guarantees, are actually highlighted in our 2015 year-end results. The new item is the change in timing of recognition of some of our performance guarantees, particularly on early Trent 1000s, where we now have to recognize the net present value of any expected payments or, for instance, the fuel guarantees. When we make the engine sale, under current GAAP, these are generally included as part of our aftermarket costs.

So turning now to aftermarket accounting. Here, the changes are more complex. The change to an input approach has a marked effect and we'll explain details more about this in the breakout. Basically, when we remove the effects of linked accounting, we won't be pulling ahead aftermarket profit or capitalizing cash losses. This means we'll recognize all of the aftermarket profit during the aftermarket contract and not take some of it upfront. Therefore, we'll no longer have a large long-term contract debt of comprising capitalized cash losses and pulled forward aftermarket profit, which we need to unwind against our profit and loss market cash flows. So the GBP 268 million benefit on the slide is the positive effect that we would have seen for this in 2015.

In 2015, we also had the effect of our change, if you remember, on provisioning against contract risk, which gave us a GBP 189 million benefit in 2015 profits. But because there's no linking under IFRS 15, our positive long-term contract balance would actually have been a lot smaller, and so we have -- would have needed a far lower risk provision. Our change in provisioning method would have only been worth GBP 33 million so we'd have seen GBP 136 million less benefit in 2015 than we actually reported. The level of other catch-up adjustments such as lifecycle cost improvements would also have been far lower for the same reason because, in part, this is driven by the removal of the linked accounting.

Finally, through the change from output to input from flying hours to cost activity profit recognition, this has an important effect, driven by both program and portfolio maturity. For instance, the relative position of the Trent 700 and XWB, and Andrew's actually going to cover this in more detail later on.

In addition, what is perhaps more counterintuitive is the change the new standard will bring for profit recognition on our business jet fleet. Again, these are profit and not cash rip effects, remember, but because business jets are flying far less than wide-bodies, the first who are over will actually, as often

happens, after the expiry of the first contract period, which on average, is about 10 years, very different profit recognition pattern from long contract to the next.

And the results of this is under IFRS 15, the timing of when we can recognize revenues from these business contracts is actually going to be deferred for many years. This compares to what -- to today, where we're recognizing revenue and profit as we collect the Corporate Care payments on a pay-as-you-go basis. And it's worth noting that the estimate of the impact in 2015 of around GBP 120 million is particularly high. We expect this will reduce over time as the average age of the fleet increases over the next few years.

So let's next turn to the balance sheet for Civil Aerospace obviously. We've performed a restatement as of the end of 2015 for illustration purposes only. Of course, by the time we do the actual transition adjustment to the opening 2017 reserves, we'll have moved on another year and have a slightly different mix of contracts, so the magnitudes of the actual transition impact is likely to be different from what we're showing today.

The main changes are no CARs or -- so no CARs balance; the debtor balances within TotalCare assets, which represent linked profits reported ahead of cash will no longer be there as there is no linking under IFRS 15; and then thirdly, the transition from flying hours to a cost basis means that we'll be -- actually be receiving cash revenues ahead of when we perform overhauls. And that's the trigger for the ability to recognize revenue and margin under IFRS 15. So as a result, the balance sheet will actually show a creditor to receiving cash received from customers ahead of recognizing the profit.

We've shown all of this information pretax. Clearly, when we do the actual transition, we'll have to work through the very detailed country-by-country tax adjustments to our assets and effective tax rate. But I think very approximately, if you use your normally -- your normal effective tax rate, in other words, 20% to 25% for the tax rate, that should give you a good guide.

So I've talked about how estimates on IFRS 15 would have affected 2015. So what I'd like to do now is explain how the -- direction of changes over time. But I'm going to do is using a build to show the effects. So the horizontal y-axis here represents the difference between current profit as recognized under current GAAP and IFRS 15 for each year. Once again, very obviously, I'll remind you that cash flows, the blue line here over the life of the contract are completely unchanged, hence, that blue arrow is flat.

So initially, the gap between current GAAP and IFRS 15 for OE accounting is large, as I just pointed out, about GBP 700 million. As we reduce the unit cost of our engines and move up through the bands of launch pricing on some of the engines, we'll expect this gap to close as we have forecast over the last few years. As a result, the gap will close slowly at first as we ramp up production, but more quickly as key programs such as the XWB 84k mature.

Thereafter, with a mix of high-medium -- high and medium volume engines and inevitable variations in price for different fleet operators, we'd expect the trend line to stabilize. So for those of you who are looking at the size of the area on the curve, I should point out that the overall revenues and profits over the whole lifetime of the business will be the same under both accounting methods.

However, for OE, IFRS 15 will never actually catch up with current GAAP because of the effect we would have seen under current GAAP for linked accounting. Conversely, because of the way we currently report aftermarket revenues for linked engines, effectively suppressing the cash aftermarket margin by the under winding -- unwinding of previously pulled ahead profit, our overall IFRS 15 aftermarket revenues will be higher.

So aftermarket forecasting is going to be more challenging, I'm afraid, as it will be quite hard to predict what engines are being serviced and how much of the expected contracted cost is incurred. However, as we'll explain later, the basic difference should close as overall engine programs mature, and this reflects the fact that we catch up in profit terms around the time of the second service on most engines. So the more mature the fleet, the higher cumulative profit should be recognizing and therefore, the higher the reported margins.

However, we have relatively -- have a relatively small and young fleet today as the average age of our Trents is only around 7 to 8 years. And it is reflected in our low overall TotalCare creditor balance today. The significant growth in our market share over the next few years means it's going to take some significant time for our average age to mature, so the service revenue's likely to lag between current GAAP for many years.

Our focus so far has been on Civil and it's where the most significant differences are. There will be some effects on our other businesses, although a great deal smaller. In Defence, for instance, the OE impacts are likely to be de minimis in the near term. There will be changes in the aftermarket for Defense as we do have some long-term mission care contracts with a flying hour element to them. But of course, hire their services completely different, and mission care is less than 30% of Defence Aero services revenue, so the effect actually will be quite small. We're still evaluating the other businesses as well. All have some long-term contracts in them, but we're not expecting major changes.

So we've covered the main adjustments to 2015. In the workshops later, we'll spend some time contrasting current GAAP and IFRS 15 in a bit more detail as well as trying to help you think about the modeling moving forward. We'll give you as much directional guidance as we can but please bear with us. These, on the actual outturn in 2018 when we implement IFRS 15, are highly subjective and not something we can be definitive about yet.

We spent a lot of time over the past few months working on some of the more detailed principles in the interpretation of IFRS 15 and how this would have applied to our 2015 results. Looking forward, we'll be providing some similar adjustment to our 2016 results around the half year. And in February 2018, when we represent our 2017 results, we'll then provide them under both sets of accounting standards.

So I used this slide earlier so I'm just going to keep it short now. There are likely to be some big noncash adjustments that we've just seen, particularly on OE and certainly some aftermarket profit under the new standard. But of course, cash flows are unchanged. The impact of IFRS 15 is really just a timing difference on how we recognize the returns over the whole life of the product. In the end, we'll make the same cash flow and the same profit on each engine regardless of the accounting.

So let me briefly wrap up. We expect to deliver 2016 broadly in line with our original expectations despite some mixed market conditions affecting some parts of the business and some of those will play into next year. We've made good progress with our transformation program and increased our banked annualized savings to around GBP 120 million. And when we adopt the new standard from 2018, it will initially have a negative effect on our reported earnings. But the most important thing to take away is that fundamentally, the net present value of the business hasn't changed because there are no changes to cash flows.

So thank you very much. I'm now going hand back to John. Thank you.

John Dawson

Former Director of Investor Relations

Thank you, David. So that brings the 2 opening presentations to a close. We're going to take a short break, give you a chance to get on your feet and have coffee. We are running about 5 minutes late so if we can come back in here at 10:00, that will be greatly appreciated. Coffee is back in the reception area at the front of the hotel. Thank you very much and see you in 20 minutes' time.

[Break]

D. Warren A. East

CEO & Executive Director

Hopefully, everyone is refreshed and we will move on now. And I'll just introduce what's going on in the breakout. So we had these 3 themes about engineering excellence, operational excellence, aftermarket excellence, all a little bit nebulous and intangible. And what we're going to try and do is bring some of that to life with examples from the business.

And as I described in my presentation this morning, we can't sort of do it perfectly because we'd be here all day with examples everywhere. But you will see a cross-section of what's going on in businesses and a cross-section of activities aimed at these 3 themes.

And so once we've actually got set out in the room, so in engineering excellence, we're going to have Power Systems in Nuclear, operational excellence is in Civil Aerospace and Marine, aftermarket is Civil Aerospace and Defence.

And underlying all of that, as David promised you in his talk, then we've got a detailed deep dive on our interpretations of IFRS 15 and the difference that is going to make. Before we start on all that, then all of our business presidents are here to give a quick introduction on what's going on in their businesses. And we'll start with Civil Aerospace and Eric Schulz is going to kick off.

Eric Schulz

Former President of Civil Aerospace

Thanks, Warren. Good morning. Really pleased to be here today. So my name is Eric Schulz, and I'm the President of Civil Aerospace. I spent my entire career in Aerospace from airlines and airframers and suppliers, various organizations around the world.

I joined Rolls-Royce in 2010. I became President of what was, at the time, Civil large engine in 2013. And in January 2016, Warren asked me to take the reunification of the small engine and the large engine and the supply chain within combined Civil Aerospace.

So today, I will show you a little bit of our view of the market environment and what this means for Rolls-Royce. I will also give you a snapshot of our priorities as a business. I will introduce the 2 workshop that you will begin with, our Civil Aerospace representatives, and then I will conclude with a very, very short brief summary.

So if I start with the market environment, these are the basic slides we're always contemplating. So if I look at the order and delivery, the business is a little bit uncertain today. For the first time since a long, long time, we have had less order than deliveries within a year on either airframe or engines as it goes together normally. And clearly, this is a first. But it doesn't mean that we are anxious about the future of the market. It's just 1 year and you can argue that we have caught a lot of orders in the previous years. And that may be just a natural kind of a pause in the system waiting new orders in the future. But, nevertheless, we see a rebalance compared to the start of the decade.

We believe in terms of business that we are quite insulated from it because as you know, we have a very, very massive order book. We have not seen that many cancellations. We've seen a little bit of postpone but not something that we are really anxious about. So again, we are putting a lot of attention to the market, looking at this. It may not be anything. It might be a first sign of a slowdown. We don't know yet, but we are watching this.

Air traffic, which is very important because this is clearly the end customer flying the airplane, air traffic is somewhere on the same lines. I mean, if you look at the Western world, it's kind of slow. It's a 1% growth over the year. And of course, there's always that real unbalance between Asia Pac and namely, China and India, versus the rest of the world.

The load factors are fantastically well. I mean, I remember my time, I would have dreamed about load factor of these levels, 80%-plus. And we believe there are -- the long-term fundamentals are still around 5% CAGR overall but clearly also something to watch.

If we focus on parked aircraft, we had a difficulty last year in 2015, which was, I would call it, based on 2 very specific things that happened to our customer base. One was Malaysia that started to stop 13 777s with the Trent powered and also the bankruptcy of [indiscernible] Aero which parked quite a lot of airplane and these were the 2 main events. Since the situation has recovered, I mean, when you -- I look at 2016, we've done 24 Trent-powered transitions as compared to 10 last year at the same period. So clearly, we have accelerated. We have, as you probably know, we've been quite public with this, we've set up new switchers within Civil Aerospace to serve our customer and be more flexible, adaptive. And of course,

our target is always to be better than the competition. So the if there is a 777 or if there is an A330 to be parked, I rather prefer to see a Pratt or GE aircraft being parked as compared to mine. So what we are doing, we accelerated the transition, we've tried to get very, very close to the customers and get that motion moving.

Now there is a point of caution I want to give everybody is, as we will reach 50% of market share in the future within the next 3 or 4 years, we should expect to have more aircraft parked because this is just a sign of maturity. And again, this is why it is very, very important for us to work on transitions, mainly with leasing companies such that we ease the Trent-powered transition, and we gain -- we protect our market like this.

In business jets, this chart represents the projected number of billionaires around the world, and you probably know that probably better than I do. We expect that -- for that to continue to grow, especially in emerging countries. So I believe that when I speak to the airframer, Gulfstream, Bombardier or Embraer, I always get the same signal, which is the next year and -- the last year and this year, the next year, look a bit difficult. But the long-term growth in the business is -- seems to be quite sustained largely because of these people will be future customers of global corporate jets.

And one of the key themes as well, which is always of note is that when we talk about this market, the corporate business, the large cabin, which is clearly the niche where we play, the large cabin is expected to grow much faster than the rest of the corporate jet business, which gives us more opportunities.

So this is a little bit of view of the environment. Warren described the chart on the left and this shows that we are pretty strong on the market where we are, especially well positioned on wide-body but also well positioned on narrow-body. The brand on -- sorry, on the corporate jet. The brand on the corporate jet is really, really strong. I have to say that every time we go to people like Gulfstream, our brand means something for that niche of the market.

And we'll continue to innovate in aftermarket. You could see the growth in aftermarket on the right-hand side. So in 2015, we had about 3,500 engines in the world flying. And within 10 years, we will barely double that number. So this means we are doing a lot on aftermarket. We are doing a lot on the network to prepare it and to serve these engines because all of these engines will require maintenance. And clearly, the use of big data, which connect to the presentation that Paul has made yesterday is really, really important because we count on a level of efficiency, which is given by managing bigger data, EHM solutions and being more interactive with the airlines.

If I go to the key priorities for the business, so if we had an elevator conversation today, you ask me, well what are your big priorities in the business. Well, clearly, the first one is a ramp-up in capacity. We have a massive order book. We have to grow our capacity, especially on the large engines. And it's growth of about 20% year-over-year. We've done 20% last year. We are doing 20% this year. We'll have to do 20% next year. Until a point where we reach a peak of about 600 large engines a year. And clearly, this is all about capacity. This is all about efficiency. This is all about having the supply chain rightsized either internally or externally.

The second big thing we have in front of us is what we call NPI, new product introduction. As you know, we have 3 programs in parallel that are -- that is unprecedented in Rolls-Royce, with 3 big programs, which are very, very close to each other, the Trent 7000, the Trent 1000-TEN and the Trent XWB 97k. And these are the ones that we can start now to see. I hope within weeks, you will hear more about where we are and we'll be able to be a bit more public about this. And you will see that I think, the bulk of the effort has been made, but there are still a lot of effort to get to entry into service.

The third one, which is also very, very important are the fleet issues. When we have one, the ability of the organization to be flexible, to be ajar, to propose new solutions to use data, to be able to serve the customers in the art and really as close as we can be, as Warren explained, what we've done on the 2100. I think coming from the airline industry, I can say that people understand that these are technological products, and sometimes, you have something you get surprised by. I think the reaction and the reactivity that the system has is the way you keep the customer with you or not. And this is really, really important for us, and again, we'll show you a little bit more example in the breakout session today.

Transformation, and transformation in our system as it has been presented this morning by Warren and David, is not just about restructuring. Yes, we have reduced by more than 20% the level of override in Civil despite the fact that we are growing. But on top of this, it's more about changing the way we do business. Changing the pace, changing the actions, changing the accountabilities. I mean, not having 3 people believing to be in charge who can make 180 degrees directions, but having one pilot on board and only one pilot in command at any time who is making decisions; consulting others, but making decisions. And that's what the transformation program is. And for Civil, it is also a roadmap that identify what -- where the best practice are in our whole business, which includes procurement, includes manufacturing, includes engineering, includes production, includes aftermarket, where are these pockets of best practice around the world, and how do we get these views and these methods and these tools and processes back into our business so that we improve efficiency. And the transformation program goes over the next 3 years. We have a clear roadmap on that. And I think it will deliver -- it is delivering and it will continue to deliver.

And last but not least in an organization and a business like ours, it's all about technology. We sell technology. Sometimes we forget we believe we sell only product, but that's not the case. We sell technology. We sell fuel burn. We sell SFC. We serve valuability. We sell -- all of these values that we serve are coming through technology, and the reinvestment in the program, and you all know about the advance program, you all know about the UltraFan, this is preparing the 2025 deliveries from Rolls Royce and it's absolutely important. The world has changed a little bit, Boeing and Airbus, just to take these 2. I think they have been impacted and hit in their reputation, but also in their numbers -- financial numbers of delays for airplane. And the problem that they have now, they are asking for demonstration of technology. So it's no longer a world where you can show a nice PowerPoint. You need to show products.

If I go back to the -- what we will present to you in the breakout room. So we'll have a session on operational excellence, and Mike Mosley -- Mike, can you please stand up? So Mike Mosley, he's the VP in charge of all of operation for Civil. So he will walk you through what we are doing to meet our operational targets, ramp up and quality in particular. And so I won't go into any detail. You will have the sessions with Mike and you will be explained and you will have an opportunity for question. Likewise, on aftermarket. Dominic Horwood, who is the VP in charge of customers and aftermarket. Dominic, can you please stand up? Yes. Dominic will walk you through what we are doing in the fleet to serve the customer better, get closer. So I won't get there in order to save a little bit of time.

So in summary, this is where we are. We have a massive ramp up unprecedented for Rolls-Royce, but we are on it. We know what we have to do. You will see good pockets of examples of how we move the needle. The transformation program, which we call Fly, I mean, why not, in Civil Aerospace. The flight program also delivers well, and you will see in both aftermarket and operation presentations, examples of things that we are transforming. Addressing the in-fleet issues is absolutely key to preserve our reputation and keep the customer with us, and that's a big, big focus for us. And the long-term outlook of our business look very, very positive. I mean, we are moving the needle. I mean, this company, by 2020, will have beaten GE on the large engines. This is something sometimes we forget, but we should not because the customers and the market does not. We will have beaten GE by 2020 in terms of market share and in terms of engine deliveries.

With that, thank you very much.

Chris Cholerton
President of Civil Aerospace

Well, good morning everyone. I'm Chris Cholerton, President of Defense, Aerospace. I'm going to start today with just a short overview of the business, giving some context on the market and then focusing on our 3 strategic priorities in what I think is an exciting time for the Defense business.

We operate in all 4 segments of the market. So in transport and patrol where we're the market leader particularly focused on tactical transport, in combat, in trainers and in helicopters. And in our core markets of combat and transport and patrol, we have strong positions. That's 80% of the revenue in the business.

We also have a large and mature installed fleet of some 16,000 military engines. Actually, on top of that, you could have 15,000 Civil helicopter engines that the business produce and support. So it drives a strong focus in maximizing value from that aftermarket. And that's the breakout session, which you'll see later, which I'll describe shortly.

If we look at the market environment, defense spending, well, it's a very hot topic last night at dinner and in conversation, particularly in light of the new -- after the U.S. election. I think the -- our forecast will show that defense spending over the next 5 or 10 years is growing at a compound annual growth rate of just under 1%. But there's some differences around the world. So broadly flat in U.K., U.S. and Europe; growing in the Middle East, which is 17% of our revenue; and growing even more strongly in 4 countries I pick up there which we've given some particular focus to in South Korea, Turkey, India and Japan that's close to 3%. And clearly, I was asked many times last night about the impact of the U.S. elections. So clearly, we're seeing some very positive intent. And I think we just need to see how that converts into policy and action, but clearly some positive mood music. It will have to include repealing the budget control act, of course, which is currently still in place until 2021.

I think also the environment of our market is very competitive. There are a few new platforms. So that gives intense competition when there is a new platform. We're seeing affordability at the heart of every customer decision. Some regulatory pressure coming on the single-source regulatory office in the U.K. So we're seeing pricing pressures, and that's caused us to drive significant and aggressive cost reductions in recent years through our business. And you've seen that, that's been successful in actually protecting some very attractive returns through that period. And we continue to drive cost base production to sustain returns in the level of 15% to 17% return on sales.

Our strategic priorities are in combat, so we need to secure a new combat position, perpetuate our capability and military engine design. In transform patrol. It's about defending that market-leading position and growing where there's new opportunities arise. And in services, to continue to innovate, to maximize that value from the aftermarket.

So starting with combat. On the right-hand side, let me just touch briefly on a couple of our existing programs. So clearly, the innovative LiftSystem on the F-35B joint strike fighter, a hugely, valuable program to us, and one which is now ramping up and growing. And I hope that, that will double over the next 3 years. And the Typhoon, the EJ200 engine on which we have a share by EUROJET. So clearly, still active campaigns currently in the Middle East, but other opportunities in Europe and later in Asia.

But our primary focus on the combat sector is to secure new opportunities. And we're delighted to be part of the U.K.-French or Anglo-French FCAS program, a EUR 2 billion investment in development of an unmanned combat air vehicle, in its formative stages. And we're also pursuing opportunities to power the indigenous fighter aircraft which are being planned in a number of countries, Turkey, India and Japan in particular, with intense activity currently in Turkey. In each of those markets, technology transfer and localization of manufacturer are highly valued.

Same problem when I had -- there we go. In transport and patrol, our priority is to defend our market-leading position and grow by new applications when they arise. An example being the future vertical lift program of the U.S. Army, which is starting to gain some traction. And to this end, we're investing heavily in both products technology, to show we have a competitive product when those competitions arise; and also in our operational capability to ensure we have our competitive facilities from which to deliver those products. So in technology, we're investing both in increasing the scope on our existing products. And an example shown there on the bottom left is an infrared suppressor for the V-22 and also for the C-130, adding some scope to our supply and we just received, albeit a very small, first contract so far for that -- to that technology. But also investing in component and system level technology for the next generation of engine in this segment.

A big and significant investment is in Indianapolis in our operational footprint where we're completely revitalizing that operational footprint. We're going to have the footprint there and re-purpose the remaining footprint and also invest in new manufacturing technologies. So significantly reducing our operating costs of that facility and driving our productivity. Here's another example of the continued drive we have in the business on reducing our cost base, which is critical to that future competitiveness.

And on aftermarket. So this is the breakout session, you're going to see, which will be led by Paul Craig, my Director of Services. It's a hugely important area for us. It's something I think we do very well and which something where we're continuing to innovate to release and maximize more value. I have a few takeaways I'll bring out before the breakout session.

Enhancing value at lower costs. So what we're doing here is seeking to upsell our level of services with customers. We have a roughly 1/3 of our aftermarket revenues from time and material, about 1/3 is on fixed-price repairs and about 1/3 is -- no, roughly, is on long-term service agreements. So again, we can realize value by upselling those who are not yet on the full long-term service agreement and also driving a lower cost. And this has been a successful area for us in recent years and we continue to push it hard via investing in new repair technology and also in the use of data, the operational data and data we have via being the OEM to have more optimized and intelligent work scopes at MRO which drives down the costs.

Where also is important to with such a mature fleet, that we work to extend the life of those fleets in service. An examples here that Paul shared around inserting technology kits to old engines which transforms their capability and their performance, and therefore, extends their life in service to both the customers' benefit and our benefit. And we've opened services in the U.K. and the U.S., Saudi Arabia and just next year in India to that end.

So in summary, I think the strong positions in our core markets of transport and control and combat, we're investing in technology to protect those positions and in our operational capability to drive competitiveness and a real focus on delivering further aftermarket value from that very large and mature installed base. And as I said, I think that continue to drive the cost base with those strong positions, we'll get returns in the 15% to 17% return on sales through that period of investment and with that pricing pressure I described. So I think some exciting times and some exciting opportunities heading in the defense world. Thank you.

Marcus Wassenberg

A very good morning to you. I'm Marcus Wassenberg, the CFO of Rolls-Royce Power Systems. And very grateful to be around you and to introduce my company to you.

We have been founded in 1907 by Wilhelm Maybach, one of the pioneers of the diesel engine. And I think this is why our company is still thinking engines first. May it be Bergen engines for medium speed or the 1600, 2000 or 4000 series for our high-speed, but we're thinking engine first, and then actually, we're thinking about the market and how we address the market. And that leads to a broad portfolio of applications that we address in the marketplace. You can see basically that we're rooted in Governmental and Marine which account for roundabout 45% of our business, that is business that is long cycle. And when we talk about long cycle business, I mean, 9 to 15 months. Completely different from Aero, obviously. And PowerGen, which is a business that is bringing high volume. And we are in applications of rail, mining, oil and gas, and David has alluded to that, agriculture, which roundabout account for 20% of our business and injection systems. It's that portfolio actually that makes it easy for us to bring in a revenue stream that is more or less stable within a certain corridor. So even when David alluded to the problem we see in the oil and gas market, it will not shake us as much as part of our peer groups. On the other hand. It comes with a certain level of complexity due to the increasing number of regulation on a global scale, because obviously, we have to maintain the technological leadership in all of those applications and adjust it to the increasing number of emission regulations. If we then see the market, we're addressing the market -- or the global market is roundabout GBP 17 billion. It's growing faster than the GDP, driven by megatrends such as urbanization, mobility, higher energy demand.

And if you were to look at the market and split it, it's basically centered around PowerGen, which is close to almost 50% of the market if you were to combine Governmental and Marine. It's what then gives you like the same share of market size for Governmental, Marine, Rail, Mining, Oil & Gas and C&A. And if you were to look at how we are positioned in the marketplace, then basically, we are on the top 3 level where IP and content is very, very important, such as Naval and Defense, Yacht business our mission-critical applications in the PowerGen area where reliability is important and performance is very important. On the other hand, you can see that there are areas of growth that are interesting for us because we have a meaningful footprint already, particularly in the PowerGen application. And that translates into a

very simple strategy. Our core basically is the Naval and Defense business. This is our -- where our DNA comes from. This is where we're strong. This is where we benchmark off the peer group. And we need to maintain this position by all means.

Secondly -- because this doesn't load the factory alone, secondly, we need to grow in high-volume PowerGen applications, it's very strong mission-critical applications such as applications for data center or hospitals, we need to grow in the applications that are continuous PowerGen and standby PowerGen. And we need to grow a service offering. Service is already a very significant part of our business. We need to grow it, thus. And we do that not only by increasing the fleet, obviously, in Naval and Governmental or PowerGen, but we have to selectively invest into industrial applications that are service-intensive and grow our business over there.

And that then forms the pillars of our transformation. Sorry, I need to go back. And then on the other hand, if you ask for our strategic priorities, it's, a, delivering on our transformation program, and I will come to that in a second; secondly, we need to maintain the leadership and technology that has characterized that business for over 100 years. It's crucially important for us. And that means that we have to invest in hybrid solutions. You saw the hybrid train in the beginning of the presentation. We need to invest in gas, we need to invest in systems that's very important to us. And we need to replace our existing product range with succession -- with succeeding products that really fulfill our customers' needs. We need to pursue additional growth opportunities, and that very much alludes to the things that Paul said yesterday. So we have to increase our digital offering and harvest the know-how that is available in the group for us as well as partner up with strategic partnerships as we just did with Yuchai in China with of their -- in the fracking area to offer system competence to our customers.

Talking about the transformation. This picture is just a very simple expression of the 4 modules that actually form our program, RRPS 2018, shaping our future. And it's not only a cost program. It is very much driven by the thought that we have to shape our markets. Basically, our revenue stream, the composition of our revenue stream, the composition of our product because we need to take out complexity of the business in order to cope with the magnitude of applications that we're seeing. But not in every applications we need to be full range, and therefore, this is very important to us. And from there on, actually, we're then streamlining the whole organization by taking cost out, partnering up with other elements of the group to offer shared service solutions. We try to speed up decision-making by bringing decision closer to the business, closer to the markets, and therefore, improve flexibility and resilience. At the same time, we need to shapen our ambitions in the sales and service department. It sounds a little bit technical maybe, but basically, what we're trying to do here is, for example, we're taking down lead times for great engine overhauls by half. Actually achieve that already and we are sure that this will bring us more orders in the years to come in the service department.

And then shaping edges is about -- China just talked about the joint venture that we've just announced with Yuchai, which is about the Series 4000, lowering our cost base on the one hand, order up on the other hand; bringing in more market access for us in a very important market and leverage the opportunities that digital brings industry [indiscernible] brings with it. Actually, that is a huge opportunity for us, as well as for Power Systems because we can leverage on the experience that our colleagues in Aero and Marine have. So leverage digital opportunities and manufacturing and service offering is very important to us. If I'm now taking those elements and transform it into R&D, and actually, Petar Pelemis, our Director for Program -- for Product Strategy, will talk about that in the breakout session. The priorities that this brings along for R&D, and I'll put it in my nonengineering more simple terms, is basically focus on customer requirements, i.e. in improved life cycle cost situation, focus on investments for the lead applications. Lead applications are Governmental; Navy on the one hand, PowerGen on the other hand. Invest in new growth areas such as gas system and hybrids, and offer new services based on digital and system integration offerings.

With that, I hope I was able to talk about the broad and diverse market positioning that Rolls-Royce Power System has. I made clear to you the clear strategic direction that we're following, that the transformation program that we initiated is well underway and first results are already achieved. And the increased focus that we have from limiting, shrinking, focusing on the product portfolio and the discipline that it brings now in the R&D program that Peter will elaborate on in the breakout session.

With that, I thank you very much and hand it over to Mikael on Marine.

Mikael Makinen

President of Marine Business

Thank you. Yes, my name is Mikael Mäkinen. I'm heading the Marine business. I've been with the company for 2.5 years.

Marine. Well, we all know what has happened to the oil price. We all know what's happening to the day rates and so on. But we have to remember a few things. I've been in the business my whole life, and it's a cyclical business. It will come back. It will change. It will add up another type of business. But when it comes back, it will be again a very, very interesting business.

The first slide here is a Hurtigruten cruise vessel. Nothing happens under the offshore market in Norway right now; very, very few projects. But at the same time, our offshore people managed to get an order for Hurtigruten. We have designed the ship. We have done all the propulsion system for it, the whole breach communication systems. Some, very exciting future possibilities of using batteries and so on. So using that knowledge that we have in offshore is not so that it disappears and it cannot be used anywhere. We just have to find other applications for it.

But let's have a look at the market. Yes, I have here a few slides. If you first look at the dotted line on the left-hand side, Clarkson in March, what they said how the market will go down, it will come up later. Six months later, Clarkson is more pessimistic. That's typical in a market, that you don't really know what's happening, where is it going. If you look at the light blue slide, there's a curve, that's the Douglas-Westwood exploration and production spending in offshore. Again, same type of curve, then coming back.

Do I believe that these curves are right? At least the history is right, yes. But I don't think that we will tomorrow see a big upturn in the market. But it will come back. I think it will be a slow kind of a u-turn, coming back, let's say, one year later than this. Exploration & Production will start coming back about one year before we will start to see big orders. Because we have to remember, there are a lot of idle vessels out there right now that will be first fully deployed before you -- before the market turns back.

How was our performance? It's very similar. You can see revenue, profit going down. And that created, in my opinion, both opportunity and the need to do a transformation. Yes, you can say that we are behind the curve. But I think we are taking very, very decisive actions here. You will hear about it in the breakout session later that what we have done, going from 2.5 years ago, we had 27 operational sites, now going down, you will see later, to very, very few. So a big transformation had to happen. Our strategy. As I said earlier, we are very, very good solutions. Very good at complicated solutions, applications, designs for customers. So let's use it in wind power, in Navy, in other types of applications now that offshore is down. So I think we have to protect our unique offering. Don't let that go.

Second thing is talked is Paul Stein talked about digitalization and 4.0, when he talked about Marine 4.0. I think this is a huge opportunity. I think marine is a very conservative market, but I feel that this downturn has led to the fact that we will see marine being in the forefront of something called Marine 4.0, digitalization, reduced group. How do you transfer data from a ship to shore? How do you analyze the data? What do you do with the data and so on? So I think this is very, very big. During my whole lifetime, I haven't seen this big a change. In some literature, it said that the previous change was when the container came about 50 years ago. So there is a big, big change happening in marine market. And I think because of our unique position, then we have the knowledge within the group, whether it's Defense or it's Civil or it's Nuclear or Power Systems, I think we can be one of the forerunners here if we do it right.

The third one, becoming shipshape. We call our transformation program shipshape. Shipshape because it will never stop. Every time when a ship goes out to sea, it has to be shipshape. So it's not a one-time program. We have to drive efficiency. It will never end. We have to take a big boost now and then -- but then we have to continue with it.

The next one is winning the customer engagement. Very important. Don't forget the focus on customers during a big transformation. Don't turn inwards.

Marine. I think that maybe I'll talk about this in the breakout session more. I don't want -- I won't go into all the details here. But as you can see here, it's very much in line with what Paul Stein said yesterday. This is what's happening in Marine. If we do it right, we have very, very exciting projects in development going on here. It's a long-term. It will not create a huge revenue 2017 or 2018. But I think that if we do it right, it will be a winning concept.

What will we look like in Marine? Going from 27 production sites, what will we be? We will have our Naval business based in U.S., based in U.K. We will have innovation, mainly Norway, Finland and Singapore. Those will be our innovation hubs. Those will also be our hubs where we produce very complicated products. And the new capabilities, Eastern Europe where we are already moving some of the high-end engineering to Eastern Europe. We have a big set up in India where we moved the rest of the engineering. And we have a very good facility in Vietnam, which will be our production site for those more commoditized products or components. And then of course, you need route to the market, and that's very much focused on Asia, which is the biggest market for Marine.

So I think that we have responded well to the market challenges, not losing what was good in the company. We continue to lower the fixed cost base. I think that, that's a must. I don't think we were as flexible as we could have been. In a cyclical market, you have to take it down to a certain level, and then you can always take care of the better market conditions.

And focused investment. I also want to focus investment on those products that will create a future, not just spreading the investments all over. So that means that some of the products will not have as much investment. Some of the products we will maybe stop over time, use them as cash cows, and then they are phased out.

So with this verse, thank you very much. And now, it's over to Harry.

Harry Holt

Chief People Officer

Thank you, Mikael. I say good morning, everyone, I'm Harry Holt. I'm President of the Nuclear business. And I'll give you a very brief overview of the business before leaving you with some of the key messages that I want you to take away from the breakout sessions that we've got later on.

So the Nuclear business addresses both the Defense and the Civil market. So in Defense, we're the sole supplier of the Nuclear steam raising plant for all the Royal Navy submarines, and we've been doing that for nay on 60 years. And in the Civil market, we provide safety-critical instrumentation and control systems and a range of other products and services, from engineering support through their licensing process, through to the supply of high-value components and systems on the Nuclear island, and all the way through to service support during the operational life of a reactor across many of the world's Civil Nuclear power plants. And we've been doing that for 10 to 20 years. So a slightly more recent journey in the Civil side of our business compared to Defense.

The revenue split is 80% in the Defense business, 20% in the Civil business. And as you can see, we're split roughly 40% OE and 60% services across both sides of the business. Both sides have grown strongly over the last 6 to 7 years. And as a sector, we have trebled in size since 2009.

So our submarines business, and you'll hear more about this later on, we design, we manufacture and we provide, through-life service support as a technical authority for the Nuclear reactors on the Royal Navy's fleet of submarines. And at the moment, that fleet consists of 4 Vanguard-class deterrent missile submarines, providing the U.K.'s continuous at sea deterrent, and 7 hunter-killer or attack submarines currently 4 of the old Trafalgar Class boats and 3 of the brand-new Astute boats. Now both these submarines provide a strategic capability for the nation. The Vanguard class of submarines is obviously our ultimate guarantee of security. But the other boats, the attack boats, also provide a range of strategic defense tasks for the nation, including the anonymity of the deterrent, keeping open our sea lines of communication, strategic national intelligence gathering and support to covert operations. And the reason for mentioning that is it gives this business relevant -- strategic relevance at the very highest levels and it's resulted in a largely customer-funded business model that's very predictable and stable,

offering pretty -- attractive financial returns, and of course, it provides the bedrock on which we can grow our Civil Nuclear ambitions.

So on to the Civil Nuclear market, everyone's aware of the world's increasing demand for energy. You all heard Paul talk last night about electricity being great stuff, I think he said. And most forecasters predict that the world's demand for electricity will increase by well over 60% in the next 20 or so years. How that electricity is actually generated depends on a number of things. It depends clearly on the relative economics of energy technologies. It depends on the makeup of the power market. It depends increasingly on government legislation around emission control and energy security. But one thing everyone's agreed on is that low carbon electricity will form an increasing proportion of that energy mix. And all respected forecasters expect nuclear energy generation to be a steward that sector providing a safe, secure, reliable, continuous carbon-free baseload power. And that results in a market of about 80 billion per annum across the next 20 or so years.

Now that market covers the entire life cycle, from uranium mining, all the way through to the Civil construction of a power plant and the operating -- and the operation of that power plant. And we as a company have capabilities that address about 25% of that overall market. In big chunks, the things that we don't do are, obviously, uranium mining, fuel processes -- fuel processing and fuel fabrication. We're not involved in the Civil side of the construction of our nuclear power plant. And obviously, we're not involved in the actual operation of that power plant throughout its 60 to 80-year life cycle. So we have an addressable market of some 20 billion per annum. And then there's some other genuine constraints that we have to work within that bring that target market down to about 5.5 billion per annum. One of those constraints is a geopolitical one. We clearly can't do business with countries that don't have a Nuclear cooperation agreement with the U.K. That rules out, for example, India. And many of our utility customers have in-house capability, in particular, engineering, which is not necessarily fixed in stone but provides, in the short-term, at least a little bit of a constraint on the available target market size for our business.

We address that market in 3 major areas. First of all, in newbuild where our geographic focus is here in the U.K., supporting the U.K.'s ambitious newbuild program. Secondly, in -- through-life service support where the geographic focus is in North America and Western Europe, which has over 50% of the world's current operating Nuclear reactors. And then the final area is modernization and upgrade projects retrofitting in particular safety-critical control systems where the geographic focus is again in Western Europe and North America, and at the moment, a particular project that we're running in Finland.

So as you go into the breakout sessions and come to my session on engineering excellence, there's a number of key messages that I want you to take away. First of all, our Defense capability, and of course, some of this is classified. So I'm slightly restricted in what I can and can't say, but it's a genuinely unique national capability that we have. And we have nay on 60 years of experience in designing, manufacturing and providing through-life service support for nuclear reactors that have powered the Royal Navy's fleet of submarines successfully for the last several decades. That does provide a strategic relevance at the highest levels. It does result in a largely customer-funded business model that's predictable, stable and offers pretty attractive financial returns. And of course, it gives us a bedrock of capability and credibility that we can leverage for growth in the Civil Nuclear market. That market in the Civil application of Nuclear power is very substantial. It is growing. And if you look at it across all phases of the life cycle, it's pretty resilient.

We have grown capabilities over the last few years to address that. Particularly in newbuild and in through-life service support and in major modernization projections, and that offers us attractive opportunities for organic growth, and we believe we've created the platform for further optionality around growth options in the Civil market beyond that. Thank you.

D. Warren A. East

CEO & Executive Director

So very much on a whistle stop to all of the businesses. And hopefully, a little bit of a clue as to some of the things you're going to be getting from the breakout sessions that now follow. So our intention here is to get you on your feet a little bit. Some of it will be here in this room. But other rooms will be used the hotel, so you'll be moving around from place to place. The intention is to give you more of an insight

as both Warren and the business presidents have said around what they're doing to drive engineering excellence, operational excellence and aftermarket excellence within the business. What we're going to do is divide you up into groups. So on your badges, you will find the colored dot. So about the investors and analysts and the audience -- I'm afraid advisors aren't included in this because the capacity is limited. We've divided you up into 4 groups of roughly 20. You'll have a chance to go from place to place. You'll start off in these rooms, so depending on the color of your dot. If you've got a blue dot, your host in my IR team is Ross Hawley. And you'll start off, as it shows on this diagram, in the drawing room.

So follow the structure. We're going to sequence you through every 40 minutes. We'll allow little bit of time in between for natural breaks, but about 5 minutes to get from place to place. And during the course of this session, you'll also have a chance to have lunch back in the main restaurant.

So hopefully, a fairly balanced agenda. One of the sessions will be in here to do IFRS 15. Please, when you're in this session, use the table to the front. That will make it a little bit more engaging for the speakers and give you a chance to ask questions. We've got a microphone and so on and so forth.

In the other rooms, I'm afraid there's a bit of standing, there's a little bit of sitting. And of course, there's a bit of food. So that's the intention. We're running about 15 minutes late, which is not a big deal. No discredit to any of the speakers. We've started off late and we're finishing late and so be it. But the sequence basically follows this depending on your colored badge, so take your pack with you and you would have this as reference, but add roughly 15 minutes to the time for each session when it starts. So if you decide to go off to do something else, please rejoin. You will find it a very interesting and very engaging 3-hour session.

Thank you very much. I will let you gather in the rooms that you got to go to. Have fun.

[Break]

John Dawson

Former Director of Investor Relations

Okay. Welcome back, everybody. There are a couple of people -- I think one of them is not here, but I was going to just introduce as well, that joining us, say, they'll probably prefer to remain anonymous, but: Neil Julliver [ph], who's been leading the whole IFRS 15 task force within the company; Will Mansfield who's a real technical accounting expert. So if I get stuck then, I can call on one of those two. And obviously, Andrew Dickinson, who is going to be co-presenting with me. So welcome back. To those on the webcast, I'm repeating this IFRS 15 breakout session 4 times today. They're only going to webcast once, as we're using the same material for each group.

In this workshop, I'm going to briefly run through some of the slides I took you through earlier, and then I'm going to hand over to Andrew Dickinson, CFO of our Civil Aerospace Division. He'll be taking you through examples of how IFRS 15 differs to current GAAP and then try to help you think about how to model the business in the future.

So I've mentioned before, whilst the aim here is to give as much as directional guide us as we can. Please recognize that we can't be definitive as how to -- how it will work exactly before we actually implement IFRS 15 in 2018.

So as a quick recap, I explained earlier the removal of CARs in linked accounting. This impact will be -- this impact is significant in terms of non-cash adjustments to OE revenue and profit, and these will be particularly felt in the near term given the current engine unit losses. But there is no change to overall profit achieved over the engine life and, of course, no change to cash flow.

This slide is also to help you think about how to model the different elements of our revenue. The application of the new standard requires us to treat our contracts with airframes and airlines as independent, even though the economic substance of the overall transaction is to generate overall positive cash returns from the combined arrangement. So the standard removes the option of capitalizing cash losses that we make when we sell as an installed engine and spending it over the lifetime of the aftermarket contract. As a consequence, around half of our current civil OE revenues are quite significantly

impacted. For the rest of the business, the application will not really change the way we report principally as they generate positive OE cash margins today and hence, there's no need to capitalize upfront losses. And this includes spare engines, business jet engines and the V2500 modules, which we will continue to report it pretty well on the same basis as they are today.

And in the aftermarket, roughly 1/3 or so of our revenues come from Time & Materials style arrangements, which will continue to be reported in the same way, given there's no long-term contract. It's really in our pace, you go flying our base long-term service contracts, where we switch to a cost of shop visit recognition basis where we'll see the change. And this is because currently, we recognize more revenue and initially also the agreements, move the margin, and that's going to be deferred under IFRS 15.

So when adding OE and aftermarket together, getting on for half of our revenues would be impacted, while the other half remain broadly unchanged. So this is again is the same slide as before. It illustrates the level of adjustments between IFRS 15 and current GAAP for OE that we would have seen in 2015 if we'd applied this standard then. The largest item is the GBP 370 million, which represents the aftermarket profit pulled ahead into OE contracts on linked contracts, and that were introduced under IFRS 15 as we're no longer linked, the 2 contracts. And then the other items are the cash losses of installed engines, the GBP 150 million is a loss from linked and GBP 161 million from unlinked contracts, and that in the future will be a single combined figure.

On the positive side, there's no -- there is an annual benefit to the profit line through not amortizing CARs in IFRS 15. Note that in 2015, we also had a GBP 65 million one-off benefit release from a CARs related provision, if you remember, on the launch of Trent 1000's. Neither provision nor release would have to existed on the IFRS 15 because we'd have already taken a cash loss through the income statement when the engines were sold.

So moving now to the aftermarket. The GBP 268 million at the top is a positive effect under IFRS 15 of not having linked contracts and therefore, having to unwind the aftermarket profit that's already been pulled ahead into the OE sale as we move through the aftermarket contract. In 2015, we changed the way we provisioned risk against our positive long-term contract balances. And if you remember, this gave us a 189 benefit. That GBP 136 million negative you see here, is the reduction in that benefit we'd have seen under the new standard, because we wouldn't have been linked -- linking that contract and that contract balances would've been so much smaller and, therefore, the adjustments are smaller as well.

Conversely, we had also seen a lower level of positive catch-up adjustments in areas such as life cycle cost improvements under IFRS 15. Again largely because we wouldn't have that linked accounting. So finally, the change from a flying hours to a cost activity basis of recognizing revenue and profit in the aftermarket is quite complex. Andrew's going to explain how this works in a bit more detail in a few minutes.

And then the final slide here, again, helps you appreciate the magnitude of balance sheet transition adjustments by the time we come to do the actual adjustments for the opening 2017 balance sheet. Clearly, the actual impact will be different as we will have completed another year of trading and have a higher CARs and TotalCare net asset balance, for instance. But as I said earlier, this is on a pretax basis, including there will be a tax effect, and I would suggest for modeling, you use the tax rate you're already using, something in the 20% to 25% range should be appropriate.

I think -- if I think about how the balance sheet develops going forward under IFRS 15, as opposed to the initial adjustment itself, it will be the deferred revenue creditor now, which grows as we receive cash from flying our payments ahead of recognizing profit. And then, looks further ahead. It's going to a while, therefore, between -- before revenue and profit recognition under the IFRS 15 standard for OE moves ahead of current GAAP, but that GAAP will narrow over time as we reduce the unit engine costs. In the aftermarket, it's fleet maturity that will lead to reporting under IFRS 15, moving to positive territory versus current GAAP. And this reflects the fact that we will be catching up in profit terms around the time of the second service of most engines. So the more mature the fleet, the higher the level of servicing, and therefore, the higher the reported margins. However, there is some near-term upside. The absence of linked accounting under IFRS 15 also means no, on wine I've already said, [indiscernible] had profit

against the aftermarket and therefore, we'd expect to see our aftermarket revenue and profit under IFRS 15 becoming greater than under current GAAP before the middle of the next decade.

And now I'm going to hand over to Andrew for the next section.

Andrew Heath

Former President of Energy

Thank you, David. Good morning, everybody. So we've seen some of the IFRS principles this morning. What I'd like to do in my presentation is actually just take some of those principles and just use them in some practical examples, so you can see how we think of IFRS 15, and maybe give some indication how we can actually model the business going forward. So I say, so I'll go through some examples, and then we'll go through some modeling on some engine-specific projects that we've done.

An example I've got here is a very simple example. There are some more detailed examples laid out in your packs. But what I'm looking at here is an example where we have a gross revenue of GBP 100 million, we have a concession of GBP 60 million at a net revenue of GBP 40 million with a cost base of GBP 50 million. So under our current accounting, and this is an unlinked example under our current accounting, what we're doing today is the cost of sale would remain unchanged at GBP 50 million. We would actually gross up the revenue to equal to GBP 50 million and show a 0 margin at point of OE sale. And that GBP 10 million that we grossed up, we would create a contractual aftermarket rights and we would amortize over 15 years.

Under IFRS 15, because we're no longer creating Contractual Aftermarket Rights, we will now recognize that GBP 10 million cash loss in year, as you can see, an example in the bottom left. So I think it's important to know that because we are no longer linking contracts and we're seeing airframer contracts, there's distinct contracts that we have with the customers, with the airlines, that all OE sales effectively will be treated in this manner under IFRS 15. So whether they were previously linked or unlinked, this is how we will account on them going forward under IFRS 15, and in the manner that all OE profits and losses will be recognized at the point of OE sale. And I think we hopefully believe that this will significantly improve the transparency in our accounting around in the OE, because it's pretty much, is just cash accounting on the net revenue versus what the cost of the engine is when we sold it at point of sale.

Aftermarket. This is not so straightforward as OE. So we are moving from a revenue recognition on a, flying our basis, which, does today occurs smoothly over the contract period. And we're removing to a position of revenue recognition on an input basis or on a cost basis. So this will mean that our revenue will no longer be linear over the contract period. So the example that I've got on the screen here, for illustrative purposes, I presented a contract period that has 2 engine shop visits in it. Approximately about 20% of our costs occur outside of the shop visits and those we will continue to recognize this cost in revenue on an ongoing basis, and you can see this depicted in the diagram here between start of contract, so where the shop visits occur. So this is this cost that we incur for engine health monitoring, operational service desk, lease engine, cost provision. So these are ongoing costs that we will see throughout the contract.

The balance of the revenue though, and the profit will be recognized at timing of shop visit. So in this 2 visit -- this 2 short visit example, you can see that revenue recognition profile increasing at first shop visit and the second shop visit. And we just put for some help here that in terms of the cost of the shop visits, we see the cost of the second shop visit, about 1.2x the cost of the first shop visit. You will also notice in this example that there is an inflection point between current accounting and IFRS 15, around the time of that second shop visit. So we expect second shop visits to occur between years 8 and years 12, depending on what operation the airline is using the engines. And therefore, the portfolio level, we do see a correlation between this inflection point on the maturity of the fleet.

So with that correlation in mind, this table shows our view to choosing the selection of some of the large engine fleets and looking forward at their fleet maturity levels. So starting at the top with the Trent 700. The fleet today has an average age of 8 years, and by 2030, will have an average age of about 20 years. And the bottom line on this chart is XWB. So this engine has only just entered into service, and is steadily increasing new engine output volume, ramping up over the next few years, or the next 5 years. And based

on our current estimates will reach an average age of 10 years of fleet maturity by 2030. So we've seen some examples of how we'd see OE being accounted for under our IFRS 15. When I look at some of the revenue recognition or aftermarket under IFRS 15, what I'd like to finish on really, just taking a couple of engine projects or taking the Trent 700 and Trent XWB, and actually walking through those two engine projects and just seeing the differences between current accounting and IFRS 15.

So on the first thing, I'd just like to point out that the legend on here is Trent 700. This has been updating on the screen, and I think in your packs it says XWB, but this is a Trent 700 example. So let's start with OE, which are the bottom 2 lines on here. The dotted line is current accounting, the hardline is IFRS 15. So you can see on the current accounting that we are making profit, that is because of the linked accounting that we're applying predominantly on the Trent 700 contracts. And as we switch to IFRS 15, we will start to recognize cash losses at point of sale, which is why the hardline falls under the 0 y-axis here. It is worth noting though, that historically, we have made profit on the Trent 700 on OE and that cash losses that you see here are a reflection of the price reductions that we've given to secure end-of-life volume on this program.

On aftermarket, which are the darker lines, the dotted line again being current accounting, the hardline being IFRS 15, we see the Trent 700 having a pull forward on revenue recognition under IFRS 15 and this is driven by 2 reasons. One is the average age of the Trent fleet, so total by this average age of 8 years today. And the other reason is, that it benefits from the absence of amortization from previously linked profit on OE. If I then look finally to XWB example. Again, starting with OE. We see small losses under current accounting. I guess these are reflecting amortization of historical cash losses and sale of the spares engines. And you see under IFRS 15, on the current accounting on the hard turquoise line here, that as we start to see the cash losses on these engines that we've talked about previously, and the comparison here to current accounting will narrow as we improve our drive on cost reduction and move away from launch pricing on the XWB.

On the aftermarket, however, due to the age of the fleet, we will see a revenue and profit drag on the XWB in the near term. And this, importantly, will self-correct as the engine portfolio matures, just as we've seen on the Trent 700 program.

So in summary, as we mentioned previously, we will see significant non-cash adjustments to OE and aftermarket revenue and profit, and these are influenced by high-volume, new engine programs, and as we go on market share from the 30% today to the 50% on wide-body over the course of the next 5 to 6 years. There is no change to profit over the life cycle of the contract. It's just a different timing of recognition of that profit and there is absolutely no change to the cash flow and the years that, that cash flow falls over this change to IFRS 15.

So that concludes my presentation. And I guess, we're opening the floor to Q&A now, Helen, [ph] yes?

Question and Answer

Unknown Attendee

Maybe, starting off with that Slide 15, the one with the Trent XWB margin. That looks like a pretty punchy margin for OE engine deliveries. I mean how does that compare versus history, in terms of mature Trent engines? You've been able to get up to that sort of level. That's the first one.

Andrew Heath

Former President of Energy

Yes. So on the current accounting, this chart is very much recognized in the sale of spares that we do through the contract life cycle as well, so the current accounting, we'll be recognizing 0 margin on the installed fleet. So this is just a growth of the fleet and the spares percentage that we sell through the life cycle of that fleet.

Unknown Attendee

But if I'm looking at the right line, Trent XWB OE IFRS, it's a right mouthful, that implies still a pretty healthy cash and profit margin on OE deliveries for XW when we get out into 2024. How does that look versus -- hello? How does that look versus what you've seen on older Trent engines, on the A330 and things like that?

Andrew Heath

Former President of Energy

Yes, so, it's reflective of what we've seen on the Trent 700 historically, when the program was at the level of maturity. So it's historically reflective of what we've achieved.

John Dawson

Former Director of Investor Relations

It's really the last couple of years where we've had the CEO run a program that's declined both, I think, on the other chart, you can see it's come up quite a bit, but it was at much high levels, going back 2 or 3 years.

Unknown Attendee

Right. So it's like you're -- it's not blue sky thinking.

Andrew Heath

Former President of Energy

We're not doing anything differently. No.

Unknown Attendee

Yes, okay. And then secondly, I know it's an issue at the moment, but how are you going to treat risk revenue-sharing contributions by suppliers going forward?

Unknown Executive

Yes. So I think we said there'll be no change to the cash flow that we have on risk and revenue sharing partners. Again, there will be a difference to the timing. So today, because we've smoothed the margin over the contract period under IFRS 15, we'll be recognizing the RSP contribution as a cost out shop visit. So we're taking that cost out shop visit and taking a margin on that out of shop visit, but there'll be no change to the cash flows or to the commercial construct that we have with the RSP partners.

David Miles Smith

Former Chief Financial Officer and Executive Director

So relatively small effect today, I think it's within the lines that we showed. It's within the aftermarket timing difference, effectively. So it's relatively small today. It will grow with the XWB delivery profile, because as I think everybody knows, XWB actually has, yes, quite a high proportion of RRSPs. And I think by the time we get out to sort of the early 2020s, it becomes a relatively significant part of the aftermarket gap, but it's quite small at the moment. So the basic principle is, we're treating it exactly the same, which is, we will spread the RRSP effects on effectively short visit input cost, as opposed to linking it to falling asset today.

David Howard Perry

JP Morgan Chase & Co, Research Division

David, Andrew. David Perry over here. I've got 1 sort of technical question and sort of conceptual question. And just -- the one number that surprised me, and I think your legend's quite clever. If these were numbers we knew, these were numbers we could have inferred. And these are things that are totally new. The one that's really surprised me is the numbers we could have inferred, but which have come out a bit different, the one that is surprisingly low to me, is the amortization of prior year concessions. So 2 questions on that: One is, just how many years are you amortizing those concessions over? And secondly, I think a lot of us have inferred that number wrongly. I'm just wondering why we couldn't see that or back that out from the sort of total care numbers you are giving at the end of this year. So sort of question 1, A and B, I'll come back to question 2.

David Miles Smith

Former Chief Financial Officer and Executive Director

So you're talking about the GBP 268 million?

David Howard Perry

JP Morgan Chase & Co, Research Division

Yes, the GBP 268 million, because I thought that number would be close to GBP 500 million.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, and I think that included -- when we did that, let me just get my little awkward sheet. So what we have within that was also in retrospect of adjustments also. So it was getting mixed in with the whole cost reduction and any other retrospective adjustments as well, which was the GBP 521 million, was it, that we gave you. Yes, GBP 521 million, I think.

David Howard Perry

JP Morgan Chase & Co, Research Division

I guess, just making the question simpler, how many years have you amortized these concessions over? I've had mine a little estimates. I was just using 10 years, maybe it's much more.

Unknown Executive

It's over the, whatever the contract period is, whatever the term of the contract is, so it will vary customer by customer. So on average, between 10 to 12 years.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay, all right. And then my other question, maybe a bit more conceptual is, the mantra we keep hearing all through the morning is, these accounting changes don't affect cash. But we all build cash flow statements to start with a profit number, and it -- almost certainly, your profit will be lower than most of us thought in -- for 2018, given what we've learned this morning. So why wouldn't profit expectations that we all have in this room not be lower than we thought, prior to today?

David Miles Smith

Former Chief Financial Officer and Executive Director

Well, I think we are. I mean they -- the chart where we're showing the OE and the aftermarket, if you take those 2 together, it says in 2015, we would have been GBP 900 million lower. We don't get to a point where that gap closes until the early 2020s. The point is then, when you work through all the cash adjustments to cash flow, the bottom line stays the same. So it's that movement between profit and cash flow that's changing. So no CARs adjustments, no total credit growth adjustments, all of those things are changing. So we end up with the same bottom place for cash flow. The starting point is different and the movements within it are different as well.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay, so just -- last one for me. And there was a sell side dinner, think a lot of the people in this room were there, just after the H1 numbers and I think someone asked you, could you do GBP 750 million of free cash in '19. And you said, you'd hope to do, if anything, a lot better than that. Do you stand by that?

David Miles Smith

Former Chief Financial Officer and Executive Director

So somebody asked me this morning, I think about the GBP 500 million that's effectively in our LTIP. The GBP 500 million for 2018 that's in our LTIP, that still is the plan, in terms of what we're trying to get to, consistent with our own internal incentive targets, which will clearly imply further growth in '19 and '20, beyond that.

Unknown Attendee

David, I'm sorry, if you can go back to Slide 41, which is the cash flow chart. I don't know if you can talk -- yes from this morning, is that all right, just to touch on that?

David Miles Smith

Former Chief Financial Officer and Executive Director

I don't know if I can bring that one up.

Unknown Attendee

Is that yours or not? I can leave it to later, if that's not allowed.

David Miles Smith

Former Chief Financial Officer and Executive Director

No, it's fine. But I don't know if we've got the presentation at the moment.

Unknown Analyst

All right. Well, it's basically the one that has all sorts of arrows in it?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, yes.

Unknown Attendee

And I was just wondering if you could just talk through practically, what's going on there with CapEx, property plant equipment and the directions there? And also, working capital.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. So in terms of the PP and other intangibles, the other intangibles is actually the important bit of that. So that's the 1 that's really moving. And effectively, what we're going through at the moment is the peak of the 97K and other programs that we're delivering in 2017. We're actually capitalizing now, the majority of the spend there. So what we're seeing is therefore a peak in capitalization of intangibles, which clearly

means when we do the cash movement -- so that will have improved profits further, when we then have to adjust them to cash flow, it effectively means it's a negative effect. That begins to turn around once we've launched those engines, because we stopped capitalizing, roughly at the point maybe a little bit after the aircraft goes into service. So all 3 of the programs that we're working on at the moment, the 97K, the Dash 10 and the Trent 7000 are all due to go into service next year, all towards the right at the end of the year. So we'll start seeing when we get to 2018. Therefore, that will no longer be a big effect. In fact, it'll be going in the other direction by then. So it is really the intangibles as opposed to CapEx that's really driving that. So helping, yes.

Unknown Attendee

And the one about capital direction.

David Miles Smith

Former Chief Financial Officer and Executive Director

Sorry. Yes, so one of the things that we -- so when we think about working capital, we're talking about really, trade stuff. So inventory trade payables, trade receivables and importantly actually, customer deposits as well. So we are trying to drive improvements in cash flow clearly from inventory. It's a bit difficult while we're going through this ramp period. And particularly, that's probably being something that we haven't made as much progress as we would have liked this year, because we've had to pull back a little bit, on XWB, for instance. But certainly, that is quite an important part of our cash plan in 2017, put together, quite a big improvement in inventory. And then just the net of deposits, payables and receivables as being -- we think will be a bit positive this year, and a little bit positive next year. But it's really the inventory that's going to primarily improve 2017. Once we get into 2018, although we're still going to be improving inventory turns, the, just the size of the production increase means that the absolute, will still be a negative on cash at that point. Well, back to David. Is anybody else -- sorry, it isn't David. Sorry. You're right in the right side.

David Howard Perry

JP Morgan Chase & Co, Research Division

Back to Slide 15, which is the XWB margin chart. So the question is, why is there such a lag in the catch-up on the services margin? So if we look at the solid blue line, it's quite a long way below the current method, almost 10 years out, give -- and we're saying conceptually that IFRS 15 services line is more profitable.

David Miles Smith

Former Chief Financial Officer and Executive Director

So if we just go back to the installed base slide. So this is the really an important thing, but actually because we are still delivering a load of XWBs and a growing number, actually the average age of that fleet isn't increasing very much at all through 2024. You can see it's actually still, sort of 2 to 3 years. What Andrew said is, this becomes -- when we get to a point where the average fleet age is roughly about the same as where the second service occurs, then you'd expect those 2 lines to be at the same point. But we're not going to get there until we get out here. So those lines will continue to diverge for a bit, and then they will start to come together once we get to the point where the average fleet age is roughly about the same as where the second service occurs. Does that make sense?

Andrew Heath

Former President of Energy

Just out to David's point. So on the chart, same problem as Warren. As you can see, the very light, dotted line at the bottom, and you can see in 2024, the average age of the fleet is still only 2 years. Yes. And then, if I go back to this chart here, so you can see versus current accounting, if we think the first shop visit is between years 4 and years 6, and under today's accounting, we are -- we're collecting revenue from day 1. And so if the average age of the fleet is still only 2 years, we're not collecting anything apart from the ongoing, this 20% of cost that is outside of the shop visit. So that's why there are these certain breakpoints you see in these revenue recognitions, around 4 to 6 years in terms of where the average age

of the fleet is, at around 8 to 12 years, where the average age of the fleet is, and we see this infection point under current accounting versus IFRS 15 around where the second shop visit is.

David Howard Perry

JP Morgan Chase & Co, Research Division

But we're correct to think that the slope of the IFRS services line is steeper than the current method because we're not taken profits forward, right? So it just, it crosses the line further away than we thought, is I guess, my point.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. On XWB in particular, it's particularly acute. On Trent 700, we're virtually there already. So it's very temporary, that effect. And the reason for that is, we're coming towards the peak of shop visits on Trent 700 over the next sort of 5 or 6 years, I think, we get it back the peak on shop visits on the Trent 700.

Unknown Attendee

On Slide 42, it says that under unlinked, under IFRS 15, it must be with the same customer. I'm assuming that' the aftermarket and the OE. I thought that, that was all with the same customer, and unlinked wasn't. Can you just explain that nuance? Is there -- are there contracts that are not with the same customer, that are currently being booked and linked? What would that circumstance be?

Andrew Heath

Former President of Energy

What this is referring to is the contracts we would have with the airframer, so be it Boeing or Airbus, contracts that we would have with the airline for the aftermarket. So we're saying under IFRS 15, we are treating these substantially as separate contracts now. And so we're no longer linking the OE and the aftermarket together under IFRS 15.

Unknown Attendee

I may have misunderstood, I thought if there they were separate customers, that's what unlinked was.

David Miles Smith

Former Chief Financial Officer and Executive Director

So I think the basic principle is, we're not going to be linking. The standard I think technically, will maybe -- help me here, but would allow you to do some sort of form, but you have to make various tests, so we're not -- we've basically just taken the decision not to link anything, in any case.

Unknown Executive

Under current grounds, yes we are present on IF 18. But we have allowed the different [indiscernible] sales of the airframer are also sales to the end customer, which in substance is the same customer in the end. [indiscernible]

IFRS 15 is much more [indiscernible] . You have to look at the real -- the individual contracts that you have, and therefore if they are actually legally with different parties, that the opportunity to link goes away.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. So it would only be, if we were selling to Airbus, and they were operating the aircraft, which may happen in a few [indiscernible], I don't know, but where that would occur soon.

Unknown Attendee

And then you also mentioned that you were deferring over the average life under the length, the 10 to 12 years, and under other unlinked, is it, was it the same [indiscernible]

David Miles Smith

Former Chief Financial Officer and Executive Director

Under the CARs balance, I think we deferred 15 years, yes.

Unknown Attendee

And what accounts for the difference?

David Miles Smith

Former Chief Financial Officer and Executive Director

The 15 was -- in a way, a sort of conservative view on the lifetime of that engine. Clearly, we know the average is 25 years, but it was a slightly conservative view on that.

Unknown Attendee

Just to clarify, on Page 12. The overhauls take place at 4 to 6 years, and not 10 to 12 years, is your assumption, is that correct?

Unknown Executive

Yes, 8 to 12, yes.

David Miles Smith

Former Chief Financial Officer and Executive Director

So one of the slightly perverse effects, unfortunately, of the enhancing is, the further we push our overhauls by improving time on wing or the more we can take out our cost, actually the rest, revenue and profit, we book or it happens further out. But that's something we just have to accommodate. But it's still the right thing to do, from our point of view.

Unknown Attendee

Okay, just two questions there. If I could, just on the OE part, you sort of said that the average losses are GBP 1 million to GBP 2 million, and then you've talked about where you think that will go for the XWB. Can you just talk about where you think the average OE cash losses will trend for the overall portfolio?

David Miles Smith

Former Chief Financial Officer and Executive Director

Well, I think by the time that we've eliminated the XWB losses, which will include the 97K within a year or 2, I think, of the 84k. Really, it's already going to be the Trent 1000 of any significance, I think, and probably Trent 7000s are, a bit -- that will have losses. So for the overall portfolio, I don't know, do you know?

Unknown Executive

No.

David Miles Smith

Former Chief Financial Officer and Executive Director

But they ought to be positive when we take spare engines into account, I always thought.

Unknown Attendee

And then on the aftermarket, can you see the cash is leading the profit recognition under IFRS 15. Can you just sort of talk about what that gap is, and how and when it closes?

David Miles Smith

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Former Chief Financial Officer and Executive Director

So effectively, that is the -- when we look at the balance sheet slide, the 0.9 is the creditor that we're effectively going to create through that. That will grow over time. And it will only start closing at the point where we reached this, the honor of the average portfolio being about the same as the average or where the second service is. So we're going to have a -- quite a long period where, to everybody's delight, will have a growing total care admit creditor, as opposed to having a growing total care net debt, so that will be -- if you model that, that's what we would expect to see. But that creditor will increase over time.

Unknown Attendee

And the [indiscernible] very helpful guiding on the net debt [indiscernible]. Could you offer any guidance on the creditor?

David Miles Smith

Former Chief Financial Officer and Executive Director

[indiscernible] what I'm saying. I think it won't be until that aftermarket catches up, that we'll actually, for a whole portfolio. So that's, I think it must be in the 2030s, but I'm not sure that we've actually modeled it. But by intuition, that's going to be in the 2030s.

Unknown Attendee

Two questions. First of all, have you gone through each and every contract to get to those numbers, or is it a statistical way of approaching the issue? That's my first question. My second question is on Slide 50. If the graph is rightly measured, we can assume then, that in '18, you are half -- you are getting half the losses of '15 on OE, so possibly GBP 300 million instead of GBP 700 plus million. Does it -- is it right, and does it imply that the XWB engine will be breakeven on OE at that time?

David Miles Smith

Former Chief Financial Officer and Executive Director

So remember, the numbers will also include spare engines, so that helps, if you like, in terms of the overall cash loss a bit. But as we've said before, XWB should -- we are planning on that breaking even by the end of the decade on a, just the OE nonspare engine bit. The first part of the question...

Andrew Heath

Former President of Energy

Yes, in terms of remodel, come to terms, we'll try to give you some general guiding principles. I mean clearly, there are always exceptions to rules. So if you think around where we've had let's say on the Trent 1000, where we've had some earlier shop visits, unexpected then, that profile will behave slightly different to what we've shown here, but we'll try to give you a picture of this is how it generally behaves, and how we see it modeling going forward and we have looked at that on a contract by contract basis, but there are exceptions, as always.

David Miles Smith

Former Chief Financial Officer and Executive Director

Okay. Thank you. Thank you, everybody.

Andrew Heath

Former President of Energy

Thank you.

Presentation

John Dawson

Former Director of Investor Relations

Good morning, everybody, and welcome to Rolls-Royce's First Half Results for 2016. My name is John Dawson. I'm the Head of Investor Relations of Rolls-Royce. And with me here today are Warren East, our Chief Executive Officer; and David Smith, our CFO.

Our agenda today is as follows. Warren will kick off with some highlights of the first half, David will then run through the financials in more detail before Warren then returns to take you through some comments on our transformation agenda and priorities for the second half of the year. The presentation should last around 35 minutes, and we'll have plenty of time for questions afterwards. We are conscious you need to be away by about 10:00 to go on to your next meeting, so we'll try and make sure that finishes on time.

Before I hand you over to Warren, let me just remind you of a few housekeeping matters. We are presenting the webcast today -- the presentations today as a webcast as well, and we will be able to take questions for those of you joining us on the webcast. Please submit your questions online and we'll make sure they're asked in the room if they haven't been asked already, or follow it up afterwards if we do not have time. Please turn off your mobile devices out of courtesy to the speakers.

And finally, we will be including forward-looking statements in our presentation. Please refer to the slide in your pack about that. Numbers will be on a constant currency basis, unless stated, and that includes our comments on guidance as well.

With that, I'll hand you over to Warren.

D. Warren A. East

CEO & Executive Director

Good. Thank you very much, John. Well, as he says, good morning, everybody, and thank you for coming. And we do understand that it's a very busy day for results today, and you've come along to share some of that time with us, so that's very much appreciated. Thank you.

Now those of you who can remember, this is roughly where I left off in February when talking about our full year results for 2015, and we're going to stick with the same framework for talking about our results this morning. The framework here is the priorities that I set for 2016, and I'm going to sort of start off now and after talking a little bit about the business, talk about restructuring. And then I'll pick up with the other priorities here when I come back in a few moments after David has run us through some numbers.

So for the group as a whole, the first half of 2016, I'd say, it's been a steady start. Actually, the business is a little bit better than we expected for profit and cash in terms of the absolute numbers as of the end of June. That is largely due to timing of certain deliveries in our large Civil business and a little bit in Defense as well. And we're saying this morning that our expectations for the full year remain absolutely as they were, which means we've still got a lot to do in the second half.

However, we remain confident in those expectations for the full year. It's driven by the schedule of production and deliveries in our Civil business; the timing of a few specific Defense contracts; and also, fortunately, the benefit of some of the restructuring activities and simplification activities that we're starting to do, some of those benefits starting to come through. And that's all pretty much in line with what I said at the beginning of May in -- at our AGM.

So now we'll just have a quick look at the business, some of the highlights from the first half of the year. I'll start off with our activities in Civil Aerospace. Looking to new engine programs, these are engines which are not in service at the moment and which are going to be fueling our growth in the future. We hit some important milestones. Here's a picture of our new version of the Trent 1000 engine and at Farnborough a couple of weeks ago, we were able to announce that, that had received EASA certification.

Also, in the new engine sphere, our Trent 97K, this is the higher power version of our XWB engine, that's also been achieving its first flights on our flying testbed, and things are going well there.

The big lever for our Civil Aerospace business, however, is achieving the ramp-up in volumes that we need to achieve last year, this year, next year and so on. And so in 2015, as a reminder, we supplied just over 300 large engines in total, and the Trent XWB was just starting and part of that. This year, we expect to deliver 400 large civil engines, and we're on track for that, having delivered 164 in the first half. And incidentally, that was just over 100 in the second quarter. We're moving the volume run rates from around about 30 a month to around about 40 a month. That's happening as we speak. And so we anticipate the next couple of quarters significantly over 100 engines per quarter, and that will take us into the realm of just over 400 engines for the full year. Now I'll talk a bit more later about manufacturing lead times and what we've been achieving on improvements in manufacturing lead times and that is, of course, one of the drivers that's enabling us to ramp up the volume like that.

As I look forward at the Civil Aerospace business on a slightly longer term, and the graph here you can see the slightly longer-term view, then obviously we understand this is a business which grows in the long run. There are short-term perturbations caused by external events. But when you look back on those in history, they don't make a huge amount of difference to the long-run picture. And we also get small perturbations when we have things like spikes in orders and that leads to, in the moment, a little bit more capacity in the market than there is demand and you get perturbations there.

As I sit back and look at the slightly longer term, however, I see a strong order book, which continued to grow in the first half of the year. I see us increasing our capacity to service that strong order book, and I see firm commitments from our airline customers and our airframe partners. And that is putting resilience into our revenue growth for the future.

Near term, we absolutely hear about high shipments of wide-body airplanes, a little bit of softness in passenger kilometers, and that does certainly put out more risk there in terms of risk of deferrals, risk of slowing things down. But interestingly, we're not actually seeing any changes from the airlines, particularly in the routes that they're flying, which is, of course, what really drives our engine flying hours. And so from an aftermarket point of view, we're comfortable at the moment.

From an OE point of view, if some of these risks start to materialize, then what we can see at the moment at most is a little bit of re-phasing actually helping us with some of our delivery plans and easing a little bit of that pressure. And that's what we're seeing versus anything radical -- any radical changes. Now obviously if we see some radical changes, we'll be up and we'll be talking about it, and we'll let you know if we see that change.

Right now probably my -- if I wanted to talk about a concern here, the concern is simply are in terms of our resource and the significant demands that we are currently placing on our engineering teams as they seek to help with this ramp up of volume at the same time as bringing some very sophisticated new engines into production. However, things are going pretty well on that front at the moment.

So let's move on to Defense. That was a steady first half and a very good setup for the full year. Looking forward, there are opportunities for new OE over the next 5 to 10 years, and we are working with keeping our designers -- with keeping our designs fresh and working with the partners on those for as and when the opportunities materialize. But this business for the time being is mostly about what happens in the aftermarket, servicing the fleet that's out there and getting that servicing activity more efficient and more profitable from our point of view.

So we're doing things like working more closely with our defense customers, getting some of our activities physically located on the site with some of those customers so that we can get more value out of our aftermarket business and share that value with those customers, actually give them better service as well. And we're investing in future technology to build on this strong position both for the aftermarket and the OE. We have a strong position today in transport and patrol, and we have opportunities in combat, and our investments are all targeted at that.

Looking at around the rest of the business. I'll start with Power Systems. Like in 2015, the first half of the year, actually fairly close to breakeven. It reflects lower volumes and product mix where we've certainly seen higher shipments of the lower-margin products. Meanwhile, our R&D focus is on higher-volume applications like power gen where we can leverage our capacity and grow our market share and really capitalize on the high-performance differentiation that our products have. And so we're comfortable where we are with that business for the second half of the year.

Switching to Marine. I mean, it has been a very difficult period, and it's been a difficult period for quite a long time now. We're seeing some good results from the restructuring that we've been doing in Marine, and we've been focusing R&D. We've actually increased -- I mean, it's not hard to increase the R&D as a proportion of revenue in our Marine business, but we have actually stuck with the expenditure in R&D, investing in new technology there, and I'm quite encouraged by the innovation that's happening in the product portfolio. We announced an investment in some new permanent magnet technology to expand the activity a few weeks ago. Meanwhile, as the offshore sector in oil and gas continues to be depressed, we're seeing people get a little bit more creative in terms of seeking opportunities offshore in slightly different applications in fishing and other non-oil and gas applications. So it's really stimulating innovation in our Marine part of the business.

In nuclear, we are investing. We've announced some headcount increases. This is to service better the business that we do with the U.K. government on submarines, and we've made progress there in terms of improving our project management, our manufacturing and deliveries from there. And we're also exploring opportunities with small modular reactors.

Switching now to one of those key priorities, and I'll talk about this transformation one now before handing over to David. Back in February, I talked about the need to address what I'd call the organizational hardware, that is the structures and organization, and both -- and the software, the activities, what people actually do. And we've been proceeding with the left-hand side of the chart, hence the green tick, where we've been looking at the structure of the business, simplifying the structure of the business. That's where the initial focus has been. We're seeing costs leaving the business. I'll come up with some numbers in a moment, and we're certainly on track at the top end of expectations there.

Moving forward, in the second half of the year, the emphasis is switching to the right-hand side of the chart where we attack some of the way we work, the way we share information, the way management decisions get made within the business. And that is certainly harder, and it's a bit less tangible as well. So it's also harder to talk about it, but I'll endeavor to talk about that a bit more later in the year.

On the tangible side, we're very much on track to deliver the GBP 150 million to GBP 200 million that we talked about in terms of cost reduction for the end of 2017 and going forward, and that's what's showed in the cumulative savings here. So by the time we're finished with 2017, we're absolutely in the zone for GBP 150 million to GBP 200 million out. The type of progress we're on so far, the initial phase we've done. So we're actually talking about achieving very close to GBP 50 million for 2016, which is at the top end of expectations, and those changes will also have a knock-on effect and we'll actually benefit from an additional GBP 50 million as we move into 2017.

For the next steps for the remainder is work in progress. We've identified activities that we can reduce, which we hope will deliver GBP 20 million to GBP 40 million of benefit in 2017, and we have some work to do to find some more in 2017 and moving into the piece which comes from the end of 2017. But I'm comfortable with where we are at the moment. It's work in progress, a little bit more to do. But 6 months in, we're in pretty good shape.

Just a reminder on how some of that plays out then. What we tried to do here is show diagrammatically the simplification at the top of the organization where we've effectively moved from 9 businesses to 5, and we've connected those 5 much more closely at the top of the business. That has really sharpened the ability for us to make decisions. It's increased accountability and raised the level of debate at the executive team.

We're starting to -- talk about leadership and accountability. We are starting to see some real simplification here in how we execute the business, and that simplification is, for instance, measured

in terms of reduced number of committees that we have to operate the business, reduced frequency, reduced numbers of people that are there at those meetings. And it's very much the start of the simplification piece. There is no shortage of opportunity here to reduce the complexity. The business is engaging well. As far as I'm concerned, I'm very encouraged by the response that we're getting around the business. I stress, it's a good start, but it's only a start.

So overall, pretty good first 6 months. There's still a lot to do. I'll talk about the other priorities shortly. Meanwhile, I'll hand over to David.

David Miles Smith

Former Chief Financial Officer and Executive Director

So thank you very much, Warren, and good morning to everyone. It's really good to see you here. Warren has already run through some of the operational highlights. I want to stress, obviously, the results were clearly down as expected versus last year. But we did end up marginally ahead of pre-close expectations, and the business clearly responded to the rallying call there.

This outperformance is principally down to Civil Aerospace, and it included some earlier-than-planned deliveries and profit on some spare engines together with more life-cycle cost reduction and obviously, a little bit of an FX tailwind. We also had particularly strong end-of-period cash flows and -- which was always hard to predict and included some early delivery of second half actions, but again, evidence, I think, of the business responding to the challenges that we've given them.

In addition, Marine, while still negative, had a good end to the period. Both of these parts of the business have more to do with the second half phasing, and any real upswing in performance or outlook, I think, is something that we're still cautious around. So we believe that group underlying performance remains broadly in line with the expectations that we gave you earlier in the year on a constant currency basis. As I go through this presentation, any percentage change, in fact, on sterling value I give will be at constant FX rates and on an underlying basis.

So moving on to just dividends quickly. There's no change from what we said at our full year results. We're halving the interim dividend from its 2015 level, and so that will pay out at 4.6p. And that implies just over GBP 300 million total cash outflow to shareholder payments in this year, in calendar 2016.

And talking about our balance sheet also, so S&P did adjust their ratings in May and now they're in line with Moody's and Fitch at A minus. But we still do have a very robust balance sheet and with good liquidity that's been helped during the year by the additional GBP 500 million of revolving credit facility we raised in April. That's now up to GBP 2 billion. We continue to pursue a prudent financial policy. And so while we do have some cash calls such as the IT purchase consideration coming up over the next 24 months or so, these are definitely manageable.

Turning now to group revenue. At a group level, our OE revenue fell by 5%. That was due fairly equally to Civil Aerospace headwinds and much larger offshore market declines that we've talked about in Marine. Likewise, services was 5% lower for broadly similar reasons that we've explained before. In fact, throughout these slides, you can see that the first half outcome really does reflect the headwinds we identified during last year and reconfirmed at the full year results presentation in February. We have seen some positive impacts of translational FX. On a revenue basis, that added GBP 183 million. I'll talk more about this in a moment as well.

Turning now to group profit. The headwinds we've discussed really did lower gross margins. You can see that fairly dramatically on this slide and were the core factors in the decline in group profit before tax. In other parts of the income statement, the differences were relatively small and mainly related to nonrecurrent or repeated costs and benefits from last year. And that included GBP 39 million non-repeat of underlying restructuring costs as the 24 aerospace program is now largely implemented. Maybe I'll just add that the transformation program and the Indianapolis redevelopment program have been booked in the first half as exceptional costs, and we can come back to that. Similarly, the non-repeat of a GBP 24 million finance benefit that we saw last year on dividend hedging in 2015 contributed to financing cost being up about GBP 35 million versus last year.

We're also in line at the moment with our remuneration targets for the year. So at this point, we are accruing bonus in line with that policy, and that does impact C&A, which is why you see an increase in C&A, and part of that comes through in the gross margin as well.

So here is our usual bridge from profit to cash flow. On an absolute basis, the main drivers were a GBP 235 million increase in net working capital. That included a GBP 149 million increase in the TotalCare net debtor to GBP 2.36 billion and together with inventory buildup in preparation for the rise in second half production. We did see some offsets just FX related and unfavorable effects of translation of net foreign receivables and payables.

We had just over GBP 300 million of CapEx spend during the quarter, part of which was actually payments for 2015 invoices. And of the GBP 232 million increase in intangibles you can see here, GBP 90 million came from CARs. The net movement after amortization was GBP 71 million, taking the balance in the period to GBP 460 million at period end, and the rest of the intangibles movement primarily related to higher R&D capitalization.

So cash flow was clearly better than we'd expected at this point in the year primarily because of the work on working capital, certainly helped by earlier customer receipts; some earlier delivery, for instance, of those spare engines; and also some forecast OE concession payments which slipped into the second half and a pull ahead for some of our second half cash actions.

Thinking about the year-over-year, which isn't actually on the chart, profit was clearly down, CapEx spend was only up marginally and the net long-term creditor balance increased by about GBP 176 million year-over-year. And we did see, as I said, a strong favorable move in net working capital.

So before I turn to the divisional review, I should probably touch a little bit more on foreign exchange. At year-end, we had \$29 billion of dollar cover, and the average hedge book rate was about \$1.59. And as I say, that hedges our dollar exposure, which is currently about 5 billion to 6 billion. It will increase over time as we see volumes increase. This absolute exposure -- sorry, will increase over time as volumes increase.

We have been taking, in fact, since the beginning of the year both before and after the Brexit vote, advantage of the weaker pound in terms of adding to that hedge position. And we've now, at the end of June, increased that \$29 billion up to \$35 billion. That's still well within our normal trend lines. And so over the next 5 or 6 years, that equivalent cover, that's about 5 or 6 years equivalent cover, it's spread over a longer period than that because we hedge progressively. And the most recent transactions were clearly being struck at much better forward rates in the sort of \$1.35 to \$1.40 sort of range, and that has brought our average hedge rate down. So the average hedge rate in the hedge book at the end of the quarter ended up at \$1.57 as opposed to \$1.59 at the end of last year.

All our hedges, as I said, are taken in line with a policy of trying to lower volatility and smoothing our margin over time, so there won't be any FX cliff in the forward rates. And we'll continue to take our longer-dated cover up as we use existing deals. So in practice, this means we're only likely to see a gradual decline in the long-term effective rate in any one year. And therefore, I would suggest that for those of you modeling our long-term rates in the out-years, I would be cautious about ascribing too much value to these short-term spot movements that we're seeing. And of course, we all know that those could come back at some stage in any case.

So there are a lot of movements going on through foreign exchange caused by sterling weakness. It's worth running through maybe a couple of others where that impacts on the business particularly around transactional impacts. And also, on translation, there's more detail in the appendices to the press release as the recent significant changes made this much more pronounced.

So on revenue now, we'd expect roughly a GBP 600 million translational impact for the year if current spot rates continue at the point they were on June 30, and the profit effect would be about GBP 60 million as opposed to, I think, the GBP 40 million we were talking about previously.

We've also adjusted our long-term planning rate. So this is the rate at which we both do our sort of long-term decision-making, but it also gets into the long-term contract accounting. And that's reflected,

therefore, primarily in Civil Aerospace, and we'll continue to review that. That added, as it says here, about GBP 35 million to Civil profit, and it also changed the order book by about GBP 2.1 billion in terms of the valuation of the order book.

And then finally, sort of the big number is the noncash mark-to-market movement just on the hedge book itself, which does hit our reported profits by nearly GBP 2.2 billion on our derivative contracts. This has very little real impact on us, and we don't get concerned by this figure and nor should you as it will be fully offset as those contracts mature, there'll be the underlying hedges which are being -- underlying transactions which are being hedged. So in conclusion, while we're clearly a net beneficiary of the recent FX movements, our conservative long-term hedging strategy and translational exposures make our in-year benefits relatively modest.

Right. Turning now to the divisional commentary. We provided the same breakdowns as last year in the statement. In the interest of time given it's such a busy day, we've cut back some of the charts today, but you do have them in the appendices, and I'm just going to focus on the key points for each division.

So starting with Civil Aerospace. Both the revenue streams were down around 5% for OE. This was principally due to lower linked Trent 700 sales and to lower corporate sales of the BR710 engine. On aftermarket, we did see a significant increase in our in-production Trent fleet, recorded roughly a 15% increase in installed base and flying hours. But this was more than offset by the reduced activity particularly on time and materials that we've talked about before on the Trent 500, the Trent 800 and also the RB211 and regional jets.

Turning to the revenue mix itself. So linked engine revenues were up 3%, and that was helped by deliveries -- higher deliveries of the Trent 900 and the Trent 1000 as well, offset by that lower Trent 700 delivery picture. XWB deliveries also helped drive the improvement in unlinked sales. We saw lower business aviation, as I've already referred to; and V2500 module volumes were lower, and that reflects the declining volumes ahead of the airframe transitions away from Rolls-Royce engines.

We turn now to the aftermarket revenue mix. Declines in the large engines were driven, as I've just said, by lower activity in the legacy fleets particularly on time and materials. This was mitigated by a 4% growth in thrust and the 15% engine flying hours growth from the in-production Trent fleet that I've described. While business aviation aftermarket activity was pretty stable actually in the period, the regional aftermarket continued its downward trajectory and as an offset, we saw higher V2500 aftermarket revenues.

So turning to gross margin, starting with the volume and trading margin bars. The significant proportion really came from the Trent 700 headwinds that we talked about last year. These were around GBP 130 million negative impact along with aftermarket headwinds from the legacy fleets. This is very consistent, as I've said, with the guidance we gave you last year.

Turning to long-term contract accounting adjustments. You can read a fuller description of this on Page 12 of the statement. In absolute terms, the net of all of this was actually relatively smaller, produced a net GBP 23 million reduction compared to a GBP 48 million positive last year, so a GBP 71 million year-over-year effect. And within that, there were 5 specific catch-up elements. 66% of the year-over-year was due to a gain that we had last year on the risk policy adjustments that we talked about, and that was, if you remember, GBP 189 million in the full year but GBP 66 million in the first half.

We also saw a GBP 64 million negative effect from higher technical costs, and that was various in-service related programs particularly around the Trent 1000 and the Trent 700. And we saw life-cycle cost reductions of GBP 35 million, which was a GBP 10 million improvement from what we've seen in the prior year. And then as I've mentioned earlier, there was a GBP 35 million impact from the change in our long-term planning rates for foreign exchange; and then GBP 14 million basically of all other, which are primarily a whole series of operational and commercial factors.

Turning, therefore, to the full picture. So beyond that large movement in gross margin, there were fairly limited movements. The increase in C&A was actually more than explained by the incentives accruals that I've described. Lower R&D, was lower due to increased capitalization for the Trent 1000-TEN engine, and

we saw lower underlying restructuring charges. As I've said, the management reorganization has been booked as exceptional.

So the end result was a profit of GBP 31 million. That's down 91% from the prior year -- oh sorry, GBP 22 million or GBP 31 million after FX. The overall profit was higher than we had expected for the first half, which have been forecast for modest loss. However, this was largely due to the timing effects that I described right at the beginning. So in the second half, we're going to continue to face some of these legacy headwinds through the second of the year, but we would expect a stronger performance overall in line with expectations with headwinds mitigated through increased deliveries including profitable spare engines, again, and positive results from our dedicated focus on improving life-cycle costs in the in-service fleet.

Turning now to Defense. So this is a simplified slide. Defense revenues were marginally lower with strength in OE revenues offset by some weakness in spare parts principally, again, for legacy products. This product mix did have a negative effect on gross margin. And in addition, we booked a GBP 31 million charge, which is for both incremental expenditure and expected expenditure around the whole improvement program on the A400M. So this is our efforts to try and help the consortium in getting over some of the technical problems that we've obviously seen on the gearbox and other areas.

Restructuring costs were lower as the focus has now switched to the upgrading of the Indianapolis site, which we're treating as exceptional. So net Defense profits at GBP 123 million, although they were down GBP 61 million from last year, about half of that was due to the TP400 charge that we took. Looking forwards into the second half, we expect performance will be supported by growing engine deliveries, particularly of the AE 2100. And while we have some headwinds from supporting the TP400, as I've said, we're trying to mitigate that in terms of a full year effect.

Turning to Power Systems. Power Systems had a solid start to the year. We did see slow oil and gas sales and also a little bit on the rail and the Naval side, and that impacted OE revenues and particularly also aftermarket in terms of the service side of oil and gas. The segments on such as construction and agriculture and power generation were actually considerably stronger than the year ago. As I said, service revenues were affected by lower activities particularly in the energy and commodity sectors. So the adverse mix of all these movements on top of the small-ish decline in revenue did mean that we saw lower gross margin, but that was partly offset by slightly lower spend on R&D and therefore, the profit impact of all of that was relatively modest, a GBP 6 million decline to GBP 11 million profit.

In terms of resilience, we won't be immune clearly to the challenging market dynamics. I mean, that's very evident, I think, from peers. But our revenue base certainly has strength in the high speed market, which helps us here. So while some short-cycle sectors are hard to gauge at the moment, the order book coverage is over 80% in some of the longer cycle parts of the business and particularly in higher-margin sectors. So this is broadly consistent with the prior year and remain a cautious but positive outlook for the full year for Power Systems. But undoubtedly, there's much to do in the second half on both revenue and cost.

So I think on Marine, given the market environment, I think actually Marine had a pretty creditable first half and was a little better or perhaps less bad than we had expected. But order weakness was there and included cancellations, particularly being a feature of the offshore market. And OE revenues reflected pretty low volumes, while services were a little more resilient but still at subdued levels. So this isn't really surprising, I think, as services do tend to lag the OE market a little bit by 9 to 12 months.

In contrast, actually Naval and Merchant segments actually held up pretty well, and we did okay on order intake on naval as well. So the teams work pretty hard to try and find opportunities in adjacent markets to offset some of the direct offshore side. And within gross margin, the significant impact was really from volume rather than any decline in trading margin. There was also no reoccurrence of the GBP 30 million contract provision, if you remember, that we took last year.

So I think overall, Marine's loss of GBP 14 million, which was down GBP 18 million from a small profit last year, was a pretty good result. And while our original guidance may now seem a little over pessimistic as the businesses continue to work hard on rationalization efforts, it does, I think, still reflect caution in the

marketplace. There is still risk of further cancellations, and I think it is right to continue to be a bit prudent here.

Finally, for Nuclear, we did see the Nuclear businesses actually improve in revenue terms in the first half. That was led primarily by strong growth in OE activity in the submarines business, which mainly reflected program phasing. We had some delivery challenges to overcome, and these did depress our margins a bit. And so the submarines business is very, very focused on achieving cost-effective, on-time deliveries at the moment for their core customer.

Overall Nuclear profit of GBP 17 million was marginally down on last year. On the Civil Nuclear side, we are seeing quite a lot of good business opportunities at the moment, particularly around instrumentation and controls in China and other markets. So the long-term outlook for our Nuclear business actually looks -- remains pretty positive. We've also, as has been described in the press a bit, started to make some modest investment in development work around small modular reactors. That clearly depends on government decisions, but we think we're very well positioned there and want to continue to support this -- what could be a very interesting market opportunity for us.

Covering our technical factors. Our guidance basically remains the same. We do expect higher net R&D spend to be closer to GBP 900 million as we support a very full program of delivery milestones, as Warren described, on the new projects.

So I'm just going to finish on some comments around the impending arrival of IFRS 15. I say impending, although the implementation is still 2 years off. It does feel appropriate to introduce this topic at this point given its likely significance to reported results. And I wanted to give you my best view as to the framework which we're likely to apply now in Rolls-Royce coming from our own initial and tentative conclusions from some very detailed work we've been doing.

We are trying to seek consistency across the aerospace sector on this, although there may well be some detail differences in interpretation. I think we're getting quite close to that. And overall, recognition is now going to be linked much more to the actual timing of provision of goods and services rather than smooth over the lifetime of service contracts. The one clear and firm constant that I want to really emphasize is it doesn't change the cash flow profile and therefore the embedded value of the business, and you'll hear this again and again, really isn't impacted by this change.

Our initial conclusions as to principles of what's likely to change is that we will no longer apply the contractual aftermarket rights or CARs concept. So we will no longer essentially capitalize engine losses. We also wouldn't differentiate in future between linked and unlinked contracts. As you know, that's partly happening anyway because of changes in market mix. But we would actually move away from that treatment.

And for both OE and aftermarket, the timing of revenue recognition and offsetting concessions will change to an input basis, in other words cost where consequences -- that will have some different profit and loss effects. So as a result, all of the OE revenues net of concessions will be recognized at the time of sale, and therefore, we'd see no longer the pull-ahead of profit from some of the linked accounting that we've seen in the past ahead of cash flow.

TotalCare would be recognized over the contract term with higher margins therefore because we're taking the concessions up front. And catch-up adjustments and contingencies are also likely to be smaller, while the impact on time and material is probably largely unchanged, although we still have to work through that.

So I thought it would be helpful to give some overview of the impacts on the balance sheet and the profit and loss. This really is the high level. This is very detailed. So the changes that we're going to need to make here. At the outset, we'll have some balance sheet transition adjustments as we will essentially move to a completely new set of accounting policies. And the CARs and TotalCare net debtor balances are therefore going to be eliminated or at least certainly significantly reduced. And going forward, we're likely, therefore, to see a greater focus actually on the TotalCare creditor line because unfortunately, we're not

going to get a complete alignment even with this between profits and cash. But we'll get a much more closer alignment.

A number of consequences are within the profit and loss account. First, the changes to OE profit recognition mean that the forecast of any engine build, as I've said, will be taken in the first year. And this underlines really the importance of our focus on improving our unit cost position for cash purposes, which will significantly reduce these cash losses over time. And then secondly, the removal of the CARs balance. Since we're no longer going to be capitalizing the losses, we won't have any amortization charge either.

The most complex area that we're working through to be able to give a more coherent, aggregated view of the results is the removal of linked accounting and the changing of revenue recognition points. This will affect timing and margins and will be quite contract-specific. And we'll come back to you with a likely time for an IFRS teach-in, which I envisage to be during quarter 4 when we're able to do that.

But in the meanwhile, I hope we've given you some help, some leadership really, I think, in helping you understand these principles and actually how they're probably going to apply to the whole industry. And finally, I'd just like to reiterate once more that this does not affect cash.

So just to sum up, wrap up, let me summarize our half 1 performance. Overall, this was in line or ahead of expectations for the first half. But as a whole, it's stronger. But we don't think that this is going to come through in terms of a full year effect. So while the phasing in Civil and Marine brought forward a little of the half 2 performance, we've made good progress and we've made good progress in mitigating market weaknesses, there's still a lot to do in the second half. We are making good progress on cost. We've put in a strong cash performance. Clearly, FX is now a bit of a tailwind, although we also have some technical issues like the TP400 to offset. And finally, I think we've got a reasonable order position, so the focus now is clearly on the second half and our ability to execute on our orders and our strategy in order to deliver full year expectations.

So thank you very much, and now back to Warren.

D. Warren A. East
CEO & Executive Director

Thanks, David. I'll try to be fairly brief. So you can see a number of slides in the pack, but I promise I'll try and go fairly swiftly over these next few. I hope you appreciated the communication there about IFRS 15 and our desire to get ahead and start engaging and talking about that. And I suppose that's really speaking to the box on the far right-hand side of the slide here. And I'm not going to talk anymore about the box on the far right-hand side of the slide. That's really for you to judge.

I'm going to talk a little bit about what we're doing on priority 1, focusing on our 3 key areas. These 3 key areas are essentially what we do, engineering excellence; how we do it, operational excellence; and how we deploy that in our business through our business model. And the biggest lever we have there is using our installed base of engines.

So there are many actions in all of these 3 areas that we could take, and the way these slides build up is that you can imagine in each one of these themes, in each one of these boxes, there are some actions. And they accumulate, and they accumulate in terms of benefits to the business. And what I'm going to do is just pick on a few examples in each of these areas.

So let's look at engineering excellence to start with. Our engineering excellence is it's the collective of the experience, knowledge, skills, techniques, know-how that's been built up in Rolls-Royce over -- well over 50 years. And actually, deploying that is potentially hugely beneficial for our business. But deploying that sort of stuff, which has been built up over quite a long period of time, is quite challenging because a lot of it is just locked up in people's heads. And in particular, quite a lot of it has historically been locked up, if not in people's heads, on pieces of paper.

And so here's an example where we are digitizing some of our product definition so that, that knowledge can be transferred and it can be transferred around different parts of the globe where we're carrying out different activities. It can be carried out -- it can be carried between different teams to get more efficient

and effective reuse of that knowledge. Now we think when we complete this project, then we will be able to reduce the time it takes to develop a new product by the order of about 20%. And we'll have completed that project -- it's going to take several years. We'll have completed that project by around about 2020. Now as you can imagine, my first question on this was why can't we do it a bit sooner. And I will continue to push on that, and creative, collective brains at Rolls-Royce will work on how we can realize this benefit a little sooner. But that's an example of one of the things that we're doing.

Now switching to the operational excellence. I mentioned at the start of the presentation one of the tools that we have at our disposal to be able to deliver on this ramp-up of volume, doubling of volume run rates of our large Civil engines, is to reduce the amount of time it actually takes us to make one of them. And as we've put XWB engines into Derby, so we've moved some of our Trent 1000 production to Singapore. And over a period of several months, we've worked -- we've had lean workshops with everybody, brainstorming on how they can reduce, how they can -- the cycle time, make that operation more efficient.

And after about 4 months, so far, we've taken about 25%, a little bit under 25%, away from the lead time that it takes us to assemble a Trent 1000 in Singapore. The good news is that we think we can take this quite a bit further, an additional 15% to 20% coming out on that particular engine. And we think we can then take some of those techniques and apply them back on XWB and possibly make a very significant lead time reduction on how long it takes us to build an XWB. And if that materializes, then that's making a huge impact on the available capacity. And you can see why that's quite a powerful tool in enabling us to deal with the volume ramp that we have to deal with.

There are opportunities in other parts of the business as well. I'm not going to go into all of these examples in the interest of time. But applying the same sort of methodology in other parts of our business, this is the sort of improvement in lead time that we're seeing in some of the activity in our Power Systems business.

Now, again -- or moving on rather to -- away from the engineering and operational excellence and thinking about how we effectively utilize the asset that we have out there, which is our installed base. One of the issues which people have been talking about increasingly over the last 12 months has been the maturing of the fleet of engines that we have out there, airplanes being parked and so on. Now it is a normal thing that airplanes start off with one owner, and after some period of years, they move on to another owner. So secondhand market develops. Now typically, people keep their airplanes for 8 to 12 years. And so after about 8 years, this starts to become a phenomenon.

We have a relatively young fleet of Trent engines. We've got an old fleet of RB211s that's coming to the end of its life, but our new Trent engines are relatively young. And you can see that in 2010, we only had about 200 of these that were 8 years or older. Today, we've got about 500 that are 8 years or older, and in 2020, we'll have about 900 that are 8 years or older. And once you get into that 8 years or older phase, then there's a propensity to start thinking about transitioning from new to secondhand. They become secondhand, transition to a new owner. That can take about 6 months just for the aircraft to be refitted. And so 6 months out of flying, this is a potential downward pressure on our aftermarket revenues. So if we can do something about smoothing that transition, that's a good thing for our aftermarket revenue. And it's going to become increasingly important as we look forward.

So we've introduced a dedicated team to work with finances, to work with lease companies, to work with our airline customers. And the good news is that since introducing this team at the beginning of this year, then we've become much more effective at transitioning airplanes from one owner to another compared with the corresponding period last year.

Again, in leveraging the installed base a few weeks ago at Farnborough, we -- some of you might have seen us announce a partnership with Microsoft. And this is where we are working to take our product knowledge, customers' knowledge, industry knowledge, combine that with data from our engine health monitoring, do some analysis, use some analysis tools, predictive tools and improve the customers' operation, release some value so that we can release some value for our customers and potentially share some of that value in our service business.

We've deliberately chosen not to invent all our own here but work with technology partners like Microsoft so that we have an open architecture for our digital activity. And so at Farnborough, we announced that partnership, and we're looking forward to applying that around the industry in Civil Aerospace. And we're looking at applying it to other fleet operators in sectors like marine and combining some of that with some of our smart chips innovation that we're doing in Marine.

I'm sorry, I'm running a little bit fast over some of these, but we can talk about them later. Before we close, it's important just to sort of put ITP in context. And that -- I think the context is largely about leveraging our installed base. We moved closer to ITP. We've been working with them as a risk- and revenue-sharing partner for many years. We moved a little bit closer last year. And especially as we look forward to XWB and Trent 1000 volume ramps, they become more significant as our partner.

Our joint venture partner chose to exercise a put option. Absolutely, the timing was their choice, not ours. But directionally, this is quite a desirable thing as we can consolidate more of the high value that is there in both the OE and aftermarket. Now as I look at -- add up all the Trent engines ITP have been working with us on and particularly looking to the, say, Trent 1000 and XWB, we can see an increase in -- of more than 10% in the value that we will now consolidate in aftermarket revenues coming in.

So a quick reminder before I close. We do have some legacy issues. We're making good progress, I think, at embedding behavioral changes into the organization and best practice in this sort of thing. We've got no significant announcements to make in terms of any inquiries but just to remind you that that's still out there.

Our second half priorities are to deliver on what we say we're going to deliver, maintain some progress on the transformation that I talked about earlier, hopefully continue with a more open dialogue with the outside world. And back at the ranch, we will be concentrating on those 3 strategic priorities to drive value.

With that, we'll move on to questions and answers -- well, questions and we'll try to answer. Thank you.

Question and Answer

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Two questions from me, please. First one particularly for Warren. In regards to your ongoing review, what have you learned over the last 6 months incrementally? And how have these insights sort of influenced what your vision is shaping up to be the future of the company? That's the first one. And then secondly, around the production ramp, in particular with XWB, over the next 5 years, how confident do you feel about the bottom part of the supply chain? And what I mean are around forgings and castings where in particular Rolls-Royce as well as GE and Pratt & Whitney are relying on some of same suppliers to support respective production ramps over the next few years. How's your confidence level about that part of the supply chain being able to keep up?

D. Warren A. East

CEO & Executive Director

Yes. So your first question, I'm afraid we could go on all morning. But basically, I've continued to learn, and I'm encouraged by the amount of opportunity there is for simplifying and taking activity out. I mean, some of those numbers that we put up there on the slide, okay, they're almost anecdotes. But actually, some of them are the result of a lot of hard work for a lot of people over a period of time. But a fantastic improvement. If we are able to really realize that lead time transfer, which we've proven on Trent 1000, and transfer that to XWB, that's sort of equivalent to almost doubling our capacity with no incremental operational costs since it's just materials. So I've been hugely encouraged by that over the last 6 months. So I suppose it's been more of a quantification of the opportunity that I felt that was there in the first place. As I say, we could go on all morning. There's lots of that. In terms of the supply chain, then we are talking about a significant increase in volume for us and for the industry as a whole. But compared with the other activities that some of these companies do, it's not actually that significant an increase in volume. We work closely with these companies. There are always challenges in terms of actual deliveries, but we have teams embedded in these suppliers that work with them on a day-to-day basis and solve the problems as and when they arise. I'm not pretending that there are no issues, but I'm comfortable with the way in which we interact with those suppliers at an engineering level.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

It's Ben Fidler from Deutsche. A couple of questions, please. Are you able to share with us how many spare engines you delivered in the first half and what that was year-over-year? You mentioned that was quite a significant driver of the growth. That would be helpful. Secondly, I see you've increased the TotalCare net debtor guidance by about GBP 100 million to GBP 200 million over the next 12 months. Does that mean we should be thinking that Civil profits will be GBP 100 million to GBP 200 million higher than we were previously expecting over the next 12 months? And the third question, I know on the accounting stuff -- and thank you very much for early heads-up on that. I think it's been a fascinating part of the release this morning. The profit effect, my head is not big enough to understand that for some time. But just sticking with the easier part, which is the revenue effect, are you able to give us any indication of how much in Civil Aero this could see a revenue impact from both the OE, as you no longer have that future pull forward, and secondly, on the shop visits, which you won't be booking -- or the revenues you won't be booking until shop visit with a lot of the fleets still being relatively young, as you demonstrated in your Slide 49, presumably anything less than 5 years on that chart isn't going to actually be going through the revenue line under IFRS 15 on shop visits? Just any sort of steer on that will be very helpful at least to understand some revenue scaling effects in Civil.

David Miles Smith

Former Chief Financial Officer and Executive Director

Okay. Why don't I try that in reverse order while I try and find the spare engine number. So yes, in terms of IFRS 15, I don't want to get into numbers. It is complex, Ben, and I think we're all going to be

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

challenged by this. The combination of the fact that we have some engines already, clearly in service like Trent 700, the effects will be different from new engines like XWB, means that we have to go back and look at these actually on a contract-by-contract basis and work our way all the way through that including the RRSP tails and all that sort of thing. Your main point that there's going to be a timing difference, I completely agree with. And that's one of the things that we need to understand better in terms of, for new projects in particular, the later booking of revenue. So I'm not able to quantify that at the moment. That is what we're working through. In terms of the TC effect, so part of this is what we've already actually seen, which is the long-term planning rate did have an effect. So that does come through the TCA net debtor. We also expect probably some higher overall impact on lifetime cost improvements in the second half. And that's offsetting within Civil other issues that we have, particularly on the engineering spend that we've seen increase. So yes, there is going to be a change in the mix of Civil profit but not a net improvement when we take all of that into account. And that's why we've adjusted the TCA range a little bit because, as you've obviously figured, some of those effects come through in the TCA net debtor. Helen, can you help me? I know it's in here but...

Helen Harman

Assistant Director of Investor Relations

It's a small number, Ben. There are a few more.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, I think it was...

D. Warren A. East

CEO & Executive Director

It was more a reflection of -- XWB is new engine. Airlines are taking this engine for the first time. We need to put more spare engines around so that we can satisfy that.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. We will see more in the second half. So the second half effect is quite a bit bigger because in the first half, I think we sold 3 XWB spare engines, something like that. We're going to see a lot more than that in the second half.

John Dawson

Former Director of Investor Relations

So we have a question from the webcast, if I may, from David Perry. It's a question for Warren. There have been recurring press reports that Rolls-Royce could achieve significantly higher cost savings than the formal plan currently in place. Could you comment on these reports, please?

D. Warren A. East

CEO & Executive Director

Yes. Obviously, I've seen those reports and talked about them with journalists. This is a performance gap between ourselves, and if you like, people seen as the market leaders. First point, the #1 difference between our Civil Aerospace profitability and that of our #1 competitor is driven by the difference in maturity of our fleets. We have a young fleet. The proportion of aftermarket, which is relatively profitable compared with OE, which is relatively less profitable, is skewed, in our case, more to the OE than it is in the case of our #1 competitor. So when you put the 2 pieces together, they are going to be significantly more profitable than we are. So some of it is a business model maturity factor. The rest of it is indeed a performance gap, and that's performance gap that I see no reason why we can't close. And that's what our transformation program is about. In terms of quantifying it, we've quantified the savings that we expect to be able to make for the end of the 2017. We're reporting this morning. We're very pleased with the progress over 6 months at the top end of our expectations in terms of that trajectory. And as and when we communicate, we'll probably end up -- we probably will -- as David said, IFRS teach-in,

we probably need to do an update as we get towards the back end of this year as to how we're doing on the transformation program. Then maybe we'll talk about rolling the targets a little bit further out. But for now, I'd like to concentrate on actually delivering what we've said we're going to deliver. And as and when we can talk about fresh targets, we will. But I don't think the performance gap is an unreasonable performance gap to think about closing.

Gordon Hunting

Gordon Hunting of Fiske. On something quite specific, on the TP400. Why aren't the blames put to GE, FiatAvio? Why do you have to pay? And secondly, perhaps I've also got a problem on planetary gearboxes whereas you have fantastic expertise on the J35 and the F-35B, why can't you profitably help those other 2 manufacturers to sort out their problems?

D. Warren A. East

CEO & Executive Director

Yes. So on the specific of the TP400, it's not a question of us paying for any inadequacies caused by other people. It's a question of us as part of the consortium helping our customer to solve a problem. I mean, for instance, one of the things that our team has done over the last several months is vastly reduce the cycle time to take one of these engines and service it mainly by removing the need to take the engine off the wing and to actually create some apparatus which enables us to service it on the wing. That has reduced the cycle time from about 3 weeks to about 2 days. And that's great as far as the customer is concerned. It's actually great as far as we're concerned as well. But it does cost, and so it's that cost of developing some of that sort of stuff that we've booked today. We have not taken the cost of somebody else's problem. We're going to have a -- here it comes.

Sandy Morris

Jefferies LLC, Research Division

That was a good exercise for Georgina. A very mundane question. When did we last change our planning rate?

David Miles Smith

Former Chief Financial Officer and Executive Director

It was actually about a decade ago. And we review it every year. And I felt given our actual experience on rates over the last 20 years, I couldn't justify leaving it where it was. And that was something we discussed with our auditors as well. So I think that was the right decision to make.

Sandy Morris

Jefferies LLC, Research Division

Because if I remember correctly, the last adjustment probably came when the hedge book was at about 1.83 or something.

David Miles Smith

Former Chief Financial Officer and Executive Director

Sorry, I wasn't around. I can't remember, Sandy. But when we looked at the data, it was fairly clear that needed to make a change. We are not necessarily even responding to the short-term spot movement. It was much more just the progression of what we've seen over the last few years.

Sandy Morris

Jefferies LLC, Research Division

And then -- I mean, I know we're in a hurry, but I'm fascinated by this Trent 1000 thing. But one, I'm fascinated by the technical cost that go on and on. I mean, things happen. But I'm really fascinated by the Singapore thing because I can understand how you get a lead time change in Singapore because we kind of, I thought, made our life more difficult by putting it in Singapore. For that to be able to bring XWB down 50%, it would be astonishing.

D. Warren A. East*CEO & Executive Director*

And as I said, in terms of how I presented this, if we map across what the changes that we've made to the processes and procedures, then that's what we can achieve. It's unproven at the moment because we haven't mapped them across. And it's also a bit of a round number. I think what is definitely in there, however, is that the improvement is very significant, or the potential improvement is very significant.

Sandy Morris*Jefferies LLC, Research Division*

It's just fascinating. And then without going into numbers in IFRS 15, but TotalCare, I can't imagine it's going to change things where we make or assemble. I don't believe these people can work to TotalCare. But in terms of our commercial approach, is that going to change, do you think, the business for the better in terms of focus on cash or focus on profit or whatever?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Well, I think it completely underlines the focus on cash that we've been trying to actually change over the last couple of years in the business anyway. And I made the point that the way to mitigate the CARs effects is to get the cash losses out as quickly as we possibly can. But equally, managing the whole cash cycle is going to be very important here. So I think it will help internally because it's removing some of the barriers, I think, internally in terms of just understanding the numbers. I think it will help externally because we're getting a closer alignment of profit and cash over time. But absolutely, running the business and trying to improve cash conversion is a clear imperative, whether we have the accounting change or not, to be quite honest, but that gives added impetus to it.

D. Warren A. East*CEO & Executive Director*

So we got one from the webcast.

John Dawson*Former Director of Investor Relations*

We'll take one more question from the webcast in the time we've got available. Apologies, we do need to finish at 10 to give you a chance to get on to other meetings. So this a question from Chris Hallam. On the new accounting basis, will you still disclose all the various elements that you are currently intending to disclose around engine flying hour payments and engine losses, et cetera, that you set out back in February?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Well, I certainly don't see us moving us away from the enhanced disclosure. Maybe as we look at the standard further, there are some other things we want to disclose as well. So clearly, one of the things that we will all have to think about is how to model the shop visit side of things. So I think it's a bit early to get into that yet, but there will be implications like that we need to think about, yes.

D. Warren A. East*CEO & Executive Director*

We've got another -- I think we probably got time for another couple from the floor.

Harry William Freeman Breach*Raymond James Euro Equities*

It's Harry Breach from Raymond James. Three quick ones. Firstly, can you help us think a little bit about where we are with the parked Trent 800 situation, where -- in terms of how many of those moved during the first half and broadly where the sort of parked fleet is at? Secondly, just looking at Civil Aerospace --

now I'm very slow on the uptake at the best of times, but aftermarket change at constant FX, negative 5% in the first half. And I think, David, you called out T&M down on the 500, 800, RB211-RJs [ph]. Given that T&M -- I think last time I recall seeing a comp was about 27% of overall aftermarket at Civil. And presumably the TCA side grew in line with flying hours on the Trent fleet. Does that imply T&M was down really quite hard, like 20% year-on-year?

David Miles Smith

Former Chief Financial Officer and Executive Director

T&M was down a lot. I think, in roughly revenue terms, it was around GBP 100 million, something like that.

Harry William Freeman Breach

Raymond James Euro Equities

And then final one was just about Marine. I appreciate the oil price has moved up a little bit. It's not long since it bottomed. Just wondering if you're seeing any early signs of sort of behavioral changes from your Offshore customers, any signs of bottoming there?

D. Warren A. East

CEO & Executive Director

Okay. Well, I'll answer that one and then go back to the Trent 800. The answer on Marine is that it does appear that we are moving along the bottom rather than getting worse. So I think the change in behavior is that we're not seeing further declines. But if you think about it from a service point of view, people still got plenty of spare boats out there to go and remove components from to service the ones that they actually want to use. On the Trent 800 then, we are making good progress. I think I put on the slide the effectiveness of the team there in terms of getting airplanes back into service. And I believe the numbers that we talked about -- around about 13 airplanes have been placed in the first half. And we have a further 28 where owners have been identified. And that's a big improvement compared with where we were a year ago.

Harry William Freeman Breach

Raymond James Euro Equities

[indiscernible]

D. Warren A. East

CEO & Executive Director

Overall, it's a bit shy of 10%, I believe.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami Myerson from Investec. Just 2 questions. On working capital, there's been a lot of discussion in the last few weeks about deterioration in terms of payment to suppliers. And I'm just curious if some of the improvement in working capital is due to delayed payments to some of your suppliers and if you are planning on changing terms.

David Miles Smith

Former Chief Financial Officer and Executive Director

No, that wasn't effect. Actually, there were some FX effects, as I think -- as I mentioned, on payables but not from terms. We've actually -- or we may have done already. I can't remember exactly the timing. We're issuing a new policy, and we're absolutely coming on board with the new voluntary -- the new version of the voluntary code that the government has encouraged, particularly around earlier payments to smaller suppliers as well.

D. Warren A. East

CEO & Executive Director

Great. With that, I'm afraid we've reached 10:00. And so we're going to call a halt to the general Q&A there so those who want to rush off can rush off. And we'll probably do 1 or 2 questions in the margins as we're leaving as well. Thank you very much, everybody.

Presentation

John Dawson

Former Director of Investor Relations

Excellent. Okay. Well, it looks like everybody's in. So good morning, ladies and gentlemen, and welcome to you all here in London and to those joining on our webcast presentation today. My name is John Dawson. I'm the Head of Investor Relations for Rolls-Royce, and it's my pleasure to welcome you and to introduce Warren East, our Chief Executive; and David Smith, our Group Finance Director.

The running order of today is as follows. So following -- Warren will take you through the highlights of 2015. David Smith will then review our financial results in more detail and take you through some additional business disclosures. Warren will then return to share some further thoughts on the next steps we're going to be taking. We'll then turn the proceedings over to questions.

We have quite a lot to cover, so we're expecting the presentation to run for about 40, 45 minutes. But we've allowed time for questions at the end. We will be able to field some questions from the webcast. So if you wish to submit a question, please enter it into the system, and one of the IR team will read it out. If we don't get a chance to cover all those questions, we'll make sure we follow up with you later.

There are no planned safety alerts, so if the alarms do go off, just follow the signs and exit the building in an orderly fashion.

Worth saying, we may also include some forward-looking statements, so please refer to the disclosures in the back of our results pack.

Finally, before we begin, could I just ask you to make sure you've turned off all your mobile phones and other devices.

Thank you. And without further ado, I'll hand you over to Warren.

D. Warren A. East

CEO & Executive Director

Great. Thank you, John. Good morning, everybody. The last time I was presenting in this room, it was actually to a bunch of lawyers at the London Patent Summit. So this morning is much more interesting. And it's actually going to be a little bit longer than our usual presentation as well because, as promised in November, we're including a little bit more disclosure, and David's going to take you through that in a few moments.

I'll start off, however, just with having a quick review of 2015; some of my thoughts on that as well. So we've delivered 2015 in line with the expectations that we set out earlier in the year, with revenue at just under GBP 13.5 billion. That produced a gross margin of just over GBP 3 billion. And I think we're well known that, that was driven by -- the reduction in gross margin there, driven by weakness in our Marine sector and through various mix effects in our Civil Aerospace sector. So the underlying profit was down as well, and that had an effect on the operating margin. I think the cash -- at the very, very end of the year, the cash did surprise us slightly on the upside, ahead of our expectations in November, and David's going to cover that shortly. I think the news this morning, although we did, again, talk about this in November, as far as dividend is concerned, it's very important that we make the transformations that we've been talking about in this business happen. And those transformations do require investment, and that does put pressure on cash. At the same time, we need to retain a healthy balance sheet, which gives us flexibility and preserves our credit rating. And so the board has decided that we will halve the payment to shareholders for the final payment for 2015 and halve the interim payment for 2016. But it is our intention to keep that under review. And subject to the short-term cash requirements, we intend to rebuild that, which reflects mine and the board's confidence in the future cash generation of the business. So that dividend move is important for us.

Now, I just wanted to share some of my thoughts on what really went on in 2015, but I don't seem to be able to -- ah there we go okay -- can advance the slide. I'll start -- and I think there were some good things and some bad things, but I'll start with the things that went well in the markets in which we operate.

In the Civil market, we saw Trent XWB, our new engine, do its first full year of service, and we've passed that milestone now. The ramp-up in production that we foresee over the coming years, we're well positioned for that. Overall, in Q4 last year, we delivered nearly 100 engines, including XWB. That's on the back of large engines. That's out of a total of just over 300 for the year, so you can see the trajectory developing there. The capacity is in place as a result of the investment that we've been making, so we're now very well positioned to exploit that new capacity and deal with the XWB ramp-up.

Trent 1000 TEN, the latest version of the Trent 1000 engine, we did incur a few extra costs there to push that through tests during 2015. But that's now happened, and it's clear that we've made a major advance with the Trent 1000 TEN, and we're very, very pleased with the performance of that engine. And that positions us very well to gain market share on the platform for that engine on the 787.

So from an orders point of view, it was also a strong year for new orders in Civil sector. Clearly, the highlight was probably the Trent 900 engine order from Emirates halfway through the year; but also, towards the back end of the year, with orders from the Chinese airlines. And you saw some noise about that as well.

So overall, we delivered just over 300 large civil engines, and we took orders for nearly 500 large civil engines during the year. The backlog is, therefore, up; and it's up about 4%, which is good.

Switching to Defence Aerospace. I think the story there, revenue, slightly down. There is weakness in demand there, particularly in helicopters and some of our transport business. But in spite of that, there was a modest increase in the profit from that group, and that's been driven by the effectiveness of the cost activities that we've been undertaking there. So that, I think, was a highlight for that business.

Moving around the other parts of the business. In Power Systems, that was a very good result for the full year. There was a strong mix effect across in -- playing into different end applications there and a strong finish to the year and a strong finish in terms of taking orders as we look forward as well. So we're quite well positioned now going into 2016 in Power Systems.

In Marine, we all know that our business is exposed to the offshore sector, and we all know that there are serious problems in the offshore sector, driven by the price of oil. But we have taken swift action on cost reduction. There's some very challenging reorganizations going on, but the focus in the business there have really taken -- they've grasped that metal and getting on with it, and I found that very, very encouraging.

And in Nuclear, we've had some very steady performance.

So the -- group-wide, there have been some good news stories in 2015.

I think we are going to have to change the battery in this thing at some stage. Can you just advance that one instead? There we go. Thank you.

But of course, it hasn't all been glorious. I do understand there were some issues in 2015, and these issues emerged. We talked a lot about them in the second half of 2015, changes in the Civil Aerospace market and, in particular, how we communicated about those changes over the period. And now some of that was directly linked to the speed and complexity of decision making within our organization, and that's highlighted to me that we're just not nimble enough, and we need to do something about it.

Some of that is associated with sort of how we're integrated together and how we work together within the business, and that's a real issue. Part of our transformation program is addressing that. Another part of our transformation program is addressing the thing which became very stark with our announcement in November; the fact that our fixed cost base is simply too high. It makes us very sensitive to market changes, and that's not acceptable, and we are doing something about it.

And underlying all of that, of course, the famous TotalCare accounting complexity. Now, when I look at that, there's nothing intrinsically wrong with it, absolutely nothing, particularly in steady state. But clearly, when we move from one business model to another, it doesn't handle that transition very well. And compounding that, I understand we haven't done a very good job at explaining it. So these are the issues which emerged in 2015: some good things; and some bad things.

So my first month in the business, last July, I have to say, it was interesting month, to say the least. And at the end of July, I had established 5 goals for the remaining part of 2015, and these are the 5 goals. It was just sort of thoroughly understand the business, the products, the processes, the management structure we had; to try to identify areas of improvement; at the same time, keep the wheels turning on the business, and we've delivered what we said we were going to deliver in 2015. We've not changed our outlook for 2016 this morning. So that was also done. And we are making progress on working out how to communicate better, and you're going to see some of that from David's talk in a moment or two. And there's a lot more to be done, and we -- another one of my objectives was to work out what those priorities for 2016 would be, and I'll come back and talk about those priorities in a moment when David has just talked through some of the numbers.

So with that, I'll hand over to David at this stage.

David Miles Smith

Former Chief Financial Officer and Executive Director

So thank you, Warren, and good morning to everybody. Well, I hope you found the statement informative as we provide greater disclosure and context. We've also included within this presentation further slides to paint a clearer picture as we navigate through some of the challenging market conditions, the product transitions in Civil Aerospace and our significant transformation program.

As Warren said, I should warn you that this will make it a longer commentary than normal given the introduction of the new disclosures, but I think we've improved how we talk about expectations both for the current year. And I hope we're therefore meeting -- as we meet with you -- many of you on our roadshow, help you to progress your understanding of those new disclosures as well.

So let me turn now to the review of 2015. And during this, when I give a percentage figure, I'm going to be doing that at constant FX rates, unless I specify otherwise.

So starting with the group highlights. As Warren said, 2000 [sic] [2015]

was a solid trading performance given the outlook deteriorating in some of our key markets, particularly Marine. Our trading outlook for 2016 is also unchanged from the one that we shared in November. Our order book grew 4%, particularly in Aerospace, including the record \$9 billion order from Emirates; but there's no surprise that our Marine order intake was very weak. While revenues held up well, after adjusting for FX, profit before tax declined by 12%, and that included 2 credits for an intellectual property settlement and an R&D credit. Free cash flow also reduced from last year.

On the shareholder payment, as Warren said, I think it's essential that we take a disciplined approach to our financial policy here and manage both the expectation of our shareholders in a balanced way. And I believe that the 50% reduction is a prudent and measured response to what we see before us and the current macro environment.

So group revenue, and this is the comparison to 2014. Underlying group revenue declined by 1%, with growth in Civil Aerospace offsetting weakness in Marine. OE revenue fell by 5%, but was partially offset by a 4% increase in service revenue, particularly in Civil. FX translation effects totaled GBP 414 million, and that took 3% off the revenue line and primarily reflected weaker European currencies.

So turning now to profit. The underlying result was in line with the guidance range of GBP 1.325 billion to GBP 1.475 billion that we gave at half year, albeit at the lower end when I adjust for the 2 credit items that I've already mentioned. There were significant reductions in Marine and Civil profits of similar, absolute amounts year-over-year and a more modest decline in Power Systems. The impacts by business

driver were primarily from gross margin; GBP 311 million gross margin reduction. I'm going to talk about that in more detail as I go through each of the businesses. A small overall improvement in C&A costs.

On R&D, we have -- we did invest further on R&D for the new Trent programs, plus the work that we're doing on the next-generation technologies across a number of our businesses. And that together increased the net R&D charge by GBP 83 million for the year. And within that, the R&D spend was up by about 5%. And there was also a significant decline in capitalization of R&D and an increase in amortization and further higher development cost contributions. So those net brought about this GBP 83 million increase in the charge.

On restructuring, we had a lower underlying restructuring charge for the year at GBP 108 million; less than 2014. That was principally because we took the charges, as you know, for the big programs at the end of 2014 that we announced before November.

And as I mentioned, we benefited from a GBP 58 million gain on intellectual property and GBP 19 million for an R&D credit in Nuclear. FX wasn't a major factor for profits net in the year.

So let's move now to cash flow. Free cash flow for the year was GBP 179 million. As Warren said, that was ahead of our expectations, principally due to customer receipts coming very late in the year, which we've been expecting in 2016. So those will naturally reverse early in this year, and our outlook reflects that.

Having added back depreciation and amortization, which was slightly down from last year, the most significant movements were as follows. So within net working capital of GBP 544 million negative, that was predominantly around a GBP 406 million increase in the Civil long-term contract balance, which now stands at GBP 2.2 billion. There were also higher trade receivables. But that was offset by a reduction in inventory, and our inventory turns improved to 3.4x. Our cash spend on capital expenditure was 100 and -- GBP 479 million. That was lower than the prior year, but it still included new test facilities, together with the turbine blade and disc manufacturing and other production facility upgrades that we've been talking about.

Our intangibles additions of just over GBP 400 million were principally within Civil Aerospace and included the growth in contractual aftermarket rights that comes from additional unlinked engine sales and, further beyond that, certification, software and development costs.

And then finally, the other, the GBP 229 million, was one of the main drivers of cash outflow, and that essentially is because we took the restructuring provisions in 2014, and the cash came out in 2015.

So we get, therefore, to a trading cash flow of GBP 385 million, and that was then further reduced by GBP 160 million of tax payments and GBP 46 million of pension contributions over and above the profit charge within the profit number. And that gets you to the GBP 179 million for the year.

So cash conversion was down year-over-year from 54% to 27%, and I'd just remind you again that we do cash conversion on trading cash flow compared to profit.

Turning now to our balance sheet. We've maintained a strong investment-grade credit rating. We've worked very hard at this. Standard & Poor's updated their rating in January. We moved to an A/Negative outlook; while Moody's have maintained their current rating at A3/Stable. And that did follow very detailed discussions with the 2 agencies, who, I believe, took a very constructive and considered approach to a more challenged outlook.

Also last year, following the October refinancing and the debt raise, we've now total liquidity of around GBP 5 billion and also extended our average maturity out to over 6 years. Our plans for this year include redeeming a couple of smaller facilities, which total just over GBP 200 million. And we obviously had that in mind when we raised the \$1.5 billion bond in October.

So I'll come back to FX hedging in a moment, but I wanted to go straight to the shareholder payment. And as Warren said, the board has taken the decision now to halve the level of the final payment to shareholders when compared to last year's final payment and to do this again at the 2016 interim stage against the 2015 interim. So as a consequence, going forward, cumulatively, this will have reduced

by 50% the shareholder payments over the next 12 months. As we pay both interim and final in the subsequent year to when they're declared, our 2015 cash wasn't affected by this decision; but clearly, 2016 cash below trading cash flow will benefit. Beyond this, future dividend policy will have a stronger relationship with our cash-generation capabilities, as noted in the statement. I think Warren has already covered that quite well.

In terms of foreign exchange translation. So just to remind you, our main foreign exchange exposures are really within the Aerospace Division, where we hedge our net U.S. dollar long position against pounds and euros, respectively. And at year-end, we had a hedge book on the dollar of \$29 billion, which is roughly 5 years of cover. We also have a \$3 billion, roughly, euro-dollar hedge book, which is around 3 years of cover. And the objective of our FX hedging policy is to reduce FX volatility over time and smooth the achieve rates over that period. It's a very conservative policy. It sets maximum and minimum levels of hedging and allows us to take advantage of attractive FX rates while not exceeding certain cover ratios.

We do build flexibility in the instruments that we use to do the hedging, and that manage changes in forecast exposure in any one period through order pull-aheads or delays. Consequently, in my view, analysis of the hedge book split by calendar year is not particularly relevant. I don't believe that's particularly helpful, and we've told you here what the average hedge book rate is over the whole hedge period.

So let's move on now to the business reviews, starting with Civil. Consistent with the plans that we laid out in November, we have enhanced the financial disclosures for all of our reporting segments. And within Civil Aerospace, in particular, we provided some additional revenue segmentation and a trading cash flow breakdown for the first time.

So starting with revenue. For Civil, our revenues increased by 3%. We saw growth in the aftermarket revenues. And that was partly offset by a reduction in OE sales, and that's largely down to reduced corporate engine volumes as opposed to wide-body. The services growth did include GBP 189 million of TotalCare, retrospective adjustments, and I'm going to come back to that at a moment. We sold a similar number of large engines in 2015 as we did in 2014, just over 300 in each case. But our corporate engine volumes fell back because of weaker customer demand. The impact of foreign exchange on Civil was GBP 105 million adverse, and that made about 1 point of difference on the numbers as well.

So Civil Aerospace revenue. Let's break that down now and look at the performance in the various categories, as we said that we would do in November. And I'll also be giving my views -- or our views on 2016 based on this same segmentation. So revenue from large engines, linked and other, which includes spare engines, reduced by 11%; and that reflected the reduction in the Trent 700 and 900 production volumes and was partly offset by the increase linked to Trent 1000 sales.

Unlinked installed large engines increased by 29%, albeit from quite a low base, and largely reflected the higher deliveries of unlinked Trent XWBs for the Airbus A350.

We had good OE revenue growth from -- within corporate from the recently launched BR725, which powers the Gulfstream 650ER. But this was more than offset by lower volumes of other products as we saw weaker demand in the sector due to weaker demand for Russia, Brazil, China, et cetera.

Revenues from our V2500 original equipment sales, so these are the modules that we provide into the consortium, also reduced on the back of lower volumes. So the airframer is starting to migrate now obviously to the A320neo production, and that impacted us last year, as it will further this year and next year.

As part of our work on refining the disclosures, we've also made a change to the breakdown that we give you on reported 2014 revenue, and that resulted in a GBP 198 million movement or reclassification between aftermarket and OE sales. While it doesn't have any impact on the accounting or the business or group level, I think it does give a better alignment of the reporting that we do to you to how the accounting actually works on those long-term contracts.

So turning now to Civil revenue aftermarket. The large engine aftermarket revenues were up by 17%. That was driven by increased flying hours from the growing -- growing fleet of our newly installed Trents

but offset by lower utilization on the older Trent 800s, 500s and RB211s, as we talked about in the last couple of meetings.

These 2015 aftermarket revenues also benefited from the nonrecurring GBP 189 million refinement that we made in 2015, so the way we measure our valuation-risk contingency, which, effectively, is the way that we look at credit on airlines. And that improves the granularity of the credit analysis. For example, we can now, under our new policy, apply a 400% haircut to a specific contract value if we perceive a customer default is more likely. But we've reduced contingency rates for stronger credit airlines. And the net effect of those adjustments had been considered as we gave our updates earlier last year.

Our installed base of corporate engines continued to grow, however, and contributed also to a 13% increase in service revenues on corporate. As expected, our revenues from the regional aftermarket business declined, reflecting retirements and reduced utilization of our fleets, primarily by North American operators. This will continue as we move forward, as we discussed, again, last year. The aftermarket revenues for the V2500 are actually broadly unchanged in the year. Now, those will increase over time, as we've also discussed previously.

Civil Aerospace gross margin. So this is the first slide in our new format now that we're providing greater disclosure around the elements of profit within each of our business segments. Gross margin for Civil reduced by GBP 139 million to GBP 1.5 billion in 2015, and the main trading factors here were the reduction in the linked OE Trent 700 sales, the weaker performance in corporate jet sales and the declining regional aftermarket. And that was partially offset by growth, as I've mentioned previously, in the installed base of Trents.

The margin also benefited from catch-up contract accounting adjustments, and they totaled GBP 222 million in absolute terms for the year, as set out in the statement. And that comprises the methodology refinements I've just mentioned, the GBP 189 million, plus GBP 140 million of in-year lifecycle cost improvements, partially offset by GBP 107 million of other operational factors, so a total of GBP 222 million. And that compares to GBP 150 million last year, which is where we get the GBP 72 million year-over-year effect.

These different items are all broadly expected at the half year and reflected in the guidance we gave at that time. And on the waterfall slide in front of you, as I said, this produces a year-over-year movement of GBP 72 million, so the GBP 189 million of catch-up, the GBP 117 million of net movements over 2014 from the lifecycle costs and operational factors.

We also had, in addition to that, an GBP 84 million year-over-year movement on the Trent 1000, and that follows some detailed and positive engine analysis on the first service. This was recorded as a GBP 65 million in-year benefit from -- by reversing a balance sheet provision that we'd taken to previously impair contractual aftermarket rights. So a lot there, but hopefully, that's providing more granularity.

Turning now, therefore, to the overall Civil profit movement. In addition to that gross margin move, we had some big swings in both net R&D and restructuring costs, and that's consistent with Civil's share of the group analysis that I covered earlier and primarily driven by the spend, obviously, on the Trent 7000 and the spend as we approach flight testing on the -TEN and the XWB-97K. Entry into service of the XWB 84k also had an effect not on spend but through capitalization and amortization of R&D.

So again, a new slide here, trading cash flow for Civil Aerospace. So Civil Aerospace for the year was breakeven, and that compared to roughly GBP 180 million -- GBP 181 million inflow in 2014. It was up about GBP 48 million, however, before we take account of working capital movements. The GBP 130 million lower underlying profit was a clear driver. We also had a slight reduction in the level of TotalCare net debtor growth in the year and an increase in contractual aftermarket rights additions. The year-on-year change of GBP 268 million (sic) [GBP 286 million] in working capital was effectively down to timing differences of payments to suppliers and an increased drawdown of deposits in 2015.

Other significant movements include around GBP 110 million of lower CapEx as we slowed down major development efforts in 2014, GBP 135 million of lower certification and development costs and GBP 29 million higher D&A.

Right, now let's turn now to the outlook and we'll -- again, with Civil. This is a slide format that I shared with you in November and follows the segmentation disclosure that we gave on 2015. For OE revenues, we expect an increase in the large engine revenues. Overall, there'll be an increase in wide-body engine deliveries from just over 300 to around 400 engines in 2016, led by higher volumes on Trent 900 and XWB deliveries, offsetting somewhat the decline in Trent 700 production we've talked about many times before. Other dynamics within OE revenue include the market-led corporate jet declines and the ongoing reduction in V2500 module revenues.

Within the aftermarket, I'd expect large engine to be slightly lower year-on-year as increased revenue from our growing installed base is offset with the aftermarket wind -- headwinds that we discussed in July and November. And this is after excluding the non-repeat catch-up on the risk methodology, so the GBP 189 million. We've taken that out of this analysis.

Corporate jets are expected to be broadly flat, while regional aftermarket revenues will continue their decline. And V2500 aftermarket revenues should be broadly unchanged to slightly up in 2016, reflected expected maintenance activity on our modules.

On this slide, really, I just wanted to remind you again of what we've told you before in terms of the profit headwinds that we see for the Civil business, which, in aggregate, comes to a net GBP 550 million. This is unchanged from the expectation that we gave previously, and we don't see any reason to change that absent any external market conditions or rate changes from the airframers.

Turning now to cash flow outlook. And looking at trading cash flow outlook, and this is -- I struggled a little bit with this slide, so bear with me. We start with identifying the GBP 550 million of headwinds impacting profit. So this will reduce cash flow, and that's why we've shown it with a downward pointing arrow. So that's the logic here; that the downward pointing arrow shows a reduction in cash flow, not a change in the magnitude of the figure.

We would expect an increase in the net debtor for 2016 as linked high-margin Trent 700s are delivered, but not of the magnitude of this year. This movement is expected to be as much related to cost improvements coming through and renewed activity and linked programs as being from any other adjustments. We've, therefore, shown that with an upward arrow as it's less of a drain in 2015; the growth is less than the prior year.

We'd expect the Civil debtor peak to be around GBP 2.5 billion as we continue to be more confident over achievable lifecycle cost improvements coming from the successful launches and first services.

As a quick reminder, the net debtor figure in the group balance sheet was -- is a little bit lower than the Civil number because there's some negatives in other business; it was about GBP 39 million last year.

The CARs balance will also increase in 2016 because we'll sell more unlinked engines. But while volumes will rise, we're also looking for some improvements in unit costs, which will moderate that growth to be about the same as it was in 2015.

One of my personal challenges to the business is to improve the various inputs to trade working capital, particularly better inventory turns, through leaner manufacturing techniques and supply chain improvements. We'd expect this to improve cash flow for the year.

And then finally, within other, there will be an increased spend on development costs, certifications and PPA as we ramp up our production capability. And that will reduce cash flow.

So overall, we'd expect trading cash flow to be negative in 2016 compared to the breakeven in 2015, and that will form a significant portion of the group movement in cash flow we've indicated for the year.

So turning now to Defence. The Defence revenue chart shows a 5% decline, split pretty evenly between OE and services. By category, the lower OE volumes were due to slower [sic] [lower] volumes in helicopter and trainers, partially offset by growth in transport and patrol and combat. Lower volumes in helicopter-related spares also impacted on service revenues, although revenues were supported by higher volumes

related to long-term service contracts on combat aircraft. The FX impact was around GBP 67 million, so relatively modest.

For the gross margin analysis, we've -- it pretty well mirrors the revenue profile, together with a one-off margin improvement on existing long-term service contracts. These LTSA improvements reflect changed flying patterns and improved cost on various combat platforms. And just to note, the benefit in 2015 was at an exceptionally high level, representing an increase of GBP 47 million over 2014. We don't think that that's going to be repeat in 2016. This helpful overall gross margin -- this helped overall gross margin, however, which improved from 27.4% to 28.4% for the year.

In terms of the profit overview then. Underlying profit performance rose by 4% from the prior year. There was a GBP 20 million increase in R&D costs, and that reflects some of the increased investments we're making in next-generation technology platforms. Offsetting that was the lower restructuring costs, again, because some of the major downsizing exercise came in 2014.

So the outlook for Defence. We're very positive still on this, or pretty positive still on this, about the long-term outlook. Defence includes a high proportion of revenues from availability based service contracts, where we've had significant experience in maximizing productivity and returns. However, shorter term, there is going to be some operating market pressure over the next few years; as a consequence, both the pricing pressure, some increase in R&D and also, the operational restructuring that we announced at Indianapolis. Ongoing free cash flow is, however, expected to remain strong, although at a lower level, due to some of those investments. So whilst a drag for at least a couple of years, the benefits of a modern plant on a significantly smaller footprint will be very notable when those come through.

Power Systems. Turning to Power Systems. Underlying revenue of GBP 2.6 billion was 3% lower. That comprised lower OE revenue, offset partially by a small rise in service revenue. The FX impact was of around 10%. It was significant. It was due to the euro weakness, coinciding especially with higher sales activities later on in the year.

In part, the OE decline was impacted by strong governmental business in the prior year we -- where we had had several significant project orders, but also reflected the negative oil and gas market. More positively, the luxury yacht business grew strongly. And we also saw growth in construction and agriculture, helped by demand for new emissions regulation-compliant products.

The order book at the end of the year was broadly unchanged, at GBP 1.9 billion, reflecting quite a diverse end -- set of end markets and a resilience particularly within the Defence sector.

For gross margin. Looking at this gross margin waterfall, the drivers of the decline from 2014 really fall into 3 buckets: firstly, lower overall volumes, impacted by about GBP 20 million; and that was broadly offset by a decline in warranty costs in the prior year, where we'd encountered some previous technical challenges, which we've now been successfully able to overcome. Overall, the GBP 41 million impact of pricing pressure and adverse mix -- business mix on margins, such as, for example, lower naval mix but higher agricultural sales, was the most significant influence on our gross margin for the year.

And then the overview on profit. Other than the gross margin just discussed, the other slightly material event was the FX impact of the sterling-euro movement, which was GBP 22 million for the year, which is a drag on the reported numbers.

So turning now to the outlook. The outlook is steady. As we said -- stand here today, the outlook remains positive, supported by a healthy order book for a number of key markets.

So turning to Marine. The revenue and gross margin slides for Marine show just how challenging this market environment has been for us. OE sales were down 19%, while service revenues were more robust but still 10% lower. The large FX impact was from the movement in the Norwegian krone, in particular.

The order book fell sharply during the year from GBP 1.6 billion to GBP 1.1 billion, with very weak order take in the offshore parts of the business. And this reflected the fact that shipowners in both offshore and, to some extent, merchants segments, are significantly reducing their activity both in terms of replacement vessels but also deferring overhaul and maintenance work. The Merchant business did make

some progress, however, in specialist areas, such as wind farm support vessels. But overall, the markets are subdued.

The Naval business was also down a little, particularly in spare volumes; but continued, actually, to focus on long-term development work and deliveries, such as for the U.S. and U.K. navies.

In terms of gross margin then, the decline in volumes, including some canceled contracts, placed increased pressure and further strain on our gross margins. Together, these produced a negative GBP 139 million movement in gross profit. These included some financial charges, which were a provision related to offshore -- an offshore customer contract terminated due to market decisions, as well as some other smaller contracts. And the product quality provision that we took in 2014 wasn't repeated this year.

So while we take all these factors into account, total gross margins declined to GBP 286 million. As I said, that was GBP 139 million lower at constant FX.

And really, that's the story for Marine. Because we're operating effectively very close to breakeven in Marine now, that -- that relatively small drop in revenue produced quite a significant drop in gross margin and, therefore, a big drop in underlying profit of 94%, reflecting the gross margin impact. This was partially offset by some improved C&A costs as we reduced direct headcount -- indirect headcount and footprint, especially in the second half of the year; but also, we therefore incurred some higher restructuring costs as well. During the year, we announced 2 large restructuring programs, and that will lead to the reduction of around 1,000 employees in operations and back-off functions. We're well through this process now.

So the Marine outlook. With continuing volatility in the oil markets, I think it's very unlikely that the offshore market will see much improvement in confidence and activity within 2016. As a result, we are continuing to focus on the positioning of the business and addressing its cost base. As Warren discussed in November, part of the cost savings will derive from the programs, but we will be investing some of that back into additional R&D. We'll also seek to develop further relationships and make inroads into the Asian merchant marketplace. Naval is likely to fare better with some long-term contracts, reflecting the greater stability of the business.

For the Nuclear business, underlying revenues increased by 9%, with OE revenues up 12% and service revenues up 7%. The OE growth came particularly from the Vanguard refueling project, together with a Finnish instrument and controls upgrade. Within services, growth came through the refueling project and also a broader spread of Civil projects. Gross margin was lower due to the submarine servicing program and the impacts of recognizing revenues, where we passed through some subcontractor costs to the project manager at 0 margin.

At the profit level, lower R&D expenditure was largely due to that R&D tax credit -- R&D credit. This included a retrospective element back to 2013, where we elected to join the R&D credits regime for the first time for the submarine business. While having no impact on profit after tax, it did move GBP 19 million of credits from the tax charge up to the R&D charge. Overall, the outlook for the Nuclear business remains steady.

So I'd just like to comment on some more technical elements within our business. In addition to the segment analysis that we've provided you, we also actually created an "other" category this time which contains some smaller residual retained assets relating to the Energy business. They were previously reported within Nuclear. The value of those isn't particularly material, but we think it helps to split them out. We've also included within that the onetime gain that we saw last year from the intellectual property gain. So I hope that will make things a little clearer as well.

On finance charges. In 2015, the finance charge number benefited from around GBP 34 million of intra-group dividend hedging, and that was mainly associated with prior-year M&A activities. So the true comparison is really the GBP 94 million to GBP 90 million to GBP 110 million that we're showing on this slide. And we split -- the GBP 90 million to GBP 100 million splits roughly 2/3 between interests and 1/3 within commercial arrangements.

Our effective tax rate will rise from a 24.5% level in 2015 to probably around 26% in 2016, and that's actually just being driven by the mix of where we make profits into higher tax regions.

CapEx will be focused on our Aerospace transformation activity, including the Indianapolis investments. We expect this to increase a little bit from the last year's GBP 494 million.

Our net R&D spend will continue on new development programs as we complete some significant new product launches, such as the 97K, XWB; and we expect net R&D spend should be broadly unchanged or slightly lower.

For free cash flows. In 2015, we did come up ahead of expectations, probably GBP 200 million plus ahead of expectations, and that's been led by strong cash receipts, including the IP receipt that we got; and good management at year-end of inventories. This reflects how varied our cash flows can be at any one moment in time. For 2016, I believe that we'll be in line with our previous expectations of a modest overall outflow, somewhere in the GBP 100 million to GBP 300 million negative range.

So thank you for your patience. I know that was a longer presentation. In conclusion, the full year results were in line with our year-end -- with our earlier expectations, albeit at the bottom end of the range. That reflected the challenging oil and gas markets and the transition effects in Civil Aerospace. Both of these we see coming -- continuing throughout this year. However, from what we know as we stand here today, our outlook for 2016 is unchanged.

With a prudent financial policy and the actions we've taken in 2015, we have a stronger balance sheet; a significant growing market share, particularly in our key aerospace markets; and a transformation plan set to deliver meaningful and sustainable savings. And it's for that reason I remain very positive on the long-term future of this business.

I'm going to now hand back to Warren.

D. Warren A. East

CEO & Executive Director

Thank you, David. Thanks very much. Well, there was a lot of information there, but I hope that helps you all to better understand our business, set it in the context of all the other information that you're able to get about the market in which we're operating. So I'm just going to share a few thoughts now on 2016, and what we're going to be doing in 2016.

In November, we put this slide up outlining our vision and strategy. And I said at the time that the actual articulation that you see here on the slides is work in progress, but the thrust of what's said here is correct. And that remains the case as we go into 2016.

Now, I finished the first part of the presentation talking about the 5 goals for 2015, and the last one of those was to establish our priorities for 2016. So these are our priorities for 2016. And alongside the 5 goals in 2015, I quickly realized that we needed to add more pace and simplicity into this business. And so for '16, we've just got 3 priorities. And actually, the first of those 3 priorities is to strengthen our focus on the 3 strategic themes that I talked about in November. That is engineering excellence. This business is all about our engineering excellence. And what we need to do now is strengthen our operational excellence. And together, those 2 will enable our strong business model to really work, and that's all about leveraging the installed base. So the first priority for '16 is to focus our efforts on those 3 strategic themes.

The second one is the transformation program that I announced in November, together with the transformations which were in-flight both in our Aerospace business, improving our industrial base and the like. That, absolutely, we need to continue, and we need to get off to a good start in the transformation program I announced in November. 2016 is going to be a pivotal year, and getting off to a good start on that is essential.

And the third point, the third priority for '16 is about rebuilding trust and confidence in our long-term growth prospects. This is a fantastic business. We are playing into structurally growing markets. We have a great set of products and technologies that people actually want to buy. And all the transformation we're

talking about is about improving our profitability fundamentally. And what's missing is the confidence, and so it's a priority to rebuild that.

So I'll start on the left-hand side of the slide with the first of the 3 strategic themes. Now, the first one is engineering excellence. Rolls-Royce is all about engineering excellence. And the example here on the left of the slide is showing how we're making our contribution to improving the emission performance of airplanes over the next several decades. And already, over the last several years, we've moved -- from 2000, we've moved to well over 10% improvement on the 2000 original carbon emissions with Trent XWB. And with the new engine programs that we have in-flight at Rolls-Royce, then you can see that we're making really big strides through our engineering excellence.

But it's not just about the underlying technology and the products that we design; it's also about the technology that goes into how we make these products and how we make the components for these products, our manufacturing technology, too. We don't do all of that ourselves. Some of that is done in partnership with other companies and with universities. And this is an example of one such manufacturing technology center.

Now, such facilities as those, of course, help us with our second priority about driving operational excellence, and those sorts of things are already making a difference. And, for instance, in 2015, in our Aerospace products, we achieved a product cost reduction overall of nearly 2%. Some of that came about through better collaboration and partnership with our external suppliers, and some of it came by really being able to tightly constrain our cost increases against upward pressure caused by lower utilization of new facilities and inflation. We managed to constrain that against those pressures to 1%, so overall, an almost 2% improvement in product cost in the year. A real example of that would be this component, our wide chord fan blade, where, by applying some of the manufacturing technology I talked about a moment ago, by basically increasing the amount of automation around one particular critical process, this is quite innovative, patented technology, but it enables us to get much, much better consistency, reducing scrap, reducing processing time, producing an overall improvement of 6% in that component cost. So the whole transformation, of course, is the sum of many such projects, but these projects are happening.

In November, I talked about a new form of 80-20 rule, where we're able to produce 80% more components in 20% less footprint. And I talked in November about our aspirations with those goals for 2020. Actually, 2015 was a pretty good year on that journey. In 2014, the footprint actually went up as we invested in new facilities. But in 2015, we began to come down on this trajectory towards 2020, and so an 11% reduction versus our 2013 base achieved by the end of 2015. And that was at the same time as, if you'll recall the first part of the presentation when I talked about our volumes being on an increasing trajectory. Although the year-on-year volumes look pretty flat there, as I said, by the time we got to Q4, we were pushing out engines at a much higher rate on that journey to 80% more by 2020. So good progress in operational excellence as well, and we need to keep focusing on that as we go through 2015.

Now, the third strategic theme is the installed base. And the big thing about the installed base is that we are in the middle of a transition. We're in the middle of this period. If you take from, say, 2005 to 2025, then we are more than doubling the number of large engines in our installed base. And that, obviously, puts big pressure on our repair and overhaul network, and it puts big pressure on because we need more capacity but also because we need more flexibility. So we have made changes in our repair and overhaul network, and we've made changes to increase that capacity, to increase that flexibility and actually, as a consequence as well, to increase the competition within the network and so provide better value.

But it isn't just more engines that are out there, there's a change in the nature of those engines. Because if we look between 2005 and 2025, we're increasing by a factor of 100, more than 100, the number of engines that are over 10 years old. When the engine gets older, then it needs different type of maintenance. Customers need different -- a different type of care. And so not only are we changing the structure of our network, we're changing the business models associated with that to deliver better value for our customers as they deal with older engines. And that better value, of course, is then shared with us and makes our business more resilient.

The second priority for 2016 is all about transformation, and I talked about this a lot at the end of last year. We have, since then, installed a transformation team. We've got that team up and running. It's

building; we're adding people to that as we speak. And that team is going to ensure governance over all the programs, not just the new program that we announced in November but actually, making sure that we really deliver on the programs that have already been started. And it's important that this team achieves a really enduring impact on the business with this transformation activity. And that's what they're doing through process simplification, making sure that our cost reductions are sustainable. And they're also helping to update how we manage that with our key performance indicators. By the time we're done, then we'll have much more robust management of not only the transformation process but much more robust management of our ongoing performance.

So what's actually happening in all these transformation programs? Well, we put this slide up in November. This is a snapshot of the programs announced prior to November. One program in the Aerospace markets and one in Marine, and they are on track come the end of November. And the good news is that reviewing the programs then, it looks like there's possibly a modest upside in the benefits that we get from the Aerospace program. The one going on in Marine is at an earlier stage, but that is also on track. So we're on track to deliver these programs.

If I look to the new program -- or sorry, not quite yet. In the Power Systems part of our business, we kicked off a new program in the back half -- or in the back quarter of the year, and this is quite an overreaching one. This is looking at all the processes and capabilities that we have in our Power Systems business. It's looking at the market opportunities, making sure that the products are better aligned with the market opportunities and looking at the actual operational performance and how we can improve that. That's under way now, a few months under way. We've got 7 work streams up and running on that. And I think this part of our business offers great potential.

Now to the program that we announced in November. We are off to a good start. It's a mixture -- if you remember in November, I talked about organizational hardware, that's the -- that's really the sort of structure of the business; and organizational software, which is about the processes and behaviors that you wrap around the organization. And we've got off to a good start. We've made some structural changes already. We've already identified about half of the target that we set out in November, and we've established that the cost to achieve that, for 2016, looks like it's going to be somewhere between GBP 75 million and GBP 100 million. But as we go from Q1 into Q2, we'll be moving from structure more into the processes, from the organizational hardware into the organizational software. And we'll be doing that. Most of the planning for that will be done in Q2, and by the time we get to the end of Q2, we'll be able to update you on progress as we go into implementation on that in the second half of the year.

I think we can now move on to the third goal for 2016. This is about rebuilding trust. Now, this is a hard one. It's obviously going to take some time. I hope we're making our first steps, and I hope you've seen the first steps with the improved disclosure. And you've seen an example of that this morning. Not only what we produce in the slides and what we produce in the release, I hope you're going to see us more open in our discussions. When you talk with us, I hope you'll see us more open and ready to discuss the challenges and opportunities that we have.

Now, to that end, a quick update on -- so where are we on that November program? We set out this time line in November. I think we've done with the analysis, we've done with the prioritizing, we've got the team up and running. We now -- we've -- I just talked about some of the initial costings. We're making progress on that. We're starting to develop measures, measures addressing things like unit cost improvements. There will be measures addressing things like cycle time improvements, and we will be communicating along with that time line that we set out during this year.

Crucial to rebuilding confidence and trust, of course, is keeping an eye on the ball so that we actually realize some of this great future potential; that we deliver what we say we're actually going to deliver. And there is tremendous underlying growth in our long-term markets. We can see passenger volumes set to continue to increase. I mean, yes, these things will wobble around a bit year-on-year, but over multiple years, there's a very solid underpin to our growing markets. The quality of our products and our technology is there. You can see that in our growing market share. And the fact that our customers actually want to buy this, you can see it in our growing order book. So what we need to do is keep up our investment in R&D to fuel the sort of innovation, some of which I talked about a moment ago, to complete

the transformation in our supply chain internally and improve the collaboration with our external suppliers. And our backlog is already starting to reflect the value of our products. I'm very confident that our pricing is robust. And our visibility, of course, is good for the long term. Of course, there will be some short-term fluctuations. But you can see evidence which is there to support our confidence in the long-term strength of the business.

Now, there are opportunities in the portfolio, as we discussed in November. My focus for 2016 is much more operational, but the opportunities are there. Remember what we said in November, 75% of this business is very well positioned from a competitive and market attractiveness point of view. Clearly, there is stuff we can do to improve some of the other parts of the portfolio. We've not forgotten that. We will be getting on with it.

So what sort of things can we do to improve those other business in those other parts of the portfolio? Well, within our Power Systems and Marine sectors, we talked about improving value-added products and services. By looking at the systems and the products in that portfolio that actually work together, we're able to pull through sales and make a difference.

To drive the cost competitiveness, yes, there are certain parts of the business where we need to really focus on driving the cost competitiveness, but that can be achieved. And for instance, improvements that we're now making in some of the project management within parts of our Nuclear business, not only improving the delivery for customers but, of course, removing a lot of the cost because we're removing a lot of the rework.

And strengthening our routes to market, we're already seeing examples of that happening and being reflected in the order book in our Power Systems business.

In Aerospace, it really does remain the fact that installed thrust is a good proxy for aftermarket revenue potential. Installed thrust is all about volume, number of airplanes that are there and the price per flying hour. The price per flying hour increases with thrust because more thrust means more passengers means more value for our customers. You can see we remain on that cusp of really seriously increasing the size of the installed base. And I think some of the data points that I highlighted earlier in the presentation about how the volumes of orders taken last year compared with the deliveries going out of the door accurately reflect the fact that we're on that cusp.

So that's why we shared these slides with you in November. That's why we're confident about the cash generation of the business. I'm confident that the analysis is robust based on what we can see today, what we can see in our order book, what we can see in our pricing, what we can see in our expected costs and what we can see in the expected utilization of our facilities. And so today, at just over a 30% market share with the journey to a 50% market share, this is what continues to fuel our confidence and what I hope will improve some of the confidence that's out there.

Just want to remind people, there are a few legacy issues, and we haven't forgotten those. And we are committed to ensuring the promise of the Rolls-Royce brand, which means we're doing everything we can to cooperate about these legacy issues. We have addressed, and we continue to address, the underlying factors behind the issues. And we're absolutely totally firm on 0 tolerance to anything untoward.

So in summary, the messages I want to leave this morning, we delivered what we said we were going to deliver in 2015. We're not changing anything about our expectations for 2016. We do understand the issues that we face within our business, and we are dealing with them and we're injecting some pace into the way in which we're dealing with them. And I remain very confident in the future as we play into growing markets, growing our market share and take steps to grow our profitability. So with that, we'll take some questions. Thank you.

Question and Answer

D. Warren A. East

CEO & Executive Director

Who went first? Let's start in the middle row here. You'll have to know all the tricks. I was looking at the chair, not...

Nick Cunningham

Agency Partners LLP

Nick Cunningham from Agency Partners. First of all, thanks for the extra disclosure, although I think it will be a mixed blessing because I'm probably going to lose the next month rebuilding the model. A question on the point you were making about better value for owners of older engines. I mean, does that roughly translate to lower pricing for, say, maintaining 15-year-old-plus engines? And does that have any effect on the business case when you're looking at, say, a Trent -- an Airbus A380neo with a Trent 9000 or whatever it is? And then the second even broader question, if you like, in the absence of external surprises or the sort of macro issues you were mentioning, that's a big caveat, looking at the moving parts that you do know about within the group, does -- would they make 2016 the worst year in terms of profitability and cash flow? Do those known bits start to get better in 2017?

D. Warren A. East

CEO & Executive Director

Okay. So the question about the aftermarket and the new models that we've introduced in the aftermarket and delivering extra value. The point here is to better match the customer needs. If we've got an old engine that the customer's only going to keep for a relatively limited period of time, then tying in a long period of service agreement doesn't make sense. So more of a sort of "pay as you go" makes it much easier for the customer. And for us, being able to deliver on that through not necessarily supplying totally new parts but being able to sort of recycle parts from older engines improves our costs dealing with that. So it's a genuine sort of win-win, and it's trying to be flexible and understanding the position from our customer's point of view. I believe if we're delivering real value like that, then we stand a much better chance when it comes to the front-end than signing up the longer-term agreements in the first place. The actual impact that, that has on things like the A380neo program, well, the A380neo program, of course, completely the other end of the time line, and it doesn't have an impact as far as our business case is concerned because when we do our business cases, we're only taking into account the first part of the lifecycle of the engine when we're building our business cases.

David Miles Smith

Former Chief Financial Officer and Executive Director

So Nick, on your second question, I mean I think this is very consistent. As you said, there are always external factors. And I've been pretty clear I'm not betting on a improvement in the Offshore and Marine outlook in the near future, but we are taking action on the cost of the Marine business. And essentially, I think all of the things that we're doing, as we've discussed before, are addressing 2 or 3 different issues. One is we've got to get the cost right as we ramp up the Trent ramp. We are dealing with the industrial footprint there. The cost improvements of that are going to start coming through as we go through the rest of this decade. We're dealing with the issues that we see in Marine. Warren showed a slide with the RRPS program, that's actually a really well-thought-through program, and they're looking at revenue, cost and sort of business structural issues as well. So in my view, 2016 is where we start transitioning from dealing with a lot of legacy issues to getting ahead of the curve on driving the business. And we will start seeing the benefits of that, both lifted by growing aftermarket revenues in Civil, obviously, install based growth, but also lifted by the benefits of the cost improvements that come through. And we clearly have to work hard at that because the macro environment is not kind to anybody at the moment, and we're cautious about that. But we think, as I say, we've been through all the plans again for 2016, and we're very comfortable we've got that in the right place. But 2016 is about delivering on those plans and driving that transformation that will improve '17, '18, '19, '20.

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

Edward John Stacey*Haitong Bank S.A., Research Division*

Ed Stacey from Haitong. Two questions. The first one's on the risk provisioning in that Civil gross margin slide, GBP 189 million of benefit to 2015. I just wanted to check whether that was historical risk provisioning that had been taken that had been excessive, and so you're sort of getting a one-off write-back or whether that GBP 189 million is sort of an ongoing benefit; annually, you're going to book GBP 189 million less of provisioning. And then the second question is the 2016 guidance, and apologies if I've missed something that you actually told us, but is IAE and the profit contribution -- because you've given us additional detail on IAE revenues, but I wonder if I've missed something there on what the profit was. I mean, is it more than half of the Civil division profit for 2016 is IAE?

David Miles Smith*Former Chief Financial Officer and Executive Director*

So on the risk provisioning, so effectively. 3 years ago, we put in a -- both an accounting policy and a methodology for looking at credit risk, so, effectively, our risk on airline contracts from the credit risk of those airlines. And we had a policy that was almost directly derived from the credit ratings. Our accountants, for a couple of years, had been flagging that as a bit cautious. We said that we would look at it after 3 years, and we did that during this year. And we concluded actually, we were being overcautious on the higher credit-rating airlines and -- but under-cautious on some of the higher-risk airlines. And I'm certainly not going to give you any names, but -- and therefore, the policy was both overcautious and not very well focused. So we've changed the policy. Now the outcome of that is this onetime change in the risk provision, but it will fluctuate over time. So if we see a general trend in credit around airlines, that's going to change that number over time. But the policy is, I think, a much better way to think about the credit risk on these long-term contracts. The second question around IAE, I mean, we've discussed this a few times in terms of the profitability. You're right; it is over half of the Civil profit this year. The revenue, as we've discussed before, is in 3 parts: the modules that we supply, which is obviously now going to decline to 0 over the next couple of years; the revenue from spare parts that we provide; and then our ongoing -- or our own activity around those as well. Both of the latter will increase a bit over time. But IAE is a significant part of the Civil profit because we're quite close to breakeven at Civil at the moment.

D. Warren A. East*CEO & Executive Director*

Let's go here. Can we go back there first, and then maybe -- oh, we've got one at the back and then Maria, then you [ph].

Christian A. Laughlin*Sanford C. Bernstein & Co., LLC., Research Division*

Christian Laughlin from Bernstein. Two questions for me, please. Firstly, Warren, specifically for you with regards to the ongoing strategic review. I was just wondering if you can add any color or commentary on, incrementally, what you have learned since November. Just kind of like a broad, open question there, I guess, on that. And then secondly, David, you had mentioned in your presentation that inventory turns, particularly in '16 and the implication is onward in '17 and '18, are an area of focus for operational improvement with respect to working capital management, cash flow, et cetera, and so on. I was just wondering if you could kind of add some color as to what provides the comfort or confidence in trying to tackle issues like inventory turns or just, in general, being very aggressive in performance improvement during a time where you are doubling production and delivery of large commercial engines over the next 5 years. How do you balance going after costs and, say, trimming some fat against the risk of -- of schedule risk in execution?

D. Warren A. East*CEO & Executive Director*

Let's -- I'll answer those 1, 2. I mean, on strategic review, I think I've been fairly clear that this is a background activity and we must set that as a context. I mean, basically, the focus for right now and for 2016 is on operational activity. It's on improving the operational performance of our business. Now, as I

said in November, it turns out that it's absolutely impossible, really, to separate that from thinking about the way the portfolio is built up. But that doesn't mean to say that we're diving right into the portfolio and changing bits here and there. So my brain cycles spent on the portfolio versus brain cycles spent on the operational transformation are very heavily weighted in favor of the operational transformation at the moment. That said, since November, specifically, my understanding of the opportunities that we have in front of us in our Power Systems business, I would say, has definitely improved. I'm actually feeling a lot more optimistic that by applying the efforts that we're applying from an operational point of view into that part of the business, we can make that an interesting opportunity. And also, my understanding of some of the detail of the product portfolio in our Marine business and how some of those system components work with other parts of our business and -- or not, as the case may be, I would say has improved. And as and when we sort of are able to spend a bit more time on that strategically, then probably, my own understanding of that has improved. But it's not really a priority for now.

David Miles Smith

Former Chief Financial Officer and Executive Director

So on the second part of your question, I mean I will answer that in sort of 2 parts. Firstly, I don't think anybody who sort of goes around our businesses would say that we are where we want to be on inventory performance. One of my board members told me that yesterday, so I agree with him. So I think from a lean systems point of view, we have lots of opportunity within the business. We're at sort of just under 3.5, which, I turn around and say that's about 100 days. There are certainly people who are able to operate at 60 to 75 days. Whether that's in best-in-class, we can debate, but that's more like sort of 5 turns. So we have plenty of opportunity here. And it's the lean manufacturing that will really drive that. And as we change our industrial footprint, if we don't get it right now, clearly, we'll lock in inefficient practices for a long time. So this is actually the time to do it. But you make a very, very good point about competing priorities. So just in that case, as we want to develop lower-cost sources, we extend our supply chain so we've got to watch that balance as well. And particularly, as you say, as we ramp production, it's extremely important that we meet our customer delivery schedule. Now, in my experience, that's a virtual circle, not a trade-off. Because if you can get much more effective at delivering to schedule, it means you've actually fixed a lot of the issues which create the inventory and the buffers in the system. So they are not trade-offs. They're reinforcing things, but it's clear our priority has to be to make sure that we can deliver to schedule as we go at this ramp, and we are doing that and we'll continue to really focus on that. And we will be making that one of our really key metrics that we measure people's performance on as well.

D. Warren A. East

CEO & Executive Director

I think we're at the back there.

David Howard Perry

JP Morgan Chase & Co, Research Division

It's David Perry from JP Morgan, right on the back row. I've got 2 questions, one on Civil Aero and one, rather broad, on everything that's short cycle. Just on Civil Aero, and I really hope I'm not going to make myself look silly here that I've missed something obvious, I'm just trying to understand the guidance because it seems -- you've told us there's GBP 550 million of headwinds, but there's GBP 80 million of cost savings and yet the profit guidance seems to be very clearly GBP 550 million down. So I'm not sure where the savings are. And certainly, the guidance you've given today does appear to be below the consensus that you disseminated yourselves in Civil Aero. So if you could just explain that to me. Secondly, and so it's a broader question, if I take the shorter-cycle businesses, and I would include in that the Oil & Gas piece of Marine, a lot of what Tognum does and business jets, it feels like the world has changed quite a bit since November '15, for the worse, in all those markets and yet your guidance is unchanged. Is that because you were extremely prudent, you think, in November? Or do you think you're just being a bit optimistic in terms of what you're expecting now?

David Miles Smith

Former Chief Financial Officer and Executive Director

So on the first bit, you're right; we have cost savings coming through. But as I said, I think we will see a lower level of onetime adjustments coming from contract accounting, so that's a bit of a negative from profits. So the GBP 550 million is still, we feel, about right. Now, there's a little tweak on that, I guess, in that we've also said within the statement, we didn't have it on the slide, that we think the transformation program will probably deliver something between -- sorry, I'm talking about the program that we announced in November, an incremental saving of GBP 30 million to GBP 50 million. We haven't allocated that by the businesses at the moment because we're still working through that. So that will provide a little bit of support also to the Civil business. So overall, I think the numbers are still about right for Civil. In terms of the macro environment, I would agree with you. I mean, I have to think just the first 3 days of the year caused me to shudder a little bit in terms of all the things that people are talking about around the world. And certainly, we've seen that over the last week or so in terms of the concern about financial markets as well. So yes, there are. But I think we took a pretty deep view when we came up with the outlook in November around how we saw the marine market. We've not assumed any uplift from the oil and gas sector there. Oil & Gas is, remember, a relatively small part of RRPS's revenue. I know it's less than 10%, I actually think it's close to 5% at the moment. So it really is it's Marine that's affected by that. And we took a more conservative view on how we saw the legacy Trent business developing based on what we were seeing during the second quarter. I think we probably got ahead of everybody there because I think some of the things that we said and told you about have now been demonstrated, I think, by some of the external evidence. And certainly, we took a more conservative view on the corporate jet market which, again, I think is being reinforced with what the airframers are saying now. So all of that, we've taken into account. We've been round it. We've been round it in a lot of detail. And we didn't want to change the outlook based on what we see. Clearly, we understand our responsibility if we do think it's changed to tell you about that, but we absolutely don't see the need to do anything at the moment.

D. Warren A. East*CEO & Executive Director*

Yes, let's stay at the back for a bit, and then we need to come down to this corner at the front.

Jaime Bann Rowbotham*Morgan Stanley, Research Division*

It's Jaime Rowbotham from Morgan Stanley. Two questions, please. David, very useful to get the trading cash flow table for the Civil division and understand why you think that goes into negative territory in 2016. I just wondered, given further CARs additions linked to XWB in 2017, do you think we're looking at another step-down year-on-year in '17? Or can it flat-line? Or can it start to inflect the trading cash flow in Civil? And the second question, a bit of a follow-on from David's, but just focusing specifically on Power Systems. In 2014, I think the order book grew a little bit from GBP 1.9 billion to GBP 2 billion. And yet in 2015, ex FX, revenues fell GBP 72 million and profit by GBP 37 million. In 2015, the order book has actually come down a little bit from -- I mean, we're talking small beer, but GBP 2 billion back to GBP 1.9 billion, and yet you're projecting growth in revenues and profits. Again, what sort of drives the confidence there? And where do you think that growth's coming? Is it in mining? Is it in agriculture, construction, rail? Any color -- or is it linked to the work-share programs you've talked about? Any color would be much appreciated.

David Miles Smith*Former Chief Financial Officer and Executive Director*

On Civil trading cash flow, I'm not going to get drawn into giving a '17 guidance, I wasn't planning to do. But the dynamics are going to be favorable because we will start getting the benefits coming through of the cost improvements, as I was describing earlier. We'll start picking up further engine flying hours on the Trent installed growth. So you're absolutely right; there will still be negatives going in from CARs. We're working on bringing the cost per engine down, which will mitigate that somewhat. And we actually see -- we'll see some benefit in '16 versus '15 from that source as well. But absolutely, we will be inflecting to more positive views, but I'm going to stop short of giving you any specific numbers, certainly, around 2017. On your RRPS question, this, unfortunately, is one that you have to go into a bit more detail because of the mix of businesses, so some of the shorter-order book and longer-order book contracts. And I think there's actually -- positives, actually, in the order book even though the absolute number has gone down

because we are seeing stronger order book coming in, in some of the shorter-cycle business, things like power generation, for instance, which aren't necessarily longer contracts that have replaced some of the governmental business we saw. Power Systems has got an order book over quite a wide variety of end sectors. That area of power generation is certainly a positive one for us at the moment. We see some upside in some other areas. Warren mentioned the locomotive businesses. That's a very successful product line. And I think there'll be some positives also in some of the Defence-related businesses for MTU. So -- and as I said, Oil & Gas is actually quite a small part of their business at the moment, so the commodity exposure is quite low. So I think, yes, the absolute number is about the same, but we are actually quite positive that we'll see some revenue and profit growth in 2016.

D. Warren A. East*CEO & Executive Director*

Okay, I think we're over here.

Rami Yehuda Myerson*Investec Bank plc, Research Division*

Rami Myerson from Investec. Three questions. First, on the new maintenance facilities and the maintenance -- well, not new for maintenance, but maintenance contracts that you've announced in the new -- and the way you've split the facilities, will these new facilities be able to part out existing engines by themselves? Will they be able to develop their own techniques to fix secondhand spare parts? Or are they going to compete on labor only and, of course, all the spares will be coming out of Derby? And will, over the course, encourage a secondhand market in your engines? A second question's just on pricing because we've heard anecdotes that there's a lot of pressure on pricing on wide-bodies. The market looks like it's becoming more saturated, increasing product to wide-bodies. And also, comment on A330ceo and of course, the lower oil price environment. And lastly, just on the Defence aerospace, is the increase in revenues related to increased flying of export customers in the Middle East? Or is it increased flying of RAF aircraft?

D. Warren A. East*CEO & Executive Director*

Okay. A comment on the increased flexibility within the repair and overhaul network then. I mean, today, the individual companies are able to sort of move around the activity that they're doing. And absolutely, we're seeing some doing more of the sort of reconditioning of old parts. And the structural change we made was more about the geographic region in which these people operate rather than the scope of activity that they're actually doing. And that geographic region means that somebody in Asia, for instance, can service a customer from Europe and vice versa, which was not the case previously. So that's where the sort of flexibility comes in or the increased flexibility comes in and it actually increases the competition as well, which probably stimulates some of the more creative thinking for the former. Question about the sort of general softness in wide-body, concerns about overcapacity and the like. Then, there are some very specific issues associated with some of the aircraft that are parked at the moment. They're specific to individual airlines. What we see is underlying growth continuing in the demand for a number of people who are flying and the amount of flying that they're doing. We saw that happening throughout 2015 through to the end of 2015. And even in China, we're seeing continued growth there. So I think I'd sort of fall back on some of the fundamentals to understand how we're not getting a basic imbalance between the rate at which the industry's able to supply new capacity and the rate at which the industry's able to consume it. In the detail, there are certain airlines and certain planes which it gets a bit out of balance. And sometimes, as evidenced in the numbers we talked about in November, we get a little bit caught in the crossfire.

Rami Yehuda Myerson*Investec Bank plc, Research Division*

And are you seeing any impact on pricing?

D. Warren A. East*CEO & Executive Director*

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

In terms of pricing, it's always competitive out there. And where we are competing engines, then, yes, we're seeing competition. But I wouldn't say it's, in any way, directly correlated to some of the issues that we're seeing in parked aircraft. We have to work hard with the customers that we have, but we are placing secondhand aircraft and we're placing secondhand aircraft at the sort of absolutely competitive rate.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. I'd just add, I mean, clearly, the area that we have seen the most pricing pressure was on the A330ceo. We talked about that, and that was a big impact on the GBP 250 million headwind that we talked about for the Trent 700. So that's clearly an area where we have. But I think on the A350 perspective, Trent 7000, A330neo, I don't see any evidence of that at the moment. On your last point, I mean last year, it was really around U.K. combat. But I think we will see some more Middle East-related benefit in 2016.

D. Warren A. East

CEO & Executive Director

Well, let's go here, and you.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Ben Fidler from Deutsche. Three questions, please. Sorry if they're a bit nitty-gritty. Thank you for the ultimate guidance on where the TCP net debtor comes out at. I just wondered for CARs, which I think was about GBP 400 million at the year-end '15, where do we see that ultimately peaking and when? The second question was just again on -- thanks for the new disclosure. On the C&A allocation to Civil Aerospace, just a question about the order of magnitude of that number. It seems that the central admin cost allocation of Civil Aerospace is about the same as Marine, for example. Marine is 11% of group sales. Civil Aero is 60% of actual group sales. Just trying to understand why that apparent allocation is in place. And then maybe if you could deal with this, I'll come back with the third question because it's a bit more complicated.

D. Warren A. East

CEO & Executive Director

Deal with that one.

David Miles Smith

Former Chief Financial Officer and Executive Director

On CARs, so interestingly, the CARs growth last year was a combination of Trent 1000, which is actually about half of it and a smaller number on XWB and some Trent 700, obviously, because of the lower pricing that we got on the ceos coming through. So we will see, as I think was mentioned on the slide, about the same level of CARs growth in 2016 or slightly higher. So that's a combination of higher volume but actually better unit cost, so the 2 are beginning to mitigate. So over time, this better unit cost is going to be the thing that creates the peak. And as I've said previously, I think that that's going to peak probably around the sort of 2020, 2021 range. If I tried to give you an estimate now, I'd probably be where I think I might have mentioned numbers before in the sort of GBP 1 billion, GBP 1.1 billion sort of level. That's -- but it's going to be volume increase but each year better cost position that will essentially get us to a peak situation and then, obviously, that will start falling off. Remember, every year also within the CARs growth, there's a negative because we're obviously amortizing a bit. And that will start growing over time as well.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

On C&A?

David Miles Smith

Former Chief Financial Officer and Executive Director

Oh, sorry. Yes, on C&A -- actually, a larger part of the C&A than maybe is implied is actually within Civil itself, so this is Civil's own C&A to run the Civil business. They do get, clearly, an allocation of central services, accounting and things like that, but the larger part of Civil's C&A is actually what they're spending to run their business. It is much lower as a percentage of revenue than Marine or Power Systems, for instance. You can easily do the Math on that now. And that's a real focus, actually, because that's quite a large part, for instance, of what the RRPS program is trying to address, but clearly, it's a higher percentage. So it tells us that we need to do more work in those areas. So the allocation methodology of anything that's in the central is fairly standard. It's much more about what it actually takes to run the businesses.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

Well, it's great to hear that there's some good efficiency there in Civil. Gross margin in Civil, if I can now come back to that. Just to clarify, and sorry if you've mentioned this already and I missed it. So that gross margin, the gross profit number, GBP 1.526 billion [sic] [GBP 1.536 billion] includes the GBP 200 million IAE earnouts. It includes the TCP net debtor growth of GBP 400-or-so million, correct? And the CARs movement of GBP 160 million is included in that number, is that right?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Yes, yes.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

It doesn't appear lower down in the table.

David Miles Smith*Former Chief Financial Officer and Executive Director*

I'm staring at Helen, but, yes.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

So if I take those numbers to try and get a sort of, life is never perfect, but a broadly comparable, let's call it, a unit accounting-type approach, your gross profit of about GBP 750 million for Civil, which is an 11% gross margin in '15., that's coming down quite materially in '16 with the GBP 550 million headwinds you talked about. You're a high IP business; you've got 53% of your revenues that are already in services, decent services mix, and just wondering why those gross margins are where they are. And circling back with Warren's comment about pricing is robust, I'm just, in my mind, trying to reconcile all of these data points and getting confused.

David Miles Smith*Former Chief Financial Officer and Executive Director*

Yes. So if you forgive me, I'll may be answered slightly differently to the way that you constructed the question, but hopefully helpfully. Yes, yes, IAE is a part of that. We talked about that earlier, part of the GBP 1.5 billion. A large part of the rest of that is, essentially, the gross margin on our aftermarket business, whether it's in TCA or spare parts or T&M contracts. And we've talked before about margins there being in the 30% to 40% range across that range of businesses, so that's a large part of the rest of it. When you then go to the -- and clearly, there's some profit contribution from the corporate jets. When you look at the wide-body market at the moment and think where we are, you can see it very obviously in the CARs in terms of the unlinked contracts and the losses on those which, as you say, are contributing to gross margin in a negative sense, but -- sorry, they're not contributing in a negative sense because they go on the balance sheet, but they are negative because we are having to amortize some CARs each year. When you looked at the linked part of that and think about, well, how is that linked part made up, it's essentially the same concept in the sense that we have losses on the original linked engine

sales that go into the contract packs, and then we pull ahead, effectively, some of the contract aftermarket revenues on those linked sales. And some of that goes into the revenue that we book and, therefore, the margin we book at the beginning on those linked engine sales. So because we've still got quite a negative cost position on the XWB and the Trent 1000 and we will have on the 7000 at the start in terms of unit cost, because we're not up the learning curve, the net effect of all that is negative to the business at the moment. And therefore, the fact that we now have the Trent -- this is a long explanation I know, but the Trent 700, I'm sensing it's overall [ph] now, but the Trent 700 margin's coming down as well because of the pricing pressure means the overall gross margin contribution at the moment of that large engine business is relatively small, within the GBP 1 billion, GBP 1.5 billion. And that's really what has to change over the next 5 years. As we get the cost structure right, we improve the unit cost of those engines, we get the benefit coming through the aftermarket on the installed base. That's the thing that's really going to swing over the next few years. Does that help? It's a different way of answering your question.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

No, it -- helpful. I suppose pulling it all together and keeping it big picture, what is the right ultimate long-term gross margin for your sort of business?

David Miles Smith

Former Chief Financial Officer and Executive Director

Well, if you -- you can now see across the businesses the sort of range in the -- apart, I think, from Nuclear -- in the sort of 20% to 25%. We clearly have to get that up if we're going to get EBIT margins where they should be, which is sort of in the mid-teens long term. So you can walk backwards a little bit from how much we spend on R&D, how much we spend on C&A to work out where that gross margin has to be to be able to deliver that kind of profit level. But clearly, it needs to be north of where it is at the moment.

D. Warren A. East

CEO & Executive Director

I think we're going to have to just say that was the penultimate question. We've got one more from the middle there, and then that's going to have to be the last one. Just dot your hand up, Celine. Get her a microphone.

Celine Fornaro

BofA Merrill Lynch, Research Division

So I've got one question, which is regarding the CapEx and how you think about this investment. Now, if you look over the last 10 years, I think Rolls has spent around GBP 4 billion and even plus than that on CapEx. And it just feels that we always hear every year there's new plans, new facilities and upgrading and it's been for a while. So how do we judge or how do you judge that the investments that have been made in '08 or '09 were actually the appropriate ones and are now paying off? Because we're still hear in 2016 that you need to do new plans, refurbish all facilities and et cetera, et cetera. How do we get traction on this because it was a huge number?

D. Warren A. East

CEO & Executive Director

Yes, and I think the numbers are what the numbers are over that period of time. But actually, we haven't specifically changed what we're about doing. A lot of what we're talking about today is actually following through on a lot of what was talked about in 2008 and 2009. It is the same facilities. I mean we're now sort of talking about some of the facilities that the programs kicked off in that time, they're coming to fruition now. Yes, we have kicked off some additional ones. So for instance, the rationalizing of the footprint in Indianapolis, we only made that decision earlier in 2015. We started working on it before and we had plans to work on that before, but we only kicked it off in 2015 and it will take until the next several years to finish that. So you'll still hear us talking about it, but this is, in the round, between 2010 and 2020, one program of industrial transformation that is changing the nature of our facilities. And so I think

by the time we get to 2020 and we've finished this transformation, we'll be very well positioned looking forward. Are we going to continue with manufacturing technology research that I put in that presentation a few moments ago? Absolutely, we will. Will some of that involve CapEx? Absolutely, it will. But we think we're rightsizing the footprint for being a competitive business in 2020 and beyond.

I think we have rather overrun, and so we're going to have to finish at that point. But thank you all very much for your attention.

Presentation

John Dawson

Okay. Thank you. Thank you very much for your patience in settling so orderly. This is the largest Investor Relations presentation gathering I've had the pleasure of addressing as the Head of Investor Relations over the last 18 years. So thank you all very much for coming. I hope you all find the next 2 hours interesting and enlightening on Rolls-Royce.

Thank you all very much for joining us here today in London and for those of you joining on the webcast. My name is John Dawson, I'm the Head of Investor Relations of Rolls-Royce. And with me here today are Ian Davis, our Chairman; Warren East, our Chief Executive; and David Smith, our group CFO.

The running order today is as follows: Ian will make a few opening remarks followed by Warren who will take you through the highlights of the operating review. David Smith will share some thoughts about this in his financial review before Warren returns to give his conclusions, and we'll turn the proceedings over to questions. We expect the presentation to last around 75 minutes. And we've allowed plenty of time at the end for questions. We will be able to field some questions from the webcast, so for those of you online, type your questions and a member of the Investor Relations team will ask them on your behalf. And if we don't have time, we'll come back to you by e-mail later on.

There were no planned safety alerts today. So if you do see the alarms go off -- or you do hear the alarms go off, please exit in orderly fashion through the main doors, out to the front and exit the building through the way you came in. There are 1 or 2 other exit signs, but I've been told that's the quickest way to leave the building.

We may also include forward-looking statements in our presentation today. As normal, you should refer to our safe harbor statement included at the back of the presentation materials.

Finally, before we begin, could I ask you please to turn off all your mobile phones or make sure they're silent during the course of the presentation.

With that, thank you. And over to Ian.

Ian Edward Lamert Davis *Chairman*

Thank you, John. And good afternoon, everyone. Thank you all for joining us. Today is about Warren East, our new CEO, and his plans for the future. But before Warren starts talking to you, I would just like to say a few words of introduction by way of setting a context.

Firstly, let me say that neither the board nor myself are under any illusions, any illusions at all about how concerned and how frustrated many of you in this room are. We get it. And we get the associated need for decisive but well-judged action.

There's a lot of talk about portfolio and about capital allocation in the business, and what -- Warren will address these in his talk. But let me just say that from my and the board's point of view and the management's point of view, the overwhelming priority now is to improve our financial and our operating performance and to increase the speed of response to events and improve our internal controls. This is the absolute priority. At the same time, we recognize that we have to continue to improve our communication with investors. I hope that today will be a stepping stone in that direction. But let's be clear, our priority is improvement in the financial and operating performance. Those are our priorities. And I should just say that the profile of appointments to the board reflect these priorities and will continue to do so.

But as we focus on operational and financial performance, let me be also -- be clear that I, in no way, want to detract for the fundamental and underlying growth potential in the business. I know we've banged on a lot about this in the past, but it is real. The value creation in this business is not aspirational, it's not a mirage, it's real, it's there, it's underpinned by the order book, extraordinary order book. It's

underpinned by our engineering and technology platforms proven in the marketplace and it's underpinned by the extraordinary breadth and depth of our customer relationships.

There is value-creation potential in this business, and our focus and priority must be and will be to capture and deliver that potential. We are going to return Rolls-Royce to a position where it not only generates attractive returns to shareholders but ensures that these returns are growing returns as well. Fundamentally, long term this is a growth story.

In my and the board's judgment, Warren has got off to a very strong start in challenging circumstances, I think you'd all agree. He's now going to describe his plans and priorities for the business. And I just want to emphasize that he and the management team have the total support of the board in executing these priorities and delivering the value-creation potential in the business.

Warren, over to you.

D. Warren A. East

CEO & Executive Director

Good afternoon, everybody, and thank you all for your patience in turning up in number and waiting for us, for the webcast there. Now I'm going to -- I'm going to talk for quite a while about operational review. But just before we get started, I'm going to be talking about a number of things, which arguably are wrong and need fixing. And I'm going to be talking about what we're doing to fix them. And there's been a lot of questions about things which are less than desirable. And it's very easy to go away with an impression that it's all bad. But then I thought "Well, why on earth have we got so many people coming to this event, if it's really all that bad?" And I think it's very important that we do retain that sense of balance because whilst I'm going to be talking about improvements, I'm going to be talking about improvements around a great company, that arguably has some of the best engineers in the world doing what they do, creating some of the best engines in the world for what they're used for. And that business is positioned in markets which are, as Ian just said, growing markets.

We're strongly positioned and we are growing market share in those growing markets. And this afternoon, amongst other things, I'm going to be talking about steps we're taking to grow our profitability around that. So actually, we're talking about a great company with a great future that happens to be in a -- at a bit of a turning point and that does happen with large businesses that are long-lasting businesses and have been there for a while, and have a long future in front of them. And I think it's important to retain that sense of balance whilst we go into the depth of some of the things we're going to talk about over the next 30 to 60 minutes.

So key topics for today. We're going to talk about what I have discovered in my first 3 to 4 months in the job. And back in July, I said, no, I wasn't prepared to just stand behind everything that we were saying because I wanted to review the operations first. And you'll see some of what I've been looking at.

Then we know there are a handful of pretty key questions for this community. We're going to address hopefully a lot of those key questions today. But in particular, there's some key questions around Civil Aerospace performance and cash generation, and I'm going to go through that. Then David is going to give us an update on the improved disclosure that we are striving for. We know that one of the issues is around financial disclosure, and we are striving to improve that. We'll also talk about cash -- capital allocation. And then I'm going to come back and talk about the areas for business improvement, and that's very much -- that last box is very much the emphasis for me over the next several months.

So review of operations. This isn't a discrete thing, this is an ongoing process. And what I'm going to say today is that we are committed to giving you regular updates on this. Today, we'll talk about some initial findings and some of the actions that we're taking. I think it's important to the note that some of those actions involve people and jobs and that sort of thing. And we are not going to talk about details of that today because a lot of discussions are happening right now. We're engaging the team.

But what I will say is that we'll commit to this roadmap, if you like, this plan of communication. We will be back on February 12, and we'll at that stage have nailed down, in fact, by the end of this year hopefully we'll have nailed down a high level structure we intend to work with, and we'll have nailed down plans,

costs and timescales by the February 12 update. We'll give you more updates in Q2. We'll have -- we're intending in Q2 to hold an additional Capital Markets Day at some stage in early in Q2, we have an AGM and interim management statement. So plenty of opportunity for communication or updates on how we're doing versus measures of success and so on.

Now down at the bottom of the slide, we've got a strategy and portfolio. And it would appear that, that sort of starts not now. And I have to say in July, I talked about doing an operations or review of operations because I thought we could park strategy for a while. Well, of course, it's impossible to divorce some elements of strategy and the portfolio of activities that we're undertaking as a business from reviewing the operations today. So I will touch on some of that -- some of those portfolio questions as we go through the presentation.

Now then let's have a look at what we do. Now clearly, as Ian said, we are fundamentally an engineering company with a focus on engines and power systems targeted at a range of different applications. So how do we look at that as a business? Traditionally, we look at it like this. And actually, it's a little bit of a mix of markets and products. And it's quite hard to see what's going on in the business when you look at it like that. So actually we need to get under the skin of it and break down some of those markets, and go a little more granular in order to analyze what's really going on. And then, absolutely, we can reassemble from that more granularity to create a simpler presentation as we go forward.

But in reviewing the different parts of our business, the different markets in which we operate, what we've looked at is we basically looked at it through the lens of competitiveness and market attractiveness. And in competitiveness, I mean, the strengths and weaknesses of our products and our technologies, the strengths and weaknesses of our routes to market, how we are positioned in terms of routes to market and the cost competitiveness of our product offerings.

In terms of market attractiveness, I mean things like long-term growth potential, absolute levels of demand and potential to generate margins. And as you look around the different parts of our business, then different parts have different strengths and weaknesses and different levels of market attractiveness. So going into the detail on that now.

And I -- normally, a Rolls-Royce presentation like this starts with a review of our aerospace applications and then we run out of time in the presentation. And so I thought we'd do it a bit differently this time. And so we are starting with what we currently call our Land & Sea businesses, and actually this is a collection of different businesses, some of them are historically very strong generators of cash flow and good margins. Certainly, we've seen some headwinds over the last couple of years. And some of those reasons have been well debated over the last couple of years.

The chart on the bottom, the light blue line, is group average and the dark blue line is these particular businesses. And you can see that, generally, these are lower capital intensity businesses with modest levels of R&D. If you look at what the activities are, what markets we're operating in, then we're operating in 5 broad market categories and 14 separate sectors. And the areas of these blocks are roughly proportional to 2014 turnover.

So a current snapshot when looked at through the lens of market attractiveness says that it's a mixed bag. And we have some areas with definitely high levels of market attractiveness. Others less attractive for the time being, and that might be due to the margin potential; it might be due to the growth potential. And we've tried to look at it fairly objectively and recognized that, for instance, in some sectors, there are particular conditions that exist at the moment that aren't necessarily normal. So example, in Nuclear services, it's strong, it's a growing market and our expertise can really command a premium in that space.

If you look at it through the lens of competitive position, then again, it's a bit of a mixed bag. And I would say a good -- a real mixed bag because if you look at, say, the Offshore sector, we've marked that in both colors because a mixed picture represents the fact that we've got some opportunities, but we've also got some challenges. So we have some very high quality product there and yet our route to market is non-optimal for 2015 and going forward.

So if I put that all together on a chart and plot competitive position for competitiveness versus market attractiveness and look where we are today, you can see, fundamentally, we have about 60% of our revenue here in areas of good competitive position. There are some significant areas of -- for improvement and refocus. And there's clearly opportunities to adjust the portfolio. There's good opportunities to adjust the portfolio. And I want to say that just because some of these in the bottom left-hand quadrant does not mean that we need to sell this business or get out of this business. It could mean that actually we need to change what we're doing in that business to improve the competitiveness or take us into a different place to improve the market attractiveness. So it doesn't necessarily signal sales just because we happen to have put some business in that bottom left-hand corner.

So how can we change that as we look forward? This is -- this chart shows the position in 2020. If we take the existing portfolio, so this is the existing portfolio of activity. And arguably, if you got out of everything in the bottom left-hand corner, then of course, you won't have anything left there and you would look as if you're in a fantastic position. But that's the route, a quick and very reliable route to small business. And in 2020, I don't think we necessarily need to be there. This shows that there is significant opportunity to change. There could be some very good reasons for being in that bottom left-hand quadrant. It could be to perhaps give us some scale, so that we can deliver profitably in some of the sectors where we are more competitive and where the markets are more attractive. Or it could be simply a matter of timing where today and in 2020, things aren't particularly attractive but we absolutely need to be there for some stage in the future where we recognize there is a large opportunity in the future.

So how do we make that move and make that change? Well, just before we do that, I want to draw out one of the parts of this business that we don't mention very often, and let's give just a quick look at the Nuclear activity.

Now first of all, obviously, timing with the strategic defense review yesterday, I think that was broadly good news for Rolls-Royce, by the way, had an interview with a journalist this morning, who was asking that question, it is broadly good news for Rolls-Royce and certainly good news as far as our submarine activity is concerned. I think what we found with the characteristics of this business is that it's excellent cash characteristics and some very good long-term customers.

Our Civil Nuclear business is small today, but we do have an amazing presence in terms of our presence on nuclear reactors around the world. Our technology is present on approximately half of the nuclear reactors around the world. So our penetration is quite small within each of those nuclear reactors, but our presence is very strong on approximately half. And here's an example of the business with great growth potential because we are very well respected where we are present on these nuclear reactors, and there's a market sector with a lot of growth potential in excess of 50% over the next 10 to 20 years.

So now how are we going to change the positioning on that portfolio more generally? What can we actually do about it? A lot of the good news about me looking around this business, what I've discovered is we can do an awful lot of it with self-help. This isn't a matter of having to go out and spend -- spending billions of dollars on acquiring this business and that business and selling other businesses. There's a lot of self-help that can be done within this business. So how do we change the portfolio? I think broadly there's 3 axes here to work on. There's providing more value where we are engaged. There is strengthening our route to market to ensure that we can grow our market share and also, again, to help grow our market share really drive our competitiveness.

So a few examples of that would be here in our Marine business. One of the key drivers right across Rolls-Royce actually of increased value is increasing the efficiency of our product. And here's an example where we are delivering to a customer improved fuel economy, materially improved fuel economy, and that's an example where by doing that we can hugely increase the competitiveness of our product, and expose us to a potentially quite large growth opportunity over a relatively short term.

What do we have to do to do that? We have to increase our expenditure in R&D in this part of the business. This is the part of the business where actual capital requirements are, as I said, much, much lower than the group overall, but we do need to spend a little money to improve the competitiveness of our products in this part of the business.

And another example would be in terms of route to market. Here's where we had some very good products, but we didn't actually have much of a position in the market in the U.S., which is a huge market opportunity. And so through a relatively small acquisition a little while ago, we now take our technology with a much better route to market in the U.S. And 6 out of 10 of the top technology companies are now relying on our technology for power -- backup power. And these are the sort of usual suspects in terms of technology companies with their data centers. But I think that is a good illustration of what you can do with small changes to improve our channels to market.

And then there's competitiveness. And we've had quite a lot of announcements in this part of our business, in particularly in the Marine areas over the last 12 months where we are repositioning the business so that we're operating in the areas of market growth. And we're also getting the much more efficiency in terms of numbers of locations and actually reducing our fixed costs, so that we're leaner and fitter to deal with these. And by the way, I would stress that this is an already, this particular example, this is stuff we have already announced, and I'll return to that, but quite significant cost savings on an annual basis by 2018.

So if you want to summarize where we are in terms of the collection of businesses that we currently call Land & Sea, then here it is on the chart in 2020. And basically, we think that with the current portfolio, we can be in 60% of the business in growth markets, attractive markets where we can improve our competitive position as well. We're not dependent for this on specific market recovery, by the way and certainly, in our Offshore sector, where we are very, very sensitive to market conditions at the moment. Certainly, if and when that improves, then the position will be further strengthened. But right now, this is about self-help.

So in that stage, I'm going to switch to summarizing applications in the aerospace field. So in aerospace, we are, basically, if you want to step back from it and say where are we? We're in a position of transition. We've talked about that before. We're bringing a whole new series of products to market. We're undergoing once-in-a-generation frequency sort of levels of investment in new engine technology for our next-generation products and once-in-a-generation transformation of industrial base to improve our competitiveness.

Specifically, we can split into 2 parts and we can -- we're going to talk around these 2 areas of Defence and Civil Aerospace.

So I'll start off with Defence. And again, compared with the group, this is lower levels of capital spend and R&D is quite well supported by government customers. And you can see the line here, the very light blue line on the right-hand chart down the bottom is gross R&D versus real R&D in that business. And I think maybe the scales -- not quite sure we have to dig into the scales there.

So if you look at the portfolio, then we've actually got nothing in the top right-hand corner here. But that is not bad. Actually, our transport and patrol applications, this our strongest position, where we are very competitive, right at the moment, there are no particular new design slots there for those aeroplanes, but it's a matter of optimizing and servicing the aftermarket that's there. The attracting features of this business is that they're very, very long cycle and very, very good cash generation potential in both the OE with the government support and in the aftermarket. And what we intend to be doing here is very much depending -- defending our current applications, but we do anticipate growth in transport and combat in the sort of period post about 5 years and you'll see that, that can actually means that it becomes much more attractive post 2020. And what we need to do now is exploit -- is position ourselves to exploit those future opportunities in 2020.

If we look at the Defence business and the cash flow characteristics, I said it's a long-term business. It is a very long-term business. Some of the -- the horizontal line here represents sort of 0, so below the line is cash consumption; above the line is cash generation. So we start off by investing in technology and development, and that can be a very long time. That can be like 20 years before entry into service. But then we get product development. And some of this is actually cash-generative. So some of this in the Defence business actually sits above the line, because it's customer-funded. Then the engine goes into service and we're in production, and then typically it is a very long period of the engine being in service and we have support packages every so many years. It's very consistent cash generation.

If you take a sort of slightly stylized view of those blocks, you end up with a curve which we'll see in a minute if I press this button enough times. Unfortunately, we're going to have advance that slide manually because this doesn't appear to be doing it. Definitely not doing it. Great, thanks. We'll see if it starts working, if that was -- otherwise, we might have to change the battery.

If we look at the portfolio that we have today on this slightly stylized curve, you can see that it's actually a fairly mature stage and a lot of our products are reaching a fairly mature stage. So this is an elderly portfolio. But we are investing in new technologies to capitalize on those new opportunities in transport and control -- and transport and patrol and in new combat. Unfortunately, we're not going to talk any specifics about the new technology that we are developing, but we're confident that with developing that new technology we'll be improving our competitiveness to take advantage when that market becomes more attractive.

One of the other ways that we're improving our competitiveness in the Defence space is by looking at our costs of production and our facilities. And this is a transformation that we talked about for a little while and we announced at the beginning October this year, where we're taking our facility in Indianapolis and we'll be occupying roughly only half of the footprint in a few years' time. And as that is all about improving the cost competitiveness. So as well as reducing the size, we are investing a lot of money in improving the manufacturing technology that's there. And that's a 5-year program. It's going to take a little while.

To finally summarize Defence for a moment, then it's very much about maintaining our leadership positions in transport and patrol, investing to strengthen those positions if possible, and the focus there is about adding value through new technology and improving our cost competitiveness through more modern manufacturing.

So now let's talk about the Civil Aerospace applications, and there are several different applications here. It's made up of -- different applications have different characteristics. So I can't really treat this as a block. I have to go into the different characteristics here. This is a higher capital-intensive operation and a higher R&D operation than the group average because we just talked about all the businesses that are lower. So this is clearly the space that is higher than the average.

So let's start off with business jets. And our large business jets, this is where we have a very strong brand and a strong position. The OE revenue is volatile year-to-year. This is a market that is driven by business spending and high net worth individuals. And you will find volatility in the OE. But the aftermarket, which obviously depends on the installed base, is much steadier. And a snapshot where we are at the moment in this sector is that we are moving from a position of very strong market share. It will decline following several platform losses that have happened over recent years. But we do have very strong customer relationships. And we are using those strong customer relationships and investment that we're making in new technology to hopefully regain some of that strong market share in future years. So that's where we are in large business jets. If we look at the cash flow cycle, it's quite similar to the one that we built up before. But note here, the product development is all on our P&L rather than being shared with our customer. And so we're talking about a long period of aftermarket revenue.

If you stylize it and look at where our cycle is at the moment, then what I would say here is that the OE margins are good in this particular sector and, therefore, the cash flow turns positive quite early on in the cycle. And of course, we are investing, as I said, in new technologies here which will hopefully recover some of that market share.

Why is it an attractive market? It is a long-term growing market. Now, we are -- you can see where we are in terms of timing at the moment. Please don't assume that, that line goes up into the right as smoothly as it's shown on this chart. It's clearly an estimate at the moment, and we obviously will anticipate bumps in the road as we go along there. But in terms of units, there are going to be ups and downs. I said the OE is a little bit volatile. Obviously, right now, we can't second guess exactly when the various economic conditions over years out to 2032 are going to cause bumps in the road. They're going to cause bumps in the road like we've seen bumps in the road if you look back over the last 25 years. However, you can draw through those bumps over the last 25 years and see that, that market has consistently grown, and that's what we're saying is going to happen over the next 20 years or so.

Regional. Regional jets. We've put this in the bottom left-hand corner because actually this is a legacy position for Rolls-Royce. We do expect this revenue to decline. We have no new opportunities for design -- getting design into new products. And we actually expect that revenue to decline as the existing products retire to about 1/3 of today's revenue over the next 5 years. And we don't actually anticipate any new market opportunities here for the next 10 years or so. And so this is very much an example of a business that we need to harvest. There is aftermarket potential here for the next several years. We need to harvest it as efficiently as we can.

Now switching to narrow-body. Narrow-bodies, in the bottom right-hand corner, our competitive position is similarly not so good. But it is a very attractive market, let's be honest. On the top of the slide, it's a strong growing market. And we were in this market to a limited extent with a share of a joint venture that had a small share of the overall market. So in total, Rolls-Royce commanded about an 8% share of the market opportunity once upon a time. And the important thing to note is that what we've actually sold, when we sold out of this business a few years ago, is only part of it. We retained our business, and that's why there is a square in the bottom right-hand box. At the moment, we retain a cash-generative business, supplying modules for a while, and for many years into the future, to enjoy an aftermarket revenue. So Rolls-Royce is actually present in this market sector.

The big question, I think, and there's been a lot of debate that I've heard since joining the business, is so what about narrow-body in the future? And surely, you have to be in narrow-body in the future. I think the answer is, no, we don't. We don't have to be in narrow-body in the future. It's a great opportunity at some stage when it arises. But right now, there isn't an opportunity. There is no opportunity for us to enter this business for another until the early 2030s. There's maybe a little bit of discussion about a sort of quasi wide-body opportunity maybe 5 years ahead of that. So this is actually not something that we should be wasting our time on right now in terms of debating. We're developing technology for the wide-body jets, and I'll come on to that in a moment or 2. That's a much, much harder environment for developing our technology and a flow-down to the engines for these types of products. It works if you flow down.

So we don't actually need to do anything right now other than enjoy the aftermarket revenue and work on making sure that we're earning that aftermarket revenue as efficiently as possible and maximizing the profit opportunity on that over the next several years, developing our technology and taking advantage of an opportunity if and when an opportunity arises. But that is essentially the position for now on narrow-body.

The area of most interest to the room probably is where we are in wide-body aircraft. And here, of course, it's a well-known story. We're in a strong position in a market which is growing and there are high barriers to entry and we have a great order book, which gives us good visibility that our market share is going to grow. In fact, we're on course to achieve a greater than 50% share of the installed base by the early 2020s. And right now, as we transition from older engines to newer engines -- and there are some headwinds. Some of the new engines that we're selling at the moment, pricing is lower than it could be. This is launch pricing, this is normal. This has happened with all the other engines that Rolls-Royce has introduced over many years. And right now, we're seeing headwinds because people are doing that transition. They're refreshing their technology and there are older engines with aftermarket revenues associated with them that are retiring.

But if we look at -- look at the trend over years going forward, projections, we can see a growing demand. And actually, we can see that in the order book as well. And if you look backwards in time, as well as forwards in time, you'll see the wide-body fleet that's out there and GDP remarkably well-correlated. If you look backwards, you can see they're sort of correlated but they don't actually sort of line up. So looking forward into the future for the next sort of 20 years or so, they may not line up exactly as shown on the graph, but they certainly correlate fairly strongly. And in the past, yes, we've had GDP shocks, the light blue line is GDP. When you look at it on this sort of timescale, you see the world recovers from GDP shocks fairly quickly. And in the big picture, then these wobbles are wobbles. So there is a correlation there. There isn't going to be a smooth trend line for both. There will be opportunities for OE in terms of replacing older engines with more efficient, less noisy, cleaner, nicer to the environment, newer engines and also to feed the growth of the installed base.

So if I look at the installed base and look at the -- it is the installed base that drives the aftermarket revenue. Some of you in this room have seen me present this chart before because it looks remarkably like the ARM royalty chart. By the way, different processes, different engines but, hey. The value -- and this is the crux of the business model here, the value is all about the installed base and it's about how we generate profit from that installed base. And of course, there are wobbles in the line there. When you look at it on a year-by-year basis, you will see fluctuations. But as that installed base grows, some years we won't grow it quite as quickly as other years, but the trend is unmistakable. And the revenue that we extract from that is about the volume of the installed base and the price that we're charging for the flying hour. And that's why it correlates roughly -- the aftermarket revenue correlates roughly with installed thrust, more thrust equals more passengers.

So if I look at the portfolio progression for the whole of that bit that we've been talking about, Civil Aerospace, then 3/4 of the portfolio is currently in a very strong place. And as we look forward due to the growth of wide-body and our growing market share there, then that grows to 90% over the next several years. I think there's a clear message in the other sectors. The narrow-body is essentially about harvesting and keeping our options open and regional jets is essentially about harvesting.

So what does that mean for the group portfolio? For the group portfolio, it means that over 80% -- in 2020, over 80% of our group activity is in attractive markets. Over 75% is where we have a strong competitive position. That doesn't mean that we're going to bail out of the other areas. It means that we have opportunities to improve or it means and that, actually, we deliberately need to keep those, and we looked at a couple just now in the Civil Aerospace business, why on Earth would we get out those even though they happened to be in the bottom half of the chart right now? 2/3 of the activity here is set to benefit from the transformation programs that we have underway, and that's about improving the competitiveness and improving the operational excellence.

Now as we look forward, it would be wrong to ignore some of the legacy issues that we're carrying forward from the past and various investigations into historic behaviors. So let's just remind ourselves, we are cooperating with all the relevant authorities in all the relevant regions. We have taken significant actions about this. We've got a lot of consistent education going on within the business. We have a very clear zero-tolerance policy to misconduct around this sort of thing, and that has become very well-embedded in the business over the last several years. So I think those are issues which we need to remember there, but we need to deal with those issues and concentrate on the operational excellence of the business.

So our future is, and I think, going -- a couple drivers for the future here. It's all about product innovation. I said we had an excellent engineering base, and that, I'll return to in a little while. But we need to turn that into innovative products, addressing real customer demands, take note of the geographic changes that are happening. And our order book at the moment is very much a reflection of the significant value that's in the business. The order book is very strong. Contrary to popular belief, the pricing is robust. We are driving cost savings. Now we can talk about the pricing at some other stage. The essential thing to remember there is that we are competitive, and pricing is about pricing in the market. We are competitive. We don't win everything, so that tells us that the pricing is not ridiculously low because we actually lose some of these opportunities against our competitors. And the emphasis is very much on -- for the order book, for the installed base, driving competitiveness in our operations as we go on.

So I think I'm going to come back to this slide in a little while. The Rolls-Royce core is all about engineering excellence. We are an engineering company. We're good at engineering engines and power systems. We have a very strong powerful business model that's all about on installed base and capturing value in the aftermarket on that installed base. And right at the moment, we have a few issues around our operational effectiveness. And those are some of the issues that I'm going to address when I come back and talk after David in a little while.

Just going to whiz through one of the key questions before I hand over to David. So one of the key questions is particularly with regard to wide-body engines, the cash flow dynamics there and what actually happens. We've shown you this chart before. This is typical Rolls-Royce chart actually because it's actually quite difficult to work out what's going on. And this is exactly one of the things that we need to improve. And so hopefully, you'll see that this is an improvement. Because what you struggle to work out from that

is, okay, so that's a cumulative cash flow chart for an engine program. So what does that tell me about what's going on this year? You have sort of, in your mind, work out a slope. So we've done that for you. The light blue line is the cash generation on an annual basis. And going forward, we're going to talk with a little bit more clarity about this and make these things a bit easier to understand.

So on an annual basis, the light blue line is a more recognizable project cash flow. The dotted line, by the way, represents the time it takes to be cash flow positive on a cumulative basis, and that's a very long time. But actually, we get cash flow positive on an annual basis much sooner than that. So let's step through the stages.

First of all, we're doing R&D, capital investment, we're building engines, we're buying equipment to build them and working on new advanced materials.

If we go on to the next phase, we actually start manufacture, start selling product. We're starting to wind down R&D, and we're starting to generate aftermarket revenues. It's still making cash losses at this stage.

The next stage is when we start going cash positive. At this stage, we've gone beyond the launch phase. The OE costs are coming down with the learning curve effects. The prices are going up because we have gone beyond the launch pricing effects. And the aftermarket revenues are starting to exceed production losses. And this phase runs for quite a long time. We are now out -- the right-hand edge of the blue chart here is maybe 10 to 20 -- is 10 years on from where we've flipped over the line. And we're sort of 20 years and more into production here. So this is quite a long life cycle.

And then there's the aftermarket. This is the installed base of those engines. They're in service, they're flying around, we're servicing them, and we're generating revenue out of that. And obviously, on an annual basis, it declines with time because some of the earlier engines that got shipped in the very first phase, they're coming out of service.

w, not every program is the same. So some of them will have greater launch pricing. Some of them will be -- will take longer to ramp up than others. And some of them, the aftermarket, will build more quickly. There are higher volume products -- projects, lower volume ones. And in some, they last -- some have very, very extended lives. The RB211 has very, very extended life and still going now. So all the curves are slightly different shapes. And when you put them together, the inflection points roll at slightly different places. And so we end up with a kind of a shape to remove all those lines from it in that sort of broad area, that's how we could simplify the picture. So below the line is cash-consuming, above the line is cash-generating.

And what we can do is plot our portfolio of different engines on that chart. And you can see at the moment, the balance of the portfolio is very much in -- where we are at the stage, I said at the beginning of this aerospace piece, by the way, that we are in a transition with lots of new engines. And so we are cash-consuming at the moment. And the cash consuming nature of some of the newer engines is outweighing the cash-generating nature of some of the older engines that are in service.

We look forward 5 years, then everything has moved to the right. And also the balance of cash generation has moved with this portfolio. And if you move forward another 5 years, then we've moved significantly into the cash-generative position.

So that's one way of looking at it. Another way of now simplifying the picture is let's look now, let's look in 5 years and let's look in 10 years, and the little white arrows going down are cash consumption. The blue arrow going up is cash generation. You can see we're in a phase where, as I said, cash consumption exceeds cash generation. Roll forward 5 years, things have changed. We are strongly into positive territory now. The blue line is much bigger than the white line. And in 10 years, the blue line is ever so much bigger than the white line. But the white line has grown again as well, because by that time, we're investing in the next generations of engines that are going to take us forward even more. And we mustn't forget that next generation of engines, obviously, has to be included.

So when it comes to what can we actually do about this to improve. What we need to do is look at so what can we do to flex this line and move things around? So first of all, we can talk about engineer -- improving engineering efficiency, improving the ramp-up, so making the below the line a bit smaller, making the

ramp-up steeper, and then we can talk about ways of improving the profitability of the large section above the line.

So just a very quick glance at some of this. Engineering efficiency, this is an example of where we're doing some modeling, and so we are able to do in days in computer modeling what would otherwise take weeks or months in real-time measurements on real engines. And that means that we have fewer iterative experiments with very costly kit, which is a very valuable resource and we do more on the computer.

Delivering the ramp-up. Obviously, we talk about a strong backlog, we talk about doubling our engine production over the next several years. We have to provide new facilities to do that, newer manufacturing techniques.

Industrial transformation is about improving the profitability of the production phase and as we go into the tail. And that's happening at the moment, improving our OE [ph] costs and actually improving how much it costs to service our aftermarket as well, so making the business model really work.

And as I talked about the aftermarket, with our TotalCare programs, we take on the risk of maintaining these engines for our customers and we charge them by the hour. So how can we improve our profitability. How can we reduce our cost there? Well, the first thing we can do is make sure that we don't have to service the engine quite as often as we used to. And so the chart on the right shows the percentage improvement in time to the first time we have to bring an engine in and refurbish it. We can then reduce the amount of time that we take and the number of parts that we are putting into the engine when we refurbish it and by better means of inspection and by making full use of data.

So a number of ways that we can improve the shape of that curve. Again, self-help. But put all that together and look at cash flow for the group as a whole, then Civil Aerospace, we've just talked about in much detail. The others have broadly the same business model, but if I look at cash characteristics over future years, then they are sort of broadly flat. The Civil business is where we're going through the big transition. And it's also the biggest number, so it's having the biggest impact on the overall cash generation of the business.

So just quick summary. I think we've done the first couple of things. I'd now like to hand over to David to take us through the next couple of stages.

David Miles Smith

Former Chief Financial Officer and Executive Director

So thank you, Warren, and good afternoon, everybody. You can see that we've been spending a lot of time really examining the fundamental strengths and weaknesses of the business, and this has really reinforced the need for focus on improving operating performance, cost and cash in the near term, while also evaluating the priorities we have for investments to support the long-term growth of the business.

A few things are clear to me from this, and you have heard some of this from me before. Firstly, we have an outstanding opportunity with wide-body engines to transform our business into a true world leader with critical mass in both scale and financial success.

Secondly, our other businesses offer differentiated levels of prospects for growth. We have products and services that command real competitive advantage and are focused on attractive growth markets, or at least markets where we can sustain good margins as a result of our concentration or local presence.

Thirdly, we have significant opportunities to improve our operating performance and our pace, customer delivery, program delivery, project delivery, lean manufacturing, et cetera, as well as reducing our capacity.

Fourthly, we need to ensure we have the right platform for the future and are making the right decisions about footprints and technology investment and have the optimum space to grow profitably.

And finally, there are no special cases here. We've identified businesses, products and services where we need to make more fundamental decisions, decisions around investment, JVs, small divestments or

small acquisitions, to optimize value for shareholders. And we'll make those decisions with a clear focus on return on capital employed. That sets the scene for what I'd like to share with you.

These are my thoughts on our financial framework, our balance sheet, cash generation and investment outlook, to give you a context on how we'll be making these decisions and the targets we'll be setting the business to achieve. It also introduces the opportunities we're going to be looking at to enhance our disclosure, which will replace our medium-term guidance framework. Now we can't deliver all of this ambition right now. Some of it is dependent on our management information systems and the project I kicked off earlier this year, but I'll share a bit about this with you so that you can understand the journey we're on and where we are aiming to get to.

So clearly, the developments over the past year have created a number of major challenges, but we have managed our cash position thoughtfully and taken the necessary actions, where needed, to ensure we don't stretch ourselves too far. We recently raised around GBP 1 billion in new debt to replace maturing facilities and to provide the headroom needed, as well as increasing our revolving credit facility. And our balance sheet can cope with the stresses and strains placed on it by the headwinds we've identified over the next few years. So fundamentally, our long-term outlook is unchanged. Consequently, I still feel comfortable targeting an investment grade rating in the medium to long-term, and we've been A rated since 2006.

As far as the dividend is concerned, our next decision on that will be in February when we consider the full-year payment for 2015. We clearly want to present the market with a sustainable policy that reflects the underlying strengths of the business and its long-term growth opportunity, but at the same time being mindful of the potential interplay with our rating. That is ultimately a board decision and one for early next year.

So our recent news flow emphasizes that our business and assets and reporting remains a work in progress. However, the review we've done over the last few months does confirm to me that our judgments around capital investment, program management and pricing are improving. In some of our businesses, our systems are strong and providing good quality financial information. But the areas of strength are not consistent across the group, and this is where our new investments will help us. Most importantly, we need to focus on developing a much more intuitive reporting of in-year and near-term performance, the linkages between physical drivers and financial results and between profit and cash, and underpin these with clear measures of success, that we can drive the right behaviors in our team. This, in turn, will help us provide the market with better information.

Allied to better scenario planning analysis and an enhanced disclosure framework, this will help you model the business and overlay your own judgments. So I'd now like to share some of the changes that we are proposing to make the disclosure going forward.

At the moment, in addition to group figures, we provide you with a breakdown of revenues split between OEM services and also profit before finance, charges and tax for each of the 5 business segments. We've only had the group data on headline as opposed to underlying up until now. However, looking forward, we're proposing to expand our level of disclosure to include both a group level underlying gross margin and to introduce a breakdown of gross margin R&D and aggregate other costs below gross margin for each of the segments. This will enable you to better understand the relative gross margin performance across our businesses in addition to having better insight into where we're targeting our R&D investments.

We'll also break out our estimates of capacity underutilization or double running costs that we are currently incurring in the cost of sales line and show how they improve over time.

At present, we're only showing the group split within the chart, but we will fill in the blanks for 2014 and provide a breakdown of the 2015 figures when we present our preliminary results in February. We are also intending to expand our breakdown of revenue for Civil Aerospace to give you more detail on the moving parts of the distinctly different achieved gross margins. In the past, we've shown a breakdown of Civil Aerospace revenue generated from our large engines and our small and medium engines. But what we haven't told you is how these are represented by OE and aftermarket sales. And as you can see from the slide, I propose us to provide more detailed disclosure for each of these areas.

Our current plan for OE is to separate out revenue from our large engines into linked and other, which includes spare engines and unlinked, and also by corporate and the V2500 program.

Within aftermarket, the split would be large engines, corporate, regional, and V2500, all of which are meaningful.

So when we announce our prelim results in February next year, we'll provide you with the actual revenue splits for these categories in addition to total gross margin, R&D and other costs. Now we are pretty clear that there are still some important commercial sensitivities about our publishing accurate gross margins beyond the segmented total. We are already providing quite a lot of data here. So you will have to form your own assumptions on the gross margins for the different categories, but these are some useful observations I can make.

Large engine, linked and other, will include the profit on spare engine sales, in addition to blended margins from linked account to OE and TotalCare contracts. Unlinked engines are generally at 0 standard gross margin as we capitalize any cash losses or contractual aftermarket right so that grows over time as a proportion of our sales. The impact from gross margin will be quite material.

Corporate jet engines as Warren set out earlier are normally sold at a cash profit. And our remaining V2500 modules are sold under our agreement at a modest margin. These, of course, will decline in volume and then quite soon as Pratt & Whitney transition to the new transition to the new geared turbo fan on the A320 Neo variant.

Aftermarket margins are more consistent with less of the disruptive characteristics of mix changes within TotalCare accounting, and on an achieved basis, are fairly consistent between corporate and large engines. So overall, there should be quite a lot of additional scope here for analysis based on an accurate revenue split, and an overall gross margin to reconcile back to.

Looking forward, what we are also proposing to do will be to provide additional directional guidance on the absolute trends in each of the important revenue lines. We'll include these in our appendices and pull out the key elements in our review of the business or updates on expected trends as appropriate. I think this is an approach used by a few of our peers, although we will no doubt have more lines in [ph] most, it should provide a sense of what's going on in our judgment.

In addition, due to the nature of the accounting within the Civil Aerospace, we will also extend to this disclosure down to trading cash flow by providing details on the net TotalCare debtor movement, net contractual aftermarket right movements, working capital movements, and other noncash movements in depreciation, capital and other intangibles, capitalized R&D for instance. Doing this on an annual basis and then providing directional guidance should enable you to model out our views on cash conversion and get a proper sense of how sensitive this will be to other performing measures going forward. And as Warren indicated, at the moment, this would be a negative number. But over the next 5 to 10 years, if you remember those charts, it's going to turn strongly positive.

As you know, we believe the NPV of embedded cash flow is the most appropriate way of valuing our Civil Aerospace business, and I believe that this improved disclosure will go a long way towards helping you model on this basis.

Turning now to look at 2016 and the headwinds, which are shown on this slide, it's worth considering how this would be modeled if you broke the revenues and margins out in this form of analysis. Well clearly, it does depend on where you start from in terms of core assumptions you've made. But if we look at some of them in turn.

Firstly, the impact of the Trent 700 rate reduction we outlined in July. At the time we talked about this being a significant volume and price effect of about GBP 100 million each as well as the loss of spare engines. So in modeling the volume reduction, you need to form your own views on the degree of impact based on revenue segmentation, average number of engines sold, and factoring in a higher average achieved margin as a Trent 700 is a very successful engine program.

For you to model the comments on pricing there, we have to indicate what that would mean in terms of a likely margin decline, a modeling that would bring you down to the result you'd expect. Implicitly, this means that the average achieved margin for our new linked and other OE sales would have reduced significantly.

But of course on a cash flow basis, what we are losing in 2016 is a lot less, reflecting only the change in the net cash loss of the engines we're actually selling compared to those we would've expected to sell previously. Here, we would be pointing you to this fact, indicating that you'd expect a reduction in the change in the TotalCare net debtor.

Turning to the more recent headwinds, and looking at the new wide-body developments, the GBP 100 to GBP 150 million we discussed on the 12th breaks down into 3 parts. Around GBP 50 million to GBP 80 million relates to aftermarket changes; GBP 25 million to GBP 35 million reflects lower JV profits and the rest is the net of a lot of other different factors.

Looking specifically at the aftermarket issue, quite a few frontline fleets are now changing quicker than we expected. And as a result, the older planes are coming into the second hand or release market. This is creating hangover in capacity in specific geographies. Regrettably, because of specific customer mix, this is mainly on Rolls-Royce powered aircraft. Our Trent 500s, more recently a few Trent 7 -- 800s on older 777s.

We're also seeing a continuing decline in the revenues generated from RB211 engines as more aircraft are parked.

Overall, we expect something like a 15% to 20% decline in legacy engine revenue in 2016, that's around double what we saw in the first half of this year. In modeling terms, you know these are large engine effects, and you would also have your own assumptions on the degree of margin and you would need to adjust the line items accordingly.

For our corporate jet business, we are expecting a volume reduction impacting revenues by around 20%, with some effect on pricing, and therefore margins. Again, that's significantly higher than we saw in the first part of the year.

For our regional business and the V2500 program, the headwinds are more structural, as Warren described, and reflect an acceleration of already anticipated trends. While the endpoint has probably not changed, the pace in the near term at which these businesses have deteriorated remains an issue for us. Overall, our regional business is declining around 20% per annum, a little faster than we would have expected a year ago. You'd be able to model each of these impacts into the relevant line items through a mix of volume and margin assumptions.

I now want to share a few thoughts and take you through the investment we are making in our management information systems project, and how this fits in with our review of forecasting and analysis.

As I discussed earlier, we've identified a need to improve transparency through better communication both inside and outside Rolls-Royce, and have been working in putting a better framework in place. The important drivers of this are the links between physical factors, such as engine volumes, flying hours productivity, inventory turns, et cetera, and our financial forecast as well as the more complex links between contract accounting and revenue margin and cash recognition.

We've, to date, been inconsistent in the way we've given guidance here, and this is clearly unacceptable. I know -- and as you know, I started a project in January this year to undertake a major overhaul of our management information systems, try and improve transparency and accuracy. Together with our enhanced disclosure framework, our improvement will, over time, help the market to get a clear understanding of our performance, and be able better to anticipate changes based on our market factors.

We are starting to see the first positive outputs: A framework of key performance indicators, which includes both internal and market-facing metrics, and that's being rolled out right now to our business leaders. We are planning for further actions and forecasting and also revisiting -- thank you, Warren -- forecasting and also revisiting costing systems and processes. This is a pretty major project, and we do

have appropriate external support for it. Next year, we'll update you on this project and its output, and also we'll give you our assessment of IFRS 15, and its likely impact on the financial reporting from 2017 onwards. That is more change, I'm afraid. And I'm also afraid that it's unlikely to eliminate all of the timing issues created by present accounting standards, but we are trying to find ways to simplify it. And as I think you know, we are also working with our peer groups to try and find a consistent approach.

Before I hand you back to Warren, I'd like to say a few things about capital allocation. I touched on this earlier, when I discussed our balance sheet position. And I know it's an important topic for many as we consider the investments that Warren has set out and will talk about more in a minute.

Capital allocation at Rolls-Royce is essentially about evaluating and balancing priorities across some important investment needs, as well as maintaining a positive and coherent dividend message for investors as we grow the business and improve cash conversion strongly in the future. The decisions we make as to how we prioritize and best make our discretionary investments, including investing cash in building out our installed base of large engines, and capturing that long-term aftermarket revenue stream are fundamental to the long-term shape and scale of this business, and the enduring benefits it will create. It requires us to have a clear view on our weighted average cost of capital, our return on capital employed for individual projects, and the risks of those projects and make sure that we have available capital both by project and for the group as a whole.

It is also essential that we impose greater discipline as to the hurdles we are seeking and for the senior team at Rolls to robustly challenge and monitor the programs and the detailed analysis our teams do. With improved reporting and enhanced financial scrutiny, I'm confident we'll be able to make -- be better placed to make these judgments.

At this stage, we've many uses for our cash resources over the next few years, and relatively few strong cash generators. But it does mean we have to be very clear about our priorities, disciplined and with a focus on initiatives that offer the strongest returns and most enduring legacies. But we will do this without also reducing our commitment to R&D, and the essential investments needed to complete our supply chain transformation because those underpin our future success and are really key to the business journey we are on.

As Warren has said, we must complete the journey we started without compromising on customer service and product performance. We'll therefore judge our dividend policy in the light of the priority uses of cash. But we also have a clear and balanced view as to how important over time a strong cash payment to shareholders is, as a way of both judging and reflecting our success as we become more cash generative over time.

So in summary, we have a strong balance sheet. We are working very hard on improving our management information systems and the financial framework, but this has to be underpinned, as Warren said, by improvements in our operating assumptions and performance as well. Put simply, we need to have to define a realistic plan and deliver on that plan. We've updated you on the headwinds we see, primarily from market realities, but we're also working hard on mitigating actions. And we'll maintain a focused discipline on capital allocations.

Thank you. And now back to Warren.

D. Warren A. East
CEO & Executive Director

Thank you, David. Bear with me, I won't be long. I'm now going to talk about that last box on the agenda slide about what we're doing with the business as we change. Quick reminder, we're starting from a pretty strong base really in terms of strong mix of businesses, well positioned, and 2/3 of the group benefiting from the announced transformation programs that are underway.

I spoke earlier about the 3 themes based around the core of Rolls-Royce, the strength of the business model and the operational effectiveness, which we need to turn into operational excellence. And just a couple of contextual points. I would say that since joining the business, I've spoken with quite a lot of customers, and almost to a person they've told me how much they like working with Rolls-Royce. They

find our people very easy to deal with, very helpful, and they're very appreciative of the products and the engineering support and services that we provide. So that customer support for us is really important.

And the other contextual point I'd make is that I think the arrival of the digital age presents a number of new opportunities to add value, both to the business as a business, but also to how we go about doing our business.

Now to improve operational excellence, and I said this wasn't going to be a strategic review, we certainly need some strategic clarity. Now these statements, by the way, are not tablets of stone. These statements are work in progress. But I think the thrust of these statements is clear. And importantly, to us internally, as a management team, it provides us with a framework so that we can actually be more ruthless in managing the portfolio and making some of the tough decisions that we've got to make about how we deploy our capital. And it will guide us as we make changes to products and services over time and redefine what we're actually doing.

Just set out a few timelines here. The middle part of this slide, this so there's bold blue writing, is very much what we're -- the thrust of what we're doing from an operational point of view. And the lower box is more some of the strategic activity that we're doing to help with the future. And the 2 boxes that are left blank on the bottom are left deliberately blank, because actually I don't know what we're going to be doing from a strategic point of view in 2025 and beyond. However, we do need to recognize that we will be doing something there. And so those are blank boxes for the time being, but we will need to fill those in, in time so that we know where we're going, and we do the right strategic things over the next 5 years to position us to do the right things in the years after that. But there are great opportunities there. We might well be developing a much larger nuclear business. We might well be exploring all sorts of new methods of propulsion, and we'll certainly be exploiting greater trends towards more electrification. But the focus very much now is on the top line, the operational piece and over the next 5 years. So that's where we're going to focus.

So picking up on the 3 themes that I've used to talk about. This is about focusing our resources, thinking about what we actually need to do. And it's clear to me when I look at Rolls-Royce, the image that I get is one of an athlete that's a little bit overweight. And we need to get rather more fit. And that means possibly shedding a little bit of the overweight. And that's what I mean by defining what's really needed.

If I look at it from a business point of view and look at some of our costs, and I said on the IMS last week, the real problem here is the operational gearing in our business. So let's look at those operational costs. We are spending today about GBP 4 billion on sales -- on being a sales and engineering organization. So this is money that we're not spending on building products and shipping them out of the door, or supplying spares into our aftermarket. This is money that we are spending on keeping that machine going. Are we are doing this as efficiently and as effectively as we should and as we can be? And I think that's sort of a little bit of a rhetorical question.

Now there's a lot of very good things already in train. If I look at programs that we've already announced to date, an aerospace program that was announced approximately 12 months ago. Now we are making great progress on that, and you can see some of the reductions that we are making in headcount.

In the Marine space, again some significant improvements. This is program only announced this year, but already announced and again targeted around restructuring and headcount reduction.

Now one of the issues with headcount reduction is that the cost does come out eventually, but you have to be very careful about it growing back because -- and you have to be careful about it growing back if what it leads to is essentially doing the same thing with fewer people. It's actually a bit of a negative motivational point as well.

So those are programs announced to date. Other programs announced to date, the manufacturing transformation. And if you put all of this in aggregate, we're talking about over the next 5 years reducing our footprint by 20%, and improving our output by about -- or increasing our output rather by about 80%. You can think of that as an alternative, a new 80-20 rule, that's how I'd like to think about it.

However, all of that is necessary, but it's not sufficient. And that's why we talked about the program we talked about last week. If I break the 3 into the 3 buckets, and think about how we are deploying resources to really maximize -- are we deploying those resources to really maximize value to our customers? And look at it through the lens of what are we doing? What do we know that we can do well? And how can we do that better? And how can we better exploit our strong business model? And then what are the processes that we actually use to execute that?

So our program, as we announced last week, is primarily going to be around fixed costs. As far as people are concerned, it's going to be primarily around -- we have a top-heavy organization with a lot of management. And this complexity associated within our organizational structure of our corporate and divisional organizational structure. What I'm talking about here is the organizational hardware of the business. And you'll excuse me for using a few computery-type terms, the structure of the organization, how the people fit together, that's the hardware. We need to dig deeper than that. We need to get into the organizational software. And I don't mean SAP systems, I mean the processes and procedures that you wrap around the organization to make it work.

And when I look inside Rolls-Royce at what needs changing, then the list on the left-hand side of the slide is a noncomprehensive list of some of the things that we need to do. But we know and we've talked to you before about -- the numbers are too complex. It's too difficult to extract the information from the data. We have multiple owners of processes and data. We have difficulty and ambiguity in -- over our accountability. We operate too slowly, and we need to increase the frequency. And I think all of you know what it's like trying to run a computer with rather bloated software, and that's really the situation we have with the organization software -- organizational software that is in Rolls-Royce at the moment. So it's all about simplification to improve the pace at which we are operating. So making sure that the right people are having the right conversations at the right time to get things done.

An example of that, an example of that, we're a technology company, an engineering company, and it's really important for us, from a competitive point of view, to be right at there in front with the technology. And so we identify a number of key technologies that we need for our businesses, 27 key technologies. But can you imagine what it's like trying to manage all that? Can you imagine the number of meetings, the number of reports, the number of processes that go around that? Colin, our Director of Engineering, sat there, he's raising his eyebrows to the skies, just imagining it as I'm saying it, right.

But it's another way of looking at that is you can think about that as around about 8 different technology themes. Now I don't know whether the -- this is again, it's a bit of work in progress. I don't know if the right answer is 7, 8 or 9. But it certainly isn't 27 in terms of managing those technologies. And so we're talking about reducing the number of meetings, the length of time it takes to manage these things by simplifying how we actually go about doing it.

It's very important that we deliver to you some operational measures. The picture on the right talks about how we talk about our performance with the market at the moment. And it's all very, very financial. And the trouble with it being very financial, as David has just outlined, there's an awful lot of accounting fog that sits around there. So it's very difficult to understand what's really going on, what is the real operational performance of the business. Because, yes, we do have complexities in capitalizing costs. We do have complexities in accounting for our TotalCare service products.

Now as I've looked at that and thought it's complicated, actually I look at it, and it isn't really rocket science. But we perhaps could do a better job of explaining that and taking you to the underlying operational performance of the business from a financial point of view. And as David has just outlined, as one of the things that we intend to do, just strip away some of that fog and make it easier to understand from the numbers point of view. But it's also about much more than the numbers. Improving the performance here is about metrics around productivity, it's about unit costs, and it's about how effectively we're using our working capital and so on. And so we have a list of -- a very small list, really, of measures which we think are a bit more around operational performance that we hope to be able to share targets and progress on as we go forward.

So as we look at updates in 2016, then very, very roughly we'll have some structure at the end of this year. In February, we'll have costs, timescales and our first look at measures. In Q2, we'll have an AGM

and we'll have a Capital Markets Day and we'll have some updates on how those programs are going and on the measures. We'll have an opportunity to do that at the half year and this time next year as well.

So I think we've hopefully addressed these key topics. I think, just by way of conclusion, this is a period of amazing change for this business. And as I said at the very start, long-term successful businesses do go through these periods of change. And just because we happen to be in a period of change at the moment, doesn't mean to say that we're not sitting on top of a fantastic business with great growth potential.

Actually, everything I've done in terms of reviewing the business over the last couple of months absolutely underpins my confidence in that future. It has also exposed that we've got a heck a lot of work to do, to change the way we do things at Rolls-Royce to realize that potential. But it has highlighted a huge number of areas where we can make these simplifications, where we can inject pace into the business and improve our operational gearing and turn our operational effectiveness into real operational excellence.

So with that, I'm going to finish. David is going to join me, and we'll take your questions. The IR team are going to wander around with microphones, I think.

Who's got the microphone? No microphones going? Yes, okay. I think we've got one there, and one there. This one's got a microphone first. Second. Have the first one from over here.

Question and Answer

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Rob Stallard from RBC. Just a couple of quick questions, Warren, you set out where we stand today on net cash generation, and you set out where we should be in 2020, which is nicely positive. When do you expect the crossover point to be? Do you expect that should be in 2020? Or to be before that? And then secondly, maybe one for David, you said you have one of your targets is obviously to maintain your investment grade rating. How much capital buffer do you have in case some of these maybe shorter cycle areas don't go as well as planned in power marine or in the old aircraft aftermarket?

D. Warren A. East

CEO & Executive Director

Yes, so on the cash generation question, certainly, our cash is quite volatile. And so picking the exact moment when that transition happens is quite difficult, but it's certainly going to be comfortably before 2020.

David Miles Smith

Former Chief Financial Officer and Executive Director

And just on the cash buffer. So we, at the end of last year, had, I think, GBP 1.6 billion of cash, and we've now increased our revolving credit facility to GBP 1.5 billion. So that kind of GBP 3 billion at year-end is about what we think is the right number because we do have peaks and troughs during the year as well, and the aim is not to use our RCF base.

D. Warren A. East

CEO & Executive Director

I think we have a question over here.

Nick Cunningham

Agency Partners LLP

It's Nick Cunningham from Agency Partners. You're confident about the long term, but you've withdrawn guidance for the medium term. And I was wondering whether -- I mean, it's sort of hinted partly that's because you're setting new metrics in place and you may not actually have those metrics yet. But also, is there a genuine lack of visibility into '17 and '18? And if so, what are the kind of the big known unknowns, which give you that, if you like, that pause in terms of giving guidance? Second question, you want to recapture BizJet share and to sustain your wide-body, sort of circa 50% share. Is that containable within, say, 6% of sales as an ongoing self-funded R&D spend? Finally, a little detailed one. In the Slide 76, the sort of breakdown of Civil Aero engines profitability and revenues, is the UTX payment that you received from the IAE disposal, will that fall into V2500? Or will that fall into, presumably more likely, other right at the bottom of, say, the top -- bottom right-hand side?

D. Warren A. East

CEO & Executive Director

Okay. Well, I'm the one that's very reluctant to talk about medium-term guidance right now. And I'm not sure that '17 and '18 is particularly medium-term guidance. That's actually quite short term. I think right now, we talked about the challenges that we have with our information systems, and producing medium-term guidance, based on those information systems at the moment is unhelpful for us and it's unhelpful for everybody in this room. This is the sort of business, which we can actually be quite bullish about. We can be quite confident about in the longer run, but things do happen in the short term. And I think we've adequately demonstrated over the last 18 months and, certainly, over the last 6 months that our systems at the moment are just not capable of picking up short-term fluctuations. And therefore, to be -- it's very easy in this business to be approximately right in the longer term with trends. It's also very easy to be

precisely wrong in the short term. And we do need to improve those so that we can at least talk about a medium-term range and a range of targets, but we're just not in a position to do that at the moment. I hope that we can improve these management information systems and possibly get into that position in a sort of 12- to 18-month time period. But we won't make any promises on even that right now because this is very much work in progress. That's the first question.

David Miles Smith

Former Chief Financial Officer and Executive Director

You want me to tell you the second question? So in terms of R&D -- I mean, R&D will fluctuate a little bit from year-on-year depending on what we're capitalizing, what we're expensing, et cetera. But -- so keeping within this sort of R&D level is absolutely what we intend to do. And it does assume that we continue with the programs on technology that Warren mentioned, in terms of simplifying that -- those technology programs as well as the wide-body and the BizJet product development programs as well. I'm struggling to find Slide 76 at the moment, but maybe I'll answer your V2500. Clearly we've got 3 sources of revenue: We've got the license fee, we've got spare parts, and both of those will be in aftermarket. And then we've got the modules, which are within OE at the moment, and that's the bit that will drop off over the next 2 to 3 years, as perhaps switched to the neo.

D. Warren A. East

CEO & Executive Director

Yes, I think we've got one here.

Andrew James Hollingworth

Holland Advisors LLP

I'm Andrew Hollingworth from Holland Advisors. Just 2 questions. Obviously, you've gone through and highlighted the areas that you are likely to spend future R&D and CapEx on. Would it be fair to say that, perhaps, if we look back and have the disclosure on those, that is not where we've been spending money in the past. So do we have effectively free resources to focus in more focused areas, if you like? So you know that they data but we don't. Would like to get your sort read on that. And the second one is, obviously, you've outlined this sort of cash flow profile, which is really sort of useful with in different time frames attached to it. But is there a sort of real-world threat to this, by some of what's happening in the aftermarket now? Sort of gives a clue that the sort of aftermarket market might not be what we think or what we project it to be. And is there anything we can learn from that? Is QE meaning that people can buy capital faster? And is it dangerous to have a 30-year cycle without fully understanding that?

D. Warren A. East

CEO & Executive Director

Yes. Do we have the resources to invest where we need to invest? And broadly the answer is yes. The fact that we, perhaps, haven't been investing in some of those areas over recent years doesn't really mean that we can't. I mean, we -- most of the area we need to invest in is the underlying technology that we developed for our large Civil Aerospace business. The other businesses are, as I showed on the charts, less R&D intensive and less capital intensive. And so the answer is broadly yes, we can invest in the areas that we need to invest in. Your second question is...

David Miles Smith

Former Chief Financial Officer and Executive Director

Maybe I should take that one. So on cash flow profile, it is -- you're absolutely right that what we're seeing at the moment is an increased acceleration -- or a deceleration in flying hours essentially and T&M activity on the legacy programs. And that would cause you to question maybe what's going to happen in 20, 25 years in new programs. I understand the point. When we model this in, say, the triangles that you saw on that graph, we absolutely look at scenarios around that. So don't think that in there, we've necessarily got a straight 25 years, which is the experience over the last 20 years of engine life. We actually model that in different ways. So we look at scenarios and we put risk factors in about that and take account of that when we look at the program cash flows.

D. Warren A. East*CEO & Executive Director*

Got 2 in the middle here. One over there. We'll get to you [ph].

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

Yes, Ben Fidler from Deutsche. A couple of questions. Thank you for your slides -- I'm looking at Slide #54, your cash flow trajectory by program. And in the back of my mind, bearing in mind what you also presented in Slide 42, which is the embed installed thrust growth. So over the last 15, 20 years, your installed thrust has grown -- looks like it's kind of doubled. And yet Slide 54, we have a portfolio of engines, which are reasonably old, which -- most of which don't seem to be generating much cash: Trent 500, Trent 800, Trent 900. The next stage of -- back to Slide 42, your installed thrust growth, very strong growth. And yet, if we look at your 10-year on cash flow chart, we have a portfolio that is phenomenally cash generative. So the question, sorry, it's quite a long one, the last doubling in installed thrust doesn't seem to have ended up giving us a portfolio of legacy engine sort of throwing off much cash. Yet in a decade's time, we will have that with a doubling in installed thrust, the lot of which is coming from engine programs where the RSP positions are roughly twice that which they are on the existing portfolio. So presumably, twice as much as that cash flow is to your RSP partners from that installed thrust. So just to understand what I'm missing in that linkage there.

D. Warren A. East*CEO & Executive Director*

Okay. Well, we can probably -- I think we'll have to deal with all of that linkage in another level of detail. But broadly, it's about the size of the installed base. And if I look back, then whilst the cash generating potential of the installed base has, indeed, been growing, then the challenge in terms of it not actually appearing to be delivering is -- actually, we've been consuming cash as well. The position of these engines on the cash flow chart towards the bottom of the shaded area there, if that's what you're referring to in -- don't forget this graph is not scaled. And it isn't scaled. They are drawn towards the bottom because they are low-volume programs. And I think in order to answer your question properly, we'll have to actually pull out the numbers. This chart was meant to be illustrative there, and those dots are in roughly the right place but the chart is not scaled deliberately.

David Miles Smith*Former Chief Financial Officer and Executive Director*

Maybe if I can just add a couple of points as well because there's a very important portfolio thing, I think, to understand here, which is the snapshot of our portfolio of the moment is actually probably at its weakest point. We've got the RB211s as the 800, 500 are coming down, not generating all that cash. Trent 700, despite the fact it's been in production for 20 years, has only become cash positive in the last few years. So it's actually still climbing up its cash ramp. In fact, this year's cash flow from that product is higher than last year's. That's where you can see -- actually, Trent 700 becomes a stronger cash generator as we go through time over the next 5 to 10 years and will be added to by XWB. So this point, I think, we may have discussed before a little bit about understanding where the portfolio is in this transition is actually pretty fundamental to understanding the strength of the business. The other thing, Ben, I'd say is that the other change really, over the next 5 to 10 years is where we're really going to sort out industrial footprint over the next 5 years. So we will have a much better capacity cost position by the time we get to 2020 and, therefore, our cost structure is fundamentally changing as well.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

Could I ask one more question just on management remuneration. And obviously, compared to the number of the targets that you had in place -- and this may be one that the Chairman wishes to answer. I see some non-execs are here. Maybe they wish to answer. I don't know. I'll leave it up to you. You have a free cash flow per share target, which is you need to achieve 100p of free cash flow per share as a minimum over the next 3 years to qualify for one of the performance share plan targets now. Obviously,

that is, in the current environment, out of the ballpark. How the board feels they're going to deal with that to incentivize you and the people to deliver numbers, rather than have a target that is so unachievable it almost becomes demotivating? And when those numbers may or may not be released.

D. Warren A. East

CEO & Executive Director

Yes. Well, I mean, the answer is, of course, motivation. And it isn't just for executives, by the way, this is -- it runs into the business. Of course, that's our motivational headwind at the moment and we are looking at how we can design things to be more appropriate. But it is a matter for the remuneration committee and the board. And I don't know if anybody wants to add anything to that. It's not something that we're sort of ready to have that discussion right now. Is that fair enough? Yes, the Chairman's nodding. Good. Thanks.

Nedko Kyuchukov

Nedko Kyuchukov from Westray Capital. You talked about double running and underutilization costs that are included in the gross margin. And from Slide 88, it seems like the target is to remove those, so to eliminate those. How should we think about those in relation to the GBP 150 million to GBP 200 million cost reduction program? Are they entirely separate and entirely incremental?

D. Warren A. East

CEO & Executive Director

Completely different.

Nedko Kyuchukov

Completely different?

D. Warren A. East

CEO & Executive Director

I think we've got one over this side who's been waiting for a little while. So let's go that way first and then come back there.

David Howard Perry

JP Morgan Chase & Co, Research Division

It's David Perry at JPMorgan. A few questions please. One of them -- it's probably for David. Can you just help me? I got a little bit lost on where you stand today on linked contracts because 18 months ago at the big accounting teach in, you told us that quite substantial margins were taken on linked contracts on the OE sale. You probably -- I estimate it's about GBP 1 billion of sales a year going forward on linked, on the Trent 900 to Trent 1000 and still, for a few a years, the Trent 700. So are you still taking quite a big margin on that OE? And if you're not, why not? Because something would have with change in the policy. That was the first question. The second one, perhaps more for Warren, I was a bit surprised in the presentation. There wasn't really anything about the structure of your aftermarket, which may be quasi-operational, maybe more strategic. But it seems to have been a hugely topical issue in the last few months, partly on the potential EU inquiry, but also a lot of commentary in the trade press about airlines not liking your closed aftermarket network, therefore, parking some of the older engines. And it's sort of created a vicious circle for you that -- and may explain some of the increase in the parked planes. So can you just tell us your thoughts on how that may play out, please?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. So Dave, just on the first part. Yes, I mean, we haven't changed the accounting policy. Clearly, the Trent 700 for this last batch of engines over -- that we'll produce over the next 2, 3 years is going to be a lot less profitable than we saw there. And that's the reason why we're seeing this GBP 250 million headwind into 2016, so they will still be accounted for as linked. We will book a gross margin at inception,

but it's not going to be as high as we booked in the past. And the other thing that's really changing at the moment is the mix. So when you see look at the mix of our production between linked and unlinked, that's going to change very significantly over the next 2 or 3 years as XWB ramps as well. So the OE -- on the linked engines themselves, our policy will remain, but it's a lower profit level on the Trent 700s. And then we've got this mix issue between linked and unlinked, which drives some of the short-term profit headwinds as well.

David Howard Perry

JP Morgan Chase & Co, Research Division

But I've actually, I'm more interested in the Trent 1000s because your [ph] selling Trent 1000s are linked.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes.

David Howard Perry

JP Morgan Chase & Co, Research Division

I mean, if you're not taking the margin on the OE, does that mean you're not expecting those to be as profitable over their life?

David Miles Smith

Former Chief Financial Officer and Executive Director

We are taking the margin on the OE. It's not as profitable an engine as is the 900 -- as the 700 was, no. Part of that was because on the 900, certainly, is a volume effect. And on the 1000, it just isn't as profitable an engine as the 700 was.

David Howard Perry

JP Morgan Chase & Co, Research Division

And on the aftermarket issues, please?

D. Warren A. East

CEO & Executive Director

On the aftermarket issue, actually most of our engines are sold with a TotalCare agreement, the very, very significant majority of those. And talking with our customers then, our customers actually like that arrangement. Our customers are prepared to pay for that arrangement. And as I said in the presentation, that effectively means that we are taking the risk. And what they -- the customers appreciate is that we take that risk and they pay us a premium for taking that risk. Actually, a lot of the issues that are in the -- sort of swirling around in the room are actually around narrow-body engines and other. We're not playing that in space right now and are rather more associated with the sort of Time & Materials and spare parts-type business model than the TotalCare business model. Where some of our customers find the TotalCare business model less useful is towards the end of life of some of the aircraft, and we've recently increased variations on a theme with TotalCare Flex to address some of those concerns, and we're signing up our first customers on that. So I actually don't think that's a particular concern right now.

Thanks, let's -- we've got one there. Did we have one over this side [indiscernible]

Zafar Khan

Societe Generale Cross Asset Research

It's Zafar Khan from Societe Generale. Just wanted to pick up on David's question, if I may, please. David, you've been very helpful in giving us the -- little bit more granularity on the GBP 650 million headwinds you faced, '15 and '16. And I think the disclosure on the different engines is extremely helpful. But starting point this year, the guidance is GBP 800 million to GBP 900 million for the Civil division. And if I remember correctly, GBP 200 million within that is a provision release on the Trent 1000. So the underlying number's GBP 200 million lower than the guidance, and then we've got the headwind. So if

I transpose from '15 to '16 using your guidance, I end up with a very small number in the civil division for the EBIT. And even in my sort of simple way, a lot of that would appear to be profit coming from IAE, which means the rest of the portfolio is not really making any contribution. So I think it'd be very helpful to us in this new spirit of openness and being very helpful to the community if you could either give us a starting point or the ending point to the kind of bridge that you're creating. Because you've left me dangling in the middle there without a starting or an ending point.

David Miles Smith

Former Chief Financial Officer and Executive Director

I hope I'm not -- don't leave you dangling too long there. But I mean, you're basically right. I mean, I think it's clear that the profit that we get on the V2500, both from the license fee and sort of the engine flying hours fee and the module and spare parts profits is a significant chunk. The -- it was 100 [ph] for the Trent buyback by the way. But there are other factors that will probably add up to more like 200 [ph] in total. It's a factor. So yes, if we strip all of that out, then we get quite a small number for civil profitability, which is a point I was trying to make that you can actually see that when you look at it on a cash margin basis. And I think that that's going to be helpful. And I think various people have analyzed that already. And so I don't think there should be a huge surprise, but we want to do is actually provide some specific clarity around it when we report the numbers.

Zafar Khan

Societe Generale Cross Asset Research

I think we really appreciate -- we do need some sort of understanding of why everything else is making nothing. If I look at it the other way, there's GBP 4 billion within the civil division, which is aftermarket. So is it making such a tiny margin? I really don't know where to start with this.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, I mean, it essentially comes back to this portfolio point of where we are in that portfolio. We've got 4 or 5 engine programs now that are just going through the key investment phase. The Trent 7000 is the latest one. We've got the 2 versions of the XWB. We've had several versions of the Trent 1000, and the Trent 900 is still climbing up, it's clear as well. So the weight of that is outweighing the benefits of the aftermarket on the installed base so far. And that's where we're seeing a relatively low profit, but that -- you'll see that change, both in cash terms but also in profit terms over the next 5 to 10 years.

Zafar Khan

Societe Generale Cross Asset Research

But I understand that in cash terms but in profit terms -- and I'm talking profit here. All the stuff you're delivering, 90% of it is TotalCare linked or unlinked. So you don't book any losses on the OE because on the linked, as is David pointing out, you book a pretty big margin. And on the unlinked, you capitalize a loss, so I can't -- there shouldn't be any real loss on OE, because of the way you account. And that then takes me back to Ben's point. I'm just trying to add up these various things. You quite a big installed base, so is that not generating any profit? Because we've just established, you and I, that big element of the profit is V2500.

David Miles Smith

Former Chief Financial Officer and Executive Director

We should probably spend some more time, but you also have to look at this GBP 4 billion FX cost and where that falls as well. So why don't we spend a little bit more time talking about that? Because we are very keen here to try and -- as we increase the level of disclosure, try and help people get through issues like that. It does make sense to me, but obviously, I need to spend a bit more time thinking about how to explain it to you maybe.

Zafar Khan

Societe Generale Cross Asset Research

I think that would be right. Maybe everybody else would welcome that. And just on the management information systems. I'm getting old now so not very good with the memory. But did you not put in the SAP system, many years ago?

David Miles Smith

Former Chief Financial Officer and Executive Director

So I think Warren said it. We're not talking about SAP here. We're actually talking about all of the systems that we used to assemble information from the marketplace, trends data through a gearbox into physical assumptions that we want to use, and then how we transfer that effectively into the actual forecast. So it's not really SAP issue. This is absolutely the software of what we do with that information and the processes that we use in the business.

Zafar Khan

Societe Generale Cross Asset Research

But the information is there. It's just the extraction. Why is it going to take you 18 months to do that?

David Miles Smith

Former Chief Financial Officer and Executive Director

The data is there. The information takes a lot of work actually. And we are -- we're working with the best in the business to try and improve it. This is -- and I don't intend to take 3 to 5 years like some other companies do when they do this, so we're absolutely working pretty hard on this.

D. Warren A. East

CEO & Executive Director

Thanks. We've actually got some questions from the WebEx, I think. So given that we've had quite a lot in the room, we ought to go to the WebEx briefly before coming back into the room.

John Dawson

Thank you, Warren. So one question on working capital. Can you provide further guidance on working capital? What benchmarks are you setting? And which areas of the business offer you the biggest opportunities?

David Miles Smith

Former Chief Financial Officer and Executive Director

Why don't I take that as well. So obviously, the 3 elements of working capital here are -- or 4 elements are the receivables, payables, deposits and inventory. So classically, I think inventory is the thing that we're paying most attention to here. Our inventory turns are just over 3 at the moment. We believe a competitive benchmark is much

more in the 4 to 5 range. When you look at that across a peer group, we're not actually that bad. But when you look at it across, I think, what an industrial benchmark is, I think there's quite a lot of opportunities for Lean manufacturing to improve that. We will continue to work on receivables and payables and deposits as you normally would but inventory is, I think, the biggest area of opportunity we have.

John Dawson

There's another question on credit ratings. Just to check, you talked about an investment-grade credit rating on one slide, but you also referred to having a long-term credit rating of A-. Is taking the additional debt and possibly sacrificing the A- rating in the short to medium-term a necessary option?

David Miles Smith

Former Chief Financial Officer and Executive Director

Well, this is the sort of issue I want to spend some time on over the next months or so. Clearly, we need to have some extended discussions with our rating agencies, and think about this in a broad context of

capital allocation, dividend policy. I would love to maintain the rating exactly where it is, but I have to be a realist as well, that there are some competing pressures there and we have to take the right decision, I think, on balancing those pressures and based on that assessment, we'll have the right discussion with the board and then we'll let you know in February where we come out.

John Dawson

And one final question, really referring to the reference you made to the digital opportunity. How big is the Internet of Things as an area of focus for Rolls-Royce? As engine reliability improves and data management increases, do you see this as a positive or negative effect on your ability to manage the aftermarket?

D. Warren A. East

CEO & Executive Director

Well, broadly, it's a positive effect. I think I'm sort of very aware of the impact of the so-called Internet of Things, but I'm also very aware that not many people make much money out of the Internet of Things. And what I indicated in the presentation there was we can use more digital capability in 2 ways. One, to drive value by providing incremental value for our customers, and that's the one I'm more skeptical about making money from. And one to provide value which might be to our customers, but is also to us, to improve our profitability. And that's the one I'm much more bullish on, our ability to do that. Rolls-Royce is actually in this space, established an underlying technical capability quite a long time before its peers. Before anybody had ever heard of the Internet of Things, in fact, Rolls-Royce has been collecting data. The challenge now is how to with the so-called Internet of Things and an ability to gather much more information much more often so it comes in greater quantities, to do proper analytics on that to extract real information out of the data and translate that into value for us in terms of more information about the engines it serves. Right. We should go back to the room, I think. My WebEx friend is telling me. So microphones?

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Just 2 questions for me, kind of taking it to a high level, if I may. So one, in general, broadly speaking, since 2011, you have a workforce that since then anyways, have been exhorted by senior management to kind of dig deep and improve cost performance, manufacturing performance and so on. Just Warren, especially in your short time, I mean, what's your qualitative sense about the motivation from the factory floor through the layers of management to kind of dig deep and go harder faster with respect to restructuring? And quantitatively, with the numbers that you do look at internally, at least directionally, are you starting to see some performance from their earlier efforts around the 4 Cs, et cetera? That's the first question. And then secondly, with regards to the recent press releases around the maintenance network in Delta TechOps being awarded a license to overhaul XWBs and 7000s in the future and then more recently around the restructuring of your Asian and German JVs, just what are your goals and objectives with kind of reshaping the network now at this point? And what is driving the timing and how you are doing it?

D. Warren A. East

CEO & Executive Director

Okay. First of all, on the general question about motivation, here's a workforce that has been exhorted to save money, reduce costs over multiple years. Actually, when I came into the business, I found a pretty much more motivated workforce than I expected to find, and people are absolutely up for it, if you like. However, I do think it's important that the message isn't just costs needs to be reduced. I mean, that's clear but it's a question of how costs needs to come out. And as I say, the effect of some of the programs that have been in place so far is one of basically removing headcount without actually changing too much what's actually going on in the business. So you end up with fewer people doing the same stuff, working harder, and that is demotivating after a while. And what I found sort of chimes with the people with whom I've spoken is a recognition that it isn't about costs. This is about simplification, this is about an organization which has gone through a huge period of growth over the last couple of decades, and

processes and procedures have been added to and added to and added to, and nothing has been taken away, seriously. And it's important that, that next stage happens and things get taken away and there is a simplification so that we actually have people doing more stuff rather than -- and they're happy because they're doing more stuff more effectively rather than doing more wasteful stuff. So when we talk about becoming a lean organization, that's another way of putting it, but it's essentially simplification and going back in and looking at what's really necessary, and I found people absolutely up for that. In terms of quantification of some of the benefits of the programs that were already in place, well, on the slide we put some of the programs that were already in place and some of the quantification around there. But in terms of things like customer satisfaction, delivery date, delivering more product on time and so on then actually, we've had huge strides over the last 3 years or so on that. And what we measure as the cost of non-quality, a bucket which includes things like not getting it right first time and having to do it again, that's also made vast strides over the last little while. And I think there's a lot further to go on that but those programs are in place and they are happening. They are necessary, as I said, but they're not sufficient, we need to do a simplification step as well. In terms of the goals around the simplifying the -- or sorry, changing the network of external MRO shops, this is about our costs of handling our TotalCare, this is about reducing the cost. So it's introducing competition into the network there so that people can more effectively and we can more effectively shop around the network. So it's actually a cost-effectiveness activity. Why is it happening now? It's got nothing to do with the noise that has appeared in the market over recent months. This is a much longer-term activity that's been planned a little while, and we're now sort of executing on those plans.

David Miles Smith

Former Chief Financial Officer and Executive Director

I think those things that are out there is also being caused by the ramp that we're going to see in the installed base, really required us to look at our geographic footprint as well. So there's increase -- there's going to be a lot increased demand in Asia or the Middle East, for instance, so this gives us more flexibility to make that happen.

D. Warren A. East

CEO & Executive Director

Let's go here and then a couple over the side there.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami Myerson from Investec. Three questions. You mentioned on the one hand that you talked about the operational gearing and increasing volumes, but on the other hand, you're focusing on wide-body which is a lower volume segment of the market and you've decided essentially not to go back into narrow bodies. Can you explain how to potentially square that circle? Second question is on the suppliers and supply chain because I think you've talked a lot about internal but to what extent have you had discussions with your suppliers? We've heard that some of your peers actually pushing cash of the supply chain to bolster them to give us more of the suppliers. And what is the relationship demand at the supply chain? And thirdly on -- you mentioned nuclear and I've understood that the U.K. lacks Nuclear engineers and do you actually think that you have sufficient engineers actually to grow that business and how are you trying to work to address that?

D. Warren A. East

CEO & Executive Director

Yes. I'm not sure I quite understand the first question about the operational gearing and the volumes. The fact that the wide-body is a lower volume is interesting but the increase that we need to do in volume is relative to the volume that we're shipping in, in wide-body at the moment. We absolutely need to double the volume that we're shipping over the next several years. I'm not quite sure I understand the relationship.

Rami Yehuda Myerson

Investec Bank plc, Research Division

[indiscernible] more engines [indiscernible] your fixed costs over a larger base of engines. Whereas if you had a fewer engines [indiscernible].

D. Warren A. East

CEO & Executive Director

Yes, the issue is that we're spreading that manufacturing cost over approximately the same value though, because the higher volume of engines are much lower cost engines. And when you're talking about spreading the fixed cost, you spread -- we're in the cost domain then rather than the volume domain and so, it comes to the same thing. If we're talking -- we've been then talking about suppliers and the supply chain. Our relationships with suppliers are where we have teams working with our suppliers. Some suppliers are even joint venture activities. Some are definitely partners, long-term partners and some are much more sort of transactional in the relationships, and we manage that supply network. You might be talking about us moving some suppliers sort of around the world. Well again, that's to David's point about where things are growing at the moment. And we are certainly shifting our supply base to take well, first of all, because we're increasing our manufacture in the other parts of the world, so around our Singapore base for example. And it costs a lot less to ship heavy things a small distance -- a smaller distance in Asia than it does to ship them from Europe. And so we absolutely have to look at the supply -- external supply chain in its entirety and optimize it for our operation. Nuclear and U.K. skills. Well, we actually have a lot of nuclear skills in the U.K. at the moment. And yes, skills are always a challenge to acquire and I think it's one of the very good things about the Defense Nuclear application, the submarines that we put out there, is that it maintains skills within our business that we can then use in civil applications. But this isn't something where you suddenly get a lot more business tomorrow and we haven't got enough engineers, these work together. And so I'm not too worried about that as being a fundamental drawback that the moment.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Just on the supplier chain, are you planning on making any changes just the way you work with the supply chain? You talked about changes in the [indiscernible].

D. Warren A. East

CEO & Executive Director

Well, we are talking about doing a little bit more outside the business. We're on a journey at the moment. We're transitioning from around about 70% outsourced value to around about 80% as we ramp up our XWB production. And the main change is the location of some of these suppliers which is a reflection of the where the market is and where our activity is. Now we've got someone over here.

Sandy Morris

Jefferies LLC, Research Division

Sorry this is the agricultural community over here, if we're a community. Sorry it's Sandy, by the way, from Jeffries. I mean, if I go back and tell my market maker I'm chilled out about Nuclear engineers, he may just slap me in the morning. So can I just try and establish a few things that I think I've learned today? So Civil Aerospace is cash negative seemingly by a couple of hundred million. So can we kind of check that off which explains why the group is coming out roughly neutral as I've checked.

D. Warren A. East

CEO & Executive Director

Yes.

Sandy Morris

Jefferies LLC, Research Division

The total -- the aftermarket installed base is at its lowest ebb now in terms of cash generation. Check? Is that, right?

D. Warren A. East

CEO & Executive Director

I think we'll have to unpick the detail on that.

Sandy Morris

Jefferies LLC, Research Division

Okay. More or less, but then if we turn to the investment that is currently going in and by investment, I count R&D, CapEx and OE engine losses because we're in the launch phase, is that at a peak this year or next year and then begins to moderate? Just so that we...

D. Warren A. East

CEO & Executive Director

Investments.

David Miles Smith

Former Chief Financial Officer and Executive Director

I think '15 and '16 are the peak period, yes.

Sandy Morris

Jefferies LLC, Research Division

Right. And then before you give us gross margins and we then multiply the wrong number by the wrong number, if the group gross margin is 24.5%, we can go back even and take Tognum out because we have enough recent information, you would be assuming aftermarket in civil defense is coming through at 40 or something. So this is GBP 3,600 million turnover at that sort of gross margin, this GBP 1,300 million, GBP 1,400 million of cash and real profit is getting taken away by what I've just called investment. Is that a fair way of looking at this?

D. Warren A. East

CEO & Executive Director

Yes, broadly.

David Miles Smith

Former Chief Financial Officer and Executive Director

I think there's 2 things, Sandy. I think there's, as you described is higher gross margin in aftermarket than OE overall. And then there's sort of the underlying stuff, the R&D and SG&A costs and whatever which we'll break out for you in the future which obviously, take us down to a lower bottom line profit and the negative cash margin you described.

Sandy Morris

Jefferies LLC, Research Division

Right. And then the other thing I think I've learned about today is I think need to go change my model because the Trent 700 cash flows are improving for the next number of years which presumably is a reflection of good aftermarket pricing.

David Miles Smith

Former Chief Financial Officer and Executive Director

And growing installed base. It's still growing -- the installed base is still growing, yes.

Sandy Morris

Jefferies LLC, Research Division

Therefore, if I wanted to be kind of sort of devious and mischievous, I would say well, many A350 operators have had A330s. Therefore, why would we have done silly pricing in the A350 aftermarket? At that point, I think I've chanced my arm enough.

D. Warren A. East

CEO & Executive Director

Well, I think you've stated it. No question. We don't really need to say anything to that. Do we? You're correct. I mean, the why would we?

Simon George Denison-Smith

Metropolis Capital Limited

Simon Denison-Smith from Metropolis Capital. Forgive me if you feel you've addressed this, I'm probably being a bit slow, but on the linked contracts, you take profit upfront based on the forecast for what you're going to get in aftermarket revenue. So if your aftermarket revenue doesn't hit your expectations which is what's going on with these parked aircraft, are you saying that you're taking a part of these projected reductions in future profitability you're giving us is coming from the provision you're taking against those profits that were originally overhyped?

David Miles Smith

Former Chief Financial Officer and Executive Director

It's more driven at the moment by the actual utilization. So the engine flying hours which has affected both if aircraft are parked or if they go onto different routes. So for instance, we have routes or aircraft which are going from international routes to domestic routes and then T&M activities, so that's a bigger effect. There will be some effects where you have linked contracts, I agree, but we update that analysis twice a year and at the moment, it's really being offset by cost reductions that we're getting at the same time. So the bigger effect is absolutely through the engine flying hours and the T&M activity.

Simon George Denison-Smith

Metropolis Capital Limited

Okay. So linked to that, I know this question was asked but I still don't think I've got a very clear answer. Are you absolutely certain that Rolls-Royce is not having a higher share of parked aircraft because the pricing is effectively at a competitive advantage to GE's engines through these TotalCare contracts? That your customers are not saying well actually, if I'm weighing up grounding an aircraft to the GE engine versus a Rolls-Royce engine, that I'm better off doing a Rolls-Royce engine because I'm paying a higher cost at that point in time than I am with the GE engines.

David Miles Smith

Former Chief Financial Officer and Executive Director

I haven't seen any evidence of that. Maybe we'll come back on it specifically. But I mean, it does -- as I said, it does get down to a choice for individual airlines on their individual routes which they may have a mix of engines or very often, they may be more exposed to us or GE on those engines. So I haven't seen any evidence at all that it's guarantee or aftermarket pricing. I think it's much more down to operational factors.

Simon George Denison-Smith

Metropolis Capital Limited

Sorry, one final question, which is completely unlinked to this. Is 3D printing an opportunity for Rolls-Royce?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, it is, of course. And we're already actually testing out, quite large and complex 3D printing components that will be the largest of anybody at the moment. The research centers that we do jointly with the government, other companies and universities have been looking very hard at how we can extend

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

the application of additive layer manufacturing various powder technologies as well. So it is for us, I think, quite an exciting, long-term opportunity but one that obviously, we need to make sure works at a very high criteria that are required for the hot end of the turbine engines or whatever. And the cost is still an issue. I mean, they're still quite expensive to make and we have to work on that over time in terms of scale.

D. Warren A. East
CEO & Executive Director

But we're absolutely using it today and will in the future.

Adrian Dolman

Yes. Adrian Dolman here from Kintbury. I've just got a quick question relating to IAE. This morning in the release, you said previous disclosure has undermined confidence in the business model. I note that when it comes to Rolls-Royce reporting your financials, you never disclose what the IAE contribution is. If I look in your Annual Report, I don't even think IAE receives a single mention. Given cash flow has declined and profitability has declined, IAE is now a very large portion of your reported profitability, and it's a significant boost to your potentially negative cash flow. Will you improve disclosure on this going forward? And also, could you give me a rough idea of what the IAE contribution you expect to be this year and next?

David Miles Smith
Former Chief Financial Officer and Executive Director

Yes, I actually think that we have talked about these openly before but if we haven't, then I can clear that up. So I think in revenue terms, it's roughly GBP 600 million and in profit terms, I think it's in the GBP 250 million range, something like that. So I actually have -- I think I've heard that mentioned before but I think if we haven't, then that's roughly where we are at the moment.

Adrian Dolman

It's more to the -- it think when actually, you give the numbers, I think it requires people to ask you on the conference call for you to actually disclose it. I'm not sure it's actually released. No, that's great. But will you disclose that going forward in your releases or will we still need to ask?

D. Warren A. East
CEO & Executive Director

Well, I think we are talking about disclosing that in the modeling the business slides. We'll talk about that.

David Miles Smith
Former Chief Financial Officer and Executive Director

If that's going to be useful, that's something we can absolutely look at.

D. Warren A. East
CEO & Executive Director

We've got a few over the other side and then okay. And in the interest of time, after we've had these questions over here, we're going to close. But we will be doing refreshments outside for any further discussion.

Ryan Shestak

It's Ryan Shestak from Citadel. I just wanted to build on Sandy and Ben's question, just trying to understand the cash flow profile of the various programs on an annual basis. You laid out what it looks like in 2020 and what it looks like in 2025. And if I just focus on the Trent 700 engine for a moment, I understand in 2020, you won't be delivering anymore, so the installed base would be at its peak, i.e. sort of maximum number of flying hours. And as we roll forward to 2025, the flight hours or the cash inflow would seemingly be lower than 2020 and the cost to service those engines that have been delivered over time would seemingly be higher. So I'm just trying to understand how to read the chart why 2025 for the

Trent 700 has considerably higher annual cash flow than 2020 if the flight hours will be lower and the shop visits will most likely be higher.

David Miles Smith

Former Chief Financial Officer and Executive Director

I'd say so the exact positioning on those charts may be a bit illustrative in some cases but the -- I think the point -- there's a couple of points why you'd still be seeing improvements. Firstly, we get escalation every year in pricing, so that's part of the contract. It doesn't stay the same, it goes up every year and inflation may increase, if you like. And then we continue to actually take cost out of that end of the legacy engines. A lot of the cost improvement that we're seeing coming through TCA last year, for instance, the 150 million that we talked about, a lot of that was on the Trent 700 and we would expect to continue to take cost out of that engine over time. So you're right, at some stage, we get to the peak on the utilization. There are still a few products being delivered on the military side as well, but you're right, the Civil side will stop. But we still have an opportunity to improve margin even after that, both on the pricing and the cost side.

D. Warren A. East

CEO & Executive Director

Yes. So just to add. I mean, these charts were based on a bottoms-up analysis, so there's the facts that David just described and they are what we expect to materialize and that's what's positioned that dot on Slide 56 compared with Slide 55. However, as he said, it is a PowerPoint, this is not meant to be financial reporting but the relative positions is absolutely correct. I think well, this might be the last question.

Nick Cunningham

Agency Partners LLP

It's Nick Cunningham from Agency Partners. Just looking at Chart 55 again, I think I got the chart number right. Obviously, that section's indicative, but the Trent XWB is both in positive cash flow territory even though there won't be that much of an installed base generating hourly payments at that point and you'll be delivering a lot of OE engines. So does that imply that you'd expect the Trent XWB to be breaking even or better on a cash basis OE by that stage?

D. Warren A. East

CEO & Executive Director

Well, the answer there is that it will actually be in reasonable volume in that stage. The Trent XWB is the fastest selling engine that we've had. And it's an engine that we have a massive order book for at the moment, and that's why we're gearing up to double the production in total but the ramp-up on XWB is really very steep. I think I'm right that the order book at the moment is for XWB is roughly the same quantity as the installed base on Trent 700 at the moment. So it's massively steep and there will actually be a lot of Trent XWB engines flying around in 5 years' time.

David Miles Smith

Former Chief Financial Officer and Executive Director

And I think there are 3 or 4 things that are helping this as well. So the launch cost through the launch pricing on OE side will obviously won't have the same level of R&D support for the product once it's in the market. And we will be generating some fairly -- even though it's early on, some fairly significant aftermarket begins to get generated by then. So all of those things are positive and we will on that 84,000 [ph], we should be in positive territory on an OE basis. Absolutely.

D. Warren A. East

CEO & Executive Director

Yes? Do we have anything else from the WebEx, John?

John Dawson

No.

D. Warren A. East

CEO & Executive Director

Okay. Well, with that, I think we'd like to close the Q&A session. And thank you all, very much for coming, and there will be some refreshments outside.

Operator

Hello, and welcome to today's Update on all the Operating Review and Interim Management Statement. [Operator Instructions] And just to remind you, this is being recorded.

And today, I'm very pleased to pass you over to John Dawson at Rolls-Royce. John, please begin.

John Dawson

Thank you, Hugh, and good afternoon, ladies and gentlemen, for those in the U.K., and good morning to those of you in the United States. This call is primarily for the benefit of our U.S. shareholders, who hopefully have an opportunity to dial-in this afternoon and, of course, to analysts and investors here in the U.K., who may have further questions that they wish to ask management.

My name is John Dawson, I'm Head of the Investor Relations at Rolls-Royce. With me are Warren East, our Chief Executive; and David Smith, our Chief Financial Officer. Warren will be taking the lead on the presentation today.

Before I hand over to him, I would remind you to review our safe harbor statement, which is attached to the PowerPoint and is available on our website.

We will have plenty of time for questions at the end of the presentation, which should last about 5 minutes. Please wait for the operator's instructions to register for a question at the end of our opening remarks. Thank you.

And without further ado, let me hand you over to Warren.

D. Warren A. East

CEO & Executive Director

Thanks, John. Good morning everyone in the call in the U.S. Thanks for joining us today, and I apologize about the short notice. We've an hour available for the call, but our IR team will be able to communicate after the call and we'll set up meetings and telephone conferences as required.

So as you've seen in the U.K. this morning, we issued an interim management statement and that covered 3 main areas. Firstly, initial findings from the operational review that I've been doing; secondly, an update on the outlook for 2015; and finally, our current views on 2016 and the headwinds that we are facing transitioning from 2015 into 2016 from a profit point of view.

Now, this IMS included some very difficult, but necessary messages and that's why we want to take the time to hold a conference call and be able to spend time with investors explaining more about the issues, and importantly, what we plan to do about things.

So let's go on to the key messages slide, the first -- first slide. I'd like to reiterate, to start with, that after 4 months of being in the business, everything I've seen has confirmed the good things that I saw. My view that the company has a strong portfolio of products and services, definitely has a world-class engineering capability, and actually, is well-positioned in the market to generate high market shares and strong cash flow, and actually, in the longer term, higher returns on capital.

And we're preparing for an increase in our wide-body engine production, an increase which doubles our production from around 300 to around 600 engines per year. And that is a reflection of a very strong order book and a growing market share.

So that's the good stuff. During the year, we've also taken steps to improve our balance sheet -- strengthen our balance sheet and improve liquidity. And so that puts us in a strong position as well. But we've been faced with a number of headwinds that continue to impact 2015 and they have material implications for 2016. And I'll discuss that in a bit more detail shortly.

But in summary, and in common with most industry players, we're seeing significant changes in some of the end markets in which we operate. And this is primarily lower demand within the corporate jets and regional jet market, reduced utilization of older wide-body jets as well. And we're also seeing a continued and even more severe deterioration in the offshore sector to which our Marine business is exposed.

So for the current year, our overall guidance is actually unchanged, although we do expect profit to be at the lower end of that range. Now, our assessment of the profit headwinds for 2016, however, totaled some GBP 650 million in total, and that equates to a further GBP 350 million of headwinds compared with what we talked about in July.

Good news, in cash flow terms, however, we expect a much more consistent year-on-year performance and we can explain that difference in a little while. So clearly, the conditions that we face are challenging, and our expected performance is disappointing. And for me it's also striking that the revenue impact of these changes in the market -- the revenue impact is relatively small, but the profit impact for us is large. Interesting observation, and we'll come back to that.

So as you know, I've been undertaking an operational review for the past few months and I had been preparing to present the conclusions to you later in November. But in the light of the numbers coming together for today and reflecting on the size of that, we decided that I should definitely bring forward the announcement of at least the headlines of what I think we need to do as a result of the operational review that's been going on. And I understand that it's -- the whole thing makes unpleasant news and it's a good opportunity to make sure that people have time to digest this before we start talking on November 24.

So let's look at some guidance -- 2015 guidance. We've guided to the lower end of the profit range that we gave in July, but otherwise, it is actually unchanged on a constant exchange rate basis. It's a reflection of growing headwinds that we've seen coming through the year, but those growing headwinds are offset by some of the mitigating actions that we've already taken.

But the impact in 2016 is more severe, as we feel the full force of these market impacts and some of the market changes, and in particular, some of those changes which have come along a bit faster than we had previously anticipated.

So let's turn to 2016 now. We've set out in the statement and we're outlining on this slide how the key factors that we see that are making up the challenges for the coming year. The GBP 650 million headline figure consists of GBP 300 million that was identified in July, in particular relating to the impact of the slowdown in the Trent 700 order book. I note that we believe the initial estimation that we made in July remains absolutely valid, so this is essentially the same position that we were in, in July.

However, since then, we can also see a further approximately GBP 100 million impact if we look at corporate and regional jets together. And in the corporate jet market, we're seeing further weakness in demand for those business jet engines, particularly for new orders. And then in the regional market, we're seeing weakening demand for aftermarket services in the 50- to 70-seat category, where people are simply not flying those airplanes for a variety of reasons.

If we look in the large engines area, then we have about GBP 100 million and GBP 150 million headwind in large engines. We're seeing good growth in installed thrust, but that's being offset by some selected short-term weaknesses on some older wide-body programs, and this is where aircraft are being temporarily parked up by some players in the industry as they manage a transition to new, more efficient aircraft. The net effect of that is about GBP 100 million to GBP 150 million of profit. Finally, there's an additional GBP 75 million and GBP 100 million of further headwinds for the Marine business as the market there continues to weaken for both the original equipment sales and for services in the offshore sector.

So these profit effects taken altogether are quite dramatic. However, as I mentioned earlier, the impact on cash flow is a lot less. And that's because of the noncash nature of the adjustments as a result of TotalCare accounting, the TotalCare accounting adjustments in 2015 compared with those adjustments in 2016. There's a bigger adjustment in 2015, it's a positive, and a smaller adjustment in '16. Therefore, the negative profit swing is somewhat less by the time you look at it from a cash point of view.

And if you add to that reduced cash impact expected benefit of improved working capital, you get the broadly neutral position that we're talking about in the guidance today -- or in the estimations today.

So now let's look at slide on restructuring because I'd like to say a few words about this in this context. This was going to be talked about initially on the 24th of November. We'll come back on the 24th of November, and obviously add a lot more color to this. And we'll probably add even more color in February as well, because it's an ongoing program.

Now, let's say, When David first became CFO this time last year, he said that one of the jobs was to improve our management information, forecasting and business systems. So that was already in motion when I became CEO in July. It's a major and complex program and that's well underway. But from what I have seen over the last several months, and importantly illustrated by the news today, we've got a lot more work to do on that.

Right now, it's not working properly and it needs to work better. My key requirement is to add a bit of pace to this and simplicity and accountability into decision-making in the business. And the business itself has really shown itself over the last several months to be much less able to respond to changes in the market conditions than should be the case.

I also think, and referring to the point made earlier about small revenue changes resulting in large profit changes, I think we're carrying far too much fixed cost and we're not sufficiently flexible in managing the cost base in response to the changing market conditions. And actually, that's just unacceptable for a world-class business and particularly, where we're operating in a very competitive environment.

So we need to put into place some significant changes to make this business more resilient and sustainable, and we need to move a bit more rapidly with the restructuring in the light of the fact that we are facing further weakening in some of our key markets.

It's too early to provide detailed costings of proposed restructuring and we will give further information, as I said, later in this month on the 24th, and we'll provide, I'm sure, more detail with our results in February and updates after that.

In the meantime, the previously announced restructuring that's going on in our Marine and Aerospace businesses, I'm pleased to report that's actually going well. And I'm also confident that the benefits of the actions that we're announcing today will also have a significant impact and will be having a significant impact by the end of 2017.

And with that, we'll open up to questions. Thank you.

Question and Answer

Operator

[Operator Instructions] We go over to the line of Avi Hoddes at Millennium Partners.

Avi Hoddes

I have 2 questions. Earlier today, BAE said that they were going to be cutting your fighter production by about 50%. If you think about defense next year, early this morning, you expressed optimism about chance for aftermarket. How would the headwind from the Eurojet going down compare with the potential tailwind from the aftermarket? Is it a disproportionately profitable OE business? And then on Land & Sea, I was wondering if I could just ask on the order side, how are orders shaping up in Marine and Power Systems in the second half versus the first half? Could you give us some sort of color or flavor or magnitude of change you're seeing there sequentially?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. So I did see the BAE announcement, although I haven't had chance to discuss that with our defense team. But in terms of our own views on that, we already had basically a fairly conservative view on the engine production. Clearly, there are 2 recent opportunities, one around the Dubai contract, which was announced a few weeks ago; and then one that's still speculative at the moment around Saudi Arabia that could provide some -- or one of which will -- and the other could provide some upside, but we already had a fairly low view in terms of our own forecast around production on that engine. In terms of Land & Sea orders, very different picture here and partly reflects the fact that Power Systems is actually exposed to quite a wide range of -- or on top the old Tognum, a wide range of markets. Yes, they do have some exposure to global commodities in mining and in oil, but we're already experiencing very low level of demand in those markets anyway. So Power Systems went out of June with a record order book. They've actually had a decent order intake since then so their order book is in reasonable shape. Clearly, it's a shorter-cycle business so we don't tend to be fully covered for the next year on orders anyway. But in terms of the progression, that's pretty satisfactory. Offshore Marine is a very different picture though. We've seen actually since the midyear, quite a significant drop in further order intake, which is the reason that we're taking, based on that now having continued for 3 or 4 months, taking the view that that's likely to result in a fairly significant downgrade in revenue next year. So quite different pictures, I think, between the 2 businesses.

Operator

Okay, we're now over to the line of Harry Breach at Raymond James.

Harry William Freeman Breach

Raymond James Euro Equities

Warren and David, can you hear me?

D. Warren A. East

CEO & Executive Director

Yes.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes.

Harry William Freeman Breach

Raymond James Euro Equities

Yes? Perfect. Three questions. Firstly, can you give us any flavor on the 330 program? One of the concerns back in July was about potentially sort of increasing competitive pressure for the remaining undecided customers for the remaining 330 CEO production slots, if I can call it that. How are things progressing in terms of your campaign wins on that? Is it sort of in line with or better than or worse than what you were hoping? And can you give us a flavor similarly on the pricing for that? Second question was just looking at the time and material side of the business. Aside from the specific operators of certain older wide-bodies that you touch on in the press release, can you give us any feel for your time and material aftermarket demand, in particular, outside of those specific operators? And then final question is, David, earlier on, you touched on no change to your expectations or maybe that the Civil guys' expectations of 25-year service life on average for large engines. But I'm wondering if within that 25 years, are they making any change about the average annual flying hours within that? Are we -- I guess specifically what I am getting at, is are we perhaps seeing an environment where there is a greater propensity prematurely to park these older wide-bodies because there's so much new supply coming onstream and therefore, are they just -- is it going to be across-the-board issue for wide-bodies? Or do you feel that we can concentrate on what's happened today on certain operators that had issues quite specific to them?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. Okay, let me take those, and Warren can obviously add anything as I go through. But in terms of the 330, actually, the estimate that we made at the end of June, early July, of the impact here has actually proven remarkably resilient. So I said at the time, we thought the volume would be between 80 and 100 over the next couple of years and that's proved to be a good assumption and the pricing assumptions we made also. So actually, that number is pretty well -- was pretty accurate. We absolutely did see intense pricing pressure, but we've now -- the majority of those deals are now firm. There may be 1 or 2 that are not -- that still need a bit more work, but certainly with the Chinese orders that were agreed as part of the president's visit a couple of weeks back, then that's looking in pretty good shape in terms of the 330. So not good news in terms of margins, but a bit in line with what we thought. In terms of T&M specifically, I mean, there's sort of a couple of aspects to that. Firstly, clearly, one of the things that we're doing is continuing to increase reliability, which does perversely, unfortunately, push out shop visits. And certainly, in terms of the discretion of people to do that, then that gives them a bit more flexibility. But the basic issue is much more around flying hours and the -- and those older aircraft being parked than particularly T&M driven at the moment. And then on the 25 years, maybe I'll just repeat what I said again. So I didn't say -- or what I said was -- this morning was the actual evidence is actually pretty consistent over the last 20 years in terms of being about 25 years on average. That really -- that number really hasn't moved. It's remarkably the same over the last 20 years. However, when we think about programs ourselves, we clearly look at different scenarios there. And that's not necessarily the assumption that we use when we're looking at individual programs, individual airline deals. We will take scenarios around that when coming up with our own pricing assumptions and evaluating the programs. All I was really saying is actually the evidence hasn't changed, but we are more cautious in that when we do our own evaluations.

Harry William Freeman Breach

Raymond James Euro Equities

Can I possibly just press just a little bit more on the T&M side? If we were to sort of isolate the specific carriers that you mentioned in the press release, is your T&M revenues in the second half so far sort of up year-on-year or about the same or something else?

David Miles Smith

Former Chief Financial Officer and Executive Director

I think, in a way, the issue is all about utilization. It's not about T&M contracts at all. It's about the fact that planes are simply not being used. And that's what's causing the issue that we're flagging as an issue that's going to be a headwind in 2016.

Operator

Okay, we now go on to Tristan Simpson at Exane BNP Paribas.

Tristan Sanson*Exane BNP Paribas, Research Division*

So it's Tristan Sanson from Exane. I wanted to come back to the pressure that you are seeing on the older wide-bodies aftermarket. And you mentioned that the key issue was certainly with the number of our aircraft being parked. Now, if we look at how this park rate evolved over the year, I have the impression that the main recent evolution was an acceleration of groundings on 777 powered by Trent 800 at a handful of airlines. What I struggle to understand is how you get to the GBP 100 million to GBP 150 million of impact, because the number of aircraft and engine at stake is not so high in the end. So can you give us a bit of a feel for how you look at it? Is it a question of lower numbers of hours flown? Or is it driven by LLP content at your visits that will not happen? Is it all cash? Anything that can help us to understand how you build the GBP 100 million, GBP 150 million would be helpful. And the second question is I understand that the marketing of the aircraft is made complex by debates on the residual values of the engine in the absence of an independent maintenance network for developmental forces. How can you work on improving the remarketing ability of these aircraft going forward? We see what you're going to do or what you're doing with more modern programs with TotalCare Flex, happy to see Cathay Pacific signing on that one. What can you do for older engine programs?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Yes, I mean, on the first part of a question, I think, as I said this morning, actually in the first half of this year, we really didn't see an effect and we actually experienced good aftermarket, growth [ph] year-over-year in the first half of this year. I'm just trying to recall the percentage, but it was sort of 5%, 6%, that kind of level. So this is quite a recent thing in terms of what we're seeing. So you're absolutely right, there have been some specific cases. What we're essentially doing, therefore, is looking at the whole fleet and taking an assessment across all the airlines, which causes us to be more conservative about how that might develop during next year as well. So it's not just what's already happened, it's what we expect may well happen over the next year. We will hope we're being cautious about that, but that's how we get to the higher number.

Tristan Sanson*Exane BNP Paribas, Research Division*

Okay, so the ratio per engine, it doesn't mean anything for -- okay, I understand. And on the remarketing ability?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Yes, I mean, as you say, total TotalCare Flex is something that we are just launching and may help. We're obviously having -- none of these situations is one that we -- if we could avoid it happening, we'd much prefer it. So we will work with the airlines affected to see if there are alternative solutions. But the primary issue is really around their own capacity organization. Not -- that's what they're trying to address and therefore, sort of us trying to make it more viable for them to continue to fly, isn't necessarily the right answer for them either. So the solution may actually be to try to facilitate those engines moving onto -- or aircraft and engines moving onto different owners, which is clearly one of the things that the TotalCare Flex product enables us to do in terms of working with other customers.

Operator

[Operator Instructions] Okay. As there are currently no more questions in the queue, gentlemen, may I please pass the call back to you.

John Dawson

Thank you very much, Hugh, and thank you all very much for taking part. As normally the case, a shorter list of questions in the afternoon. Hopefully, that's no reflection of interest from shareholders. But please don't hesitate to contact the Investor Relations team if you have any questions and, of course, we'll

continue to reach out to you all over the next few days to provide further information and understanding of what we said today. Thank you all very much for taking part. Thank you, Warren, and thank you, David, and good night.

Operator

This now concludes the call. Thank you all very much for attending. You may now disconnect.

Presentation

Operator

Hello, and welcome to today's Rolls Royce Holdings plc update on the Operating Review and Interim Management Statement. [Operator Instructions] And just to remind you, this is being recorded.

And I'm now very happy to pass you over to John Dawson at Rolls-Royce. John, please begin.

John Dawson

Thank you very much, operator, and good morning, ladies and gentlemen. Welcome to the call, My name is John Dawson, Head of Investor Relations of Rolls Royce and with me today are Warren East, our Chief Executive; and David Smith, our Group Finance Director.

Warren will be taking the lead on the presentation today. Before I hand you over to him, I would remind you to review our Safe Harbor statement, which is attached to our presentation and is also available on our website.

We will have plenty of time for questions at the end of the presentation which should last about 5 minutes. So as the operator said, please wait for instructions to register for questions at the end and then we'll be able to take your questions.

Without further ado, let me hand you over to Warren.

D. Warren A. East

CEO & Executive Director

Thanks, John. Good morning, everybody, and thank you very much for joining the call today and we appreciate this was very short notice. Right now, we have an hour available for the call, but I know that our Investor Relations team will be spending the rest of the day talking to as many people as possible. And if we need to talk more, we will.

So as you've seen, we've issued the statement this morning and that contains information in 3 main areas. Firstly, initial findings from the review of operations that I've been doing; secondly, an update on the outlook for 2015; and finally, our current best views on 2016 and the headwinds that we're facing there. Now all of this, I know includes some very difficult messages and that's why we wanted to hold a conference call to explain more about these issues and importantly what we plan to actually do about them.

So let's switch to the first slide. I'd like to reiterate that after -- I'll just start--to reiterate, after 4 months of being in the business, everything I've seen has confirmed my view that the company has a strong portfolio of products and services. We certainly have a world-class engineering capability and we're well positioned to generate high market shares, strong cash flow and higher returns on capital in the longer term. We're also preparing for an increase in the wide-body engine production from approximately 300 to approximately 600 engines per year. That is a reflection on the strength of our order book and that is the most significant reason why we have to undertake a fairly significant transition in manufacturing capability.

During the year, we've also taken a number of steps to improve our balance sheet and liquidity. And that puts us in a strong position. We have, however, been faced with a number of headwinds and we've talked previously in the year about that and that will continue to impact the 2015 performance, and it's going to have some material implications for 2016. And I'll discuss these headwinds in more detail in a moment.

But in summary and in common with most industry participants, we are seeing significant changes in some of our end markets. It's primarily lower demand within corporate and regional markets and reduced utilization of older wide-body jets. We're also seeing continued and more severe deterioration in the Offshore Marine part of our business.

For the current year, our overall guidance is unchanged although we do expect profit to be at the lower end of the range. Our assessment of the profit headwinds for 2016 totaled some GBP 650 million in total. And that equates to a further GBP 350 million of headwinds compared to what we expected in July.

In cash flow terms, however, we expect a more consistent year-on-year performance and I'll explain that in a moment or 2. Clearly, the conditions that we're facing are challenging and our expected performance, I find disappointing. But as you know, I've been undertaking a review of operations over the past few months and I've been preparing to present the conclusions of that to you later in November, on the 24th of November, but given today's news, I've decided that we absolutely needed to bring forward some of the highlights from that and make sure that today's news is, which is obviously unpleasant, is balanced with some news about what we're doing about this.

So let's have a look at 2015. Turning to guidance on 2015, we've guided to the lower end of the profit range that we gave in July, but otherwise this guidance is unchanged on our constant exchange rate basis. And this is a reflection of the growing headwinds that we've seen through this year, but it is offset by some of the mitigating actions that we've already taken. The impact on 2016 is more severe and we're going to feel the full force of some of the market changes and some of those changes have come faster than we'd previously anticipated. So let's look at 2016.

We've set out in the statement and outlined on the slide the key factors that we see providing the challenges for the coming year. GBP 650 million headline figure comprises GBP 300 million which we identified in July, in particular relating to the impact of the slowdown in the Trent 700 order book. Note that we believe our initial estimation of this impact remains absolutely valid today. The next component is GBP 100 million in corporate and regional jets and that's because we're seeing further weakness in the demand for business jet engines, in particular for new orders as well as further weakening in demand for aftermarket services for the sort of smaller 50- to 70-seat regional aircraft. Then, in our large engine business, we have between GBP 100 million and GBP 150 million of headwinds. We're seeing good growth in installed thrust, but that's being offset by some short-term weakness on older wide-body programs. And this is where our engines are being temporarily parked up as some people in the industry manage their transition to newer and more efficient aircraft.

Finally, it's between GBP 75 million and GBP 100 million of further headwinds in the Marine part of our business where the market in offshore, in particular, continues to weaken, both for original equipment sales and for services. So the profit effects are really quite dramatic, but the impact on cash flow is a lot less. And the reason for that is the noncash nature of the total care accounting adjustment in both 2015 and 2016. And there's a difference where those adjustments are much more significant in 2015 than they are in 2016. And there's an expected benefit in 2016 with improved working capital as well. So now we'll switch to the restructuring program, because I'd like to say a few words about the restructuring program that we've announced today.

When David first became CFO, this time last year, he said one of the jobs was to improve our management information forecasting and business systems. And that was already in motion when I joined the company at the beginning of July. It's a very complex program and it's well underway. But I think the substance behind the news we're announcing today shows that we need to do a lot more there and so further work definitely needs to be done on that. I want to add some significant pace to that. I want to add some simplicity into our processes and make sure that there is greater accountability around the decision-making in the business. As the business shown itself far less able to respond to changes in the market conditions, then, really, we should be able to do.

I believe that we're carrying too much fixed cost in certain parts of our business as well and we're just not sufficiently flexible at managing that cost base in response to changing market conditions. Market conditions are going to change anyway and it's something that we have to get used to. This is, therefore, totally unacceptable for a world-class business and particularly where we operate in a very competitive environment. So we need to make very significant changes to make ourselves more resilient and sustainable. And we need to move rapidly with the restructuring, because that's in the light of these further weakening that we have seen in some of our key markets.

It's too early right now to provide detailed costings of the proposed restructuring, but I do intend that we will give you some further information on this on November 24, as previously planned, and we'll be giving you even more details with our results in February.

But in the meantime, the previously announced restructuring and cost cutting that's going on within our Marine and Aerospace business, that's going well. And I am confident that the benefits of today's actions will have a significant impact too, by the end of 2017.

So with that, let's open the call up and we'll have some questions.

Question and Answer

Operator

[Operator Instructions] The first question is from the line of Ben Fidler, Deutsche Bank.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

If possible, I could squeeze in 3 quick ones. The first of which is, just to understand I suppose, how come the deterioration in a number of your Civil Aerospace businesses has accelerated so much since July. We're not that far on for businesses where you should have reasonably good visibility around corporate and regional OE deliveries, for example. I just wondered why the pace of that has surprised. The second issue is, I know you have provided a view for 2017 and you maybe limited about how you want to answer this question, but just to understand, some of the effects dragging on '16, do they continue? You yourself, Warren, used the language of a temporary parking up of some of your older wide-body programs. Do you expect things like that to reverse in '17 and therefore should we see '17 as a strong rebound year? Or is it more a progressive recovery from that point onwards? And the third question is just with some of these older programs where you're suffering an excess level of groundings, I suspect it may be 340s, it may be 777s, does that create any asset write-down risk on some of the TotalCare assets or are you comfortable that, that is not a risk?

D. Warren A. East

CEO & Executive Director

Right. Let me start with the first 2 questions. Thanks, Ben. One, has the pace of change really surprised us? Well, I think this has been a building effect and certainly when we talked in July, there was some of this effect was there. I think -- we've just been through a process where we've looked at our budgets for 2016 and this is our estimate based on where we are today. The very reason that we're also announcing the restructuring and the program that I'm going to talk about in a bit more detail on the 24th is because these changes will happen and they do happen fast. And the issue is ability to respond and ability to take data from the market and turn that into information and do something with it. And so I think that there's a combination of effects here. It's well -- the actual issue is documented and it's been reported by other companies. And it probably has accelerated -- the pace of that has accelerated since the middle of this year. But that combines with the fact that we also need to do a better job of being able to deal with that. So that's really what I'd like to say on the pace. And it has been quite quick since July. Now we've given a 2017 view just in terms of saying that we expect the impact of some of this new changes that we're announcing to impact from 2017. It's too early to talk about the impact of the parked up aeroplanes on 2017. Some of this -- it's very select number of airlines that are involved at the moment. Some of them are basically balancing capacity and demand. And there's new more efficient aeroplanes out there and those planes are being bought to increase capacity. Meanwhile, demand wobbled slightly and so the obvious thing to do is park up the less efficient engines and use the planes with more efficient engines. I think it won't be -- it's really too early to say is it a temporary effect that will be over and done with by 2017? The -- in the long term, the demand is certainly there. And so we do expect to see the overall number of aeroplanes being used continue to increase. And so I suspect that it is temporary and it's going to be a progressive recovery, but it's really a bit too early to say this will all be complete by 2017. As for asset write-downs, do you want to have a quick...

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. Maybe I will just add to Warren's point. So Ben, you remember when we talked about the GBP \$300 million and the Trent 700 effects, we did say we thought that would be about the same in 2017 so that view hasn't changed. And what I would say in terms of improvements, this is really going to be driven by the new installed base on the Trent, as opposed to I think any improvement on the legacy programs, because they will continue obviously to reduce over time as we would expect. To some extent this maybe

pull ahead of that, but we've yet to really bottom that out. And clearly also the Marine business is really very much on how we will see market developments over the next year. And so again, that's really much too early, I think, to comment on that. In terms of specific use -- question on specific asset write-downs? No, not in general, overall. We still have sufficient cushion on those programs, but of course, as you know, we undertake actually a very detailed review and we will look at specific valuation reserves against individual airlines, that's a normal part of our process. But it won't be an overall effect in terms of any, to write-down the assets.

Operator

Okay, our next question is from the line of Jeremy Bragg at Redburn Partners.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

A couple of questions, please. Firstly, do you think know that this 2016 guidance is fully conservative or there's some areas where you think there's still risks? Second question, if it's too soon to talk about 2017, are you still confident that in the longer term, cash flows and margins can improve from now? And third question, which I think I asked last time, on the last similar conference call was, is this an attempt to reset the accounting, again for TotalCare, given the downgrades to EBIT have been bigger than the downgrades to free cash flow?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, so why don't I take each of those. In terms of -- it's a conservative forecast. I think we will continue to view it as a balanced forecast based on the market headwinds as we've seen them. We've tried to give a much earlier view. We started that in July. We're updating that now. We clearly will update that further in February. I think it's already balanced in terms of how we see the market at the moment, but clearly the market is changing and we will have to continue to ramp to that. In terms of long-term margins? No, I'm still very confident about that. That's driven as I hinted in the last answer about the long-term growth in the installed base of the new Trent engines. That will generate significant improvements in cash flow and operating margins and return on capital over time. I think we're talking about the transition effects on the legacy programs primarily here. And is this an attempt to reset accounting? No. There is no change in accounting within this guidance. This is really driven by what we're actually seeing physically in the market and trying to do the best we can at forecasting how we could see that developing over the next year.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

So can I just follow-up very quickly on the long-term margins. I mean the obvious question is as your starting point is now lower, is your endpoint also lower in the long term, please?

David Miles Smith

Former Chief Financial Officer and Executive Director

No, I don't believe so because the long-term margins will be driven by the new portfolio that's coming in place over the next 5 years. So that's what's going to drive it. What we're really talking about is the effects of the runout of the legacy portfolio here.

Operator

Next question is over to the line of David Perry of JPMorgan.

David Howard Perry

JP Morgan Chase & Co, Research Division

I've also got 3 questions, please. The first is just when you talk about the need to improve management information systems, I just wondered how much of that is sort of operational issues and how much of it is related to the complexity of TotalCare and all the inputs that go into that. And whether perhaps you're

thinking, Warren, on TotalCare accounting has evolved relative to comments you made previously that you're probably comfortable with the accounting? The second question is what do you think of the major downside risks from here? I mean, David, I know you said this is a balanced outlook. I think on the last warning in July, you said it was -- the new guidance was robust. I appreciate there are things out of your control with markets changing, but I just wondered what you thought were the major areas of risks still. And then the third question is I was just wondering for November 24, we would expect any medium-term earnings or sales and earnings targets, please?

D. Warren A. East

CEO & Executive Director

Okay, let me start with the first one. And I think the comments on the information systems have nothing really whatsoever to do with the TotalCare accounting and the accounting is more of a comment on broadly, we have lots of people engaged with customers, engaged with the market, we pick up lots of data. We turn that data into information. We make decisions about it and some of those decisions are what we expect in terms of financial outturn and some of it sort of normal operation planning decisions. The issue is that we take too long and the process by which that data gets turned into information is too complex. And so what we need to do is make the whole process more simple, but also increase the -- essentially the clock frequency, as they say that we are able to respond more quickly within the business to changes in the market which is going to happen anyway. David, do you want to talk about the second question?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, I think on your question about downside risk. It's really, as I described it earlier, that -- I wouldn't say that any of us is in a position to talk operatively about how the oil and gas industry is going to develop. We are trying to give the view on Offshore Marine that we think is based on the order intake that we have seen, which has been very low. I've described that previously, but it continues to be very low. And therefore that's our view through 2016, I think. We'll have to take a call on how that moves through 2017, '18 during next year. But, clearly, I would be more conservative than I would have been 6 months ago, just given on the experience over the last 6 months. In terms of the downside risk on the legacy off the market portfolios. I mean, we've modeled that and looked at that as closely as we can, but there clearly is a big transition going on, both in the narrow-body and the wide-body side of the business. And I think that we are not alone in experiencing this. I've seen comments from several other companies based on the airlines side and the supply side within the industry over the last few weeks. And I think what we were seeing is part of a pattern. And that may well not -- that may well change further and we've got to be prepared as Warren said for that and therefore more resilient to those sort of fluctuations, that's really why we're taking the action that we're taking.

D. Warren A. East

CEO & Executive Director

Okay, and so your third question about -- talking about medium-term guidance on the 24th of November. The 24th of November, we're going to talk about what I've concluded from reviewing the operations. And right now, I've decided that comprehensive guidance for 2016 is not a good idea, which is why we're talking a bit more directionally about this and we're explaining the factors behind the profit headwinds from 2015 into 2016. And I don't think it makes good sense to reiterate medium-term guidance now either. But what we will be talking about is the nature of the businesses, how they work, and the sorts of things that we're doing to improve the operational performance of those businesses. So people can form a judgment about how quickly we can improve the margins within the business.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay, and if I may just ask a follow-up, please, and thank you for those helpful answers. If the management inflow isn't in anyway related to TotalCare accounting, do you still stand by your comments

on the first call that you're broadly comfortable with the accounting? And that TotalCare doesn't need radically revisiting, at least from an accounting perspective?

D. Warren A. East

CEO & Executive Director

I do stand by that. It's -- the TotalCare accounting that we do, I agree, it's complex. But it's part of the complexity and that comes from the necessity to be suitably conservative. The TotalCare programs are all about providing appropriate, what the customer wants. And it's important that we remember in all this that the accounting will be what the accounting will be. We need to concentrate on delivering value for our customers. And then it's up to us to make the whole process as simple as we can possibly make it so that we can respond quickly to the changes there. No, I stand by the total accounting that we have at the moment. Do I -- would I like it to be simpler? Yes, I would like it to be simpler. And as we've already said earlier this year, the complexity associated with this is partly to do with the fact that some contracts are linked, some are not linked to the OE sales and that -- the balance of linked and unlinked is shifting as we move to newer engines over the next several years. So the issue will, in time, largely disappear.

Operator

Our next question is from the line of Andrew Gollan at Berenberg.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

I've got 3 as well, if I may. First one, quite complex really, I'm just trying to understand more about the changes in assumptions that you are alluding to within the contract accounting. David, you mentioned in one of the earlier questions, you're confident of the longer-term returns in cash flows. Part of the message today is telling us that the legacy fleet is not as profitable right now or -- you said temporary effects. I'm just trying to work out whether there is a structural change in your expectations for the profitability of that, let's say, the legacy fleet over the longer term. We're going through a transition. We're seeing, maybe, some short-term temporary effects. But does that mean that the life of these contracts -- not the contracts, the life of these engines are perhaps shorter than you expected? And that we are structurally changing our longer-term assumptions because a lot of us just sort of look at that as -- the profit and cash driver on a 5- to 10-year view is the maturity of all of that fleet. So I'm just trying to understand that a bit better. What are you telling us here? Secondly, a couple of questions on cash, just a very short term one. The cash flow effects are less, you mentioned. Can you just give us a feel for the kind of drop through or quantum, if you like, of the profit impacts that you're guiding to next year on that additional GBP 300 million of profit? And then, just longer term and I guess linked to the first quarter, as profits move closer to cash, clearly, that's a good thing; something that would have happened over the very long term anyway. But can you give us a sense of maybe some metric, like cash conversion, free cash conversion profile over the next, say, 2 or 3 years, through this transition period? And then longer term, is the kind of metric that a lot of your peers talk about, and it's really quite helpful for us to understand what's going on in the business through these big transitions.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, I'll just take the first point. So this is really about -- as far as we understand, each airline will be in a different situation, because it very much depends on their fleets, what they've got an order, how they're managing capacity and operating patterns. So I don't think this is a pricing/margin issue. This is absolutely about volume or flying hours utilization of the fleet for those legacy programs. And I guess what we and others in the business are seeing is that actually that transition that everybody is seeing. Coming in terms of wide bodies. It's going to require a bigger degree of change, I think, on the legacy than we expected. So that's really a change in assumptions, which is looking very specifically airline-by-airline, but, overall, about how we see the level of flying hours on each of those legacy products developing. To your sort of, maybe, longer term question about engine life, that's clearly a very sensitive thing that we look at. And as we model each of our new programs, such as the XWB or the Trent 1000, we look at that very carefully based on the evidence that we have. The truth is that, that number really

hasn't actually changed over the last 20 years, it's still about 25 years on average. Now that doesn't mean that we are necessarily not more conservative when we're doing our modeling, because we are. However, the objective evidence actually hasn't changed, even though we may be getting some short-term acceleration of that for some programs on some airlines. But I think that, as I said, that's much more to do with the individual capacity and operating situation of those airlines rather than a systemic issue as far as we see it at the moment. In terms of cash flow, this is a very important point and we did point out in July that, as Warren said, many of the profit effects we are going to have a much more muted effect on cash flow, simply because of the linked accounting nature of the Trent 700, which I think everybody got that. When we think about 2016 compared to 2015, clearly there are a number of things quite negatively affecting working capital in 2015. In the Marine business for instance, we believe that therefore, although we're going to see a GBP 650 million profit headwind, we will not see that degree of cash headwind. I'm not brave enough to tell you that cash will be exactly the same in 2015 and '16, because to be quite honest, we always give quite a wide range about cash flows given that it's a year-end number. But it won't be anything like as different as the profit impact. So we see a much more consistent view on cash flow between the 2 years and the primary reason is that the working capital changes in '16 will be much lower than they are in 2015. In terms of cash conversion profile, therefore, mathematically that will improve cash conversion in 2016. We said previously that we still think that -- when we go out, 4 or 5 years looking at cash conversion, north of 80% and I've said before, some years that may well be north of 100% is absolutely right, because that's really driven by the physical things that are happening in the business as we get up our ramp curve as the aftermarket installed base grows on the XWB and Trent 1000 and other products. So that's absolutely right. What I know is more difficult to do is actually predict how that cash conversion will move between now and then. But I would say that we are going to have a couple of years where it will be better than it was this year, because of all the effects we've just been describing. And then we'll progress up to that higher level by the time we get to the end of the decade. So it will be a transition.

Operator

We are now over to the line of Charles Armitage at UBS.

Charles J Armitage

UBS Investment Bank, Research Division

Two questions. I feel somewhat emasculated, I don't have 3. First of all, just to be absolutely clear, that GBP 300 million headwind that you're talking about in '17, that is versus '15, it's not an incremental worsening from '16?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, that's correct.

Charles J Armitage

UBS Investment Bank, Research Division

Excellent. Secondly, the dividend. When are you going to make a decision on that? And can you just talk us through your thinking? It just -- it seems to me that you're spending GBP 400 million, GBP 500 million on dividends, a small cut to that really doesn't make an awful lot of change in the whole scheme of Rolls-Royce and the transition. So should we be looking for a suspension for a couple of years?

D. Warren A. East

CEO & Executive Director

Yes, I think we put this comments about the dividends in the release here and we talked about the actions that have been taken over the last few months to improve our financial liquidity and strengthen the balance sheet as well. And we put them in there because given that we're talking up today about profit headwinds as large as we're talking about for the transition from '15 and '16, it's just common sense to tell people that, of course, we're considering the strength of the balance sheet and we're considering the dividend in the light of changes that will be evident to dividend cover. But I stress the fact that we talked

about the balance sheet being strong, liquidity being strong and we also talked about the fact that the board will be reviewing this. The board will be reviewing it at the normal time and changes, if any, will be announced at that time.

Operator

We are now over the line of Christian Laughlin at Bernstein.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Just a couple of questions for me, please. One, there's some positive comments on the strength of the business portfolio in the start of the press release this morning. So that implies, Warren, that you've not changed your view on the value of retaining the existing mix of Aerospace and Land & Sea businesses over the long term. Is this a fair interpretation? That's the first question. And then the second question is, Warren, also, if you could just elaborate a bit on what you mean by the inability to respond to changes in market conditions, is that really referring to production? Or service offerings? Or pricing? Or just generally too many people doing too few activities? Or an inflexible supply chain? If you could just kind of elaborate a bit on that second point, that will be helpful as well.

D. Warren A. East

CEO & Executive Director

Okay. First point on the portfolio, I think we're going to talk a bit more about this on November 24, don't forget November 24 has always been billed as an update on a review of the operations of the business. But what I have found is that it's impossible to really do that without taking into account essentially reviewing the portfolio of product and market activity. However -- and so I'll talk about -- more about that one on the 24th of November. But for the time being, then certainly, I haven't changed my views over the long term. This is a business with very strong engineering and technology. We need to focus on what we're really good at, which is engineering engines and propulsion systems, and the fact that we deploy that expertise out into a range of different market applications, which all have a little bit of a common theme. And again, I can talk about it in greater detail, I don't want to waste too much time on that now, but the view hasn't really changed over the long term. Our inability to sort of respond quickly and so on -- I think, it's a combination of the fact that -- an observation I'd take out of the review is we clearly have too much fixed costs in some part of our business. And we're just simply slow to react to changes in what's going on in the market. I think we've evolved over time, a very good ability to deal with our supply chain and make sure that we're not building mounds and mounds of excess finished goods and we're not ordering vastly too many materials and components from our supply chain either. But in the short term, we are generally not fast enough at being able to take all those things and translate that into what impact that has on our financial results and communicate both with ourselves around the business and with the outside world.

Operator

We are now over to the line of Nick Cunningham at Agency Partners.

Nick Cunningham

Agency Partners LLP

A couple of questions. One, talking about the strong cash conversion indications at the end of the decade, does that include any assumptions about major development programs? In particular, there's been a lot of coverage of A350 stretch, including your UltraFan and, of course, I suspect, you'd be bidding on Boeings middle of the market, new narrow-body? So that's one question. Second one, looking at the mix impact of accounting changes, obviously IFRS 15 is now hovering into view. Do you have any view yet on that? And in particular, whether it intensifies the impact of the shift from linked to unlinked and whether you can still capitalize OE losses under unlinked? And finally, an unlinked question, just on the biz jets, is that a loss of market share that you're suffering which you're being impacted by? Or is it a weak market overall for Gulfstream and Bombardier?

D. Warren A. East

CEO & Executive Director

Let me deal with the first one and then, Dave, could you deal with the IFRS 15 implications, all right? So I think one of the things as we go through this restructuring and improving the simplicity of our business, pace of decision-making and so on, then one of the things that we need to take care of is to make sure that we continue to invest in technology and we continue to invest in the product roadmap. And the opportunities that you talked about in the question, the A350 stretch, possible 757 successes and so on. Absolutely, these are on our radar and absolutely, these are taken into account when we talk about our forecast for the end of the decade. Do you want to...

David Miles Smith*Former Chief Financial Officer and Executive Director*

I mean, specifically IFRS 15, which, as you know, went back a year -- or at least a year in terms of the implementation timing. There is a lot of fairly intense activity going on to look at that, both with our own accounts, but also talking to other industry peers. We would like, as an industry, to try and get to reasonably align views around this. And the changes may be quite fundamental I think in some areas. Although I'm not sure that we fully understand what will happen on the portfolio at the moment. I would love it to be simpler. I am not -- what I'm saying is, it's probably won't be simpler, it would be different and that may actually have certain effects on the portfolio that we're going to have to talk about. But it's too early for us to do that yet. The industry really is still talking and obviously talking with the regulators and just trying to understand how best to model, which are still fundamentally the heart of our business, very strong, long-term business contracts, that we're trying to make sure we find the right way to model from an accounting point of view.

D. Warren A. East*CEO & Executive Director*

And to comment on the unlinked question about corporate jet, we're coming from a position of actually very good market share, particularly at the higher end of the corporate jet market. And it is well-known that we have lost some positions on subsequent aeroplanes that are coming along to replace some of those where we are incumbent today. And so as we look over the next several years, we can see a headwind from that loss of position. But what we're seeing in the short term, right now, is a softening of the market. And that softening of the market manifests itself in reduced demand for these planes generally and people would, otherwise, buy a more expensive higher-end of the market plane, buying a lower-end of the market plane, where our market share just doesn't exist today. So some of it is a longer term that Rolls-Royce has over the previous years lost out on some of the positions at the higher end, but that's because we're coming from a very, very strong position at the high-end. And some of it is due to softening in the market and we're absolutely seeing that softening in the market at the moment and it's happening a bit quicker than we expected it to happen. However, I'd also stress that we are still very well positioned to capitalize on the opportunities that are there to get back into some of these higher-end planes that are coming along in the next generation. And I'd also stress that our strong market share that we had going into this situation still means that we have an excellent installed base, which is still growing. The aftermarket is largely proportional to the installed base, and the installed base is still growing. It's just not growing at quite the rate that it was growing.

Nick Cunningham*Agency Partners LLP*

Could I just make a plea on the IFRS 15 process, could it be possible to involve the other stakeholders in the industry, including clearly the investors and analysts in the next couple of years?

D. Warren A. East*CEO & Executive Director*

Thank you.

Operator

Okay, the next question is from the line of Zafar Khan of Societe Generale.

Zafar Khan

Societe Generale Cross Asset Research

I've got 2 business-related questions and 2 general ones, if I may. The first one is just on the 2016 outlook. Power Systems, interestingly, there isn't really very much mention on that beyond saying Q3 as being fine. Comments Offshore -- [indiscernible] highway hasn't been particularly good. I think standby power problem in some of the areas is difficult to miss 20% exposure to energy for the Power Systems. And I'm surprised that there is no kind of real mention on that. So I'm interested to know the view on that visibility. Also in Defence, United Technologies, GE, PCB, they've all warned on aftermarket for military transport aircraft. I'd know for yourselves in Defence, that's a pretty big exposure, I think it's more than half of the Defence business. So I just want to know on those 2 businesses, how much due diligence has been done? And how firm you're kind of outlook is on those? That's the first one. The second one is, you mentioned, Warren, the high cost base. You haven't said very much on the potential for cash liberation from the business. And I know in the past there's been an admission that inventory levels, et cetera to hide because you're building lot of factors and needed buffer stocks. So those are the 2 specific ones. Just a couple of general ones if I may, please. First one is on the review that you are undertaking -- have undertaken? Has it been purely internal? Or have you sought out some external consultants on this one, just somebody to hold your hand? Because I would imagine having worked in a high-growth business with a very different business model, I just wonder how much experience you would've had of actually looking at something which is more mature and needs huge amounts of cost reduction? And then the fourth one is, again, Warren, you're in a unique position of having been a non-exec on the board of this grand company and for the last 5 months as a CEO. So you set there as a non-exec. What were your expectations in April when you took on the job from the non-exec position? And are the challenges far greater than you envisaged at that time when you took on this position?

D. Warren A. East

CEO & Executive Director

Quite a lot of questions there.[indiscernible]

David Miles Smith

Former Chief Financial Officer and Executive Director

Shall I start with the Power Systems?

D. Warren A. East

CEO & Executive Director

Dave, start with the Power Systems.

David Miles Smith

Former Chief Financial Officer and Executive Director

So in terms of Power Systems, yes, we haven't talked about Power Systems specifically. If you recall, when we talked about the half year results, Power Systems has actually reached a record order book of GBP 2.2 billion. They progressed well in terms of that order book through the subsequent months. So our view at the moment is actually reasonably balanced on Power Systems. You're absolutely right. There are areas that are linked into global commodity markets, for instance, like mining or oil that are weak but they were weak anyway and they have just continued to be weak. So that's not really a change from our perspective. On the other hand, we do have some positive developments. I think we continue to do well in governmental areas and things like the electric locomotive. So overall, we still think that, that is a reasonably balanced view for Power Systems for the balance of this year and going into next year. On Defence, we have done a very detailed review. I'd say Defence is probably going to be more impacted over the next 18 months by just the scheduling of OE deliveries as opposed to aftermarket. We're pretty confident in that. And we're not seeing significant change in aftermarket for the Defence, that continues a strong part of the business. And clearly, there's actually more activity around the world, unfortunately, at

the moment. So if anything, it might actually be some upside for us. So citing the Defence picture as well for Power Systems, yes, there'll be some ups and downs, but it is pretty balanced picture, I think.

D. Warren A. East

CEO & Executive Director

If I may add one thing, David, that would be obviously on transform control. We are largely now in aftermarket business. We have a very mature portfolio, much more interesting for us is making sure that the technology investments address the need to have a viable technology to tackle the next round of development of the transform control market that will allow applications. But we're doing fine with regards to life extensions and providing support for in-service transform-controlled activities, which is a core area at the moment. So it's a less sensitive to the OE side.

David Miles Smith

Former Chief Financial Officer and Executive Director

Absolutely. Right, I'll pick up on the last 3 questions then. Cash liberation from the business and what's been talked about before. Yes, absolutely, everything that's been talked about before is ongoing and continues. And I've said, the transition that we're going through is an important transition and that needs to be driven through to conclusion. The performance improvement programs that have already been announced prior to today are absolutely on track and they are on track for delivering year-on-year cost savings in the parts of the business that they apply to at the moment. And also we've had to improve inventory turns and reduce working capital. So that's happening. What we're talking about today and what I've identified in the review is the needs to do other things, to do additional things. And one of those is about reducing the fixed cost, not about reducing the working capital. That's happening anyway. External consultants, no, we haven't used external consultants. I have thought -- and one of the things I need to do coming into this business new is absolutely get under the skin of the business myself. And so just simply delegating that to some external consultants didn't seem like a very good idea. With regards to your third question, pointing out that I've actually seen this business certainly before I got involved in the process of joining the executive. I've seen this business from a nonexecutive side of the table for 9 months or so. Have my expectations changed? Well, I've only been in the business -- it is just over 4 months and so actually things haven't changed that much. What happened is -- I would say the challenges are the same sorts of challenges that I had identified from the outside. But it has been important to get under the skin. And I now have a much greater understanding of what lies behind some of those challenges and the things that we need to do to address them. And you can only really get that visibility from being inside the business rather than outside. It's quite hard to actually see that from the board. All you see is the symptom and you don't really understand the causes to the same extent. So I'm actually quite pleased to be inside to be getting my head around what's really causing some of these issues so that we can get on with fixing them.

Operator

Our next question is over to the line of Alexi Yannas at PIMCO.

Alexi Yannas

So what is your commitment to your current credit rating? What measures will you be willing to take in addition to reducing the dividend to maintain? Would you reduce CapEx? What else would you do? And should we now consider it there's some possibility that there could be a rating downgrade?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, I mean we view that by maintaining the credit rating at the kind of level that we're at, at the moment, is an important part of our financial policy. Clearly we will have, as we have over the last year, further discussions with the rating agencies that they will have to take their view on that. But it is an important part of our financial strategy. I don't believe that it would be, just to your specific sort of question on CapEx -- so we have given previously sort of guidance that CapEx and R&D over time may come down as a percentage of revenue. However, I don't think they are going to that change much in

absolute terms. We will continue to invest as we think we need to do in terms of new products. That's a very important part of delivering long-term cash flow for the business and, therefore, that's absolutely important. The kind of actions that Warren is describing that we want to take in terms of improving breakeven I think are the more significant ones where we're trying to take out fixed costs rather than investment spend.

Alexi Yannas

Is your sense that your current ratings could potentially be downgraded, you're A3AA ratings?

David Miles Smith

Former Chief Financial Officer and Executive Director

As I've said, we'll have discussions with the rating agency. We've obviously already contacted them. We have planned discussions already with them. So we'll need to go through that process.

Operator

The next question is from the line of Rami Myerson of Investec.

Rami Yehuda Myerson

Investec Bank plc, Research Division

A few questions for me. On the restructuring, just to understand, you still haven't decided whether or not the charges will be made above or below the line? And I see we'll have an update on the 24th. And just to clarify, do you expect the GBP 150 million to GBP 200 million as a run rate exiting 2017? Or is it from 2017? And have you started discussions with the various U.K. unions on the restructuring plans? And the second question on aftermarket and cash flows, if I understand correctly, one of the downgrades today are actually cash items rather than TotalCare or the old engine aftermarkets, et cetera. So could you explain why being placed -- is there an offset from working capital? Or is it actually more TotalCare than time and materials?

D. Warren A. East

CEO & Executive Director

Let me deal with the first 2 of those questions. So restructuring in a GBP 150 million to GBP 200 million per annum that we expect in terms of cost savings from this during 2017. The word is during '17, as in, I expect the impact of this to be felt during '17 is to be progressive and the full per annum benefit will be from 2017 onwards. So by the end of 2017, we expect to be at about that level. In terms of how it's going to be charged, right now, we will give some further details on the 24th of November and we'll give some further details when we report again in February, because I don't think we'll have all the answers on the 24th of November, in terms of exactly how much these things are going to cost and exactly when we're going to have to get those costs, when we going to have to spend the money and exactly when we're going to see the benefit. There's a lot of people issues involved. And so we need to consider that as well. However, I would stress that a lot of this is not just about people, it's about processes and what the people are actually doing. And so in terms of consultations, that's something that we have ahead of us rather than stuff that's already been done. But this program is incremental to the programs that have already been announced. And so there will have to be some additional consultations as we go forward.

David Miles Smith

Former Chief Financial Officer and Executive Director

Just on your cash flow questions. So I think it's really as I explained earlier, which is the -- you're absolutely right, some of the profit headwinds as opposed to the linked accounted ones we talked about in July will have cash impacts. However, we also, as we talked about on inventory and other areas of working capital, are improving performance in those areas. So we believe the drag that we've seen on what I would describe as sort of normal trade-related working capital will not be anywhere near as significant in 2016 as it has been in 2015.

Alexi Yannas

Thank you.

D. Warren A. East

CEO & Executive Director

Excellent. Operator, I think we said we'd take an hour. And we're just coming up to the end of that. So I suggest we use that as a chance to finish the call. For those who are in the queue, we'll give you a ring just to make sure your questions are answered by the team over the next couple of hours. But if I can just say, thank you very much for all taking part, and hand you back to the operator.

Operator

This now concludes today's call. Thank you all very much for attending. You may now disconnect your lines.

Operator

Hello, and welcome to this Rolls-Royce Holdings plc 2015 Half Year Results Fixed Income Conference Call. [Operator Instructions] Just to remind you, this session is being recorded.

I now hand you over to the Group Chief Financial Officer, David Smith. Please begin.

David Miles Smith

Former Chief Financial Officer and Executive Director

Good afternoon or good morning. Let me just give you a summary of some of the key highlights, I think, of our presentation this morning. We did have a more difficult first half. It was a slower start, I think, as we'd indicated earlier in the year, and that effectively reflected the phasing that we will see this year on engine deliveries, product mix and also R&D spending. The good news was our order book was up and actually at record levels in both our Civil and Power Systems businesses, up GBP 76.5 billion. So that's a really good positive for the long term.

Just in terms of some of the specifics. Revenue at GBP 6.25 billion was down about 3% from last year, although that was mainly FX related. Profit was down more. It was down about 30%, and I'm going to come back in a second to some of the main drivers of that. And our free cash flow of GBP 576 million, although actually better than we had originally anticipated, clearly was a drop versus what we delivered in the same period last year. We're still expecting to deliver a break-even or better result for the year on cash flow, so to recover that drop that we saw in the first half. And then finally, we did increase our dividend by 3%, in line with our progressive dividend policy.

So let me just go through some of those numbers in a little bit more detail now. Starting with our revenues. So as I said, our revenue at GBP 6.25 billion was down versus last year but actually flat once we adjust for the effects of the stronger pound on translating foreign currencies back into sterling. Within that, we saw growth in aero services, actually it's quite good growth at about 7%. But we saw a lower volume in our Land & Sea business, particularly around OE project -- products in both Power Systems and Marine.

Our profit, as I said, at GBP 439 million on an underlying basis for the year was down about 30% from last year or GBP 218 million after adjusting for exchange. The biggest driver of that was trading margin. And within trading margin, we saw significant volume effects, particularly engine mix in our Civil business, volume and mix in our Marine business and also the fact that we took a GBP 30 million onetime charge for a contract we don't expect to complete now in Marine and then adverse volume and particularly adverse mix in our Power Systems business. The other main factor that drove the reduction in profit year-over-year was higher net R&D charge to profits, which was a combination of higher spend and also a lower level of capitalization, so we expensed as opposed to capitalized more of R&D during the period. And that just really reflected the timing of where various programs are in their capitalization profile.

So turn now to cash very quickly. So the GBP 439 million of profit, as I said, became minus GBP 576 million on free cash flow. The biggest driver of that was working capital and primarily trade working capital, which was GBP 747 million negative. And that included around GBP 400 million on net receivables payables. We had a stronger close to the year last year, and that increased the level of payments out to suppliers in the first part of the half. And then equally, with quite a few deliveries right at the tail end of the half, that built up our receivables and that cash will come in, in the second half of the year.

The other big driver was inventory. Part of that was planned in terms of preparation for high deliveries next -- in the second half of the year. Part of it was unplanned, which was a combination of some supply shortages in a couple of our business units but also the market conditions in Marine leaving us with more inventory. And we plan to reverse that inventory build in the second half of the year, if not do a little bit better than that. And that's part of our plan, as I said, to get back to a break-even cash flow for the full year.

Our financial strength is really important to us, and we are very focused on maintaining investment-grade rating. One of the things that we did during the first half was to refinance, as many of you know, our revolving credit facility, and we increased our overall to GBP 1.5 billion. And we also took the decision, which we announced back on July 6, to curtail our share buyback at GBP 500 million rather than continuing for the GBP 4 billion that we previously announced. This, in my view, was a prudent decision. I'm confident that cash flows will improve significantly over time. But I want to make sure that we maintain the right level of liquidity in the business during the short term, especially as we will be facing some additional headwinds over the next 2 or 3 years, which I'm going to come back to in a second.

Just talking about some of the individual businesses. Our Civil Aerospace business, as I said, had a record order book, which was strongly positive. We also saw good growth in our services business, particularly. But we're impacted by quite a change in mix between more profitable linked deliveries on the Trent 700 and 900, which were replaced by Trent 1000 and XWB, which were unlinked and, therefore, on which we do not book in advance aftermarket profit.

In addition to that mix change, we also saw some weakness in business jets and also in the regional aftermarket and our smaller jet businesses as well. But as I said, our overall aftermarket revenue was actually quite a strong positive for the first half, and we expect that to continue into the second half.

Overall, Civil profit therefore declined by about 40% against a revenue picture which was up a little bit. And that's something that clearly was impacted very much by these mix changes and also some other factors as well, the higher R&D that I mentioned earlier and lower utilization of some of our lease engines.

In the second half, we are expecting to book some further improvements in our long-term contract profitability, including releasing a provision that we've had, or that we've been building since launch on Trent 1000 launch engines. And that's going to be based on improved operating performance, and we'll test that technically during the second half before we release that provision.

Defence aerospace had a relatively quiet but a slightly overall positive quarter. We saw a little bit of volume drop, but that was primarily due to some supply shortages that we'll recover in the second half of the year. And we've got very good order cover in the second half of the year. So we're confident that we'll be able to deliver Defence at pretty much the same sort of result as we saw last year overall for the year.

Turning now to Land & Sea businesses very quickly. Power Systems, we did have a slow start to the year. That actually improved quite significantly as we went through the first half, and we had a very strong May and actually a record June. Now clearly, for the 2 months, I can't say make a summer, but it's absolutely true, I think, that Power Systems now has some momentum. And their order book actually increased by 12% during the quarter, up to GBP 2.2 billion, so that's a record level for them. And I think we've got quite good confidence now based on those plans and the order book coverage to deliver a much stronger result in the second half of the year. So that weakness in the first half did affect profitability as well. And it was aggravated by the fact that within the lower volume, we also saw an adverse mix. Some of that is going to be reversing again in the second half of the year.

Marine was, as all of you I'm sure -- was still heavily affected by the difficult conditions in the Offshore market, driven by the significant fall in the oil prices over the last year. And that caused both a very weak order intake. Order intake was down 46%. And therefore, our order book declined. But also increasingly, we're seeing deferrals of orders and, therefore, had an impact on revenue and weakness in the aftermarket. So profit fell sharply in Marine.

In addition to the trading-related reductions, we also, as I mentioned a few minutes ago, took a GBP 30 million charge related to a contract that we don't believe we'll now complete. And in addition, during the quarter, we did announce 600 redundancies -- during the first half, sorry, and we will probably make some further announcements on redundancies in the second half of the year. Although that's contained within the guidance that we've given.

Nuclear. Our Nuclear business is now separated out from Energy; that happened last year. And we had a sort of quiet again but relatively positive quarter with both revenue and profit up. And I think they will also have a solid year this year.

So that really completes the overall picture. Our guidance for the year remains unchanged with the revised guidance that we gave on July 6, and that's true at a segment level as well. The only segment level guidance that we have changed was from Marine, reflecting the trading conditions, as I discussed previously.

So it is going to be a challenging second half, but there are a number of factors, I think, that are very positive and will drive this. Firstly, continued service growth in Civil building on that 7% growth in the first half of the year. We do expect higher engine deliveries, partly from recovery of some of these supply shortages but also the ramp-up that's already planned in the second half of the year in the Civil business. We will have a somewhat lower R&D charge and, as I said, some significant impacts on profit from reversal of provisions that we've taken previously on the Trent 1000 engine and also improvements in TotalCare costs as well.

In Land & Sea, a much stronger second half for Power Systems. As I described, I think we have the momentum to deliver that now, and we've rebased the Marine forecast to give, I think, a very realistic picture for the balance of the year. So that's 2015. We did also recap what we talked about on July 6 in terms of some of the headwinds that are facing us over the next 2 or 3 years, particularly the transition from the Trent 700 to the Trent 7000 engine as Airbus run out the A330 in its current form and introduce the 330neo from 2017 onwards. This is going to be a very difficult transition as Airbus announced a big reduction, 40% reduction in February in volume. But this isn't just about volume. These are very tough commercial sales. And both ourselves and Airbus, I think, are finding that very difficult. And we're also still in competition ourselves on the actual engine selection. So we are expecting, in addition to the volume drop, significantly weaker pricing on both the OE and the aftermarket on these sales as well as a lower demand for spare engines. And as we said to the market a couple of weeks ago, we think that's about a GBP 250 million impact overall for the Civil business in 2016 and indeed in 2017.

Incremental to that, the weakness in business jet and regional aftermarket will increase our number to about GBP 300 million for Civil. And we will continue to see, we believe, certainly through 2016, a fairly weak picture in the Offshore market as well.

So it was important that we reiterated that. The impacts on cash won't be as severe because a lot of this is related to the nature of the linked accounting for the Trent 700, but still there will be some impacts on cash. But overall, we should see cash conversion improve.

I finished my presentation, and really Warren built on this by talking some of the long-term trends because I think it's very important, I think, when looking at these period results to keep in perspective really that this business is on a multiyear journey to actually transform itself, both in terms of its product portfolio and its industrial base. We have a GBP 76 billion order book. That's a record order book. We have a lot of very good long-term trends that will continue to drive both sides of the business. And the embedded value, as our civil large engine market share on an installed base moves up towards 50%, is very significant in terms of the aftermarket revenues and cash and profits that, that will generate. We're continuing to invest in technology and in this major industrial transformation that I've described right across the business.

Just to put this market share issue on wide-body in perspective, it's taken us 30 years to get to this position. And we're within 5 years, really, of achieving it now. And that is supported by our order book, which will deliver this. And as I said, once we get to this kind of level of installed base market share in wide-bodies, we'll be in a very strong position to continue to drive profitability in the aftermarket, which is one of Rolls-Royce's absolute key areas of expertise.

In addition, I think the Trent XWB is an extremely important project for us. We are just really beginning the deliveries on that program. It will be generating cash through the next 40 or 50 years. And when we think about that, the cumulative cash flow that we expect from that program is actually twice as great as the best-ever program in Rolls-Royce's history, which is the Trent 700. And in fact, as we get into the next decade, we'll have both the Trent 700 continuing to be a strong cash driver on the aftermarket but the XWB as well.

So hopefully, that's an overall summary of what we discussed this morning. We also discussed a little bit about Land & Sea, but I probably covered that as much. And I'm sure you'd like a bit of time to have some Q&A as well.

Question and Answer

Operator

[Operator Instructions] And as we have no questions on the telephone lines, I'll return the call to David Smith for closing comments.

David Miles Smith

Former Chief Financial Officer and Executive Director

Okay. Well, thank you very much for your attention today. I see that there aren't any questions. So hopefully, that means we did a reasonable job of going through that information. It is very important that we commit -- keep a strong level of communication with this group. And therefore, I really value these calls, and hopefully that we can talk in the future. Thank you very much.

Operator

This now concludes our call. Thank you for attending. Participants, you may disconnect your lines.

Presentation

John Dawson

Good morning, ladies and gentlemen, and welcome to Rolls-Royce's First Half Results for 2015. Thank you for joining us here at Prince Philip House, and for those of you who are also joining on our website webcast. My name is John Dawson. I'm the new Head of Investor Relations at Rolls-Royce. With me here today are Warren East, our Chief Executive; and David Smith, our Chief Financial Officer.

Before we begin, could I ask you please to turn off your mobile phones, or at least put them to silent. We may also include forward-looking statements in our presentation today. There is a safe harbor statement at the back of your pack, and you should read this in considering these comments.

The running order for today is as follows: Warren will open today's presentation with a few remarks about the highlights of the first half. David Smith will take you then through the first half results in more detail before commenting on our guidance and long-term prospects. Warren will then return to talk about some of his first impressions and share the question-and-answer session at the end. You will be able to field questions if you are on the webcast, please submit them, and the member of the IR team will ensure they are asked if we have time or if they have not already been asked in the room today. Thank you.

And without further ado, I'll hand you over to Warren.

D. Warren A. East

CEO & Executive Director

All right. Thank you, John. Good morning, everybody. I'm very pleased to be here. It's a little bit weird interim results, my results first day with Rolls-Royce. Obviously quite weird since I joined right at the start of the second half.

However, I will make a few comments about the first half. But before we start our review, I want to say, obviously, I was quite disappointed with our announcement on the 6th of July. And for me, that served as a sobering reminder of the task ahead for me. As I continue to review the business operations, I'll be working with our team to make sure that we get on with the job to make sure that we have sufficient pace and simplicity about what we're doing.

But I'll start with some initial thoughts from my point of view, and then I'll turn it over to David to take you through the detail.

Now the highlights, for me, are quite straightforward. We're continuing to win new orders, particularly in Aerospace. And that's good because that indicates the continued support that we have from our customer base. We've also had a successful first half winning new business in our Power Systems business, leaving them, actually, with a record order book at the half year. And that's something that should be positive for that business as we go into the second half.

Now as was indicated in May with our statement at the AGM, we expect overall profit delivery. This year is more second half-weighted than usual. For the first half, it was modestly reduced revenues but quite sharply reduced first half profit. And that's for several reasons: higher engineering and technology costs in this particular phase, as we're transitioning from more mature engines to newer engines; and then, obviously, a big external market effect out there where the oil price is creating an environment in Marine, which is causing a total sort of collapse in demand, really, in the Offshore segment. And that's the same for our business and for any business operating in that sector right now. And it's those same Marine headwinds, which drove an adverse mix shift, actually, in our Power Systems business during the first half. So although I said very good finish, actually, to the first half in terms of orders coming in, it was a very slow start for that business. Now David will take you through those details in a moment.

Just want to make a few comments about cash. Cash was an outflow, a big outflow, as you can see. Our cash is going to be a very important measure of success over the next several years. I understand how important it is in terms of confidence in the business and how confidence in our long-term cash flows

is a big driver of value. And it'll be very important for us to make sure we're demonstrating the right disciplines required to reinforce that confidence.

Our use of cash going forward will be important. We have to manage through a period of transition. We have a robust balance sheet today, but we do need to be prudent, and we don't want to create any unnecessary uncertainty. And that's the main reason why we canceled our share buyback program. But the long-term value of the business, its ability to grow, its ability to generate increasing margins and importantly, cash generation is very clear to me. And so maintaining a progressive dividend policy is essential and an important building block in underpinning that confidence in the value in the future.

Now I'll hand over to David to discuss our results in some detail, and I'll come back later to summarize and give you some initial thoughts. Thank you.

David Miles Smith

Former Chief Financial Officer and Executive Director

So thank you, Warren, and good morning, everybody. I'm going to review the first half results in more detail then recap our recent guidance update; and before I hand you back to Warren, share my thoughts on the longer-term outlook for the group.

So let me start with the 2015 first half results. So our performance in the first half was actually broadly in line with our own expectations for a slower start to the year. This reflected the phasing on engine deliveries, product mix and R&D spending. As Warren has said, our order book continued to strengthen, positioning the group well for the long term, and reached record levels in both Civil and Power System.

Overall revenue was broadly unchanged on a constant-currency basis. Profit, however, was down, reflecting various mix effects within the portfolio and a higher R&D. As a result, our return on sales at 7.3% was 3.2 percentage points down on the prior year.

Free cash flow of minus GBP 576 million was also lower than the previous year, reflecting the underlying movement in profit although, again, ahead of our original expectation. So despite the challenges we're facing, we are increasing the dividend, as Warren said, by 3%.

Turning to the movements in revenue. The net flat performance, overall, masked good growth in Aerospace services revenue and was offset by lower original equipment sales within the Land & Sea Division. Overall, foreign exchange translation reduced revenues by around GBP 200 million. If FX rates stayed at current levels, we'd expect translation of our revenue to reduce that revenue by about GBP 450 million for the full year.

Turning to the group profit. The GBP 218 million reduction on a constant-currency basis was largely led by volume and mix effects within trading margin and that higher R&D cost of GBP 76 million. I'll explore each of the trading margin effects in more detail when I discuss the individual business segment performance in a minute, but the largest factors, overall, for the group was Civil engine mix, Marine volume and mix, and volume and adverse mix of Power Systems. Lower restructuring spend contributed a GBP 20 million improvement in the first half, and FX effects added a further GBP 11 million.

Total underlying restructuring in the first half was GBP 46 million in absolute terms.

Turning to cash now. We once again have 2 different cash flow charts. The first one here shows the comparison or the walk-through from profit to cash. You can see that net working capital at GBP 747 million negative was the biggest driver of the variance between profit and cash. Within that working capital number, there are about a GBP 400 million increase in primarily trade receivables and payables and reductions in payables, and this follows a pattern we often see at the half year following a busy year end in 2014 and a natural supply of payments that follow at the start of the year. And it's also affected by the timing of deliveries of the half year, which creates receivables for those deliveries.

Additionally, we saw a GBP 260 million increase in inventories between year end and the half year as we prepare for higher volumes in the second half and also worked through some supplier shortages that we

have. There was also an increase in Marine, and that's due to weaker -- the weaker market conditions. We expect this overall inventory growth we've seen in the first half to largely reverse by year end.

The TotalCare receivable increased by only GBP 62 million in the first half. It is likely that, that will be a higher increase in the second half as we ramp up engine deliveries, but -- so that was a relatively low level. And it does reflect the fact that we had lower deliveries on linked Trent 700 and 900 engines in the first half of the year.

For the full year, we expect free cash flow to be around 0, so that GBP 576 million will be improved by about the same amount in the second half of the year.

Turning to the next slide, we now compare 2014 first half cash flow against 2015 first half cash flow. And here, you can see the relative drivers compared to last year. Reflecting the challenging trading environment, you can see that cash flow from operations, largely profit, reduced by GBP 194 million; and working capital consumed a further GBP 186 million, partly inventory again. Most of this year-on-year change in working capital was driven by, as I said, inventory, and we expect this to reverse and become positive by the end of the year.

Our balance sheet and credit rating remained strong. This is important because it gives us the ability to withstand turbulence and shocks, which sometimes occur within our industry; and it also provides confidence over the long term to our customers who are buying products that will remain in service for decades. It's important to us to maintain that investment grade rating and to have prudent levels of liquidity.

During the first half, we refinanced and increased our revolving credit facility up to GBP 1.5 billion. Now I know that some of you were disappointed that we curtailed our share buyback, but I think it was a prudent decision in the light of some of the challenges we now face over the next few years. And I'm confident that cash flows will improve significantly over time, but, as I said in February and again in July, we're in the middle of a really significant growth phase and transformation of our business.

Now having covered the group, I'll turn to 2015 first half performance for each of the individual business segments, so we'll start with Civil Aerospace. Our order book increased 5% over year end, and that includes part of the GBP 9.2 billion order that we announced from Emirates. OE revenue was fairly flat, but there are some important mix shifts here. Trent 700 and 900 deliveries were down in the first half, and because, as I've said before, these are mainly linked engines where we record aftermarket profits and margins at the point-of-sale, this does have a more significant effect on profit. Business jets were also down in the first half.

On the other side, Trent 1000 and Trent XWB deliveries increased. However, these are mainly unlinked, so we don't book the associated aftermarket profit for those deliveries. The shift away from mature programs and towards newer programs, particularly where the accounting is different, will present some near-term challenges as we'll come back to. I'm also going to come back later to the XWB program in a few minutes because I really want to make sure that you understand the size and shape of this program.

Our aftermarket revenue increased by 7% in the first half, and that reflects good growth in wide-body aftermarket, which increased 9% even after we saw some lower revenue from the RB211 and Trent 500, but we also saw a weaker regional aftermarket as well.

Overall, Civil profit declined by 39% in the first half, and this reflects the revenue drivers that I've mentioned where we're seeing few of the engines that deliver upfront profits and more of the engines, which -- like the XWB, which are great programs, but the accounting is different and we record less of the profit upfront. We've also seen lower utilization in some of our lease engines; and on legacy product, some weakness in our regional aftermarket, as I said.

Onetime movements on long-term contracts were a net gain of about GBP 24 million compared to last year, and that mainly reflects cost-saving initiatives.

R&D was another headwind in the first half. R&D spend was higher for new programs, including the Trent 7000, the -- but also the Trent XWB and the -TEN on the Trent 1000. The XWB 84k has now entered into

service and we're therefore no longer capitalizing the R&D, so the P&L charge is also higher because that capitalization has now been removed.

We expect a much stronger second half, and that will benefit from both higher volumes and continued aftermarket growth. We also expect to achieve the milestones that will allow us to release a provision that we made on the Trent 1000 during the launch phase and also to improve -- continue to improve the profitability overall of our TotalCare contracts.

On restructuring, we're over halfway through the program we announced last November, and we continue to expect further benefits in the second half, much of this in Civil.

So turning now to Defence aerospace, a fairly quiet first half. The order book declined by 3%. Our OE and aftermarket revenue were both down marginally with some of this offset by a stronger dollar. In the first half, we did experience some supplier shortages that will make our engines deliveries more biased towards the second half this year in Defence. Profits declined on the lower volumes but were helped by the stronger dollar, and we also saw improved net contract profitability within our trading margin.

In the second half, we have good OE order cover and good confidence in our ability to ramp up the volumes, and we continue to see this business as broadly stable with some downward margin pressure over the next few years.

Turning now to Power Systems. Power Systems did have a slow start to the year, but we've seen that progressively improve throughout the first half. And in fact, the order book was up 12% to a record GBP 2.2 billion, and order intake increased by 4%. Revenue was down overall by 14% with OE down and services up a bit, but then a significant deterioration from FX as we translate euro revenue into sterling for porting.

Profit also declined in Power Systems, and that largely reflected the lower OE volumes and also a weaker mix coming from lower government sales compared to last year and a lower margin mix in our medium-speed Bergen Engines business, which was also affected by softness in Offshore. Bergen was also a cost drag in the first half.

The higher order intake in the 79% order cover give us confidence that we'll see a much stronger performance in the second half of the year. We've already had 2 strong months in May and June and have good sales momentum at the moment. So I'm sure it's no surprise to any of you that our Marine business had a challenging first half. Our Offshore markets are the toughest we've ever experienced.

Last year, Offshore was about 60% of our revenue, so our Marine business is very exposed to the challenges in that whole industry that we're seeing with oil prices dramatically lower today than they were a year ago. Order intake fell 46%, and the order book overall declined by 16% during the first half. On revenue, we say -- we saw lower OE sales. Again, that was primarily in Offshore. And aftermarket revenue also declined, in part that was due to the end of a multiyear Naval parts order.

Profit fell sharply in the first half driven by volume, pricing pressure and adverse mix. Some of you may remember that we had a product quality charge last year. While this hasn't repeated, this year, we're taking a GBP 30 million provision against a specific customer contract, which now seems unlikely to complete. So unfortunately, there's no net onetime benefit year-over-year.

During the first half, we announced 600 redundancies, and we may announce further restructuring actions during the second half in line with what I said earlier this month. Now this isn't going to affect our underlying result, but it's worth mentioning here that we've also taken an exceptional charge of GBP 69 million in headline profits for impairments of Marine assets where we now see a less favorable outlook. And this is driven in part by the same market deteriorations that we're seeing in Offshore.

Our Naval Marine business actually had quite a balanced first half. Looking ahead, we expect continued challenges. The order cover is high, but we're seeing high levels of customer deferrals as some of these orders may well get pushed out well into the future. And the sharp decline in new orders means that revenue may continue to decline and pricing pressure may continue. We're working as quickly as we can to reduce our costs and consolidate our footprint and ensure that when markets do recover, we're

well-positioned to offer a cost-competitive product. But we're not seeing any signs yet of a recovery. Our outlook for Marine, therefore, remains cautious.

Finally, let's take a quick look at our Nuclear business. You can see from the chart that we're showing this business now without Energy, which we sold to Siemens. And actually, for the remaining Nuclear business, it was a fairly quiet but positive first half. OE revenue increased by 5%, and services revenue increased by 7%. Profit was up GBP 8 million, reflecting the higher volumes and some timing effects on commercial and admin costs.

So that concludes my review of the first half of 2015. It was a challenging start to the year, but as I said, it came out largely in line with our expectations for a slower start.

Turning now to our guidance. Our outlook for the full year for revenue, profit and cash remains as per the update that we provided on 6th -- on the 6th of July. We now expect the tax rate to come in closer to 23% than the 24% we've previously guided. And R&D spend is likely to be a little higher than the GBP 750 million, but that's factored into our profit guidance. Our EPS range has also now, of course, been updated to reflect the end of the share buyback.

Again, there are no changes to the guidance on a segment basis we provided on the 6th of July where we reduced our Marine guidance down to 0 to GBP 40 million for the year. So while this would seem to leave a lot to do in the second half, it's actually about the same as last year, and we have confidence in our ability to deliver this.

In Aerospace, we expect, despite lower Trent 700 deliveries overall, to see high deliveries of Civil and Defence engines in the second half. In addition, we've -- we will continue to get the benefit of growth and service revenues and a somewhat lower level of R&D charges as we start to capitalize other programs. Also, in addition, as I said at the time of our guidance update earlier this month, we expect to be in a position to reverse a balance sheet provision that we made on the Trent 1000 launch as a result of improving operating performance, and we'll also recognize further improvements overall in total contract profitability.

Together with the items already booked in the first half, onetime improvements on long-term contracts are now expected to contribute around GBP 200 million of performance in the full year. In Land & Sea, Power Systems are expecting a much stronger second half as we've seen in previous years. And in Marine, we've based our expectations on a cautious set of assumptions. Finally, we'll benefit from lower C&A costs and the early benefits of our restructuring programs.

All in all, we, therefore, expect profitability in the second half of 2015 to be around the same as the second half of last year in absolute terms.

I'd now like to look beyond the end of the year and briefly remind you of some of the key points in the guidance update that we provided earlier this month. The most important issue we discussed was the product transition from the Trent 700 to the Trent 7000 as Airbus winds down the production of the current A330 where Trent 700 is one engine option in favor of the new A330neo where the Trent 7000 will enjoy an exclusive position. This transition over the next few years will, of course, phase out demand for that Trent 700, impacting original equipment sales, engine pricing and demand for engine -- for spare engines. From a business perspective, this move to an exclusive position is positive, but clearly, the lower-than-expected volumes and challenging commercial situation on the Seo [ph] variant during the transition is having a marked effect on near-term reported profitability. This is exacerbated, as we discussed earlier, by the fact that the Trent 700 engines are mainly linked, and therefore, we also lose the aftermarket profit that we booked upfront on those linked contracts.

In addition to this product transition, we're seeing market pressures elsewhere in Aerospace and Land & Sea in the shape of weaker demand for our business jet engines, the softer regional aftermarket, which I referred to, as well as the continued pressure of the weak oil prices on our Marine Offshore business.

On top of these product and market issues, I've personally undertaken a very rigorous review of our forecast and the planning assumptions that underpin them over the last few months. And as I said I would

do when I took over the CFO, I've completed that process. I believe this now gives us a better basis to look ahead. So let me remind you that -- of what that all means for the outlook for 2016.

In our Civil Aerospace business, it means that we expect a significantly lower contribution from the Trent 700 for all the reasons already set out. In total, we expect those changes to Trent 700 demands to reduce profits by around GBP 250 million in 2016 compared to 2015. It's important to remember that there are still several open campaigns for the Trent 700 engines, but we think this reflects a balanced view. In addition, we expect a roughly GBP 50 million headwind from the lower demand for business jets and the softer regional aftermarket.

Other factors, including the benefit of our growing installed base, will improve our large engine aftermarket and will also benefit from the restructuring actions that we're taking by around GBP 90 million next year. At the moment, we expect, however, these factors will largely offset the likely low level of provision releases and other longer-term contract adjustments that we're getting in 2015 compared to 2016. All of that adds up to an expected net GBP 300 million negative headwind on our reported 2016 Civil profit compared to 2015 with the impact continuing into 2017 and probably, to a lesser extent, in 2018 as a result of these product transitions.

In reviewing our new 10-year plan, I'd also -- I also put a great emphasis on cash discipline, looking at working capital management, capital allocation and returns. As a result, I'm more confident about our cash planning. In this respect, it's worth noting that the cash impact of some of these headwinds will be smaller than the profit impact because of the linked accounting issue. And therefore, cash conversion will improve, albeit off a lower level of profit.

Notwithstanding these near-term headwinds on reported profit remain very confident in the long-term prospects of Rolls-Royce. And let me remind you of the key elements behind that confidence. Firstly, our order book now stands at over GBP 76 billion, led by an outstanding position on wide-body passenger programs. We'll really see the benefit of this come through over the next few years or so. The mega-trends of population growth in Asia, industrialization trade support significant long-term growth in Air as well as in Land & Sea.

Our new products are absolutely transforming our Civil Aerospace business. The successful rollout of these new engines over the next 10 years, led in particular by the Trent XWB, the 1000, 7000, will build Rolls-Royce towards a 50%-plus share of installed wide-body passenger market and deliver aftermarket revenues for decades to come. For the even longer term, we are undertaking an ambitious technology plan to focus on the next-generation Aerospace designs with our Advance and UltraFan projects. We also now have similar technology programs that are being developed by Land & Sea. In order to maximize the benefit of this growth, we're investing in a global industrial base and establishing a much more competitive and flexible and responsive supply chain. The new facilities are lean, cost-efficient and more flexible with a much smaller footprint. Our investment plans will also reduce our dependency on older, less capable plants. This is all essential to our long-term success. So we're very confident about the future, and I'd like to briefly remind you of some of the key metrics that underpin that confidence.

This chart shows how we are transforming our market share in the installed base of wide-body passengers aircraft to evolve into an industry-leading 50% as we deliver our order backlog. It's taken us 30 years to get to this position, but within the next 5 years, we expect to have that 50% of the installed base of engines. That's a tremendous accomplishment, and it will drive significant aftermarket revenue and cash flow, as I say, for decades.

This next slide reminds you of the scale of the value creation as measured by cumulative cash flow in our largest engine program, the Trent XWB. This program is expected to generate cash flows that are around double that achieved by our previously most successful engine to date, the Trent 700. It will be years yet before the XWB actually overtakes the Trent 700 in cash flow generation, and Trent 700 itself will continue to be a powerful cash generator right through the next decade. So we will have 2 very powerful cash generation machines working in parallel. Now most of this cash flow is beyond 2025 on the XWB. I understand, therefore, that it's more difficult for the market to value. We'd really like to try and help you to develop your models around this because it's really a critical part of our future. So just to remind you that most of this cash flow is aftermarket. Rolls-Royce are the experts in the area of aftermarket. We

invented the whole concept of TotalCare service support, a concept that has been widely welcomed by our customers. And we have invested in the commercial and technical knowledge to lead the industry with our engine health monitoring systems, 24-hour operation centers, et cetera. This is a key area of Rolls-Royce expertise.

Finally, on Aerospace, why are we confident, actually, that we can build that market share base, that base of installed thrust, and that long-term growing cash flow? And really, you have to start with the schedule of large engine delivery shown here. As you can see, we expect them to double over the next few years with a decreasing proportion shown on the yellow line here on a linked basis, meaning that profit and cash flow will be increasingly aligned. We'll do this with a transformed industrial base with much greater to scale and efficiency.

Turning now to Land & Sea, and I'm sure that Warren will come back to this later in the year. Clearly, we do face short-term market pressures, but these are fundamentally sound businesses. We've completed an extensive review over the last few months, both to identify areas to improve operating performance in these businesses but also areas to refocus and intensify our technology and product development and clearly, areas to restructure and reduce our footprint. These plans will put us in a much better shape to take advantage of the strong, long-term mega-trends driving these sectors as well.

So thank you, and I'm now going to hand back to Warren for some concluding remarks.

D. Warren A. East

CEO & Executive Director

Thanks, David. That's a, hopefully, clearer view of what happened. And it's an excellent summary of our long-term prospects, and in why we're confident in that. So let me start with some of my initial thoughts coming fresh into the business. First is, there's actually a great deal to be done both in the short term and in the longer term, and my challenge is to balance those 2. Without wishing to become over-short term, so that we damage the future, which David just described. There are some urgent issues, and I need to make sure we're operating with sufficient pace in the business.

The second half needs to produce 70% of our annual profit for this year. That's good news because we have orders, but the focus absolutely has to be on delivery, to turn those orders into profit and make sure that our customers get what they want when they want it.

I will be continuing to review operations. Like any new CEO coming into the business, I want to thoroughly understand the rigor and the assumptions that we're making about forecasting our future business and about how we're building our plans for execution. And I do intend to come back to you before the end of the year with some thoughts and comments on priorities on that.

There are a couple of medium- to long-term aspects to comment on as well, restructuring programs that we have already announced in both the Aerospace and Marine business, and appropriate integration of the various acquired businesses. Now successful and timely execution is absolutely a key as far as I'm concerned to achieve the sort of flexibility and responsiveness that we need to get to, to be more competitive for our customers, and to get to a cost base that we need to drive a positive profit trajectory.

I come into this business, and I find these activities are already underway, which is good. And actually, we're making good progress. But now I need to make sure we're moving quickly enough, and I want to explore the necessity of everything that we're doing, and the feasibility and the timescales that we have for moving these programs forward further in the future.

I want to make a few comments about market communications, and of course, that is an ongoing priority. But you won't be surprised that I've received a lot of feedback over the last 3 weeks, and actually, I realized perfectly well, anyway, that we do need to make some significant improvements in our communications and you will see a change in philosophy, and that's not just about standing up here and doing more. It's about providing consistent, reliable, sustainable communication. It's about being open and transparent. And above all, it's about building trust. I understand we have to provide much clearer, much simpler explanations of how the business actually works, and sufficient tools to enable both analysts and investors to understand the Rolls-Royce business. I actually want analysts and investors

to be able to understand the opportunities in front of us as we see them to understand the growth of this business can achieve, and how the various market factors and actions that we take accelerate or retard the achievement of that growth. And I know that the current guidance and the way we've been doing that has proven to be less than helpful, partly because we've had to keep changing things and our expectations; but also perhaps because it hasn't been focused on the right things, the things that really drives our success and give you that understanding that sits behind our confidence. Now that needs a lot of thought, and John and David and the IR team, I'll be working with them together to work at how we can improve what we do, the tools that we use and the tools and the information that we provide. We will be doing things differently. We understand that's essential to your confidence in our business.

Right now there are some near-term issues. As I think we described on July 6, we have a product transition in our Aerospace business, and that isn't a 6-month thing. That's a thing which is going to happen over the next several years. And this morning, we've described how that acts as a bit of a headwind on our profitability. And at the same time, shorter term, Land & Sea business faces a very near-term headwind caused by a collapse in demand, especially in Offshore. And that leads us and the whole of that wider industry with over capacity.

However, I want to finish on the point about confidence in the longer term. We have industrial and operational transformation programs with the right programs to introduce, and those programs are underway. And they're addressing near-term issues, and they're also setting us up for higher profitability in the future in all parts of our business. We have a great portfolio of new products, a result of a lot of the expenditure that's been going on in engineering and technology over many years. And those new products have a positive profitability trajectory ahead of them. We have industry-leading technologies in development. So building on what we've been doing over many years, if you take a snapshot of what's going on today, we have leading-edge technologies going into place to enable future architectures and future generations of engines. And above all, as David just mentioned, we have some very positive long-term environmental trends underpinning the demand for the Power Systems that this business produces.

So taken together, that continues to give me great confidence in our longer-run prospects. And I could go on all morning, but I'm not going to. We'll finish there. We'll move on to questions. As John said at the start, for those of you who are listening on the webcast, please submit a question. One of the IR team will ask it on your behalf.

With that, we'll have the first question, please. Thank you. And the microphone is going to be handed around.

Question and Answer

Jaime Bann Rowbotham

Morgan Stanley, Research Division

Jaime Rowbotham from Morgan Stanley. Just one question to kick off. Apologies, because it's a bit focused on the short term. I appreciate your desire that we look to the long term, but clearly, I think there'll be a greater willingness to do so if the direction of travel in the near term improves a bit. So in the context of that and the focus on cash, it's a question for David. I appreciate, as usual, working capital should improve in the second half this year, hopefully allowing the group to break even from a free cash flow point of view in 2015. Next year, though, underlying PBT is going to decline by some GBP 300 million. Will the impact of a lower increase in the TotalCare debtor be enough to offset that profit decline? Or is there a risk that due to underlying working capital outflows and increased capitalized losses on unlinked engine sales that Rolls' free cash deteriorates next year rather than flatlining or improving? And if it did, would that be a major issue for you?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. Jimmy, and you actually drew our attention to quite an important sort of structural change that the change in Trent 700 volume has created, which is I -- and didn't mention it here, but it's in the press release. We actually see now that the long-term TotalCare net debt will peak much earlier at a lower level than we've previously indicated, so probably between GBP 2.1 billion and GBP 2.3 billion over the next 18 months or so. And that's fundamentally because where that disconnect that we've had that's been going between profit and cash will now start reversing. And when it reaches the peak, actually we'll throw off effectively cash flow. So you're right to point that out. That plateau that is happening will really, I think, then help us a little bit, I think, in terms of translating cash margin and profit margins as well going forward. I don't think it will be a particularly negative effect next year. We haven't given any specific indication on cash flow for next year, but I think if I look at where consensus is at the moment, I think that's indicating a sort of slight improvement from this year. So I -- where we absolutely need to continue to work on and we're really focused on is this inventory issue. We have made improvements over the last couple of years in turns. We went backwards in the first half, in fact we went from, I think it was 3.3 to 3.1 turns in the first half. Part of that was planned in terms of the engine deliveries; the bit that was unplanned was really the impact on the Marine business again. For instance, we have built some service inventory in expectation that we might see some increase in service business, but that just hasn't happened. So we got more inventory than we really need. I'm very confident, because I know all of the businesses and I'm really focused on this, that we will increase our turn rate by year-end, and we will continue to increase that in 2016 and 2017 as well. So that is really -- I see that as the most important physical driver here, which is to improve the operational performance on inventory in the business. We manage receivables and payables, I think, pretty well, but it's the inventory that we've got to continue to improve operational performance.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Just one question, Warren, about your review. You've repeatedly described it as an operational review as opposed to a strategic review. And I'm just wondering if that's a deliberate nuance that implies some high-level aspects such as the shape of the business or the industrial base size or the size of risk share partnerships, for example -- or for a few examples there, are off limits. I'm wondering if that's the case.

D. Warren A. East

CEO & Executive Director

Okay. It is deliberate, and it's deliberate, because I believe that the strategy is broadly correct. It does, however, include -- I would count things like our industrial footprint as part of the operations that we deploy to execute our strategy, and I would describe our relationship with risk- and revenue-sharing

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

partners again as: That's part of how we go about doing our business. It's broadly a good thing, and I actually don't see any reason for significant changes in that, in principle. I'm more concerned about the detail of exactly what we do and how we do it. And in terms of priorities, then I think that we have a -- if you step back, we have a fantastic order book. We have great confidence from our customers, not just in the Aerospace business, but across our other businesses as well. We have great strength in the service network and so on. The immediate challenge is turning that large order book and that great following from our customers into profit. And that's about operations and delivery. So that's the urgent thing that I think we need to attend to it. Now don't let me let you think that I don't care about strategy. Of course, I care about strategy. And this is a very long-term business, and decisions that we make today, for instance, maintaining our investments in engineering and technology, and particularly at the R&D end of it, to produce technologies which we're going to be building upon in 10 and 15 years time. Of course, that is important. But just in terms of immediate priority, what do I do when I walk into the door of this business? It has to be operational.

Nick Cunningham*Agency Partners LLP*

It's Nick Cunningham from Agency Partners. A couple of sort of quite narrow specific ones and then a broader one, if I might. And I apologize if we seem confused this morning, but there's a lot of results. You've, I think, suggested that some of that GBP 200 million of provision writeups, write-backs, TotalCare, et cetera, has already fallen in the first half. Could you just possibly quantify how much first half, how much second half?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Yes. About GBP 48 million in the first.

Nick Cunningham*Agency Partners LLP*

GBP 48 million, sorry. You probably already said it, and I missed it. And then the second point, in terms of restructuring cost charge, get confused between deltas and absolutes. What are the absolutes above the line in each division this year, roughly, what you expect? And how much of it are included in your underlying earnings? And how much of it doesn't get included in underlying earnings that you expect to charge this year?

David Miles Smith*Former Chief Financial Officer and Executive Director*

So in the first half, we booked GBP 46 million on an underlying basis, and there's about another 10 million, I think, on an exceptional basis. We only book exceptional charges when we close a whole plant, effectively, and that's primarily been in the Land & Sea businesses in the first half. So that's the -- those are the absolutes, which is about GBP 20 million lower than we did in the first half of last year.

Nick Cunningham*Agency Partners LLP*

And just the forecasting, how much further is it to come in the second half, roughly?

David Miles Smith*Former Chief Financial Officer and Executive Director*

So I said on July 6, I do expect we're going to announce some additional actions in Land & Sea, and I gave a range of 0 to 30, which is quite a large range, I guess. But that's because when we actually go through the details of those programs, in some cases, the voluntary redundancy side of things can change depending on the nature of what you're doing, whether you're doing a pesky alignment or a full plant closure. So that's why there is a little bit of uncertainty around that. But we will book that additional -- those additional charges in the second half. And I've included that within the guidance, and that's already anticipated.

Nick Cunningham*Agency Partners LLP*

And then finally, much broader final question. Your medium-term guidance was for 2018 to '20. I think this would flavor it [ph] if it was may be a little bit later in that time range. And then on July 6, you very specifically used the word later, which is terribly broad. So if there's any color you could add to that with detail, that would be very helpful. And today, you said that the issues in 2016 extend into '17, possibly '18. Does that go to that point that those medium-term margins you talked about in last year's guidance are further out in the future? Are they still tenable in terms of level? And how much later is later, I suppose, is the question.

David Miles Smith*Former Chief Financial Officer and Executive Director*

So, I did termed, but obviously didn't make myself clear on July 6 about the fact that the GBP 300 million of headwinds would also be seen in '17 and to a lesser extent in '18. It looks like I wasn't clear enough about that. So the reason I was saying it here is just to be clear. In terms of -- I mean, my view is actually that achieving those sort of levels on margins and certainly cash conversion of those levels is absolutely what we are aiming for and targeting. I'm not going to give a new time frame, because actually, I didn't really think it was a very clever idea in the first place to give a time frame, because if you remember, I really described this in terms of operational things that drive, that have to happen. That's clearly been interrupted and pushed back, as you said, by the Trent 700, 40% reduction in volumes basically. So I think that's something we want to come back to later in the year. I don't think there's any point in trying to update that at the moment. I think it's not particularly useful either to do so at the moment. I think once we're inside a little bit of time, we can think about exactly how we'll frame this going forward.

D. Warren A. East*CEO & Executive Director*

I think we were just -- well, we seem to have lost that one. Okay.

Rami Yehuda Myerson*Investec Bank plc, Research Division*

Rami Myerson from Investec. Two questions. Regarding the operational review in accounting, so one of your peers last week talked about [indiscernible] agreements, and I appreciate -- they are late in the game, but their comment was that they would accumulate the cash in the balance sheet and only book revenues and profits once engines start actually coming for their first overhauls, which is very different to what Rolls has done. Would you consider adopting that type of more conservative accounting policy as part of your operational review?

D. Warren A. East*CEO & Executive Director*

Well, yes, I think as far as this operational review is concerned, it's largely about in the detail of what we do and how we do it. I'm not going to sort of rule things out at the moment, but it's not primarily a review of the accounting.

Rami Yehuda Myerson*Investec Bank plc, Research Division*

And second question, they talk about the guidance and the headwinds. Can you provide any type of thoughts on the Trent 1000 and A380neo engine [ph]? Is there something that you've taken into account when you've done the medium-term guidance, the possibility of that happening over the next 5 years?

David Miles Smith*Former Chief Financial Officer and Executive Director*

So in terms of A380neo specifically, clearly, we are part, although a junior part, of that discussion that's going on. The same issue applies to us as does to Airbus, in fact, which is to make a business case out

of such a program at relatively lower volumes. The amount of investment that's affordable is relatively low. So we have to find solutions here that are not high investment solutions. If you ask me, have we provisioned for those investments in our future plans? Yes, we have, but not with a commitment to do them. So yes, sensibly, we do in terms of just thinking about cash flow and funding and things going forward, but not with a commitment to do that. We will not make a commitment until we are clear there's a business case. And I think the same would go for any further developments on the Trent 1000 -- on the -- sorry you asked about the A350? A380, yes.

D. Warren A. East

CEO & Executive Director

We're going in that way, but halfway back and then a bit further forward can speak.

Gordon Hunting

Gordon Hunting of Fiske. Are you going to geographically concentrate your various engines? For instance, will XWB be based at Darby, Singapore for the 700 to 7000 and the A380 engines, Delaware for the 2 shafts and Indianapolis for military? Because at the moment, it's a polyglot of producing any engine that fits.

D. Warren A. East

CEO & Executive Director

Yes. Well, as I said a moment or 2 ago, what I intend to make sure we're doing by way of reviewing the operations -- and by the way, let me say, it's reviewing operations, because any management is not just reviewing and then forgetting about it and doing other things. This is a thing which is in the sort of constant review. We're seeking to take the footprint that we have and optimize what we do there. It is a complex jigsaw, because we have some facilities with older equipment, older manufacturing methods. We have other facilities with much newer tools and techniques. And you can't just say, "Oh well, the old is all bad. We need to sort of move everything to the new," because actually you have to manage the capacity. Some things will only be or can only be manufactured where they're being manufactured at the moment, and it's a big challenge to move them. Others you can move a new engine straight into a new facility. So it's complicated. We will optimize it. The plans that we have in place at the moment, I believe, probably are optimal. But part of the purpose of me having a detailed look at this when I first come into the business is to sort of step back from it a bit and say, are we really doing the right thing for 10, 15 years hence. So there may be some changes. I mean, I doubt if there are going to be any significant changes. And by the way, we do make things like XWB both in Darby and in Singapore.

D. Warren A. East

CEO & Executive Director

Webcast?

Jilinda Crowley

Former Acting Director of Investor Relations

So question from the web from Phil Buller at Barclays. Phil asks 2 questions. The indicative profile for cumulative cash on XWB is very helpful, which looks to be in a positive cumulative cash position by around 2022? Given your statement that the XWB should generate double the cash of Trent 700 over time, are you able to give us a steer, please, as to how much cash the Trent 700 program is generating on an annual basis at this point? And Question 2, are you able to give us a steer, please, over what period we should expect the GBP 2.1 billion to GBP 2.3 billion of TotalCare provision to unwind?

David Miles Smith

Former Chief Financial Officer and Executive Director

That's a good question, not one I feel I'm able to answer. And there's always a danger of providing additional information that you get a follow-up like that, I know. But seriously, the reason that I've given it is the XWB is a transformational program for this business. And effectively, because unfortunately, the cash flows are so far out, I recognize that it's quite difficult for people to model. And my point of putting

that slide up is that, that is an area, I think, particularly between yourselves and the IR team that we'd really like to see these ways of trying to do that. I'm not going to give any numbers today. But certainly, if there are ways that we can think of together to try and help you appraise that, that's something we'd like to do. Because at the moment, I think it's proving quite difficult, I think, for people to appraise. Okay?

D. Warren A. East

CEO & Executive Director

And can we move back towards the speaker there. Then over to this side, we've got one towards the front, one halfway back. I'm sorry I don't recognize all of you guys yet.

Olivier Brochet

Crédit Suisse AG, Research Division

Olivier Brocher with Crédit Suisse. I have 2 high-level questions. The first one, Warren, would be on the challenges that you are facing at Rolls-Royce. How would you qualify them in practical terms compared to what you were facing at ARM? How different are they and how -- what -- how -- what things are you going to do differently at Rolls than you were doing at ARM? That's the first question. The second one is on the various investigations that you had for corruption allegations on the SFO, possibly on Brazil, or formerly at Tognum? Can you update us on the status of these various things?

D. Warren A. East

CEO & Executive Director

Okay. Why don't I deal with the one that was specifically directed at me? And David, you think about the second one. Well, one of the interesting things is, of course, this is a completely different industry from a semiconductor industry, but there are some remarkable similarities in parallel. So the basic financial dynamics of the business are remarkably similar in terms of turnover R&D upfront that may go nowhere, a ton of product development cost built on R&D that has gone somewhere, followed by some revenue coming in when one sells products in the first place followed by a long tail, over many years, sometimes multiple decades, of revenue that flows afterwards. So actually, the financial dynamics of a jet engine is remarkably similar to that of a microprocessor. Similarly, the sort of partnership-type relationship that exists between Rolls-Royce and [indiscernible], Rolls-Royce and the airlines, in terms of service operations and -- are very similar to the sort of relationships that you find in a semiconductor industry between microprocessor designers like ARM, silicon foundries like TSMC, and semiconductor companies that supply chips into end-to-end products that we all use. So I was actually struck by remarkable similarities there. And in terms of the choices that one faces in the business as well, in terms of having to avoid, if possible, making bets. It'd be very easy to do custom engines for every airplane. But as David was just describing the discussion about 380, this is a dangerous thing to get sucked into from a business point of view. Similarly, it'd be very easy to design bespoke microprocessors for every application, but it would be a stupid thing to do from a business point of view. So I see quite a lot of similarities there. The primary difference to me personally, is that we have a very sophisticated manufacturing operation at Rolls-Royce, which happens to be in a period of change that we've just talked about, significant change as facilities that have been used for many years have become somewhat dated. And one of the tools that we have to improve our competitiveness is to deploy more sophisticated facilities. For instance, some of our new factories that are able to do literally twice as much in the same period of time. That is a different world for me. That harkens back to my earlier days in the semiconductor industry. But semiconductor industry, again, is one where the challenges of delivering quality at very high volume and very good yield are right in the forefront. But the good news is that Rolls-Royce has many people engaged in that manufacturing operation with many decades of experience of doing this combined with some newer people that we've brought into the business in recent years with a bit more recent experience of manufacturing operations like that. So though that's an area which I couldn't possibly pretend to be a current expert. Rolls-Royce has lots of expertise at that. Hopefully, that's answered both aspects of that question.

David Miles Smith

Former Chief Financial Officer and Executive Director

So I think on corruption, just let me remind you that we will not tolerate any form of corruption or improper business practice anywhere in the business. We have put in very extensive programs over the last few years around this. And that's something that has the highest level of focus of the management team and the board. We -- there is actually no new news really. We obviously continue to provide information as requested by the SFO and the DoJ. We're cooperating where we're asked to do, although it's been fairly limited by the authorities in India as well -- I think you asked me that. And we will do in Brazil if we get any request. But there is actually no specific event or no new news that's happened certainly in the last few months to talk about.

D. Warren A. East

CEO & Executive Director

I think we were around in the middle somewhere on this side. You need to stick your hand a little bit higher, sir. Well, let's just go here next in microphone and then move back, okay? Hands a bit higher.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Warren, it's Harry Breach from Raymond James. Can I ask you a couple of questions? One, looking at Civil, and it's on materials. Can you give us a bit of a flavor about, either in sort of revenue or shop visit terms, whether you have any sense that we're perhaps coming off an inflection point there or if we're still in the declining trend? I guess that's really about the 524s. And then turning over to market share on current programs, how will the Emirates campaign win about a month ago start changing market share on delivered engines on the 900 -- on the A380 program, sorry, in the next 5 years? And then separately, Tony Wood on the Trent 1000 has spoken at meetings lately about expecting campaign wins and share improvement there on the 787 program. Can you give us any feel for how you expect share changes on delivered engines to run through on those programs?

D. Warren A. East

CEO & Executive Director

Okay. The first one was about small Civil ones, some materials, I think. I mean, the basic issue that we have in our sort of small Civil area is -- well, there are 2 things. There's some designs that were lost a few years ago and aircraft -- replacement aircraft going out with competitors engines on. And so there is a structural loss of market share that we're facing over the next several years in that business. However, that's something that we have to live with. In terms of installed base, we still have a great installed base of engines on those aircraft, and they're obviously generating some materials contracts in terms of service. Right now, short term, we do appear to have some economic headwinds. There are fewer people buying new smaller jets. And those that have them are not flying around in them as much as they have been in recent years.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

I was really trying to [indiscernible] get the flavor. I wouldn't think we had sort of [indiscernible].

D. Warren A. East

CEO & Executive Director

Yes, okay. Yes -- I mean, [indiscernible] You answer the number one.

David Miles Smith

Former Chief Financial Officer and Executive Director

So on the 524s, obviously, we talked about the big dropoff we saw last year. There was some further dropoff during this year, although not nearly as much as we saw last year. And an interesting, it was actually more than offset by an improvement on revenues on the 535. So we actually haven't seen that big an effect in the first half on that sort of overall family of engines. But clearly, there are a lot of parked up aircraft. So I mean, the big drivers still, remember, of our aftermarket is installed thrust on Trent. And that's the key. It was up in double-digit terms in the first half of the year. And that's what's going to drive

overall installed thrust, and both LTSA and T&M revenue. So that's really the big driver. The revenues around RB211 are relatively small within the total revenue base.

D. Warren A. East

CEO & Executive Director

And your other question was about the new 900 orders, and 380 and so on, and how that flows through. I mean, I think we put a chart up, which is basically talking about installed base growing towards 50% by 2020. And obviously, engine shipments lead to the installed base. And so I think the number today is approximately 50% in terms of engine shipping, and that is set to grow with things like the new 900 order. And obviously, 200 engine is a very significant chunk. In terms of individual campaigns that Tony may have been discussing, we only make announcements when people are ready to make announcements. As far as we're concerned, there are trickle of them of wins coming in from the campaigns that are out there at the moment.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

Jeremy Bragg from Redburn. A question for Warren, please. The topic is narrow-body. I've got a couple of sub-questions, but really, how important is it to reenter this market? Do you think it's possible to compete with GE without a narrow-body product, given the scale it offers? Plus also, you've lost share in regional and business jets. I mean, I'm aware that this isn't an immediate problem, but it kind of strikes me that investing in the narrow-body engine could be coincident with this company starting to generate a meaningful amount of profit and cash in the early 2020s. So it's something I don't think investors can ignore, particularly given there are press reports at the moment suggesting that Boeing is looking to develop the reengine -- or sorry, is looking to redevelop the 73 -- 757?

D. Warren A. East

CEO & Executive Director

Yes. I can see this business and see this as a question which is out there both outside the business and within. Clearly, as we find ourselves in a position where we're installed today on a number of narrow-body aircraft, and right now, there are no narrow-body aircraft shipping with Rolls-Royce engines nor will there be -- new aircraft shipping with Rolls-Royce engines nor will there be for some time to come. It's not a decision we have to make today, as you point out. I would say that the new technologies that we're developing, the new architectures, the advance and UltraFan architectures, these are -- the technologies that sit behind there are equally applicable to lower-power variance suitable for narrow-body aircraft, such as any new design that might come out of Boeing to replace the 757 in due course. And obviously, they're an important partner for us. That's an important opportunity. Exactly how vital it is that Rolls-Royce wins that sort of design, exactly how much money we should spend on investing in that sector, is a bit more up for debate. That is straying into the realms of strategic review, and I'm not going to have any strategic review in this Q&A session, if that's all right. So that's all I'd say right now. We are developing the technologies, which are applicable. We do understand that it's an important sector of the market in volume terms. It's very important today. Big question is, in volume terms, how significant will it be in 2030 to 2040 when the peak of revenue would be flowing from engines that got designed today and designed in at the time of that 757 and other aircraft that might get introduced to compete with that. In value terms, however, then of course these are lower-value engines, and we enjoy significant volume in the wide-body sector that we are very successful in today at the moment and very successfully -- coming on to the last part of your question, very successfully able to compete with GE in that space. We've got a webcast question here.

Jilinda Crowley

Former Acting Director of Investor Relations

A question from David Perry at JPMorgan. David writes, "Hi, Warren. Hi, David. The improved disclosure is appreciated. In this spirit, please, can you tell us what royalty you received from IAE into the first half of 2015 and how you expect the royalty to unfold in the coming years?"

David Miles Smith

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Former Chief Financial Officer and Executive Director

Okay. So the answer is about the same as last year. And I think we've talked about that number in the past at around GBP 200 million, I think, on an annualized basis. So that royalty isn't changing significantly at the moment. Over time, as I've described before, that royalty will remain a constant factor, that will obviously be constant in terms of pricing, but it'll be affected by engine flying hours. We also, at the moment, receive revenue and profit from selling modules still for the next couple of years into the engine assembly. That clearly will go out of production over the next couple of years, and we will produce a -- an increasing volume of spare parts over the next 10 or 15 years. So that will be an increasing trend. So the -- I know the IAE number is fascinating, but it's not actually going to have a material impact over time on the -- in the profitability of the business. There'll be a bit of a drop in 2017 or '18-ish as we lose the engine modules. but apart from that, it's a fairly constant number.

D. Warren A. East

CEO & Executive Director

I'm not sure -- it's almost -- we're going down on that side.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

It's Andrew Gollan from Berenberg. I've got 2 questions, one on cash flow for David and a sort of broader question for Warren again. So on the cash flow, on the Trent delivery profile and the mix of linked to unlinked, there's a fairly dramatic mix exchange that we all now are aware of, and we're also aware of the accounting change and how that brings profits closer to cash. So on a 2- or 3-year view, what should we be thinking about in terms of that being that a powerful driver of improving cash dynamics in terms of conversion? Or are we back to what you talked about earlier in terms of it's all about inventory management? Or how powerful a driver is it?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, I think the reason I talked about inventory is that's something really physical that we can get hold off in the short term and continue to manage. Remember, there's absolutely no difference between the cash flow between a linked and unlinked contract. The reason it has an effect on cash flow is simply the profit to cash flow movement. So in absolute terms, the cash income is really driven by the -- primarily by the engine flying hours or the people not on TCA contracts by on the shop visits. So it will become an increasingly important part of the cash flow as the installed base ramps. So both on the Trent 1000, and interestingly, that's a project that we'll see fairly intense probably activity in the first few years as those engines are operated in relatively short segments intensively by the launch airlines. But then as we see the XWB begin to build up as well, so those are going to be the main drivers of that. And therefore, as I said before, this isn't linear, unfortunately. It will build up over time. But once we're up to 50% installed base, it'd be a really major driver.

Andrew Paul Gollan

Joh. Berenberg, Gossler & Co. KG, Research Division

I understand the absolute cash story, but it was more on the conversion metrics. How soon do we get closer to the metrics that might look more preferable?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. Well, I -- we talked about this 80%. And I think the smarter -- those have sort of cottoned on to this LTSA thing taking out. We'll realize actually it's probably likely to be over 100% for some stages, because you'll get a net release of cash. I remember I didn't fully answer that question earlier. But absolutely, there'll be cash flowing off as the TotalCare net debt begins to decrease again. So I still believe getting to a cash conversion of those levels, albeit a little bit further out because of the -- just the volume impact of losing those Trent 700s will be achieved in a relatively short time frame.

Andrew Paul Gollan*Joh. Berenberg, Gossler & Co. KG, Research Division*

Okay. And then one last question for Warren. A follow-on from Olivia's question earlier. So -- I mean, your previous predecessor made quite a lot of similar noises about operational improvement, cost reductions, all the things the kind of want to hear; infamous 3Cs, which became 4. I guess my broader question is about the culture internally that you've experienced since you've been in your very short tenure so far. How do you feel about things like cultural obstacles? Because everything that was said before was very good. It's fair to say that progress has been way below what we all thought might happen maybe couple of years ago. So any observations you could say on that in your very short time you've been on the business?

D. Warren A. East*CEO & Executive Director*

Yes, it's a very short time. So let me caveat what I say with that. Of course, when you're trying to make operational changes, then the culture that exists within the business, the way in which people go about doing things, communicate, speed of information flow, all that sort of thing, can be a serious retardant. Now I think the now 4Cs, framework for operational improvement, has been followed at Rolls-Royce over recent years is an excellent framework. And the job is not complete and we do have a way to go on following through. But I intend to continue to use that framework to follow through. The 2 words I've used to sort of slightly sort of change the emphasis on that are pace and simplicity. And I think those possibly speak to some observations that I've made for myself, at any rate, about the culture, which possibly needs a little bit of tweaking. So hopefully, that sort of broadly answered the question. I don't think we need to talk about it any further right now.

Unknown Executive

Another question from the web from Ben Fidler at Deutsche Bank. Ben asks a question for Warren. "You have a large backlog in Civil Aerospace. How content are you that this backlog has been correctly priced versus your cost base to enable you to deliver mid-term margins in line with your large engine peers?"

D. Warren A. East*CEO & Executive Director*

Okay. And the answer is -- I think the answer is that they've been priced at the price that they're at, and that's the market price when the orders were struck. And this -- that's not within our control to make any changes to that right now. The reality is that a lot of that is a very, very profitable Trent 700 engine, and price is one component of that. Maybe there's a little bit of concern, because on July 6, we talked about pricing pressure. And I must emphasize that the pricing pressure we talked about on July 6 was due to a very changed competitive environment on a very small -- a relatively small number of Trent 700 engines in the tail end of that very profitable program. Going forward, then the lever that we have to work with on -- to turn the orders, which are already taken and priced into profit, is one of cost. And that's why we're going through this program of operational transformation under the framework of 4Cs. And that's why I'm coming in and taking another look at the way in which we go about doing things, the operational review that we're doing to look for ways of stretching that a little bit further and a little bit faster on things like the costs. But I'm confident in the transformation programs that are already underway. In Aerospace in particular, we announced program at the end of last year with some 60% of the way through the headcount changes that are associated with that program and the location where we're doing things. It's an ongoing program. It's going to last for some several 3 to 4 years yet, and I'm confident that it's going to deliver some significant improvements for us.

Thanks. I think we might be almost there. So with that, thank you all very much for turning up this morning. I know it's a very busy morning with lots of results out today. So thank you very much for your support, and we'll be back in Q4.

Presentation

Operator

Good morning, and welcome to the Rolls-Royce Holdings plc Guidance Update. [Operator Instructions] Just to remind you, the webinar is being recorded.

And today, I am pleased to present John Dawson, Director of Investor Relations. Please begin your meeting, sir.

John Dawson

Thank you very much, operator, and good morning, ladies and gentlemen. Welcome to our call on the guidance update we published this morning. My name is John Dawson, and I have the pleasure of being the new Head of Investor Relations at Rolls-Royce. With me are Warren East, our new Chief Executive; and David Smith, our Chief Financial Officer. They will be taking the lead on the presentation today.

We've allowed around an hour for the call overall, and we'll have plenty of time for questions at the end of the presentation, which should last for around 10 minutes. Please wait for the operator's instructions to register for question at the end of our opening remarks.

So without further ado, let me hand you over to Warren.

D. Warren A. East

CEO & Executive Director

Good. Thank you, John, and good morning, everybody. This is the first time I've spoken to you all as Chief Executive at Rolls-Royce and, obviously, it goes without saying, this isn't exactly what I had planned for the first communication.

I joined Rolls-Royce because I strongly believe in the fundamental strengths of this business, the scale of the opportunities available to it. It's truly a fantastic company with exceptional technology, very deep customer relationships and outstanding long-term prospects. That's why I agreed to take the job.

But let me say I'm clearly disappointed by today's announcement and the impact that it is obviously having on our investors and our employees. The last 18 months have been very challenging for all our stakeholders as we've managed our way through some important market developments, changes in leadership and so on.

That said, notwithstanding market developments, I understand it's our responsibility to build a business that is sustainable and resilient, no matter what is thrown at us by the market. And it is a responsibility I take very seriously, and it's going to be one of my fundamental priorities for the next few years.

So what happened? In the near term, we have to manage an important transition from the Trent 700 to the new Trent 7000, and that is having a negative impact on our profit, probably greater than we anticipated both in 2015 and going forward into 2016 and beyond. We also have to build our capacity to service the new Trent XWB and Trent 1000 programs.

In addition, our Land & Sea business has some big challenges at the moment and, in particular, needs to overcome challenges in the offshore market and get to rebuild a consistent trend of improving revenues and margins across all of its businesses.

As a management team, we do have great confidence in the long-term prospects for the business. In the near term, our immediate priority is to find efficiencies and performance improvements that we need to deliver on these goals. Beyond that, I'm certainly going to be doing a review of the business operations. And when we've done that operational review, I'm sure I'll be coming back to you in due course with what we, as a leadership team for Rolls-Royce, are going to be doing to ensure that this world-class business continues to meet the needs of all its customers and its shareholders.

So thank you, and I'm going to hand over to David to take you through today's update in more detail. David?

David Miles Smith

Former Chief Financial Officer and Executive Director

Thank you, Warren, and good morning, everybody. What I'd like to do today is take you through 4 things: Firstly, an overview of what's changed in our outlook; secondly, take you through our updated guidance for 2015; thirdly, set out the key items impacting our 2016 performance, particularly in Civil Aerospace; and fourthly, set out the reasons why we remain confident in our long-term prospects.

So what's changed since the prelims in February? Clearly, there've been some major changes in expected production volumes for the A330, and this has had consequences for us in respect of demand for the Trent 700, not only in original equipment sales, but also, importantly, demand for spare engines. In addition, the slowdown in production has increased competitive pressure, with a knock-on impact on engine pricing. At the same time, we're seeing weaker demand for our business jets and the softer regional aftermarket; both are relatively recent developments. In addition, already weak offshore markets, exacerbated by the sustained pressure on oil prices, have continued to worsen, and this has had a further effect on our Marine business.

Since February, we've been undertaking a rigorous review of our forecasts and the planned assumptions that underpin them. This is effectively a pull-ahead of our 10-year planning process in order to capture the degree of market weakness we are seeing today. The rigor applied to this process gives me confidence that these now represent the best view of what we have had for some time of our outlook for the next 10 years and, therefore, a sensible basis on which to make judgments that underpin our update today.

So let me take you through the update in some more detail. Firstly, our 2015 guidance. Overall, guidance for 2015 revenue is unchanged for the full year. Reflecting the movement in Marine profit, the group profit before tax is now expected to be between GBP 1.325 billion and GBP 1.475 billion. Free cash flow for 2015 is now expected to be between negative GBP 150 million and a positive GBP 150 million. And, of course, I'm continuing to work on ways to improve this.

Given the weaker near-term cash outlook, we will discontinue the share buyback program having completed GBP 500 million of the planned GBP 1 billion program in the first half of the year. As we set out, the profit reduction primarily reflects a further weakening in offshore markets. As a result, we now expect the Marine profit to be between breakeven and GBP 40 million.

In addition, we're reviewing further cost actions and the restructuring activities in Marine to help improve performance, which, including some asset impairments, is expected to result in an exceptional charge of GBP 70 million to GBP 100 million. Guidance for all of the other businesses remains unchanged.

So for Civil Aerospace, it's worth noting that though the Civil Aerospace performance is unchanged, there has been a change in mix of performance, and this will have an impact on the year-on-year comparison with 2016. In particular, we expect the A330 rate change to impact Trent 700 deliveries in the second half of this year. In addition, there will be some impact from lower-than-expected demand for engines to power business jets and the softening regional aftermarket.

The profit effect of these will be largely offset this year by a number of operational performance benefits. Firstly, we expect to be reverting a balance sheet provision on the Trent 1000 launch as a result of significant improvements in operating performance. Secondly, we are also in a position to recognize improved retrospective TotalCare contract profitability. Together, these items will contribute around GBP 200 million to performance this year, which is higher than we originally expected.

Turning to briefly look at the half year. We will be providing full details of our interim results on the 30th of July as normal, and our expectations for the first 6 months have not changed. As outlined in May, we continue to expect 2015 profit before tax to be phased more to the second half of the year, though principally by Civil Aerospace and Power Systems. As a result, first half profit before tax is expected to be between GBP 390 million and GBP 430 million or roughly 30% of the full year compared with around 40% in 2014.

While this would seem to leave quite a lot to do in the second half, we have confidence in our ability to do that. In Aerospace, we will, despite the Trent 700 reductions, see a higher level of engine deliveries across our small and large engine categories than in the first half of the year. In addition, we have the continued benefit of growth in service revenues and a lower level of R&D charges as we start to capitalize several programs. We also expect to have a significant proportion of the one-off benefits that I discussed earlier.

In Land & Sea, Power Systems are expecting a stronger second half, as we've seen in previous years. In addition, we based our expectations on a new rebased Marine forecast providing some degree of comfort in our current estimates. Finally, we will benefit from lower commercial and admin costs in the second half and the early benefits of the aerospace restructuring program.

Let me turn to the outlook now for 2016. In our Civil Aerospace business, we expect a significantly lower contribution from the Trent 700 engine program, led by lower revenues from reduced engine sales, including spare engines, and weaker pricing. In total, we expect these changes to Trent 700 demand, which benefits from linked accounting that ties aftermarket margins to engine delivery, to reduce Civil Aerospace profits by around GBP 250 million compared to 2015. Now it's important to remember that there are still several open campaigns for Trent 700, and we don't yet know how many engines we'll win. We think this reflects a balanced view. In addition, we expect a further GBP 50 million headwind from lower demand for our business jet engines and softer regional jets aftermarket.

Other factors, including an improved large engine aftermarket, led by our higher installed base and the net GBP 90 million benefit of restructuring, should largely offset the likely lower level of provision leases -- releases and other adjustments we'll see in 2016. It's worth noting that the cash impact from these headwinds should be much smaller than the profit impact and, therefore, we will see cash conversion improve.

Before I hand back to Warren, let me say a few words about our confidence in the long term. For the first time, we've done a thorough bottom-up review of our 10-year plan and applied a degree of rigor that gives me confidence in the foundations of our guidance update today. While the outcome is not good, I do believe that it does create a base on which we can build, barring further major adverse developments.

Allied to this, our exceptional order book now stands at GBP 76 billion, led by an outstanding position on leading wide-body passenger programs. The successful rollout of new engines, led in particular by the Trent XWB and the 1000 and 7000, together with related aftermarket revenues, is expected to drive significant revenue growth over the next 10 years as we build towards a 50% share of the installed wide-bodied passenger market. And this is supported by a clear set of long-term mega-trends that support profitable growth well into the future.

Whilst the impact of the transition to the Trent 7000 has reduced Trent 700 deliveries and held back Civil Aerospace profit in the near term, we are confident the transition to the Trent XWB program, in particular, will support this. As we've said before, this program creates significant embedded value, with exceptional cash flows that are around double that achieved by the Trent 700. At the same time, we are continuing to strengthen our technology plans and sustain our investment in the industrial transformation that will continue through to the end of this decade. This is essential to our long-term success.

In addition, initiatives to reduce cost and increase focus within the Marine and Power Systems businesses should help drive good performance improvements and support a growing contribution from our Land & Sea business as the company continues to reinforce its role as the leading provider of better power for a changing world.

Thank you. So I'll hand back to Warren now.

D. Warren A. East
CEO & Executive Director

Thank you, David. I'd like to just remind everybody that, obviously, we are clearly disappointed by today's announcement. David has explained the period of transformation that we are going through in the Aerospace business, transitions there and the headwinds in the offshore market, which are driving the announcement today. However, nothing in that does anything to shake the fundamental confidence that

I feel about the long-term prospects for this business, for its market position, for the long-term market trends that David has described. I will be carrying out a thorough operational review of the business. It's not appropriate for me to speak into much more detail on my second day in the job about that right now, but I will be back to update you in due course.

And with that, I will hand over to John, and then we'll be happy to take questions.

John Dawson

Thank you, Warren. Operator, if you could open the call to questions, please.

Question and Answer

Operator

[Operator Instructions] The first question comes from the line of Olivier Brochet from Crédit Suisse.

Olivier Brochet

Crédit Suisse AG, Research Division

I will have 2 questions, please. The first one is on the transition from Trent 700 to Trent 7000 and which you say has an impact which is greater than expected on profit. Can you come back a bit on that and explain how this can be a surprise? And was it pricing impact, which was not well appreciated? Was it linked to how you look at TCP contracts, and there has been a change in the way you look at them? And the second one is on the business jets. For the midterm prospects, you have a lack of new platforms. Can you tell us when you expect to reach volume trough for business jets, please?

John Dawson

Okay. David, would you like to?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. So let me take the Trent 700 question first. The profit effects that we're talking about here, which, as I described, were GBP 250 million incremental in 2016 compared to 2015, reflect both lower engine volumes, and clearly, that is a combination of what Airbus have described in terms of their own rate changes, but also our balanced assessment of where we think we are likely to win in terms of competitive situations for those engines with particular airlines. So although Airbus have made some announcements about A330ceo in the recent past, in fact, none of those engine competitions have taken place yet, so we are trying to make an assessment of that additional impact on ourselves. You're right, pricing is a big factor here, and that's probably where all of us have probably underestimated this impact as we thought about it. But the detailed work that we've done leading up to the announcement today basically suggests to us that there is a significant risk on the pricing side, both, obviously, on the OE engines, but also on the aftermarket as well. And a clear important thing about the Trent 700 is, being a linked engine, it also carries a lot of profit at the sale that's associated with the aftermarket as well, so lower aftermarket pricing impacts on that. The third element that probably most people won't have thought of as that significant but actually is fairly significant is a reduced requirement for spare engines going forward essentially because the installed base will be smaller, and these do tend to be more profitable, and therefore, that has a disproportionate impact on those engines within the build as well. So it's unfortunate, but our assessment of the overall impact, as I said, is about a GBP 250 million impact beyond what we've already seen in 2015. On the business jets, I didn't quite hear your question, I'm afraid. Could you just repeat that again, Olivier?

Olivier Brochet

Crédit Suisse AG, Research Division

Yes, certainly. It's basically the -- when you look at new platforms, you've -- you don't have many, if any, over the next few years coming online. And looking at these midterm prospects in business jets, I was wondering when you would reach the volume trough for these business jets.

David Miles Smith

Former Chief Financial Officer and Executive Director

Oh, I see. Well, I think we will see reductions, clearly, from the fact that we haven't won a couple of key platforms over the last few years, and that will come progressively over the next 5 or 6 years. We're still very confident about this market. It's an important market for us. We have still a very strong position, and we are intent on continuing to invest in the technology and to make sure that we have the right route

to market for those products in the future. So we are very confident about the long term about this, but clearly, we'll see a dip in the short term from the market share reduction.

Operator

The following question comes from Christian Laughlin from Bernstein.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Just a couple of questions from me, please. Warren, I was just wondering if you wouldn't mind elaborating a little bit on the process -- just in general terms, the process and rough time line of your review of the business operations. For example, do you expect to be largely complete by H1 earnings? Or do you expect that this detailed, thorough review will take much longer, and with respect to updates, we shouldn't expect much before much later in the year? And then secondly, somewhat related to that, just coming back to the medium-term outlook that was initially released towards the end of last year or so, the calendar at the time called for regular updates annually, every November or so. Should we still expect that, or is everything kind of on hold until your review is complete and then a kind of a communication calendar is reset, if you will?

D. Warren A. East

CEO & Executive Director

Okay. Let's say that coming into this job, I fully anticipated doing a fairly thorough review of the operations and the operational side of the business anyway. And what today's announcement is causing me to do is simply approach that with possibly a slightly greater degree, bigger than I might otherwise have done. And I don't think we're going to be setting a particular time line for output, and we're not going to have any special communications as a result of that review. We're going to be communicating according to the normal timetable, and I will be updating you in due course in those normal communications as to how we're going with reviewing the operations and any changes that I think that we need to make as a result of that. And in that context, then the time line that we set down for medium-term guidance, right now, we don't anticipate changing. But obviously, as a result of that operational review, there may be some changes. I do hope -- to take the question a little more broadly, I do, first of all, fully understand that there have been some issues around communication with the investment community in Rolls-Royce, and I do intend to make sure that we do a better job at that, and that may involve some changes to the timetable. But right now, on my second day in the role, I can't tell you what those changes to the timetable are likely to be, but we'll put our heads together, and we'll certainly be back with the regular communications, so I expect you'll hear some more from me on this at the end of July.

Operator

The following question comes from Nick Cunningham from Agency Partners.

Nick Cunningham

Agency Partners LLP

I'm probably going to follow that up with perhaps a slightly unkind question, but there've been several profit warnings in the last 18 months. So the question really is, how confident are you that this is it as far as 2015/'16 is concerned, and where do the risks lie? And then a much more specific question, I believe we're due to see a A380neo launch around the end of this year. I mean Airbus is becoming increasingly explicit about that. And it seems fairly natural that it will be, as I say, a Trent 9000 that will end up being an exclusive engine of that. So does that end up being a 0 margin engine? And also, can you afford it?

D. Warren A. East

CEO & Executive Director

Okay. Maybe if you could...

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. I think on -- Nick, this is David. So I think on your profit warnings question, essentially, what we're talking about is 2 segments today. Firstly, the offshore market within our Marine business. So if you look at our overall Marine business, the Naval business and commercial marine business is sound. The market that's being impacted is essentially that affected by the oil exploration business. And really, there's been a fairly dramatic tail off in capital investment activity right throughout that sector, which is impacting on us and the shipyards and other players in the sector as well, so we are not alone. In fact, I think you can see a lot of this throughout that sector. So what we've tried to do today is to provide a further update on the outlook we see there. None of us, however, can predict how long this trough is going to go on. What we've been absolutely insistent on is taking the right actions while we're going through this difficult period to readjust the capacity within the business and to make sure, at the same time actually, that we're increasing investment in some areas that we think are critical to our technology going forward. So I can't, with assurance, say that we won't see any more problems on the offshore market, but we have rebased our forecast for this year, and obviously, that carries through into next year, based on all that we can see around us at the moment. On the Civil market, what we're dealing with actually, in a way, is the negative effects of a very successful outcome last year of the Trent 7000 win that we had for the A330neo. The unfortunate thing is, however, there's a bridge between that product launching in 2017 and the run-out for the A330ceo over the next 4 years because they go on through beyond 2017. We have seen and you know Airbus have been attempting the best they can to sell those aircraft, but it's been a very difficult process. And the commercial situation is very keen, and clearly, both they and the engine manufacturers going to sell into the A330ceo are seeing the impact of that. We've made the earliest and best assessment that we can of the impact, which we're assessing as GBP 250 million of the GBP 300 million total aerospace headwinds that we've talked about. I think that from all the work that we've done very intensely that, that is a very balanced assessment of what we will see 2016, but clearly, this will not be just a 2016 issue. We'll see it carrying on to further years as well. So I think on those 2 issues, as I said, that we've provided a very full assessment based on all the facts we have around us. There are some other issues within the business that we've mentioned on business jets and corporate jets. Whether those will be shorter or long term, it's hard to say. On your second question on A330 -- sorry, A380neo, the thing that we said all about -- all along on this product is, of course, we're very interested in participating in such a product, but it is Airbus' decision about whether they have a business case to proceed with that. And clearly, they've had a fairly long conversation with their customers now and key customers around that product. We will also only participate in that product if we see a business case, and by definition, therefore, they will probably only proceed if we see a business case. So this has to work for all parties here; ourselves, Airbus and the key customers. Beyond that, we can't really say because they are in control of the timing, but that's our view on that product. So we won't go ahead with it if there isn't a proper business case.

Nick Cunningham

Agency Partners LLP

And just briefly, to follow up on the risks issue. There's been very little mention of the Tognum business. That has some of the same exposures as Marine, although, obviously, it's a much broader business. Is that still trading in line with expectations, and do you see any risks residing in that?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, they will have a weaker first half on profits than last year, and I think that that's part of our bias on the profits, but actually, that represents an expectation that we had around that mix of business anyway. They're certainly trading in line with delivering their full year results, and they've actually had some good order intake in the last few months. Their offshore business is a relatively small part of the overall business, as you said, and there are other sectors that are developing more positively at the moment for them.

Operator

The next question comes from Ben Fidler from Deutsche Bank.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

Yes, I actually had 3 questions, please. The first one is just I guess coming back to 2015 for Civil Aerospace and just getting your view. And take us to what it says about control visibility, whether you're content with the control systems you have, predicting the performance of that, of what should be a very visible business. Trent 700, lower spare engines, bus jet delivery declines, weren't those issues you, theoretically, or the business, should have foreseen at the start of this year? And I know your overall Civil guidance has been maintained, but clearly, it's been helped a little bit by the Trent 1000 provision release, so just wanting to get a feel for that. In your view as managers of the business in Civil Aerospace, do you feel that you've got the information systems that enable you to know what's truly going on in that business on a 12-months forward basis? The second question was just around Trent 700. I'd clearly done my math slightly wrong in terms of the drop-through margin effect for 2016 of the volume decline. And should we assume a similar drop-through margin effect for 2018 when the A330ceo program effectively all but finishes? Or will that be overestimating the next leg down in Trent 700 in 2018? And then the third question, just for 2016, your revised guidance for Civil profits, if we adjust out some of the accounting issues like TCP net debtor growth of -- I mean, it implies you do about GBP 600 million of Civil profits. You've got probably, take your guidance, a GBP 300 million to GBP 400 million growth in TCP net debtors, reasonable growth in contractual aftermarket rights, an IAE earnout of GBP 200 million. It implies the underlying Civil profit in 2016 is close to nothing; and yet for the midterm, you're guiding to Civil margins up to 15%. That seems a lot of growth in the out years. Are you still confident with that?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Thanks very much, Ben. So I would say on the visibility within Civil, I think the Trent 700 has actually been quite a difficult issue for us to assess. As I said, none of the engine allocations for the A330ceos is clear yet, so we've essentially had to look at this airline-by-airline and work out where we think our position is on those. It's been quite an uncertain environment because we haven't been exactly clear also where Airbus will be selling into as we've been going through this process. So it's a -- it has been a more difficult issue for us to assess than normal, I would say. On the bus jets, this is a relatively new issue that really was emerging over the last couple of months and it's, I think, well known who the player is who's been seeing some weakness in their own demand. And I think we've been working with them very hard in terms of that to adjust our volumes to suit their requirements. Again, this is probably a combination of market share and particular market environments, and we may well see some of the factors that are impinging on that market in terms of demand in China, et cetera, improving again over the next year. But we're trying to be realistic about the fact that we think this'll probably not just be a 1-year effect but it will probably impact on 2016 as well. In terms of Trent, Trent 700, I just want to make it clear on drop-through margins. So when we think about the GBP 250 million, it is made up of 3 components: the volume effect which, as you know, is linked and, therefore, includes an element of OE and aftermarket; the pricing effect, which -- and both of those 2 effects are roughly the same size within the GBP 250 million and the pricing effect actually represents the fact that we'll be selling these engines at lower prices than we have previously on Trent 700; and then the spare engines, which, although smaller, is essentially the loss of volume of relatively higher-profit engines. So that effect into 2016, which is -- obviously, will continue into 2017 and '18 as well, as you said is -- you need think of it, I think, in those 3 parts in terms of doing any calculations you want to do on drop-through effects. Clearly, as you said, there is a further reduction in rate as you get into 2018, I think. I can't quite remember the Airbus schedule at the moment, but I think it's a smaller reduction in 2018 as well.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

And the third question just on -- am I completely off theme with my maths for the sort of implied underlying-underlying Civil profits in '16 and the steepness of that recovery?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Yes. So the good thing about this planning process is it's identified -- enabled us to identify and put numbers around some of the things -- these things early. So we've actually been able to get out to you, I think, with a view for 2016 in terms of the headwinds that we're facing much earlier than we would have done normally in our process. The positive thing for me, actually, is it's actually reinforced my view about the long-term ability of the business to generate the kind of margins we've been talking about. We've done some very extensive work on the XWB and the impact of that. I showed you -- very briefly, I know, but showed you that slide which shows the cumulative cash flow for XWB, which is significantly higher than Trent 700. So I've actually come away from that process much more confident about the ability of the portfolio regeneration and the industrial restructuring we're doing, actually, to give us a very long-term sustainable business for the wide-bodied engine market. And the elements of the -- how we're going to improve margins really haven't changed. It's around delivering improved engine costs and customer pricing. After we get through the launch phase, it's about getting the capacity utilization up as we're increasing the ramp, and that will be progressive through the rest of this decade. It's about the industrial restructuring that we're doing which will give us much more flexible capacity. And most importantly, it's about the aftermarket margin that comes with a 50% installed base. We're still in the 30s in installed base at today, but we'll be up beyond 50% as we get through 2020. So these are really the impacts that will continue to drive this margin improvement over the medium term.

Operator

The following question comes from the Zafar Khan from Societe Generale.

Zafar Khan

Societe Generale Cross Asset Research

I have 2 questions, please, if I may. The -- and they're both really directed at you, Warren, if that's okay. First one is just on -- I know it's only your second day in the job, but you've been non-exec on the board of Rolls for a little while now, and also the announcement of your succeeding Mr. Rishton happened a few months ago. I just want to know how much you've been involved in this trading review, if I can call it that way, and the guidance that's been given for '15 and, more particularly, for '16. How much has been your involvement in that? That's the first question. Then maybe I can follow up afterwards with a second one.

D. Warren A. East

CEO & Executive Director

Yes, certainly. Well, you're right, I have been on the board in -- as a Non-exec Director. I was very supportive of David's appointment last November and very supportive of David's rigorous review of the business, which, as he said a few moments ago, has enabled us to bring this information to the market much sooner than might otherwise have been the case. Following the announcement that we made in April that I would be joining the business, then, in middle of June, I was involved in the latter stages of David's process there and saw the output as it started to emerge as part of the company's regular long-term planning process. And certainly, even though I joined the business on Friday, I've been involved over the last week as numbers have been coming out, and it became evident, over the weekend when we got the final numbers together, that the magnitude of this impact, in particular, on 2015 and 2016 and, therefore, that we would have to be making this announcement today. As I said at the start of the call, it's not how I envisaged my first communication with the market. And even up until halfway through last week or so, I was not really imagining that we would be necessarily talking quite so soon in my tenure, but I think it's absolutely inevitable we had to have this communication today. Obviously, it's a little bit scanty on the detail. And by the end of July, then I hope to be in a better position with some of the information. And your next question?

Zafar Khan

Societe Generale Cross Asset Research

Yes, this is -- I hope you'll indulge me, it's a slightly philosophical question, but I think many of us would like to ask this, so let me ask it, it'll save David having to ask the question later on. As Nick said, there have been a number of profit warnings now for 18 months or so. The stock is a pretty big underperformer against the rest of the aerospace, Civil Aerospace stocks. There's a lot of money sloshing around, very

cheap money. And you may have noted Airbus issued a convertible at a negative yield to maturity, so clearly, a lot of money around the place. You've put forward a very compelling case for the long-term prospects of this company, but it looks like, in the medium term, I think the shareholders are going to suffer a little bit of this kind of transitioning issue. And I think active markets are pretty kind of unforgiving, but the longer-term view is often taken by industrial players. So I know it's your second day in the job, but given today's warning, given the kind of numbers are down next year and maybe flat in '17 on '16, if somebody were to make an approach, how do you think the board would view that? Do you have the stomach to try and turn this thing around? It's a supertanker, really. Or if you were given tomorrow's money today, do you think the board would be amenable?

D. Warren A. East

CEO & Executive Director

Well, obviously, I can't answer for the whole board, and the whole board has duties to shareholders to consider. But certainly, the reason I joined this business, as I said at the start of the call, was because I believe it's in a great position. It has excellent relationships with a customer base, and I joined the guys at the Paris Air Show and witnessed some of that first hand, and I can see tremendous value in those relationships. I can also see tremendous value in the R&D, which is in train in this business and which is translating into products. And if I look at the newer products that are coming to market, the Trent 1000 and all its variants, the Trent XWB and the follow-on products that we have in the pipeline, and I -- if I think about those and I think about those and the -- what the company has previously described as mega-trends, and I see those products becoming more mature and more profitable. I see us occupying the new facilities that we've been investing in over recent years. Then actually, this business is very well positioned for the future to take advantage of those mega-trends. So that's why I took this job on. And what happens with other players in the market, we'll deal with as and when we have to. But I certainly intend, as I said at the start of this call, to make a sustainable and resilient business a priority, and I think we're in a great position to get there. We do have some severe headwinds, which are affecting the business today. In terms of relative to where we thought, or where the business thought it might be, in 2016, and we've explained those headwinds today, and that's why we're having this communication, but it doesn't shake my fundamental confidence in the future of the business.

Zafar Khan

Societe Generale Cross Asset Research

Could I please just ask one of David?

David Miles Smith

Former Chief Financial Officer and Executive Director

Sure, Zafar, yes.

Zafar Khan

Societe Generale Cross Asset Research

David, there was effectively a GBP 300 million release to the numbers last year on the Civil side from the long-term service contracts because I think it was on the Trent 700, in fact, where the provisioning -- there was over-provision on that.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes.

Zafar Khan

Societe Generale Cross Asset Research

And you're talking about a GBP 200 million release this year. That's a cumulative GBP 500 million release. Is the accounting under control? I mean, these are big numbers that you're releasing. How rigorous was the analysis in taking these provisions in the first place? What are you guys doing about this?

David Miles Smith*Former Chief Financial Officer and Executive Director*

So Zafar, just a couple of points. Firstly, it was GBP 150 million last year, and the main driver of that was aftermarket cost improvements. What we're talking about within the GBP 200 million this year are a couple of different things. We took a deliberate decision when we launched the Trent 1000 to actually take provisions against the launch programs there, so, essentially, the operating costs of those launch customers. And we did that very deliberately at the time because I think, as it's well known, the early versions of the aircraft and the engines had further engineering programs associated with them. As we're now assessing that, and we haven't quite completed the technical reviews, which is why I described this as something we expect to do in the second half, that we're actually seeing a lot better operational performance. So we don't believe that we need to continue to write down that asset, and we'll reverse that asset -- or that write-down in the second half of the year, which is about GBP 100 million. So this is purely being generated actually by improved technical performance. We have 1 or 2 tests left to do, and they will happen over the next 2 or 3 months, but we're actually very confident in the outcome of those tests. The third element actually within the -- sorry, the second element within the GBP 200 million, so that's about half of the GBP 200 million, the second element actually relates to our valuation reserves. So at any point in time, we hold our reserves against primarily credit risk, but other kind of risks in terms of the airlines that we operate with, and we essentially do an assessment each year. The -- that overall situation has improved quite a bit over the last year, and therefore, we can reduce the level of contingencies that we take on those contracts. Again, exactly following the normal procedures, we're just taking the benefit of -- essentially, of improved trading conditions for those as well. So I absolutely assure you that the policies we're using are sound. We have continued to review those. What we're actually seeing is the benefits of good things that are going on, allowing us to hold lower contingencies against these things because we're seeing, on the one hand, operational performance improvements; on the other hand, improved trading prospects for our customers.

Operator

The next question comes from Jaime Rowbotham from Morgan Stanley.

Jaime Bann Rowbotham*Morgan Stanley, Research Division*

Three quick questions for me, all keeping in mind Rolls' desire to give better communications. The first one is, David, I appreciate your comments on Trent 700 demand being hard to predict, but could you give us at least a rough idea as to where you were and where you now are in terms of expectations around deliveries of Trent 700 engines compared to the 184 delivered in 2014? Because without that, it's going to be very difficult for people to judge whether your latest guidance is sensible or not; whilst with it, we can then perhaps draw some conclusions on the pricing element of the moving parts there that you mentioned. The second is, David, you flagged Slide 12, where you suggest cash from XWB can be double the cash flow from Trent 700. But as you probably gathered from some of the questions, I'm not sure any of us really have a clue what cash from Trent 700 is or, indeed, what you think it is, so I just wonder, could you add any color there? And do you anticipate being able to add some financial figures to the activities on some of these charts in due course? Or will that always remain difficult due to commercial sensitivities? And thirdly and finally, and apologies for taking so much time, but perhaps missing from the guidance is any specific outlook on cash in 2016. I do though take the point in the statement on cash conversion, i.e., the bit of the profit that you're downgrading is largely forecasted noncash profit on Trent 700 sales accounted on a linked basis, so the cash impact shouldn't be as big. Does that mean free cash at Rolls could improve next year? And if so, what can you say to give us comfort on that given that in 2015, the cash downgrade is actually bigger than the one to profit?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Thank you, Jaime. So just taking your first question first, you're right, 184, I think, was the number for 2014. I think we're likely to see that drop to around 140 level this year, maybe slightly higher than that. Next year, what we've done for 2016 is we've essentially taken a number of scenarios in coming

up with our number of GBP 250 million. So it's not necessarily one volume scenario only. We've taken a number of different volume and pricing scenarios and sort of mixed out what we think the effect of that. But we're likely to see it drop to sort of between 80 to 100, I would say, next year and a similar number for 2017. Exactly how that build schedule happens between 2016 and '17 may -- is much more likely to be, depending on which airlines, what the GE's build schedule within Airbus looks like. It's a little bit difficult to predict, but those kind of volumes for 2016 and 2017. In terms of the color on XWB cash flows, yes, I mean, I'm not going to put an -- numbers on that axis, I'm afraid, because it's very commercially sensitive. I would say to you that if you go back through Rolls-Royce's history, Trent 700 has been an incredibly successful engine for the business. I'm not sure I'm particularly qualified a historian to say it's been the most successful engine ever, but probably, it's got a good shout of having been the most successful engine ever probably alongside the RB211. But the engine has gone on for -- it's still selling 20 years later and an OE and has at least another 20 years of aftermarket to give. What I'm trying to do by that graph is saying the indications on XWB, on all of the work that we've done, all the analysis that we've done, is that the XWB will be twice as successful as the previously most successful engine. So I think that I'm trying to give you a qualitative view of how strong I think that embedded value is because I do think it's very significant. And then in terms of cash, yes, we didn't provide any specific guidance for cash, although we did, as you say, suggest that because of the unlinked -- sorry, the linked accounting on the Trent 7000 -- 700, sorry, and the transition to unlinked accounting on the XWB, that the Civil profit effects are going to be more difficult than the cash effects, which will be, I think, quite a bit smaller. So compared to the revised guidance that we've given for cash flow this year, we should see sort of flattish cash flow in terms of that Civil effect at worst, I would say, so it's something that I would absolutely expect cash conversion to improve. But I haven't given cash -- a cash outlook at this moment, but certainly, I think there should be opportunities to improve it.

Operator

The next question comes from Rami Myerson from Investec.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Just I'm trying to stress the guidance for this year, next year and following in from Nick's question on the A380neo. You mentioned, David, that you were expecting a reduction in R&D this year and potentially next year as well. But given there are a number of programs in the pipeline, do you not expect R&D to increase, also based on the comments previously from the Chairman, who talked about re-entering into the narrow-body market?

David Miles Smith

Former Chief Financial Officer and Executive Director

So let me just restate what we said about our R&D. So when we gave our guidance in February, we said that R&D spend would come off a little bit this year. It would still be at a relatively good level in terms of coming off the 5.8% peak we saw last year, but coming down a bit but still at a good level. What happens between the first and second half of this year is that we have an increased number of programs actually going through the capitalization phase because they -- essentially, what we had at the end of last year is the XWB coming out of capitalization, and we're coming into the new programs now for next-generation product that will -- we will start capitalizing. So although spend is coming down a little bit, the net R&D charge between the first and second half is more biased to -- towards the first half than it is in the second half just because of the way the capitalization versus amortization is working. Ongoing, we will continue to ramp up, within our R&D spend, our spend on technology investments. We've talked about our new technologies before. These are all really developing around the advanced and UltraFan concepts. Those will step up in spend within our total R&D spend over the next few years. What we'll find, therefore, is the balance changes a bit between technology spending and new engine programs.

Rami Yehuda Myerson

Investec Bank plc, Research Division

So you would expect R&D to continue to grow, or do you expect it to come down in the next few years?

David Miles Smith*Former Chief Financial Officer and Executive Director*

We said it will probably come down a little bit in percentage terms over the next few years.

Operator

The following question comes from Jeremy Bragg at Redburn Partners.

Jeremy David Bragg*Redburn (Europe) Limited, Research Division*

Got a couple of questions, the first one being on the medium-term guidance. so appreciate that these were set by the management team who aren't here anymore, But you've set quite specific cash flow and margin targets for around 2018, and that was subject to no new program starts. But today's statement, I would say, has got quite mixed messages. Firstly, there's the comment that these will be achieved later than previously indicated. But then, David, you've talked quite positively about the long-term potential for margins on wide-body. I mean, I suppose my question with this is, when they were issued, these targets were the subject of a detailed bottom-up review, which I think you stood behind, David, as CFO of the Civil business and then later of the group. But today, we've got a sort of quite a chunky downgrade to 2016, which I can appreciate, but what would you say to sort of make people confident in the ability to actually achieve those targets if indeed you still stand by them, and when could they be achieved? And you'll be glad to know the second question is the shortest. So question two, there's a GBP 300 million sort of downgrade -- net downgrade to Civil in 2016, and you say that that's mostly noncash. I mean, is this an attempt to rebase the accounting to something sort of more akin to cash and more simple, or am I being too -- reading too much into it? And then the third question is -- I think Ben asked this in a much more clever way, but I didn't really understand the answer. Could Civil profits be lower in '17 and '18 as the Trent 700 volumes and pricing continue to fall and deteriorate, respectively?

David Miles Smith*Former Chief Financial Officer and Executive Director*

Thank you, Jeremy. So on the medium-term guidance, as Warren said, I think we need to give Warren a little bit of time also to take a look at the business over the next few months. I've just completed, from my perspective, a very detailed review, which, as I've indicated, has actually given me more confidence than I had before in the ability to deliver the cash conversion and margins improvements that we need to make longer term. It's just inevitable, I'm afraid, that this Trent 700 impact on the business for the next 3 or 4 years is going to delay the ability to deliver on both of those, although less so on cash but certainly on margins, as we get through this period. Therefore, I know people were -- and my predecessor talked about the specific data, I know, but I did try and encourage also that we think about this in terms of when the new programs are going to be delivering, both in terms of their launch curves, their volume ramp-up and the aftermarket delivery. So it is a two-edged sword here because the review has really shown me and I'm very positive about the fact that we absolutely will get the improvements that we require and expect over a period of time. But our ability to deliver those early is, unfortunately, not helped at all by the fact that the Trent 700 to Trent 7000 is proving more difficult than probably we had previously anticipated. In terms of is this a tougher way of doing the accounting trend this year, I'm not sure about that. Unfortunately, it's just the real world in terms of the outlook for that airplane and the engines that we sell onto it and the pricing considerations. It is exacerbated, obviously, by the transition from linked on the Trent 700 to the fact that the engine that's going to be growing fastest, the XWB, is unlinked. And I guess, in a way, it pulls ahead what I know a lot of you would like, which is that we reduce the timing difference between cash and profit because this potentially reverses that trend somewhat. And can you just remind me of your third question? Oh, so that was -- yes, I wouldn't take that conclusion. I think that the impact that we're seeing on 2016 is significant. It will be significant again on 27, but I think -- 2017. But we will, over time, get -- start getting the benefits of the XWB installed base. And clearly, the volume ramps up on that. It ramps up in the second half of this year and again next year as well. So I don't want to get into trying to pick a bottom here because I don't think that that's what we set out to do today. What we set out to do today is to give you as quickly as possible a view on the headwinds we saw on 2016. But

no, I think that we will see a couple of difficult years here, and then hopefully, we'll start improving as we start seeing the benefits of the XWB.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

So when you say significant impact in '16 and '17, I mean, just to be clear, are you talking about a significant incremental year-on-year impact in '17 on '16 on Trent 700, which you hope that will be countered by other things going better? Or are you just saying '16 is going to be bad, '17's also going to be bad but perhaps not much worse than '16?

David Miles Smith

Former Chief Financial Officer and Executive Director

So I think that was a different way of asking me the same question. What I'm saying is the GBP 300 million headwinds we're seeing in '16, we'll see a similar effect in '17 as well because it's the same -- it's basically the same effect, but not incrementally so, if you see.

Operator

And the question-and-answer session is now over. I will hand the conference back to you for the final comments, sir.

John Dawson

So I'll -- Warren, do you want to end it?

D. Warren A. East

CEO & Executive Director

Yes, okay. Well, I'll jump in with that. Thank you, all, very much for your patience this morning. I wanted you to take away essentially 3 things from the call this morning. First of all, the facts; we wanted you to be in possession of the data that we're in possession of as soon as possible. I wanted you to take away the fact that we are concerned about what we have found, and the management team and I will be addressing that, and my goal is definitely, over the next several years, to make this a sustainable and resilient business, to try to minimize the effects of these sorts of market conditions in the future. Thirdly and very importantly, I wanted you to take away our unshaken confidence in the long-term prospects for this business, as David's just been talking about, the new engines, the greater profit and the cash-generating potential of the new engines, the market position and so on.

I appreciate we haven't answered all of the questions. I'm sure many of you had questions that we didn't get round to. We will be reaching out over the next day and the next day or so as a team, and I will be following up with many of you over the next weeks and months, I'm sure, and we'll be back at the end of July with our half year results. So thank you very much, everybody.

Operator

Ladies and gentlemen, this concludes today's conference call. Thank you, all, for attending. You may now disconnect your lines.

Hello, and welcome to today's Rolls-Royce Holdings plc Investor Conference Call. [Operator Instructions] Just to remind you, this call is being recorded.

Today, I'm pleased to present Ian Davis, Chairman of the Board. Please go ahead.

Ian Edward Lamert Davis

Chairman

Good morning, everyone. It's Ian Davis, Chairman of Rolls-Royce. I assume you've all by now seen the announcement that we -- John Rishton is going to be retiring from Rolls-Royce in the summer and that Warren East will take over from him as Chief Executive. This happened after an extensive search once John had told me towards the end of last year of his intentions to retire.

What I'd like to do is give you a chance to ask me any questions. If I could just say a couple of words beforehand though, we do have to finish by 20 past 11, so we are a bit constrained. I'd also just like to emphasize up-front, there's no change to our guidance. There's no business story here, and I also hope you appreciate that I cannot and I will not get into a trading update or give you an update on the business as that is not appropriate for a call of this type.

I'd also just like to say I -- it was a surprising disappointment to me and the Board when John announced his retirement. Although last year was a very bumpy year, as you know as well as I do. The progress in the last 4 years, and indeed, in the last 10 years has been exceptional. We're really doing well, I think, on the 4Cs. We're beginning to see that coming through. A lot more to be done. We've had some tremendous customer advances. And if you look at John's record over the 4-year period in terms of profits, order book, share price, it isn't really half bad at all. So I do just want to say that on behalf of myself and the company, equally and genuinely, and so as the Board, very excited about Warren joining the company. I think you all know of his record. He's got an exceptional record at ARM Holdings. ARM, although it's not a manufacturing business, you may want to ask me about that, it does have a lot of similarities with Rolls-Royce in terms of supply chain, its business model and particularly in terms of services and also its involvement in technology supply chain.

So a lot of similarities there, a great record, and he does have the advantage knowing a little bit about the company and the company knowing him. And I think that does reduce the cultural risk and all the rest of it.

So disappointed John's going, excited about Warren. But just with those few words of introduction, perhaps I could throw this open for any questions you might have. But please don't push me on strategy and trading. We'll do that in the interims in 2 weeks' time and then again in July.

Question and Answer

Operator

[Operator Instructions] Our first question is from the line of Robert Stallard at RBC.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

A couple of quick questions.

[Technical Difficulty]

Operator

I do apologize. We will go back to that line.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Okay. Is it working now?

Operator

Yes, it is.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Okay. Couple of quick questions. What do you expect Warren to do differently from John? And what's he going to do the same?

Ian Edward Lamert Davis

Chairman

Well, I think Warren will have the chance to talk with you in the market in July. I mean, in terms of my expectations, there's a lot of tremendous momentum in the company at the moment, particularly on the operational 4C agenda. And I think the expectation of myself and the Board, and Warren is part of the Board, is we really want to keep that momentum going. Perhaps he may accelerate it if we can, and then real, real progress. I also would be surprised if Warren doesn't keep his relentless focus on customer. I mean, although last year was a very disappointing year in terms of financial expectations and performance, we made huge strides with customers as we have seen. And I think one manifestation of that is the order that we received last week. So I would very much hope and expect, and I have obviously talked to Warren about this, really, really keep the focus on the 4Cs, the restructuring, the focus on cost and margin. In terms of what will be different about Warren, there are some unfinished businesses that we know we have to do. For example, getting into question about how we're going to deal with narrow-body. We would look to progress on that. But I do think that continuity, as well as changes, is a very important part of Warren's appointment. And the fact that he knows a bit about the company, he's got a very good sense that, I think, is quite an important signal.

Operator

Our next question is from the line of Ben Fidler, Deutsche Bank.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

I just had one quick question really, which is -- and feel free to correct me if you think the first thesis is wrong in this. But it strikes me that what Rolls-Royce really needs is someone who's got a good track record of restructuring large, complex, heavy manufacturing industries. I guess, the question is, how do

you think Warren fits that bill, bearing in mind, although he has an extremely successful track record at ARM, from everything I understand, that was about growing the business, not about restructuring the business. And it's a business that does not have a large, complex, heavy manufacturing supply chain underneath it. So it's just to understand your thinking as the Chairman of the Board, thinking about why he is the right individual with the right skill set to manage a business as complex as Rolls.

Ian Edward Lamert Davis

Chairman

Well, thanks, Ben. Well, I think we -- I mean, he's part of the Rolls-Royce story. We have made it very clear that there's a lot of opportunity to improve our operational efficiency and to restructure the manufacturing. But by far, the bigger part of the story, longer term, is growth, and we really are looking to grow our global footprint, grow our global customer base, not least in Asia. And so I wouldn't challenge your thesis in one sense. Short term, you're right, but longer term, this is a growth story. And I think Warren really, really epitomizes what it takes to build a global business. Particularly if I call it David and Goliath, we're up against some very big beasts in not just the Aerospace industry, but in the Land & Sea business as well. And Warren, I think, has demonstrated just what it takes to succeed like that. So restructuring, yes, but growth is, to me, strategically much more important. When it comes to the point, I mean, Warren -- a lot of Warren's experience is incredibly relevant to us. The business model of ARM, with its focus on service revenues and aftercare, is very similar. The focus on technology and R&D is absolutely crucial to us. We do recognize, and Warren knows, he doesn't have the manufacturing experience, but there's a lot of that in Rolls-Royce. There's also quite a bit of that on the Board as well. And as the Board -- and Warren himself is absolutely committed to building the necessary support about -- around areas where he doesn't have the expertise. So we are going to absolutely continue the restructuring. There's a lot of momentum going on there, and I feel that we have the appropriate expertise to do that. Warren will be focusing on the strategic development of the company and building the other aspects, not least around the services, which, as you know, Ben, is more than 50% of our revenues and value.

Operator

Our next question is from the line of Christian Laughlin at Bernstein.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Ian, I just wanted to -- actually, my questions have already been answered. I tried to remove myself from the queue.

Ian Edward Lamert Davis

Chairman

Thank you. Nice to hear your voice anyway, Christian.

Operator

[Operator Instructions] Okay. Our first question is from the line of Sandy Morris at Jefferies.

Sandy Morris

Jefferies LLC, Research Division

Just pursuing Ben's sort of line of questioning slightly -- we did do an extensive search. Did we ever really get so far as interviews of people who might have fulfilled Ben's criteria better? And then having weighed it all up, decided that again, sitting on the Board as a non-exec, was already someone who best fit the bill. Is that -- did we get into that degree of detail, Ian? Sorry to sort of pester on this.

Ian Edward Lamert Davis

Chairman

Yes, we did, and we did do an extensive search both inside the company and outside, including people from either the industry or related industries. And so it was a very fair search. Obviously, the current

industries were a big part of it, but we concluded at the end of that, that Warren was the right man for the job.

Operator

Our next question is from the line of Edward Stacey at BESI.

Edward John Stacey

Haitong Bank S.A., Research Division

Just a question really about the operating difficulties that you had last year and then Mr. Rishton sort of choosing to retire just as those appeared to be sort of sold, I guess. But in a way, I suppose we are waiting for a few more quarters before we -- before the stock market will really be very confident that all of the 2014 issues are laid to rest. Can you say anything about the degree of confidence that everything has been dealt with, that needed to be dealt with?

Ian Edward Lamert Davis

Chairman

Well, as I said in the beginning, there's no change in our guidance and plan, and we are hard at work, fixing the things that need to be fixed, and most importantly, growing the business and building the customers. I would just say that 2014 was a tough year for us, particularly on the financial side, but we do need to keep -- from a business point of view, we have to keep that in context. On the technology and the customer side, last year was the best year that we've had, and we're beginning to see some of the fruits of that now. And when you look at things in 10-year cycles, 2014 was one of those -- excuse my language -- our s*** years in terms of certain things happening, but the fundamental strategic momentum wasn't really changed. I'd also say to last year, a lot of our problems weren't actually operational problems for us - they were market-related. And we know that we didn't cover ourselves in glory in the way we communicated with the market. And I hope you are beginning to see us, really the efforts that we are absolutely determined to get our communications better. But a lot of last year's problems were market-related. This isn't an easy period in equipment supply, as you know as well as I do. So yes, absolutely, we are focused on fixing those problems that we can fix. There are certain problems which should just go with the cycle, and we'll get through that. But it's really, really important that we keep our focus on the customers and the technology, and it's not just a business goal wish list thing. This is what leads to the cash in the long term. And lastly, on that sense, it wasn't such a bad year. I would just remind people for context that last year was our second record year in terms of profits and revenues as well. So this is -- to me, it was all about expectation management as it was about actual performance. And we know that we've got to do better on expectations management and communications. And I'd be very surprised if you didn't find that Warren didn't keep that momentum going, along with David.

Operator

[Operator Instructions] And we go to the line of Ben Fidler.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Can you hear me now? Sorry.

Ian Edward Lamert Davis

Chairman

Yes.

Operator

We can hear you now.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Sorry to come back with one further question. But just to understand, does Warren have a free mandate to, as CEO, change whatever he wants, whether that be accounting, whether that be the structure of the organization and the portfolio shape, whether that be the long-term strategic plans and the guidance, et cetera? I mean, you've given him a free -- you see it as him having a free rein to do what he wants with that as a Board, do you?

Ian Edward Lamert Davis

Chairman

Well, I don't think -- I mean, certainly, not on the Board of which I am Chairman, will have a totally free mandate to do whatever they want, but I -- and I do believe that the CEO should run the company with their team. And frankly, that would be the spares of it. I mean, he can and should look at anything he wants to look at. If he's unhappy with any of our procedures, accounting or otherwise, I would expect him to argue strongly the case for that. But any major changes like that would absolutely go through the Board.

Operator

Okay. At this stage, there are no further questions in the queue. Can I now please pass it back to you?

Ian Edward Lamert Davis

Chairman

Yes. Okay. Well, thank you very much. I do appreciate that this is a very, very brief call. And I do hope that if you have any follow-up questions, you'll be in touch with our IR team. I do want to reiterate, we are determined to improve our communication with the investing community. As I said, I hope you'll begin to see some signs of this, but this is something I personally can commit on the company. But if we all disappoint you not being sufficient, just let us know. We're determined to get the relationships that we seek with our shareholders. Those said, we're a long-term company. We've got to deliver, and we'd like to have long-term relationships with our investors.

So thank you very much for joining the call, and do get in touch with the IR team. If you'd like to see me at some stage, let me know. And Warren, for sure, will be in touch with you when he takes up the reins in July and August. Thanks very much, everyone.

Operator

This now concludes today's call. Thank you all very much for attending. You may now disconnect your lines.

Hello, and welcome to today's Rolls-Royce Holdings plc 2014 Full Year Results Fixed Income Conference Call. [Operator Instructions] And just to remind you, this call is being recorded.

Today, I am pleased to present David Smith, Group CFO. Please begin.

David Miles Smith

Former Chief Financial Officer and Executive Director

Good afternoon, everybody, and thank you for taking the time to join us today. Some of you will have already heard our webcast this morning, so I won't go through the results in detail.

Clearly, 2014 was not an easy year for Rolls-Royce, and we know it wasn't an easy year for some of our investors either. Nonetheless, we did meet the guidance for 2014 given in October. Our order book grew 5%, excluding the Energy business, and that shows the continued customer confidence that underpins our strong medium-term growth prospects.

We have, today, also given new 2015 guidance for revenue profit and a number of other factors. In the interest of simplicity and transparency, we are now providing guidance in terms of absolute numerical ranges instead of percentage changes.

We've guided 2015 revenue to between GBP 13.4 billion and GBP 14.4 billion and profit to between GBP 1.4 billion and GBP 1.55 billion. We see free cash flow at around GBP 200 million, plus or minus GBP 150 million. We do expect continued headwinds on free cash flow as we scale up the Civil engine business and continue to utilize customer deposits, particularly, partially offset by the early benefits of the action we're taking on cost and cash, such as our focus on inventory. We expect both CapEx and net R&D will be lower in both absolute terms and over time as a percentage of revenue. Our guidance has been based on 2014 FX rates, and therefore, assumes no currency effects either adverse or favorable.

We expect underlying restructuring charges to be around GBP 90 million to GBP 100 million. That is about GBP 60 million lower than in 2014. As in 2014, we expect performance delivery to be weighted towards the second half of the year.

Our balance sheet remains strong. This is important because it gives us the ability to withstand the shocks and turbulence, which sometimes occur in our industry, and clearly provides confidence to our customers who are buying products that will remain in service for decades and will require decades of aftermarket support, and they do look to our credit ratings.

I'm confident and excited about the future growth that we can deliver. However, we must manage the transformation of our industrial base that's required to deliver it very carefully. And in the near term, refocus and double our cash and cost activities to help counter some of the increased uncertainty that surround us at the moment. That won't be easy, but I've done this before in other companies. It takes time, but now we have the whole team focused on it.

Thank you for your attention, and I look forward to your questions.

Question and Answer

Operator

[Operator Instructions] Our first question is from the line of Sam Morton [ph] at Credit Suisse.

Unknown Analyst

So I didn't get the chance to listen to the call earlier. I just wanted a little bit more detail on the free cash flow guidance. I was trying to understand what makes the swing factor so big relatively, and maybe what factors we should think about that change in that free cash flow either higher or lower? And then secondly, I was hoping that you might be able to give us an update on the pension deficit. I could see the numbers in the release today, but I just wondered when there might be a review coming up.

David Miles Smith

Former Chief Financial Officer and Executive Director

Okay. So if I take the first question first around cash flow. Maybe as you weren't on the call, I'll give you a little bit more context, also, to the guidance that we gave. Essentially, I would say that in the Aerospace side of the business, we will still see growth on the Civil side, and we'll still see strong revenue and margins on Defence. We've guided a little bit lower on the Marine and Power Systems sides of the business, and that really reflects, I think, the uncertainty around the oil price at the moment. Marine, in particular, has a reasonable exposure to the oil and gas sectors, particularly in the offshore markets. And we have seen already and we expect probably to see further deferrals of orders and, particularly I think around the servicing of equipment in that sector, a reduction in the discretionary spend. So as we then try and translate that into cash flow guidance, we've got a couple of things going on. In the Civil side of the business, the growth that we will see during 2015 is primarily on products that have been launched, the XWB engine and the Trent 1000, and they are not cash-generative at the moment in terms of the initial OE sale. In fact, there will be cash losses on some of those engines. And therefore, when we think about our mix of business, that is a negative on cash. We also have the majority of our restructuring spend in 2015, some of which was booked as an accrual last year, but that will really occur mainly in the first half of this year. And then thirdly, around our marine business because, again, we see some risk of deferral of orders. We've been quite cautious around deposits from customers and what we would expect to come. So all of that really impacts on our cash guidance. Around the pension deficit, we have updated, obviously, the data within the balance sheet. There's a surplus on the U.K. funds, fairly significant surplus on the U.K. funds, which are primarily defined-benefit funds. On the overseas funds, some of those are funded, some of those are not, but there is a deficit of about GBP 1.1 billion, I think it is, on that side. So our net pension surplus is still around GBP 600 million. In terms of the next actuarial assessments of those, I'm just going to turn to my colleagues, but...

Unknown Executive

As the largest fund, the Rolls Royce pension fund, the next actuarial valuation is this year, that I would expect to be concluded towards the end of the year.

David Miles Smith

Former Chief Financial Officer and Executive Director

All right. I hope that answers your question, Sam.

Unknown Analyst

Sorry, I think that was off mic. The second comment, so if you could just repeat or paraphrase what was said, that would be great.

David Miles Smith

Former Chief Financial Officer and Executive Director

For the largest U.K. pension fund, there is an actuarial assessment update this year.

Operator

[Operator Instructions] As there are no further calls -- questions at this stage, may I please pass the call back to you to close.

David Miles Smith

Former Chief Financial Officer and Executive Director

Well, thank you very much for your attention, and I hope the material that we sent out also will be very helpful to you. Thank you very much, and I'm sure we will talk again in the interims. Thank you.

Operator

This now concludes the call. Thank you, all, very much for attending. You may now disconnect your lines.

ATTENDEES

Unknown Attendee

Presentation

Unknown Executive

So good morning, everyone. Thank you very much for joining us today. Before we begin, it falls to me for the housekeeping job. So I'd like to draw your attention to our safe harbor restatement, which you can see on the screen in front of you, and it's also in your packs. Can you please take a moment to read the statement? And remember that forward-looking statements carry risks and can change.

Your safety is also important to us. So I'd also like to draw your attention to the fire and evacuation procedures. There are no planned fire alarms or evacuation tests scheduled. In the event that the alarm is raised, either a constant bell alarm will sound, indicating that you should evacuate immediately; or an intermittent bell alarm will sound, indicating that you should wait further instructions. The assembly point in an evacuation will be in the carpark outside #4 Carlton Terrace.

Just one final thing that I'd like to mention before we get started. For those of you that are joining via webcast, you can also submit questions to the management team via the webcast functions, and we will read those out loud. So please participate, if you're able to, remotely.

With that, I'm very delighted to introduce this morning our Chief Executive, John Rishton.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks. Good morning. Thanks for coming. Let me start by introducing the members of the senior team on the stage: on your right, in the far left, Lawrie Haynes, who's President of our Land & Sea Division; next to him, Tony Wood, who is President of our Aerospace Division; and then Colin Smith, who is Director of Engineering and Technology. We're also joined by one colleague who is appearing on this stage for the last time and one who is making his first appearance. This morning, we announced that Jim Guyette will be retiring as President of Rolls-Royce North America. Jim has been with the company 17 years and has made a tremendous contribution, particularly on customer focus. Jim, we're going to miss you. The new joiner, of course, is David Smith, who was appointed Chief Financial Officer in November and who you will hear from in a minute or 2. For those of you who have not met him, David has an outstanding record in finance, including as CFO at Jaguar Land Rover, where he also served as CEO during the transition of ownership from Ford to Tata. He joined Rolls-Royce around 1 year ago as CFO in Aerospace. As well as driving our performance on cost and cash and strengthening management information, David shares my commitment to improving investor communications. He has spoken to a number of you already, and I'm sure you'll get to know him much better during the course of 2015. In the audience, we're joined by our Chairman, Ian Davis.

In a minute, David is going to take you through the numbers, then I will talk about the future direction of the business and the progress we are making, but let's start with the main themes from last year.

Clearly, 2014 was a challenging year in which we had to contend with reduced government defense spending in our most important markets, an economic slowdown in China, Brazil and the Eurozone, and sharply falling commodity prices that have impacted many of our customers in the oil and gas, mining and construction sectors. This has been reflected in the share price, and we've been left in no doubt about the frustration that this has caused. I said before that our communications with the investment community have not been good enough. David and I and the rest of the team are listening, and we are working to address your concerns. I hope you have seen some improvements, and I'm sure you will let us know how we're doing.

It is easy for the challenges we face to obscure the indicators that tell a different story, most importantly, that we have continued to win business and grow our installed base. The order book reached a new record of GBP 73.7 billion, and this includes the first increase in the Defence order book since 2010. In Civil aerospace, of 454 wide-body aircraft contested [ph] 2014, Rolls-Royce won 284. That's 62%; yes, 62%. As you know, we've been reshaping the company, and during the course of the year, we completed the

sale of our Energy gas turbine and compressor business to Siemens. This was an issue that needed to be addressed, and we've dealt with it. We also completed the acquisition of Power Systems.

So all our challenges have been substantial. The decisive actions we have taken are strengthening the business and creating momentum that I'm going to talk about more after David has taken you through the numbers.

David Miles Smith

Former Chief Financial Officer and Executive Director

Thank you, John. It's a really great pleasure to be here this morning. I've met a couple of you already, and as John said, I know I'm going to be meeting a lot more of you in the next couple of weeks. So I'm looking forward to that.

And although I've only been in this role now for a couple of months and in Rolls-Royce for a year, some things are already very clear to me. This is a great company with amazing technology, and I'm saying that having been in the car industry for most of my career and the semiconductor industry recently, which also have pretty amazing technologies. But 3 things I've seen in the last couple of months really bring that out to me: the dynamic positioning on our azimuth thrusters, which allows us to keep our anchor-handling winch machines on our ships to keep those oil rigs at a point of precision that allows those oil rigs to drill thousands of meters under the surface of the sea. That's a pretty amazing piece of technology. Equally, the STOVL system on the LiftSystem, the swivels that allow the thrust of those jets, those supersonic jets, to power at a vertical thrust in a way that only Rolls-Royce can do. Only Rolls-Royce has that system. We're the only people capable of doing that; and of course, the turbines in our gas turbine engines. So they're operating small instruments that are operating at temperatures that exceed the melting point of the metals of which they're made and have to be cooled with microscopic air systems. And that cooling air is still at 700 degrees. It's just amazing technology. So I'm giving those as examples because it just shows the growth -- the great opportunities that are ahead of us and the great opportunities we have.

However, there's also a lot to be done to deliver that opportunity, and one thing that's really struck me is if I take a program like the XWB, we are just at the first few years of creating a 30-year business there, a business that will generate a lot of cash flow in the future and value. And the investments that are making -- that we're making now are, therefore, absolutely critical to creating that installed base.

Let me put that another way. We're really undergoing a multi-year transformation. I call it a generational transformation. And we're in a heavy investment phase of that. And that is clearly impacting margins and free cash flow, but I don't see that, at all, as a bad thing. It's absolutely a necessary thing to build value for the long term. However, at the time, I'm still acutely aware that we've entered a period now of more uncertain external environment. And therefore, we need to redouble our efforts and really focus down on the near-term things that improve cost and cash flow we pass through this phase. I've had a lot of experience of that in past businesses, and John and I are absolutely clear that we've got to do that while, at the same time, making sure efforts to cut costs are not going to undermine the investment in our future.

From the meetings I've had already, I am also very clear that we've got to do more to improve our communications and, particularly, information flows with you. That's part of my agenda today and will remain so.

So let me now start with the numbers, which I'm sure you're keen to -- for me to start with. 2014 was not an easy year for Rolls-Royce, and we know it wasn't an easy year for our investors either. Conditions deteriorated in several of our major customer markets. Nonetheless, we met our guidance given in October. Our order book grew 5%, excluding Energy, showing continued customer confidence and underpinning our strong medium-term growth prospects. We actually took in GBP 19 billion of new orders last year. We've also increased our payment to shareholders by another 5%, and that reflects the continued confidence of the board in the future growth of this company.

This slide shows the main drivers of our revenue compared to last year. Revenue, excluding adverse FX effects and the divestment of the Energy business, fell by 3%, and that was slightly smaller than the

decline we guided you in October. The main factors of the year-on-year movement within Aerospace were a sharp decline in Defence aerospace, as we talked about. OE revenue was due to lower volumes as government spending in many countries was scaled back. This was, however, partially offset by continuing growth in Civil aerospace deliveries as the Trent 1000 engines, in particular, ramped up last year. And we also saw a Defence -- an improvement in our Defence aerospace service revenue. In Land & Sea, both Marine OE and services revenue fell due to weaker end markets.

Now the same slide for profit. So turning to pretax profit, the underlying result was in line with the guidance we gave of flat that we told you about in October. We did see a negative impact from the lower volumes I've just talked about, and that was especially so in Defence and Marine, as I've just described. We also had increased Civil R&D investment, and it was actually our peak investment that we've ever made. So the investment in technology was at its highest level ever last year. And we had higher restructuring charges, particularly in the aero side of the business. These factors were offset by improved trading margin, which included a significant improvement in TotalCare of Civil -- within Civil aerospace as we had lower cost and improved mix in Defence. We also saw lower commercial and admin costs, including the lower bonus costs. Overall, costs were down more than revenue, and if I look at that on a gross margin basis, it contributed to the 1.7 point gross margin improvement that you'll see in our numbers.

But coming back to the restructuring for a second. The program that we announced in November is an important part of the cost-saving initiatives. It's expected, as we've told you, to generate savings of GBP 50 million this year and GBP 80 million on an ongoing basis. And I'm going to talk to you about some of these factors in a bit more detail when we go through the individual segment results in a moment.

This next slide shows a fairly traditional view of cash flow, tracking from profits through to free cash flow, with GBP 254 million for the total business or GBP 447 million for the retained business, excluding Energy. You can see that -- the significant net working capital change, which was primarily driven by that increase in TotalCare receivables as we increased our linked installed base. Intangibles also went up really around certification and participation cost, our development cost and the contractual aftermarket rights, which were associated with unlinked sales.

However, personally, I actually think the next slide is a little more helpful to understand this pattern. And here, I'm comparing our free cash flow in 2013 compared to 2014, and this is all for the retained business, excluding Energy. And as you can see, there was a higher cash flow from operations and lower CapEx spend in 2014 compared to the prior year, but this was more than offset by an increase in our net working capital. And that reflects a couple of factors: the net utilization of customer deposits in 2014 compared to an increase with order intake the prior year, and then a higher increase than last year in TotalCare receivables. These are important points. To build our installed base, we have to invest in higher levels of working capital. We're also trying to manage the customer deposits where possible to mitigate that. Of course, that doesn't mean that we're not focused intently on improving operating cash flow. We absolutely are, as we did in 2014 when, for instance, we delivered over GBP 140 million of inventory reduction net of FX.

I'm going to talk to you about some of the outlook for free cash flow and the steps that we're taking to improve it in a moment. Let me turn just for a second to our overall balance sheet picture. Our balance sheet and credit rating remain strong. Why is this important? Well, not only for financial reasons. It gives us the ability to withstand our shocks and turbulences, which sometimes occur in our industry. But it also provides important confidence to our customers, who, remember, are buying products that will remain in service for decades and require decades of aftermarket support. They look very closely to our credit rating. It also gives us the flexibility, for example, to return the proceeds of the divestment of our Energy business to shareholders through the share buyback, and that's currently underway.

So having covered the group picture, I want now to turn to the 2014 performance for each of the business segments. Starting with Civil aerospace. Civil aerospace is the principal engine of our future growth, and the order book increased a further 5% in 2014. That included our first Trent 7000 orders in Farnborough and GBP 7 billion in new orders for other products as well. That represented a market share of over 60% in the wide-body market.

Our OE revenue grew strongly, more than offsetting a small decline in services and adverse FX effects. The service decline reflects the fact that we saw low utilization and saw lower times and materials for older installed engines, primarily the RB2011, which was down 24%, but this is now actually less than -- around 10% of our revenue base. And it was largely offset by growth in our Trent fleet, which was up 6%, which is more than half of our revenue base. So higher Trent 1000 volumes and the first XWB deliveries were partly offset on the OE side also by lower Trent 900 sales. The Trent 700 was roughly steady to the prior year. The ramp-up in Trent XWB production is really only just beginning. We delivered 13 engines [ph], and we have over 1,500 orders in the pipeline last year. In December, we saw the XWB enter service with Qatar Airways. We were also selected by Gulfstream earlier in the year to power the new extended range version of the G650 jet.

Talking about profit. Profit improved by 12%. Some of that was due to the higher volumes and trading margins. We also had a GBP 150 million retrospective benefit from better profitability in our TotalCare contracts. And that reflected a combination of factors: our cost improvements, changing operating patterns, which, by the way, are driven also by the same factors. So our enhanced engine health monitoring processes and systems feed back into better operating patterns for our customers; and also, reduced contract risk. These positive factors were partially offset by restructuring charges. And we also had some adverse mix effects. The significantly higher R&D costs that I've mentioned, as we invest in the next generation of products and new technologies, were at their peak last year.

So turning to Defence aerospace. We have a very good example here, I think, of how our focus on costs and restructuring programs are flowing through to the bottom line. The order book grew in Defence for the first time in 2010, but clearly, we saw, as we said, our OE revenues coming down significantly. They were down 41%, and that reflected lower volumes, particularly the EJ200 and reductions in Adour sales as well. That was partially offset by growth in aftermarket services.

Profit, though, declined at a much smaller rate of 16%. So the impact of lower volumes was, therefore, offset both by the cost reductions that we've been taking in the Defence business and also the favorable mix shift that we saw towards the aftermarket, with OE volume coming down. And in Defence, aftermarket is now 61% of Defence revenue. That's up from 46% in the previous year.

I think our success in costs in Defence reinforces our confidence that the focus on this issue is bearing fruit, albeit that it was masked by other headwinds across the business.

Let's turn now to Power Systems. As you know, in August, we acquired from Daimler the 50% of Rolls-Royce Power Systems that we did not already own and are in the process of integrating that business with the rest of our Land & Sea business and developing our common strategy. The order book grew modestly, although underlying revenue fell 4%, and that was mainly due to FX effects, particularly the euro. Strong naval sales and power generation were largely offset by a non-repeat of regulatory-driven sales that we'd seen in 2013 in Europe.

Our underlying profit declined 14% overall. However, the acquired Tognum business actually improved, but we had a very difficult year in our Bergen business. We've taken steps to improve future performance there already. FX effects were negative in the business.

Talking about product. We launched at Bergen the 33:45, which is a new range of medium-speed diesels, which gives significantly enhanced performance.

I want to turn now to our Marine business, and this is probably the area where we had the most difficult year, with revenue down 16%. We also saw a decline in orders, although at constant FX, the orders grew by 6%. So that was mainly a currency effect

Once again, foreign exchange and the oil price have played the biggest role in revenue decline, but there's also been pressure on prices in this market and also discretionary aftermarket spend in many of our major markets, particularly the Offshore and Merchant businesses.

Profit was down 41%, therefore, and that reflected the revenue drop as well as some of these adverse shifts in pricing and margins plus the GBP 30 million Marine charge that we talked about last year. And unfortunately, these negative factors more than offset, actually, some good progress that was made in the

business on cost, both on product cost and indirect cost. We lost about 300 people last year. Clearly, since the start of -- or since September, October, oil prices have halved, and that will create additional further pressure in many of our markets. And I'll come back to that issue a little bit later.

Turning finally to the Nuclear & Energy business, which, for the final time, is reflected in our numbers. That was sold to Siemens on December 1. As you can see, I've actually excluded that business from the analysis to give you a better understanding of the drivers in the retained business. Revenue, overall, improved 3%. The retained business actually showed a sharp increase in profitability, up to GBP 48 million, although that was from a low base. And the improvement reflected a combination of volumes and cost efficiency improvements as well as a nonrecurrent of GBP 10 million that was a drag in 2013 in the comparator year. While currently small, our capability in Civil Nuclear is also an important part of optionality for the future.

So that concludes my run-through of 2014 performance. It was a mixed year, but one, I think, which you can see, there are encouraging underlying signs especially on the 4 Cs, even if other factors, including the tougher external environment, mask or offset some of that progress for the group as a whole.

I'd now like to turn to the outlook and our expectations for future performance. I won't labor this point, but it is against a more uncertain backdrop, and that frames, really, the way that I'm giving the guidance for Rolls-Royce's future performance. As you can see on this slide, our guidance for revenue, profit and other -- and a number of other factors, in response to feedback from you and, actually, my own personal views, in the interest of simplicity, you can see that we're now going to provide guidance in absolute numerical ranges instead of the complexity of percentage changes. And I hope you're going to find that change helpful.

We're guiding revenue to GBP 13.4 billion to GBP 14.4 billion and profit to GBP 1.4 billion to GBP 1.55 billion, and I'm going to talk about the factors driving this expectation on the next slide. On cash flow, we expect continued headwinds as we scale up our Trent volumes and continue to utilize customer deposits. This will be partially offset by the benefits of the actions we're taking on costs and cash, such as the focus -- the continued focus that we've got in detail on inventory. And although profits are down, you will also note that our earnings per share will benefit from the reduction in the equity base from the share buyback. As previously indicated, we expect both CapEx and net R&D, in absolute terms and over time, to reduce as a percentage of revenue. Our guidance is based on 2014 FX rates and, therefore, assumes no currency effects, either adverse or favorable. Obviously, as we normally do, we'll update you during the year on that.

Turning to restructuring. We expect underlying restructuring charges to be in the GBP 90 million to GBP 100 million range in 2015. That's about GBP 60 million lower than it was in 2014. As in 2014, we expect performance delivery to be weighted towards the second half of the year. On earnings, there will be a weighting of the R&D charge towards the first half of the year, and Civil deliveries are also more biased than they were last year towards the second half. So we expect a first half bias on profit but also on cash as well, and that's incrementally on cash, the impact of our restructuring spend, which, although it was partially charged at the end of last year, the cash charges will come through at the beginning of this year. So we also expect free cash flow to be more biased towards the second half than it was last year as well.

Turning now to the detailed guidance for performance at the business segment level. You can see that we expect continued strong growth in our Civil aerospace business, and this is primarily as the Trent 1000 and XWB deliveries increase and the aftermarket begins to grow. With -- this will be partially offset by lower Trent 700 and 900 sales next year -- or this year, sorry. However, our Civil profit is expected to be lower in 2014, and that largely reflects the increase of -- increased proportion of sales that are going to be accounted for on an unlinked basis on the XWB. But also, I don't expect the scale of the retrospective TotalCare life cycle improvements to be as high as they were in 2014. This will be partially offset by lower restructuring charges, as I've just mentioned already, in 2015. In Defence, we expect further progress on cost and margins.

In Land & Sea, however, this is where I'm really more cautious as I think we can expect continued further pressure from the external environment, and there is more uncertainty here, both around the duration of the oil price impacts but also pricing and adverse mix pressures. Of course, that doesn't mean that

we're not going to be really focused on improving operating performance to try and offset some of those external factors, but they're there.

So that completes my review of the key numbers. I'd actually like to stand back a little bit from the detail for a second and talk more broadly about how I see the business and the journey we're now on. John will expand on this in his own remarks in a moment, but I want to underline that this is a growth business. That's very, very clear when you look at our order book. The size of our order book really shows the scale of our opportunity. I'm excited about that potential, and it's why I joined this company. We are, as I said, undergoing a generational change in our product portfolio and, at the same time, a transformation of our industrial base. And this has and will require major investment. The issue I know you are all very focused on, as are we, is when the timing of that growth is going to be reflected in our profits and free cash flow and, particularly, what additional steps we can take to mitigate some of those headwinds during a period of unprecedented expansion and production in our Civil business.

John, of course, recognized all of that in 2011 when he launched the program of focus on the 4 Cs: customer, concentration, cost and cash. And significant actions already have been taken. We now have real traction here, but the environment we face has become more difficult, and the scale, therefore, of the required transformation is, I think, bigger than could have been imagined back then. This multi-year transformation is now my principal focus. The next 2 to 3 years, in my view, are critical. We saw the steps we announced -- you saw the steps, sorry, we announced in the restructuring of the Aerospace business last year and the progress we've already made in Defence. We have been taking a similar action already in Land & Sea, and that process is going to accelerate now. In fact, I was in Friedrichshafen a couple of weeks ago, going around the Power Systems facilities there, and I was very, very impressed with the work they're doing on lean manufacturing. It's as good as anything I've ever seen in the automotive industry. We must and will do more, however, in all of our businesses, but in doing that, we must also be realistic. This will take some time.

Much of what lies ahead is very familiar to any industrial company, and it's grand that my experience in the automotive and, more laterally, in the semiconductor industries has prepared me for, and it starts with a thorough understanding of our cost base and the levers that we can pull within that.

Firstly, the focus on our product and manufacturing costs and our supply chain. As I said, that is now really gaining some good traction. Last year, our design and supply programs delivered good progress, but unfortunately, that was offset largely by the growing pains John has talked about in the past of having underutilized capacity in the short term. But we delivered the underlying improvements.

Second is the focus we have on life-cycle cost. This is hugely important as product life cost can be 3, 4x the OE cost of an engine. And our focus here is really delivery, and there are recurring and nonrecurring benefits. You can see that in the -- within the GBP 150 million charge, but actually, the benefits that we're delivering are greater than that. They will come through in future years as well, and so the progress, I would say, is ahead of our expectations.

The third thing that we're getting more focused on, I think, is deployment of lean processes right across the business. Actually, we made, as I said already, real progress in some areas, particularly, I'd say, in the manufacturing area. But the concepts of Kaizen and continual improvement that I'm very familiar with, again, from the automotive industry, are things that we are now deploying right through the business. One of the things I've really enjoyed in my new role is spending time on the shop floor. I always get a thrill of seeing these kind of actions. I was up in Sunderland a few months ago and had the pleasure to see the new facility there, and the first thing I -- that happened to me as I walked through the door, was a young lady, one of our high-potential graduates, talked me through not only what they were doing on cost but what they were doing to change culture in that business. Later that day, I went to our older plant at Pallion, which is a few miles down the road, and I expected to see a huge difference there. Actually, I didn't, because that infectious enthusiasm that's come from that new investment has actually spread into the Pallion facility as well, and they're really excited about what they're doing on lean manufacturing.

So of course, this continual focus is absolutely critical through our business. We're also looking now much more closely in direct cost and overhead and trying to improve efficiency there. We've reduced the size of

our head office, and we're moving to new ways of working. Overall, in the company, we've cut our indirect headcount now by about 18% in 2 years, but there's more to do.

So that, I would say, is the operating side of the business. Perhaps the greatest potential, in my view, lies in what I would describe as the transformation of our industrial base. During the last few years, we've been investing in a major expansion in our manufacturing capacity, but that capacity build phase is now over. What we're really focused now is making those investments deliver, and we're going to be making in the next -- the investments that we'll be making in the next couple of years are much more around capability and the technology that's required both to fulfill our order book but also provide the next generation of engines as well. Our task is now to build efficiently through these new facilities and reap the benefits of the improvements in the capacity utilization while progressively either exiting or resizing our older facilities.

All the time, we have to maintain service and support to our customers. So we have to do this methodically and make sure that we can continue to produce products at the right quality in our all [ph] facilities. We also need to continue to improve our focus on low-cost country sourcing, where that is an opportunity. As I said, this isn't a simple or a rapid process, but the prize is very significant. The GBP 80 million savings we told you about on the implementation of the aero restructuring last November are a part of that but only a part, and it's an indication of the potential.

I'm now really focus on what can be done also in Land & Sea, building on the work that they've already started. In my view, further benefits will come as we see our volume growth drop through, and that's an effect that many of us call operating leverage, but the key is there making sure our fixed costs don't grow as fast as our revenue line. Cost efficiency and operational leverage will ultimately be what drives that margin improvement in the future as our portfolio matures that we've talked about.

So I've talked a lot about cost in those couple of slides, but also, this equally applies to cash. What does the process of transformation look in cash terms? The question is what levers also can we pull and what milestones can we identify to ensure that we're on the right trajectory. In the near term, we are incurring heavy investment, both in the restructuring and some of the headwinds that I've described on net working capital, and that's clearly a very, very necessary part of building that growth in our installed base, which will deliver cash flow for decades to come and much more efficient operations. At the same time, as we launch the new Trent engines, as I said, we're investing in that net working capital, specifically the development certification cost, the contractual aftermarket rights, as we call them, on the launch of the OE sales. And that's alongside the build of the TotalCare net debt or unlinked accounting. And I know that this sounds complex, and I'm very happy to cover it again in more depth if you have questions. But what's really more obvious, I think, is that over time, what we will see is a combination of factors that will drive improved cash conversion.

Firstly, OE margins will improve as we exit the launch phase, which is higher cost and lower pricing. We'll also begin to generate growing amounts of cash from our aftermarket revenues as the OE curve begins to flatten out and the aftermarket becomes a bigger part of our business through increased engine flying hours. As we do that, we must maintain a rigorous focus on capital allocation and investment efficiency, and that includes inventory and net working capital. So as I said, these cash actions are what is going to improve the cash conversion in the medium term, but don't believe for a second that means we're not intensely focused on improving cash this year. For example, we've got multiple work streams now looking at investment efficiency in many different areas: inventory, logistics, improving our trade cycle management, our capital efficiency, all of those things. I'm really focused on that stuff.

So to conclude it, I am confident and excited about the growth that we can deliver as a company. However, we must manage the transformation that we're going through in this critical phase that's required to deliver the installed base for the future and very carefully redouble our efforts on cash and cost to help counter some of the increased uncertainty that's around us. This hasn't been -- this won't be easy, but I've done this before in other companies. It takes time, but we now have a whole team focused on t.

Thank you for your attention. I'm now going to pass back to John, but I really look forward to your questions later.

John F. Rishton*Former Chief Executive Officer and Executive Director*

Thanks, David. So David has talked in some detail about last year and 2015. I now want to take a longer-term view and give some context.

Above all, I want to make 3 points clear: First, the fundamentals of the business are strong, and we're committed to investing in future growth. Second, we are clear how to address the growing pains that are holding us back. And third, we're taking decisive action that will make us a stronger company and return us to profitable growth.

The journey we have embarked on will involve the transformation of our business. Let me tell you a story that illustrates the scale of change. Three years ago, I went to Montreal, where we repair and maintain engines for business jets. The facility was amongst our worst-performing anywhere in the world, and it was a depressing place to visit. The atmosphere was terrible, the workforce was demoralized, and customer metrics were dreadful. But Montreal has turned itself around. In the space of 3 years, it has become one of the best-performing facilities in Rolls-Royce. On-time delivery to customers has risen from 61% to 100%. Inventory turns have increased from 7.1 to 12.6. And last September, I was delighted to present our annual trusted to deliver excellence award to the Montreal team. This was achieved without any change in its physical location, without any real investment, but simply by the entire team putting the customer at the heart of their business, for example, by bringing customers in to meet their Rolls-Royce team and running red carpet events to celebrate outstanding delivery. It's now a joy to visit. It's a powerful demonstration, in just one plant, of the transformation that is taking hold across the rest of the group, and it's a good way to introduce the first and most important of the 4 Cs, customer.

As you know, this has been one of my top priorities. When I arrived at the company, the conversations I had with customers left me in no doubt about the urgent need to improve. One immediate issue was inadequate and inconsistent data. We've put that right, and we now record customer metrics in a consistent way across the group: measuring quality, delivery, reliability and responsiveness, the characteristics our customers value most.

In 2012, I discovered that our Civil large engine business on-time delivery to our own internal plan was 0. In Defence, the number was 7%, shocking figures, more shocking by the fact that no one seemed to think this was an issue. In 2014, we improved Civil to 59% and Defence to 72%, still not where we need to be but a big step in the right direction. In terms of delivery on-time to our customers, we've also made good progress across the business, with 100% on-time delivery by year-end in Civil large engine, 91%, for the whole year; and a substantial improvement in customer deliveries in Marine from 55% to 88%.

Recognizing the progress that we have made, Airbus has presented us with their Supply Chain and Quality Improvement Award. Both the U.S. Air Force and the U.S. government Defense Logistics Agency have recognized Rolls-Royce as a first-tier supplier, and we were awarded joint first place by Aviation International News for the quality of our business aircraft support. If you talk to the team, they will tell you how all this has transformed our conversations with our customers. So now instead of sorting out their problems, we're talking about what business we can do together in the future.

To avoid any doubt, delivery of the 4 Cs depends critically on getting the customer right. Only by getting the customer right can we focus on strong financial performance. Fix quality, fix delivery and the cost will follow.

In terms of concentration, as I hope we've made clear in the past, we are reshaping the group to optimize our performance and returns. Key to this has been the transactions over the last 4 years, some of which are shown in this chart. We have sold businesses where we couldn't make a proper return and bought businesses that strengthened our market position or added to our capability. For example, SmartMotor is a world leader in permanent magnet technology that we apply to our marine thrusters. Hyper-Therm has increased our knowledge of ceramic matrix materials that are critical in improving gas -- gas turbine efficiency. Individually, not all these transactions are especially significant, but taken together, they represent a focusing of the group on technologies and markets where we're confident of long-term profitable growth.

On cost and cash, I know there is some skepticism about our progress on cost, but I don't want any of you to be in any doubt about the management focus that has been applied to this critical area. We are addressing cost in every part of the business and in every cost category. We're improving quality delivery, reducing headcount and driving productivity. We're transforming our supplier base, and we'll reduce footprint over time. We have compelling examples of progress in all of these areas and show a number on this chart, but I recognize there is much more we can and will do. This is going to take time, with progress being impeded by the growing pains. For example, in our Civil business, we have underutilized capacity and are impacted by launch pricing and launch costs, but these are headwinds that will be overcome as the business grows and matures. Across the organization, we have grasped the importance of reducing cost, and if you look at the progress that we're making in our Defence business, you can just see how seriously we're taking this.

The journey we're on and the actions I've described emphasize the most important thing that any investor, commentator or customer needs to understand about Rolls-Royce. It's a critical point that Ralph Robins made, John Rose repeated, and you will have heard me say many times before: this is a long-term business. We invest for the long term, as we have done consistently for decades. Our products are mission-critical and take years to develop. As the manufacturers of original equipment, we are well placed to provide aftermarket services that make up 48% of our group revenue. As the equipment we provide becomes more complex, the opportunity for aftermarket sales grows. Our Power Systems have long lives in service and generate aftermarket revenue that can last for decades. In Marine, for example, we've just celebrated the 40th anniversary of the UT Design that continues to set industry standards for offshore support vessels. There are now 800 UT Design ships operating around the world, including the very first vessel that is still working off the coast of Nigeria.

The longevity and nature of our products means that our installed base grows year-by-year, and this is where the majority of the value of the business lies. This is demonstrated, I think, quite clearly when we sold our stake in IAE, when, I know, many of you were surprised by the value we've realized for what was just one small component of the Civil aerospace business. This is a company with a track record of delivering significant long-term growth. In the past decade, our revenue has more than doubled, the order book has more than trebled and profits have more than quadrupled. Looking forward to the next decade, our prospects for long-term growth remain strong.

As you know, the area of business where we have most visibility is Civil aerospace. This chart shows you the size and shape of our fleet today. We have around 4,300 engines in service, predominantly operating in North America and Europe. Turn the clock forward 10 years, and you can see that our fleet is projected to grow to 7,500 engines, with much of that growth coming in the Middle East, Asia and South America.

This chart shows our installed thrust, but as you know, thrust is a reasonable proxy for revenue. As you can see, thrust in the next decade doubles and continues to grow after that. Over the lifetime of an engine, service revenue is around 4x higher than OE revenue. And by the latter half of this chart, the ratio between OE and services shifts in favor of the higher-margin aftermarket business.

So Rolls-Royce has always been a long-term business with a steadily growing installed base. It is also a business that, from its earliest days, has made Power Systems for Land & Sea as well as Aerospace. These are markets that are characterized by growth over many decades and that we continue to address through our Aerospace and Land & Sea Divisions. There is an industrial, commercial and strategic logic tying these 2 divisions together to generate long-term value for the group.

Industrially, our advanced engineering capability benefits the whole group. And as power systems we produce become more sophisticated, deep technical knowledge will become increasingly important. Just a few areas in which we have world-leading expertise are fluid dynamics, that has a broad application from the development of fan blades and water jets to understanding coolant flow in nuclear reactors; 3D printing and hot isostatic processing manufacturing techniques that improve design, reduce costs and shorten delivery time; safety-critical engineering processes developed in our Nuclear and Aerospace businesses that are being applied across the group to meet our customers' increasing requirement for safety and reliability. Our common core of engineering capability allows us to integrate systems and to take technology from one part of the business and apply it to others, multiplying its benefits. To give just

2 examples, knowledge of material science from our Aerospace Division has enabled us to develop new seals for Marine. Automated manufacturing technology developed for marine propeller surface finishing is now being applied to Aerospace fan blades.

Commercially, we and our competitors recognize the requirement for both scale and breadth of portfolio. Scale is crucial to maintaining a strong balance sheet and protecting our investment-grade rating, which, as David has said, is essential comfort for customers who sign long-term service agreements with us. Scale also enables us to maintain a global R&D network that now comprises 31 University Technology Centers and several [ph] Advanced Manufacturing Research Centers. Maintaining and building this network is critical to our future, because this is where the next generation of products and services are envisaged, then taken off the drawing board, developed and tested for commercial application. Breadth is important because it provides a balance of different business and investment cycles. It's worth remembering that between 2008 and 2010, group performance was powered by an 89% increase in Marine profit, which more than offset a 22% decline in Civil profit.

Strategically, our 2 divisions address markets where long-term growth is underpinned by expanding population, increased affluence and environmental regulations. Both Aerospace and Land & Sea markets offer attractive returns and play to our strengths.

I've spoken about the 4 Cs, explained our long-term approach. Before closing, I want to talk about our long-term strategy that we now describe in terms of 3 things: customer, innovation and profitable growth.

This strategy has been in place for many years and proved itself through good times and bad. For example, this has driven growth in Civil large engines, where in the 1980s we had a market share of less than 10%. We now have more than 50% of the wide-body engines on order. It has guided the expansion of our Marine business that has more than doubled in the past decade. Customer is the first element of our strategy. Recognizing the customer is at the heart of our business is central to everything we do. I have talked already about the progress we're making.

Innovation is the second thing. This is the lifeblood of Rolls-Royce, and we need to take -- make sure our innovation pipeline is strong and relevant to customer needs. In 2014, we filed 600 patents and invested GBP 1.2 billion in research and development. We're pressing ahead with new technologies. Delivering today, investing for the future.

As you're all aware, we're progressing our next generation of aero engines, Advance and UltraFan. We have flown a test engine with carbon/titanium fan blades, and we're building a new test facility for power gearboxes in Dahlewitz. In our reciprocating engine portfolio, we are investing in technology to further improve fuel efficiency and emissions. These are all necessary investments in the future which brings us to the third element of our strategy, profitable growth.

Our prospects for long-term profitable growth are driven by the fundamental strength of the markets that we address. It is helpful to look at independent data to understand the scale of opportunity. These charts give a 40-year view of growth in population, GDP and energy. They demonstrate very clearly how growth is driven by the developing world, and they make the case for the fundamental strength of our business.

This chart from Airbus shows the growth anticipated in the wide-body fleet in the next 20 years, a 250% increase, with the vast majority of the fleet in 2033 made of aircraft yet to be delivered. So the fundamentals that underpin our business and provide opportunity for long-term profitable growth are strong.

Of course, in the short term, the pace of economic growth in individual markets will fluctuate. The price of commodities may be volatile. The most obvious example at the moment is the oil price, which has halved in the space of months. This should, of course, help growth across the world but has pluses and minuses for Rolls-Royce.

In Civil, there is limited short-term impact, although it helps airline profitability, which in the medium and longer-term, could translate into more orders.

In Land & Sea, reduced CapEx from the oil majors has a more immediate impact on our revenue, forcing us to focus even more on costs. So in the long term, we will be leaner and more efficient. But none of these near-term factors alter the market fundamentals. In the last decade, nearly 1 billion people have been lifted out of poverty. The middle-classes are growing by more than 100 million every year. As people become wealthier, they join the markets for goods and services that require power to be manufactured and transported. The megatrends are on our side. And that gives me a great deal of confidence for the long-term future of Rolls-Royce.

We have built strong positions in growth markets. We have world-class technology and customer relationships across Aerospace, Land & Sea, and we see significant opportunities for long-term profitable growth across our portfolio.

To take advantage of the opportunities that lie ahead, we must continue to improve performance right now by being better integrated, focusing on delivering consistently for our customers and driving performance on cost and cash. We understand this, and it has our full attention.

So let me conclude with the same 3 messages I opened with. The fundamentals of the business are strong, and we are committed to investing in future growth. We are clear how to address the growing pains that are holding us back, and we're taking decisive action that will make us a stronger company and return us to profitable growth.

Thank you. Now we're delighted to take your questions. I will go around the room and take questions off the WebEx as they come in. If you could state your name and affiliation before you start, that would be great. We will provide you with a microphone so that all listeners to the call can hear your questions.

Question and Answer

John F. Rishton

Former Chief Executive Officer and Executive Director

So I normally start at this side, so I will start at this side just at the front here. Thank you.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Just one question for me, kind of from -- taking a step back, at a high-level, the steep decline in oil price, obviously, was clearly a big surprise to everyone in 2014, and knock-on effects are still working their way through the system in various adjacent businesses. John, has this changed the way you view the attractiveness of this end market versus last year at this time, or when you took over as CEO? And might it change or influence decisions to further invest in the short-cycle businesses that are heavily geared towards Energy, Exploration & Production, either organic or inorganic investments over the same medium term?

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks for the question. I think I tried to address that, I think, in my set piece in the sense that we see the longer-term growth in these markets being substantial, the longer-term growth driven by population, driven by urbanization, driven by the increasing demands for power. I'm certainly not well placed to forecast oil prices, and I'm not even going to try. There are other people who are better placed to do that, so I'm not even going to try. But we believe that the megatrends, as I've described them, of the population urbanization that will drive demand for power are really strong in the long run. And that's what I'm looking at. In the shorter term, the issue is addressing the impacts that we see in our -- particularly in our Marine business that is impacted most directly by cutbacks in CapEx from the oil majors, and that means focusing intently on costs. Now what I would say on the plus side about that is that in my experience, where there is a clear and present need, it is usually easier to get everyone's attention and take more action more quickly. That's my experience. So I think that we're well placed to do that. Lawrie and his team have taken a lot of significant action over the last year. I think over the last 2 years, Lawrie, about 1,100 people have left the business. We've announced the closure of about 5 plants already. We need to do more; we will do more. But I think in the long run, these are still very good businesses supported by growth.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Okay. So it's fair to say, then, that your resolve [ph] year-on-year -- I mean, you're still resolute in terms of your overall view and how you view the attractiveness of this.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

So nothing [indiscernible].

John F. Rishton

Former Chief Executive Officer and Executive Director

No. Just go back around. Yes.

Gordon Hunting

Gordon Hunting from Fiske. Singapore, are you finding it much more difficult to start production there than you were anticipating, particularly, as the temperature is about 80 degrees Fahrenheit and the humidity, about a similar figure of 80. Is this going to be a problem, and did you anticipate that when you started moving XWB production across Singapore?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. The shorter answer, and I'll give you a short answer is we were fully aware of the temperatures in Singapore. Production has ramped up very successfully, particularly on the fan blade side. The issue that we have in Singapore is unrelated to temperature. It's the speed with which we fill the facility, which is geared to build Trent 1000s and Trent 900s. We're ramping that up slowly over time. We'll keep going backwards around. Any on that side, no? Okay. Okay, we'll come -- Ben, right at the very front. Always know I'm going to get a friendly question from Ben.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

I'll try and make 3 friendly questions.

John F. Rishton

Former Chief Executive Officer and Executive Director

Three. I thought it was only one.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

It's Ben from Deutsche. The first one, just to clarify, on Marine, am I -- what have we done on restructuring charges? Are there restructuring charges you have taken embedded in these numbers? Is the expectation there will be restructuring charges? Have I missed something? Just if you could give some clarity on that, please? The second question is just that free cash flow guidance of GBP 200 million, just a sort of housekeeping question. That presumably includes the cash receipt from the IAE earnout. Do I add that in at that level, or does that come below the GBP 200 million? And the third question, just come back to, I guess, your chart and your comment, John, on Slide 27, where you talk about 170-basis-point gross margin improvement. And also picking up on Slide 10 on that bridge chart on Civil aerospace profits, the trading profit improvement of GBP 263 million. It looks to me like, I know there's a lot of things going on in the business, but year-over-year, you had about a GBP 260 million swing in the cume catch-up, going from 110 negative to 150 positive. Doesn't that explain all of the gross margin improvement in that trading profit improvement? So where is the evidence that I should see, or am I missing something on the underlying cost progress you're making?

John F. Rishton

Former Chief Executive Officer and Executive Director

I'm going to ask David if he could make comments, I think, on all 3 of those. Clearly, in terms of restructuring in Marine, as I've said to a previous question, we've already taken -- in the last 2 years, about 1,100 people have left the business. We have announced the closures of -- I think it's 5 plants, Lawrie, if I remember correctly?

Lawrie Haynes

Executive

5 plants in 2014, and previously, around 4 plants. So over the year, we've closed 9 plants are consolidating. That's 30,000 square meters of property that is actually being disposed of. And about just over 1,000 people, both indirect and direct, have left those facilities.

John F. Rishton

Former Chief Executive Officer and Executive Director

So we clearly have been taking actions there. But why don't I ask David to make some comments on the 3 questions that you asked.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, sure. So just on the specific, there's about the same restructuring charge for Land & Sea in both '14 and '15. So it's -- I think it's about 25% to 30% in both years. The free cash flow guidance, yes, that would include the total business, so there's nothing excluded from that. And then on the gross margin point, so within the GBP 150 million of onetime effects and, you're right, there's a bigger swing than that on a year-over-year basis. There's a significant amount of costs within that. So I tried to describe this -- and this is quite complicated because, as everything, it gets into the way that we have to do the contract accounting. The cost actions that we take, and these are the things that we're doing to improve time on wing, the cost of intervention when we actually take engines off-wing and into service, the cost of the spare parts that we fit, all of those things, we assess within the -- each model's contract packs. And we will assess, each year, the things that we're actually confident on that we've now implemented. There may be a list of other things that we're going to do but what we've actually implemented. And we will flow that into the contract packs with a degree of conservatism. So what actually gets released in in-period year profits is, typically, the catch-up effects and anything that affects that period. It will not include what will be happening in the future, because that will come through in future years. So you're right, a large part of that gross margin improvement can be explained by those effects. But cost is a significant part of that gross margin improvement.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thank you. We're just going to drift back just on this side [indiscernible] further back. Thank you. We'll come to the right-hand side in a moment.

Jaime Bann Rowbotham

Morgan Stanley, Research Division

It's Jaime Rowbotham from Morgan Stanley. Two questions, please. The first one, for David, on cash and then a question on Defense. Obviously, it's unfortunate that in addition to the investments for growth in Civil, you've got this additional issue of working capital outflows due to utilization without replacement of deposits in the short-cycle Land & Sea businesses, which are shrinking at the moment. It looks, from the cash flow guidance, as though you've allowed for very much the same again in 2015 on that point. Is that fair? And is the work you're doing around working capital management, and you mentioned inventory turns, can that push you towards the upper end of the guidance range? And the second question, if we look at today's divisional guidance for 2015, compare it to the 2015 consensus that you put on the website a week or 2 ago, I think unsurprisingly, in some respects, the ranges on Marine & Power Systems are probably a bit lower than where people stand, but the one division where you're higher is Defense. So I just wondered what needs to happen, what are the key things that need to happen and on which programs in Defense to make -- to allow that -- that revised 2015 Defense guidance to be hit?

David Miles Smith

Former Chief Financial Officer and Executive Director

Okay. So let me take the cash working capital one first. You're absolutely right. I think this is one of the dynamics of the market that has a negative effect on the short-term at the moment that, I think, there's also -- there's both a greater reluctance to give deposits as part of the order take process. And we have seen some runoff of contracts that were longer that have actually been completed. So there is a degree of caution that we've put into the guidance for that. That doesn't mean that we're not going to work on that issue, but I'm trying to be realistic about that as well. I would say -- and this, I guess, will be a mea culpa, although it's not a mea culpa personally, but I think we were over-optimistic on that. In the early part of last year on cash flow, I think, that was one of the areas that I think we were over-optimistic on and resulted in some of the underperformance on cash flow last year. So on the second question around consensus, I mean, I think you've rightly picked up that I've -- in setting the consensus, I still have the

kitchen sink with me, by the way. But -- I haven't thrown it out quite yet, but I am more cautious in certain areas. And I think, particularly, Marine is a clear one. Power Systems is not so much just about the oil price. It's actually more about my caution around general economic factors at the moment, so what's happening in the slowdown in China, what's happening in the Eurozone. I'm hoping I'm wrong on some of these things, but I think it's right in a more uncertain environment to set guidance in a way that's cautioned. And I have a great belief that I've built up over 30 years that that's the right way to run an industrial business as well, that -- to run it on a series of plans that allow you to make the upside if it comes through so you have the flexibility, but make sure that we're planning cautiously in the short term. On Defense, there was an improvement that I don't think any of us necessarily picked up completely around the fact that OE volumes come down and, therefore, service mix improves. You know that, as I'm sure you can guess, is a higher-margin part of the business. I think, actually, the Defense numbers are very solid. I -- they've done a great deal of work and they continue to do a great deal of work in that team. I don't think there's any thinking there that I would be concerned about in terms of projects not happening or the sort of question that you asked.

John F. Rishton

Former Chief Executive Officer and Executive Director

Tony, why don't you make a couple of comments on Defense. I think we have pretty strong order cover there.

Anthony Wood

Former Executive

Yes. Three quick points. Obviously, very strong book-to-bill in 2014, GBP 2.5 billion of orders secured. That's really given us better confidence on order cover in 2015. We have largely launched the cost reduction and consolidation program to resize the Defense business for what we see the future years being, and the mix benefit that David mentioned. Those are the 3 things that largely sit behind the Defense guidance we're giving today.

John F. Rishton

Former Chief Executive Officer and Executive Director

Let's switch to this side, if we can. [indiscernible] to someone at the front, just [indiscernible] near the front anyway.

Unknown Analyst

[indiscernible]

David Miles Smith

Former Chief Financial Officer and Executive Director

I don't mind.

John F. Rishton

Former Chief Executive Officer and Executive Director

Just -- we can do everybody.

Zafar Khan

Societe Generale Cross Asset Research

It's Zafar Khan from Soc Gen. And for once, I'm going to add to Ben, if I could please ask 4 questions?

Unknown Attendee

[indiscernible]

Zafar Khan

Societe Generale Cross Asset Research

Sorry about that, Ben. The first one is on this retrospective TCP profit, David, that you released, the GBP 150 million. And as Ben pointed out, it's a GBP 260 million swing year-on-year. Could we just focus on '14 for a minute? Could you please help us in understanding the mechanics of this, because I think the -- it was given as a Trent 700 profit release. So I'd like to understand how you get at these numbers, and how volatile are they on a longer time service? So you had a positive GBP 150 million in '14, a negative GBP 113 million in '13. What happened in '12 and '11, for instance? So how do we think about this? That's the first one. The second one is on the capacity utilization in the 3 new plants that you've built, and I'm thinking of Sunderland, Seletar and Crosspointe, and when you might get to a decent level of utilization so that you get a good drop-through on that. The third one is one for Colin, if I may, is just to ask about the R&D. It's a pretty big increase [indiscernible] I was thinking that a lot of the big stuff had happened. So I'd like to understand where you're spending the money. What is it? Is it people? Prototypes? GBP 150 million is quite a big number. And then one for David on just the margin targets, David, that were given in October. And is that another case of mea culpa for the group or are you happy with the longer-term margin targets that were given? Would you underwrite those? So nothing else about it. What I'm trying to...

John F. Rishton

Former Chief Executive Officer and Executive Director

Thank you very much for the 4 questions. Yes, thank you. I'm going to suggest that maybe I talk a little bit about capacity and then ask David to comment on the 3. I will ask Colin to comment about R&D spending, but maybe David can make some comments on that one as well. Now in terms of capacity utilization, it's different across the different facilities. So we've got some new facilities that are -- quickly get up to full capacity. So the Sunderland plant would quickly up there, and we take it out of the old facility. The issue there is we've still got the old facility, which has now only got old parts in it. In Crosspointe, we've got a slightly different -- which is we've got a building. We're fully utilizing the machinery that we've put into that building, but we've got space for more machinery that we can put in. At Sunderland we've got a full site there which does fan blades, which has got quite a high capacity utilization; and the assembly, which has got a low capacity utilization. So as I've said to you many times, Sunderland, as [ph] Singapore, has got a 250, 300 capability in terms of engine assembly. Last year, I think, Tony, it was about -- we did about 40, is what we did about the year before, which reflects the mix of engines that we can build there. And as we've said a couple of times, clearly, the delay in the programs, for example, the 787, impacts when that will be used. So that will ramp up over time. But with those very large fixed capital investments, making sure that we have the capacity is very important, though the delays that we've experienced from some of the programs means that we've got them -- gotten them a little bit too soon. Volume will solve that. But it's a different story, I think, in each of them. David, maybe you want to make comments about the others?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. So let me just tackle a couple of different aspects of the first question, which is around the TCA profit movements. The swing that we saw last year and the year before are probably at the high end of the range over typical ranges. I'm just trying to recall the chart exactly, but I think the average over the last 5 or 6 years is probably more in the 50 to 75 sort of range. And there's a particular reason, I think, why last year was higher, which is what I'm going to come to. But actually, Tony and I, probably about a year ago now, initiated a very thorough process within Aerospace of essentially looking at what every team was doing on this whole area. So all of the work that's being doing -- that was being done on looking at the cost of the spare parts, the costs particularly of the intervention of shop visits, and then all the good work on time on wing. And I think we showed you all the arrival charts and things like that we look at there. We're also getting incremental benefits now from the engine health monitoring systems. So we have a process of converting that information now back to give us a much more accurate view on what the lifetime usage of parts is going to be and the replacement requirements. So that GBP 150 million has been boosted by that program, where we went through very vigorously every single program and made sure that we were using all of the tools effectively right through the business. And I think that, that -- and I'll give Tony a lot of credit for that. That really supercharged, I think, that process last year. And it is -- it has over delivered from what we might have expected last year. So I think that's why I'm saying I

don't think we'll see GBP 150 million of benefits in 2015, part of the reason the Civil profits are going to be down year-over-year. So that was the first. Shall I do the fourth?

Zafar Khan

Societe Generale Cross Asset Research

In terms of the timing on that, as to when you'll recognize this, is it arbitrary or is there some...

David Miles Smith

Former Chief Financial Officer and Executive Director

No, no, no. We have a very, very detailed and complex process that we go through -- I say complex -- a rigorous process that we go through.

Zafar Khan

Societe Generale Cross Asset Research

The reason I ask is just that GBP 150 million coming through this year, [indiscernible] to the '15 numbers? If you hadn't invested in '14, could you have deferred it?

David Miles Smith

Former Chief Financial Officer and Executive Director

No.

John F. Rishton

Former Chief Executive Officer and Executive Director

We recognize it consistent with the accounting policies that we follow, which are audited and that we are absolutely clear on.

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes, yes. Just -- shall I just tackle the last question, which was around margin targets? Yes, I'm absolutely fully behind those. And remember, the way that we describe those is very, very important here. We were not making a forecast of margins in 2018, which I think is -- there's some confusion about that. What we did was said this is where the business should be able to get to on a medium-term basis once we've met certain criteria. And these events are very, very important, I mentioned them earlier, around when we see the OE volumes flattening off and we've got the initial launch losses on the XWB and Trent 1000, in particular, were through that launch period. And the aftermarket service business begins to grow. So that -- those are the things, plus the cost leverage, the operating leverage that you referred to, that are going to generate those margins. So I think we're absolutely behind those -- I'm personally absolutely behind those margins as part of that process. So that's the answer to that question.

John F. Rishton

Former Chief Executive Officer and Executive Director

R&D?

Colin Peter Smith

Former Group President and Executive Director

Oh, R&D.

John F. Rishton

Former Chief Executive Officer and Executive Director

I look forward to the answer.

Colin Peter Smith

Former Group President and Executive Director

It's a mixture, it's a mixture. First of all, there's the mix between capitalized and expensed, which can make the numbers move around a bit more than is normally visible. But last year, we ended up investing a lot of more money in the latest variants of the XWB and the -TEN. And with the baseline, which entered service in the end in December, was -- the engineering on that was coming off in the year as the productionization was ramping up. So a lot more expense on the latest variants, a lot of which was hardware and resource. You'll see it coming off this year. As we come over that peak, we've got a lot of engine testing to do, but it's less manpower. So the balance moves the number around a bit. And also, on the technology side, the difference in funding ratios that we get when we get grants in from our customers or our supporting partners, such as governments, does vary. So that -- those movements give quite a big change in the IFRS reported number.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. We've just got one from the phone, and then we'll go to the web as well. And then we'll go right to the back, because the people at the back haven't had much of a chance.

Nick Cunningham

Agency Partners LLP

Nick Cunningham, Agency Partners. I wanted to ask about net cash flow. Because you've given a free cash flow guidance of GBP 200 million, dividend's about GBP 400 million. Do we assume that all of the buyback takes place during 2015, in which case, does that give us a net of about minus 1,000, or am I missing something? And then looking at the average net debt figure that you give, it's a complicated year in '14, but it looks like it was about GBP 1.2 billion worse or lower, if you like, than the arithmetical average. Is that a sort of good rule of thumb to apply to 2015? And obviously, there's a bit of a subtext to those questions which is, given the deterioration and uncertainty that you have in some of your end markets, does it still feel like a good idea to be pushing through with that buyback process?

John F. Rishton

Former Chief Executive Officer and Executive Director

David, do you want to take that?

David Miles Smith

Former Chief Financial Officer and Executive Director

So our expectation is that we will complete the buyback during this year, yes. We've done -- I didn't get the latest figures. I was staring at Jilinda, because I was going to get an update on that. But I think about GBP 200 million up to the end of February -- sorry, the beginning of February. And our expectation is we will, provided nothing really happens in the market, that we'll continue on that rate. You're right, that is a -- that is, on top of the dividend, that will mean that we have net cash flow after financing, if you like, that's negative. We do have -- in addition to the drawn debt that we have, we do have additional RCF facilities, and we're actually in the process of consolidating and increasing those a little bit at the moment. So from a liquidity point of view, to manage the midyear dip that we get, then we have sufficient liquidity to manage that, if that was your concern.

John F. Rishton

Former Chief Executive Officer and Executive Director

And then on the average debt? Or is that...

David Miles Smith

Former Chief Financial Officer and Executive Director

Well, I think that's the point, that the -- there's a low point during the year.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Let's go to the web, WebEx and -- go ahead.

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

Unknown Executive

Okay. I've got a question from Rob Stallard at RBC. On inventory levels, particularly in Civil aerospace, how much further do you think you have to go in terms of optimal inventory turns and how long do you think it will take to get there? And also, what sort of assumptions have you built into your 2015 to '17 plan regarding build rates on Trent 700 engine production for the A330 CO [ph]?

John F. Rishton

Former Chief Executive Officer and Executive Director

Let me take the second one first. In terms of Trent 700, as I've said many times to this audience over the last 8, 9 months, clearly, there's going to be a level of change in that -- in the number of Trent 700 engines that will be needed for the A330, clearly, depending on Airbus' sales of the A330 aircraft. As you would expect, our 2015 numbers are completely aligned with where Airbus are. As they look out into the future between '16 and '17, we'll make sure we are aligned with them. But really, it's a question, I think, for Airbus, in terms of what do we think we can sell, or what do they think they can sell of those aircraft. We'll make sure that we have the engines for the aircraft they sell and, clearly, we will help them in that sales process. But in terms of forecasting where that's going to be, I think that's just more with Airbus. In terms of inventory levels, I think the question was how much more and what do we think inventory turns could be in the Civil business. I'm not going to get into what I think we can get to, but I think we would all agree, and I'm going to look at Tony, in particular, the Civil business, that we can make quite some improvements in terms of turn rates. I mean, I think we've made some improvements in the absolute amount during the course of last year, but we're impacted a little bit by some of the volumes. Tony, do you want to make any comments on that?

Anthony Wood

Former Executive

So we're looking at inventory in a very detailed way across the whole of the Aerospace business. We have made some progress in the year. Aerospace turn is running at about 3.5 at the moment, still some opportunities to step that up. A number of areas that are driving it -- David mentioned in his pitch what we're doing on Lean, so a standardized approach to how we look at lead time, the planning of lead time and the performance in the factories. A standard approach in terms of how we run every one of those factories worldwide is the big drive that we're going for, and started 12 months ago. We've been doing Kaizen, we've been doing Lean, we've been doing value stream mapping for quite some time, but doing that in a very consistent way across all of our facilities. Clearly, we have confidence that, that will improve inventory turns as we go forwards. We do, however, have a number of programs at different stages in their life. We've had some build rates moves with some of our major airframe partners that have caused some inventory to still be sitting on the book at the end of 2014. We do expect, though, progressive inventory improvement over the course of the next 2 to 3 years.

John F. Rishton

Former Chief Executive Officer and Executive Director

Let's go into the back of the set this time. Lady with her hand up.

Celine Fornaro

BofA Merrill Lynch, Research Division

Celine Fornaro, Bank of America Merrill Lynch. Three questions, if I may. Last year, you actually commented on what was the order cover for the business at this point in the year for 2015. So it would be great if you could share that with us and probably also the divisional level, Marine being the most interesting one, depending on Defense and the commercial end markets. My second question would be on FX, what we should think about FX, any tailwind in 2015 to profits based on the hedge book rates you may have? And my final question would be just back on this life cycle cost recognition when you've got this GBP 150 million catch-up. Just to be clear, there is no cash impact on this? So even if you keep doing this, you will improve your margin, but there is actually no cash incremental recognition coming from it? Is this correct?

John F. Rishton*Former Chief Executive Officer and Executive Director*

So let's take those in the order that you gave. In terms of order cover, for original equipment across the group, it's around 80% in terms of the order cover with, as you would expect, a higher level on Civil and Defense. Marine is actually relatively high, and you saw that the Marine order book at constant exchange rates actually went up. I think that what I would say in terms of Marine, though, is we have a level of caution. Certainly, David and I have a level of caution. I think, Lawrie, you had shared this, which is, despite the fact that the order cover appears high, we are concerned, clearly, about customer deferrals in that book. And we've reflected that caution in the guidance that we've given you. In terms of service order cover, again, quite a significant variation. And again, not of particular surprise, Defense will be the highest order cover we'd have in service. And the Land & Sea would be pretty low, because it is very short cycle in terms of the service. But -- and if I look at the total book across the group, there is nothing exceptional, either good or bad, about where we sit in terms of order cover, either in terms of OE or in terms of services at this stage of the year, but for the caution I've expressed on the Land & Sea side. David, maybe you could talk about the other...

David Miles Smith*Former Chief Financial Officer and Executive Director*

Yes. So on FX, we have a hedge book that is roughly 4 to 5 years cover. It's about GBP 25 billion roughly, with an average rate of about 161. And therefore, we'll get relatively small movements on transactional exposure within a year. Clearly, there are bigger movements around translational exposures, but those are not something that we would ever hedge, and those are just conversion of balance sheet items, foreign currency items at year end. So we will, as we always do, I think, update during the year as we give progressive information, any currency effects that we're seeing. But essentially, within the guidance, there are no effects. On the life cycle cost, I think it depends really about whether you're talking about period or the life cycle itself. Within the period, you're right, there's no cash effect. But clearly, anything that we end up putting on the TotalCare debt will all come through our cash at some stage. In other words, if you never sold another engine or never delivered another engine, it didn't grow, that cash has to come back on to the business over time. So it's really a timing effect and, in fact, the whole TotalCare debt [ph] is really a timing effect between profit recognition and cash flow.

John F. Rishton*Former Chief Executive Officer and Executive Director*

Okay. We're going to go back over to this side of the room if we can. Start at the back, yes.

David Howard Perry*JP Morgan Chase & Co, Research Division*

David Perry from JPMorgan, if you can see me here. So I've got 3 questions, sort of, chronological. So just first off, for 2015, just to repeat Celine's question, because I think she was asking about if as of -- if today's rates prevailed, could just talk us through the translation impact on EBITA in each division? That would be very helpful, please. The second question then is, moving on to 2016, you may not want to comment, but any sort of tentative view on free cash flow even directionally, would be helpful. And then my third one -- it was good, David, to hear you sort of endorse the medium-term guidance. I just wanted to clarify one thing, because I think most of us assumed the medium-term guidance is 2018. Your slide now has sort of 2018 to 2020. So should we think -- as you said, they're targets. It's not guidance as such. But is it 2018 or is it more a 2018 to 2020 kind of potential target?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Thanks, David. Can I -- I'll take the last question, and David may want to add a few comments to that. What we clearly said in the release of the medium-term guidance was exactly what David said. And then we said, as we sit here, 2018 is what we think those events can -- will come together. So that was where the 2018 came from. In David's chart, which shows the period, that's -- I think it says in the chart, that's where we should be realizing the benefits from the investment which starts in 2018. So that was a period

shown for when we realize the benefits rather than anything related specifically to the medium-term guidance. But the key point that David makes and we tried to make at that time was it's the combination of factors driving the OE aftermarket, the launch pricing, launch costs, the cost progression that we make that drive the margin performance, which you all know; and based on the discussion that we had almost -- back in June last year, we viewed that as being 2018. So that hasn't really changed. But the chart that David put up had a time period, and that's [ph] when we benefit from the investments. David, do you want to talk about FX again?

David Miles Smith

Former Chief Financial Officer and Executive Director

I think I'm going to give the same answer, that as we've said, I mean, we've given the guidance obviously, at 2014 FX. From where we are at the moment, the -- at a group level, there's only a very marginal effect. We will update you during the year if that changes, and there's not a significant effect on a segmental basis, either. So I'm going to take a pass on that, because I'm not going to go through a detailed review of that. We will update that during the year. On 2016 free cash flow, I'm also not going to give any guidance for 2016. What we've done today, essentially, is given you a lot more information obviously around 2015. As we've previously committed, we'll come back at the end of the year and update the medium-term guidance. The reason that I took you, though, through hopefully to try and clarify some of the key things that impact on cash flow is -- I think it's very important that you and we, to be quite honest, work through these fairly methodically and think through them. So the effects that are coming in both from the investment phasing, from the growth in TotalCare net debtors that, that has, obviously, an effect in cash flow because of the recognition issue that we've talked about between profit and cash, on the unlinked contracts, the contractual aftermarket rights also that have a negative effect on cash as well. It is very important that we think through this, because my observation is that when I look at the way that people are thinking about that, they've taken quite a linear approach, but it clearly isn't linear. And I think we have to think about those in a bit more detail, which is why I've given you both the update on 2015. And as you can see, the cash flow is actually lower than 2014, and that's impacted by a couple of things: the additional restructuring spend, as I explained earlier, that mainly comes through in 2015; but also because we start seeing a bigger ramp-up on XWB, which is unlinked well. And think through that in terms of the following year. So I'm not going to give guidance, but I hope I've given you a lot more help in understanding some of the levers and mechanics that are going through those years to enable you to think about the modeling of that.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. We're going to take one last question, and we're over there. So that's it, and then we're going to be, I'm afraid, out of time.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami Myerson from Investec. One question in 3 parts. On pricing, general heading pricing, but in Aerospace, can you talk a little bit about pricing pressures? So how much of those benefits from longer time on wing are you sharing with your customers for new TotalCare contracts and, of course, this catch-up that you had? And also, on the old aircraft under [indiscernible] materials, are you providing incentives for airlines to keep them on wing? In Defense, in the past, if I remember correctly, you talked about a mid-teen margins for that business. Guidance implies closer to 20%. Where -- how should we think about that going forward? Is this now 20% or high-teen margin business? And lastly, of course, on the Land & Sea businesses, can you talk a little bit about pricing pressure. We have heard -- some of the customers are talking about sort of requiring price decreases from their suppliers.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Tony, do you want to talk a little bit about Aero and time on wing?

Anthony Wood

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Former Executive

Yes. I mean, certainly, we price competitively in terms of how we position our TotalCare offering. We are, obviously, confident about the process that we've put in place. David spoke, I think, in some detail about how we do that and how we leverage the tools, engine health monitoring, the detailed way in which we link our engineers to driving reliability in the components to get time on wing, less overhauls, less spare parts are being consumed. So we do share some of that with our customers. That is very much the competitive marketplace. But we price competitively, and we're winning in the market. The engines that we've secured orders for last year and the market share, I think, speaks to a combination of being competitive on pricing and having very good products.

John F. Rishton

Former Chief Executive Officer and Executive Director

And David, would you like to talk a little about margins on Defense?

David Miles Smith

Former Chief Financial Officer and Executive Director

Yes. I mean, the observation is obviously correct, that Defense margins are above mid-teens at the moment. I -- that doesn't mean that I want to change my medium-term view. I think that we have had the benefit, as I mentioned earlier, of the fact that with OE volume coming down, the proportional -- proportion between OE and services increased. I don't think that's a necessary a natural position. And I would hope and we all hope, that we will do better -- or sorry, not only do better, that we will have some OE opportunities over the next few years. So I think that's why, I think, the midterm is still the right guidance, because we'll see a bit of a reversion, I think, from where we are over time. Is that fair, Jim?

James M. Guyette

Former Chief Executive Officer of Rolls-Royce North America Inc and President of Rolls-Royce North

Yes, absolutely.

John F. Rishton

Former Chief Executive Officer and Executive Director

Lawrie, Land & Sea pricing?

Lawrie Haynes

Executive

Yes. On the Defense side, the naval side, yes, the various projects, moD, DoD are under pressure. So we're having significant pushback from our customers who say they were looking for price reductions. On the Marine Original Equipment, we are -- about 60% of our supply is into the oil and gas industry, the offshore industry. So yes, what we're seeing at the kind of top level or the top tier is rippling into us, so we're having kind of considerable discussions with a number of our customers on the OE side. And on the services side, a number of our customers are de-stocking. They're actually using their existing stock which, of course, is putting pricing pressure onto the Marine side. We're also seeing on the -- at the Land side, a number of our customers are taking advantage from the lower oil price but, at the same time, they're using that oil price to pressurize all suppliers on price. So I'm afraid it's a uniform view across the market.

John F. Rishton

Former Chief Executive Officer and Executive Director

I'm sorry. We have run out of time. Thanks you very much, indeed, for coming. A couple of just closing comments from me, other than to say thank you, as I said, for coming. We are working, I hope as we've demonstrated, extremely hard to address the shorter-term financial pressures that many businesses, including ours, are facing. We are working very hard to address our cost and cash issues.

In the longer term, as you're well aware, the fundamentals for this business are very sound. The fact that we delivered the XWB engine on time and to spec is very, very important for the future of this company. It is a great credit to the people that work at Rolls-Royce, an extraordinary achievement, in my view.

The future growth potential is significant. We understand the growing pains, as I've described them, and what we need to do about them, and they have our intense focus. The good news about that is it will make the business in the long run leaner and fitter than it would've done maybe if we hadn't have had those pressures today.

So thank you very much, again, for coming. We look forward to seeing you again soon.

Presentation

Simon Manwaring Robertson

Former Non Executive Director

Good morning, everybody. Welcome again to Ålesund, and welcome to everybody joining us by live webcast for the Rolls-Royce Marine Capital Markets Day 2014.

Just before we start, some Safe Harbor language. As always, you will see and hear forward-looking statements during the course of today. Please remember that they're based on the management team's current view of life, and of course, those assumptions can change over time.

Let's have a very quick run through the agenda for today before we get straight to it. Lawrie Haynes, President of Land & Sea, previously Marine & Industrial Power Systems. We had lots of good feedback about that name, so we've renamed it Land & Sea, will present for half an hour as an introduction to Land & Sea together with Ulrich Dohle, the CEO of our Power Systems business, who will just give a short piece about Power Systems. At 8:30 -- and remember, all of these times are U.K. plus 1 hour. At 8:30, Mikael Mäkinen, the President of our Marine business, will talk for 45 minutes about the Marine business. We will then have 3 separate sessions of 30 minutes in length. John Knudsen, President of the Commercial Marine business, will have a focus session on customers. We'll have a coffee break for 0.5 hour at 10:00, before Sauli Eloranta, EVP for Engineering and Technology in our Marine business, will present on innovation. And then the final half an hour slot will be Mark Alflatt, the Finance Director for the Marine business, on profitable growth. And then we will leave it to Mikael Mäkinen for a brief wrap up before we get to Q&A.

And for everybody on the webcast, remember, you may ask questions via the webcast. And we'll make sure that Lawrie, who is hosting the Q&A, will receive those questions before the webcast closes at 12:30. And at that point, we'll give a separate brief to those that are staying for the afternoon in terms of what goes on for the tour of the training facility in Ålesund in which we are in, but also of Highland Pride, a platform supply vessel.

So without any further ado, I will hand over to Lawrie Haynes, President of Land & Sea.

Lawrie Haynes

Executive

Great. Thanks very much, Simon. Well, good morning, everybody, and good morning to everybody on the webcast.

What I'd like to do is briefly introduce myself, and then I'm going to give you a quick view of the 3 businesses that make up Land & Sea, and give you some kind of assessment on my view about where the market's going to be in the medium term.

So firstly, as Simon mentioned, I joined Rolls-Royce about 6 years ago. I joined to head up the Nuclear business, then John Rishton asked me if I would pick up also the Marine business portfolio. And after that, earlier this year, he asked me to pick up what was MIPS, the Marine and Industrial Power, as we say now, Land & Sea, to develop this business, particularly on the occasion of acquiring 100% control of Power Systems, Rolls-Royce Power Systems. I'll talk a lot more about Power Systems in my little piece, but it is a very important acquisition that we've made. And I will give you various threads of opportunity that we see under the -- as the new owners of Rolls-Royce Power Systems. Good opportunities, good synergies, good opportunities to develop innovation, et cetera.

Well, I'm very privileged to run Land & Sea. We have, in my view, exceptional people. We've got world-class people, and you will see some of them today. We've got world-class products, and you will see some today. We have got a very strong position in innovation and technology, world-beating position actually in innovation and technology.

And so I think that whilst we recognize that over the last 2 to 3 years, there have been kind of difficulties in the Marine market, there have been headwinds. We recognize that, but what I am enthused about is

the medium-term and long-term opportunity for the Land & Sea business and the Marine business and the Power Systems business that Doctor Dohle runs.

Where I think we are is that we've got, in Marine, in Nuclear and in Power Systems, extremely deep foundations. You cannot have a business for the future if you do not have deep foundations and deep knowledge and deep experience and an understanding, a deep understanding of what your customers want and need, and we have that.

You will probably think about what are the barriers to entry, but one of the soft barriers to entry is that knowledge and that experience and that detail, and we have got that in spades.

I think that my real view about the position on Power Systems is that it's only been since we've taken full control that we have really gone in -- really gone into that business in detail to kind of start to dig up some of the golden nuggets that are in there and identify some of the kind of key options that we have to develop that business. So I think it's really worthwhile having 5 minutes, 10 minutes with Ulrich to give you a kind of insight into that business itself.

What I'd like to do now is quickly go through a couple of slides, a couple of slides on the drivers. And this -- the first one you saw John Rishton give last night, so I won't spend very much time on this. John talked about this yesterday.

But one of the key things here are these megatrends. They will drive growth across this business. There are more people on the earth -- or are going to be more people needing more resources, including power, against the backdrop of ever-tightening environmental legislation.

I think one of the key points that John mentioned yesterday was the development and the growth of the middle class. John mentioned 100 million plus new people entering the middle class every year. Now very simply, what that means is, if you are in an emerging economy, you are going to -- you will move from bike to motorbike, from motorbike to car, into urban towns and cities, which drives construction. It drives road transport, rail transport. And 90% of all goods are transported by the sea so it drives sea transport, too. So do not underestimate that these megatrends are just figures. They are influencing our strategic thinking and our strategic development. And the other area that is developing our thinking, of course, are things like the IMO, the IMO regulations, emission control, et cetera. I think you could look -- probably personally look around if you traveled by sea and the amount of pollution that's there, but also the amount of pollution that comes from maritime vessels. The IMO is now getting teeth and doing something about it. Why is that important? Well, because we are very, very good with the emissions control, and we, in fact, we're ahead of the regulators and we're ahead of the market. So it places us in a really, really good position as we go forward into the next few years.

Now why are we, Rolls-Royce, positioned to deal with that? Well, we are positioned because we've got 3 fabulous businesses. Mikael Mäkinen is going to talk about the Marine business, so I won't deal with that here.

But let me give you 1 or 2 examples that Uli won't have the time to deliver, but I'll just give you a taster. We have developed hybrid power packs for Deutsche Bahn. The first hybrid power packs are now being tested on the German rail network. These are diesel electric, equivalent of the Formula One KERS System. We are developing that and have developed it, and we have product now in the marketplace. There is global potential in this area. We are developing lean gas burn technology, which greatly reduces emissions. We are ahead of the regulatory requirements, and we continue to invest in new products in this area. In L'Orange, we have fuel injectors that are state-of-the-art, that are best in the world.

If you imagine 20, 30 years ago with your own car, and now imagine trying to do some work on your own car, it is impossible because everything is computer-driven down to the most -- the smallest micron. Our fuel injectors are state-of-the-art. They are the future in reciprocating engines.

We, also with Power Systems, have a fabulous range of high-speed diesel engines both for marine, for the off-highway market and for land power. So we are extremely well-positioned to take account of these megatrends.

And now looking at Nuclear. If you just think about the nuclear market, there are today about 440 reactors operating in the world. The projections are, from the various authorities, that there will about -- between 160 and 170 new reactors built over the next 20 years. If you add together those reactors being built, the reactors operating that needs servicing and maintenance, the decommissioning market, the fuel market, you are adding up to a market, a total global market of about GBP 1.6 trillion over the next 20 years. Now Rolls-Royce is fabulously positioned to take account of that market. We have over 50 years experience in building nuclear reactors, designing them for the Royal Navy. We operate with nuclear reactors, we understand them, so we are in a nice position to take account of that. And we have about 600 people in France, in Grenoble, who operate the instrumentation control systems for nuclear reactors around the world. And the I&C system is basically the brains of the reactor. We understand nuclear technology.

I now want to give you a quick picture. I think you saw this with John Rishton in June. It's a graphic about what Rolls-Royce is about. And Land & Sea is fully integrated into the group.

Across Rolls-Royce, we focus and deal in engineering excellence, complex power systems that are becoming more and more complex, that lead to a greater aftermarket opportunity. To be in these markets, you have to innovate. You have to spend money on research and development. You have to spend money on technology. You have to constantly learn. And one of the things that we, in Land & Sea, have great advantages over our competitors is that Rolls-Royce has got the most remarkable University Technology Centers system, learning system for engineers, advanced manufacturing research centers that are, again, second to none.

So in Land & Sea, we benefit hugely from being part of the group in taking advantage of these engineering skills.

One of the things that I would just like to pick out from this slide is we talk about the reciprocating engines and the nuclear reactors at the power level. We also have expertise, of course, in gas turbine engines, which sell into our naval market.

Now selling engines is a direct pull through for our deck machinery and our propulsion systems in Marine. Having the engine, having the deck machinery, having the equipment that is supplied for the payload gives us the opportunity, which my colleagues will take you through later on, to then be able to sell integrated offerings. And selling integrated solutions to our customers is not easy. You have got to be very good to be able to integrate a series of components and products into subsystems and then into systems, and we are good at it. People watch what we do and follow us.

Now we've got about 22,000 people in Land & Sea. We've got about 6,000 engineers. And we have, as I described earlier, a completely intimate knowledge of what our customers want and need going forward.

Now I just want to talk very briefly about the Land & Sea strategy, fully integrated, of course, within the Rolls-Royce Group. I'm not going to talk about the top, the customer innovation and profitable growth because John Knudsen, Sauli Eloranta and Mark Alflatt are going to address those. But let me just talk about what my priorities are.

Now the first one you see there, leadership in reciprocating engines. Well, it's great that we now have control of Rolls-Royce Power System because that gives us that leadership. I'm sure you'll look forward to going to Friedrichshafen at this time next year to see some of the great technology that Rolls-Royce Power Systems has been developing actually over 100 years.

We are a leader in high-speed reciprocating engines, and it's a key offering for a number of the systems going forward. For me, it is a key priority that we, firstly, protect our position in high-speed diesel, and then grow it. And growing it means getting out to more markets, working in partnerships with a number of companies around the world, but it also means continuing the research and development effort that Power Systems has put in over the last decade. Uli will talk about that. We continue to invest in this technology.

Our medium-speed diesels. If you look at the overall market position, we are probably at about 5% in our kind of overall market position in the Offshore world and the Merchant world. We have, as John mentioned yesterday, developed the new Bergen 33:45 engine. One of the real reasons behind that was simply to protect our offshore position, which we are very powerful in, but it also, the 33:45, gives us the

opportunity to develop into the short sea and the tug market, so we're -- it's a progression, it's an organic progression in medium speed diesels.

That is my policy, my strategy, that we will continue to develop our medium speed diesels through our organic growth and through partnerships with companies, particularly in the Far East, that will have routes to market that we currently do not have. We are looking to develop the range of medium speed diesels. We are looking to develop the cylinder configurations, more cylinders, more power per cylinder, different fuel types, because that's what our customers need. And as I say, we're looking for new partners around the world.

In terms of the deck machinery, the propulsion systems, again, we have got a very strong position in a number of the propulsion market, the thruster market, for example, and I think you'll probably see one of these this afternoon. Thrusters, water jets, propellers, different types of anchor handling equipment, winchers, very important payload requirements that our customers need, that's the stuff that drives their money, and we did a very strong position. Having the engine, whether it's high speed or medium speed, drives the proposition to our customers that they would like to stay with Rolls-Royce and develop with us.

If I now look at the enablers, the first one, continuous improvement. Over the last 2 years, we have embarked on a massive campaign to improve our delivery. Frankly, 2, 3 years ago, we were underperforming. Beginning of 2012, we were delivering on time about 30% of our original equipment. Beginning of last year, it was about 55%. This year, it's about 92%. So we are seeing a considerable improvement in our day-to-day delivery, our responsiveness to our customers. John Rishton has pushed The 4 Cs, we understand it, we get it.

In terms of the next couple of years, I can tell you that 92% doesn't do it for me. So Mikael Mäkinen and the team know that I'm demanding more and will continue to demand more on behalf of my customers. That's the position that Rolls-Royce is developing.

I think if I now look at Rolls-Royce Power Systems and the integration, we have, as I say, created a position, 100% ownership. We now have an integration team fully enabled, pushing forward very hard. And I'll give you some examples in a few minutes on where we see opportunities in Power Systems accelerated integration.

In terms of capital allocation, again, we are looking at this. We can now look across the whole of Land & Sea, pull the appropriate resources that we have, capital, et cetera. Obviously, working with Mark Morris and the team to have a prioritized approach to capital allocation.

On issues like customer satisfaction, one of the things that Power Systems can pick up from Rolls-Royce Marine is that Rolls-Royce Marine has developed a key account management approach that has been very highly regarded by our customers, where one executive is responsible for the key customer, and therefore, can take decisions on their behalf. This is driving customer satisfaction very positively. And working with Uli and his team, we will be developing that in Power Systems.

And lastly, in terms of geographic reach. We have, over the next 2 to 3 years, the opportunity to look at our services business. We have a very wide geographic reach, and we need to and will continue to develop that approach more openly.

So Power Systems with Rolls-Royce Marine gives us scale and scope. And lastly, just on The 4 Cs, I'll talk about cost. Now over the last 2 years, we've been very proactive in terms of addressing our cost base. When you're in a position of headwind problems, you've got to address -- as John said yesterday, you've got to address your cost base. Over the last 2 years, we have been closing or in consultation to close about 10 facilities around the world, particularly in the high-cost areas. We have reduced our indirect headcount in Marine by about 500, which is about 20%. In Power Systems, they've developed the same thing, about 400 people, indirect people, have left or are leaving the organization. Our supply chain, 2009, was 1,400; the suppliers today, it's 900. And we plan to reduce that supply chain by 20% by 2016. So there's a great deal of activity on cost and cost-saving.

Now moving onto Land & Sea today, I won't talk to the Marine or the Power Systems parts of this slide because Mikael and Uli will address this.

Nuclear, I mentioned, has got deep roots. There is -- there are some very clear threads that string across those 3 businesses: high technology, research and development, knowledge, experience of new product introduction, safety, critical components and system integration, project management, advanced manufacturing, and of course, deep customer knowledge and care. Those are the threads that bring these businesses together.

In terms of creating value, and I talked about the integration of Power Systems into Rolls-Royce, and Rolls-Royce actually into Power Systems, we see really clear opportunities.

In this connection, let me give you a few examples. The Type 26 vessel, MTU is now specified as a standard engine for that vessel. It wasn't before. The UT vessel, 40 years old, Rolls-Royce is the ship designer for the MTU vessel, used to specify engines other than MTU, other than Power Systems engines, they now specify MTU engines. Big opportunity.

With the integration of Power Systems, I'll just want to give you a little personal view, that I've met with a very senior admiral at the naming ceremony of the new Queen Elizabeth Class aircraft carrier. And he said, "Lawrie, we are just delighted that you've acquired Rolls-Royce Power Systems because now you can start to give us an integrated offering where you're pulling together MTU engines, Bergen engines, gas turbine engines and deck machinery, and power sources and powertrains. We are very pleased to think that we can get 1 integrated offering from you."

On services, we see the real opportunity of exchanging, and are doing exchanging service engineers. We're now doing it product by product, but we will increasingly look at a distributed network reach. And through training, we'll take the opportunity to expand our geographic reach into services.

In L'Orange, the preeminent technology is now linking into our ship design systems. The Rolls-Royce manufacturing, lean manufacturing systems, are now coming through very strongly, particularly into the diesel market.

In nuclear, Rolls-Royce Power Systems has got emergency diesel generators. Rolls-Royce Nuclear has got the route to market, a very clear opportunity for us to cross-sell. And of course, we've got back office rationalization, and we're looking at burgeoning opportunities now across a larger group. The message is simple, many opportunities, and we are now very actively addressing them.

For this slide, I will take 30 seconds on -- it's probably in your pack. Land & Sea is material to the group, 41% of revenue. Power Systems was and is an important acquisition. We've got a large number of staff, as I say, 6,000 qualified engineers. We're in a very strong position to build the future.

And now in summary, I want to be very clear. We've recognized the short-term market issues. We've recognized the headwinds that we've had over the last 2 or 3 years. And we're doing something about it in terms of cost. And we are also looking at acquisition of Rolls-Royce Power Systems as a real opportunity. The business does have a long-term growth opportunity based upon the megatrends and our position in our portfolio. Land & Sea is significant as a player in this marketplace and in the medium term.

What I'm going to do now is show a quick video. And then Dr. Ulrich Dohle will give you 2 or 3 slides as an introduction, a taster onto Power Systems.

[Presentation]

Ulrich Dohle

Former Chairman of the Executive Board and Chief Executive Officer

Yes. Good morning, ladies and gentlemen.

Before I start my short piece, I would like to introduce myself briefly. My name is Ulrich Dohle, I am with Rolls-Royce Power Systems, from Tognum since 5 years, serving at the board of -- in the board of management. For the first 4 years, I was in charge of technology and operations. And since 1.5 years, I am the CEO of the company.

From myself to the company. The company was founded in 1909, so 105 years of technology development. It was founded by the Maybach family, father and son. And the event that triggered the foundation of the company was actually a disastrous thunderstorm in 1908 where one of the airships -- or the airship of Count Zeppelin crashed in Echterdingen which is now today's Stuttgart Airport. And it crashed because the engines failed. And in the thunderstorm, the airship went into flames. Then the German people collected money. They had 2 million gold marks to give to Count Zeppelin so he could start -- restart his business. And together with Maybach, he decided to design new engines, reliable engines, and that we are still proud of designing and producing reliable engines as of today. So our technology goes a long way back. In these days, it was still gasoline technology. In the '30s, it turned into diesel technology because diesel injection equipment was made available in 1933, by the way, L'Orange was founded, our daughter company. And with this technology, it was possible to employ or deploy diesel engines into mobile applications. So I think these days, the diesel engine is basically on the run. And in 1932, the first high-speed train was developed in Germany, running from Berlin to Hamburg. It was called the Flying Hamburger, and nothing to do with the McDonalds. And the Flying Hamburger did 160 kilometers an hour, which is still a record-breaking thing, with a high-speed diesel engine, produced with turbochargers, turbochargers designed and made by Maybach. As of today, we do design and produce our own turbochargers, which are a distinguishing technology for us, same as injection systems, so this is where we differentiate ourselves from our competitors.

And well, the technology in our genes, as it is still today. And today, we are carrying our strong brands, MTU, this is what we are known for with our customers, MTU engines, MTU on-site energy, power generation, L'Orange and also the Bergen Engines, Rolls-Royce program, famous with our customers. And that is something that we continue to develop and continue to make further progress in.

So this is the portfolio that we are serving, the markets that we are serving from -- in propulsion. So we are not only selling -- designing, selling engines, we are providing propulsion systems, including gearboxes, electric -- diesel electric combinations in many, many different ways.

Marine, for example, we do combinations of diesel engines with gas turbines. The most -- the longest mega yacht was just launched, the Azam, 185 meters. I think a cruiser starts at 200 meters, so 185 meters. A holding space for 36 people, plus 120 servants and personnel. It's powered by 2 8,000 series MTU engines, 10 megawatts each, plus 2 gas turbines. And luckily, not Rolls-Royce, but we are working on that. The combination of these, the automatization system, all is done by us. It propels a boat like that close to 40 knots, which is close to 75, 80 kilometers. And also, it's tremendous what a boat like that can do.

You see we have many, many different applications, I cannot go through all of them, but Lawrie mentioned the hybrid train that we just developed. And that it's stored in the first prototype. It's a full-fledged hybrid. It's a diesel engine, 380 meg -- kilowatts, an electric motor, 340 kilowatts. A combination of both -- all the electrics, electronics designed by us in combination with capable suppliers. And this set up, together with the battery pack, lithium-ion battery pack, helps to save 19% of fuel. So it's a full hybrid recuperating, breaking engine, so suburban train that stops every 5 minutes. A train weighs what? 60 tons of the energy, which is normally wasted is being generated into power, stored in a battery and with this, it's actually a real good energy saver. So that is something that we are very proud of.

In Power Generation, we have developed not only diesel but also gas engines. And we're going to continue to develop gas engines also for mobile propulsion, like for ships.

With this, I would like to come to our second entity, which is Energy Solutions, which is a medium-speed engine out of Bergen, plus our nuclear piece, which is more or less emergency diesel engines for our nuclear power plants.

I was talking about gas engines, that is something where we can be really proud of is the gas engines being produced in Bergen. They are world-class in terms of efficiency and in terms of, yes, fuel consumption, something we are currently learning from -- at Tognum, how to make a good gas engines. And they were the first one to apply gas engines into ships, Fiat, ferries. Since 2006, they are in service, and they are really brilliant engines.

The last one that was mentioned already, L'Orange, it's a company that we acquired in 1985. It was founded in '33. Specialist supplier, expert in diesel injection systems, but also in gas injection components now. Liquid natural gas or compressed natural gas. The latest technology we have on our latest generation of Series 4000 engine injection system from L'Orange. The common rail system was 2,500 bars, 2,500 bars, which is really, I would say, a front runner in the industry, for this, you only can use certain special steels, which are supplied by not even a handful of suppliers worldwide. The design of these injectors are extremely difficult. 2,500 bars, that means a water column of 25 kilometers in the air, twice the height of a plane flying intercontinental. So it's really technology that we are very proud of and we'll continue to develop.

So let me finish with a couple of numbers. We are a company of GBP 2.8 billion in 2013, employing above 11,000 people worldwide. We have a service network, which is spread all over the planet, with more than 200 service stations, distributors, et cetera, so we are everywhere where engines are being used. That is something where we can find synergies, and we do find synergies together with the Marine business, doing service for components on ships. We are, yes, doing about 1/3 in service, the rest is 70% in OE. Marine is 1/3 of our business, that's important to know. Power Systems, 1/3 is Marine; 25% is -- really, 1/3 is Energy; and the rest is industrial, rail, mining trucks, all the different applications, harvesters. Defense is a very small portion, and the others is also L'Orange that I mentioned.

And yes, the distribution of our people is also shown here. The majority is still employed in Germany, so we are moving more and more into other regions. We have started an engineering development center in India 4 years ago. We have -- we're building up a strong entity also in the U.S. for development. And we are constantly developing our footprint also in manufacturing.

With this, I would like to conclude. I think you learned that we have a strong technology in the past, and we will have strong technology in the future. Thank you very much.

Mikael Makinen

Former President of Marine Business

Thank you. Yes, good morning, everybody. My name is Mikael Mäkinen. I will talk about Marine. I don't know where to steer, here to start.

Being a new member of Rolls-Royce myself, not myself, not Marine, I would say a few words about me and my background. As you might guess, I'm a naval architect. I have more than 30 years experience on the -- in the marine market.

Before joining Rolls-Royce, which is 5 months ago, I worked for -- most of my career, I was with Wärtsilä. And in Wärtsilä, I was in -- I was a Deputy CEO and in charge of the marine business, plus developing the strategy and implementing the strategy for Wärtsilä in Asia. So that's my background. After Wärtsilä, I joined a Finnish stock-listed company called Cargotec as the CEO. And then I joined Rolls-Royce, as I said, 5 months ago.

I thought that, with my background, I'll give you a few words. But how did I see Rolls-Royce when I worked at Wärtsilä or at Cargotec? What did I feel that the company was? Where was it good, where was it bad and so on? Of course, a very strong brand, as everybody knows, strong engineering, a real will to be a winner and to grow, that's what I saw from outside.

But I also saw a company that wasn't very agile. We sometimes felt that, okay, good, Rolls-Royce, they have good products, but will they be agile enough to understand the market? I also saw a company that wasn't a player in Asia. I also saw a company that maybe wasn't as customer-focused as it should be.

If I then talk about the market, in general, I felt that -- or I feel that the market is now going through a very big change. You will see it on my slides, that the marine market is going through a big change. It's a conservative market, but there will be changes. And one of these changes will be consolidation. And it's really a consolidation of those companies who are going to understand, who are going to be the real companies that understand what is the strategy, what are the customers. And I feel that Rolls-Royce could be one of these companies. That's why I joined Rolls-Royce. I'm 100% sure that we can be one of the winners here.

So let's have a look at how we see the market. I'm going to talk about marine in general, then I'm going to talk about Rolls-Royce Marine, and then what is our approach and strategy.

So for those of you who know the marine industry very well, I apologize, some of this information might be very basic. But I think it's extremely important that we create a baseline. And based on that, we can discuss then in the future meetings, meetings that you have with Simon and Mark and so on. So we create the baseline.

Actually, we can jump here. Still one general slide.

Why do I think that Rolls-Royce Marine belongs to the company, to the group? I think that Rolls-Royce gives a home with this advanced engineering. It's really a -- with all the tools and skills that you find in the group.

Take a few examples. We can start profiting from data analytics, equipment monitoring from Aero. Asset management is very well taken care of in Nuclear. And we just heard about Power Systems, cross-selling, L'Orange, injection equipment, markets where we are working together, where we can learn from their engineering, very interesting.

What do we bring to the group, Marine? A very different business cycle, shorter, totally different type of investment profile, smaller investment, quicker payback, different type of cash generation. So I think that this creates to bring together a more balanced Rolls-Royce, of course, us being part of Land & Sea.

During my presentation, which is mainly on a general level about Marine, don't misunderstand me, in my previous companies, I've done very, very big restructuring. And I know that with the headwinds that we have now in the short term, this is part of my job, to drive efficiency, to drive down costs, to see how we can be better and so on. And I think there's a great opportunity to do that, and we are well-positioned to do that.

So let's dive into Marine. A few quotes. It's a very big contributor to the world economy. Actually, the whole -- 2 reasons for the whole globalizations: free trade, containerization. Container, developed 1960, is actually the main contributor to how you can have a global trade. You have to remember that if we produce something in China and take it to Europe, if we can put -- if it's of a size that we can put it into container, the freight rate -- the freight cost is divided by 10. And we can be sure, everybody can be sure that then -- when the product starts at the factory, it ends up in a shop or wherever it goes. It's sealed all the way. So this is a huge, huge contributor. And that's, of course, the middle one. 90% of the world goods, in weight and volume, are transported by sea.

Offshore, you will see on some of the slides that offshore exploration will grow. Yes, everybody is worried about the oil price, I will come back to that. Yes, everybody is worried about what the oil companies are doing when they cut the E&P expenses for the coming years, but we will come back to that.

Last but not least, naval. More than half of the countries in the world, they have a ocean-going navy. So that's the marine industry.

Major trends. Many of these trends will be more detailed, explained by Sauli when we talk about innovation, but I'll go quickly through them.

Environmental efficiency. You heard from John yesterday, you heard from Lawrie today, you heard from Dr. Dohle that the environmental efficiency is very, very important. 90% of the products is transported by sea. Actually, it's a very big part of the air pollution is coming from ships today. There are already emission control areas, Baltic, North Sea, North America, and there will be more of them. But Sauli will explain it more in detail.

Ship intelligence. You will see today, and similar to here, again, big change in the shipbuilding industry. Intelligence is going into the ship. It's a new way of selling ships. It's a new way of taking care of your assets.

Fuel diversity, we talked about that. Gas, the only reason why you don't have more gas ships is the distribution of gas. The operators cannot get gas to the port so that they can have it as a fuel on board their ships.

Electrical ships. More and more equipment on board ships are being electrical instead of earlier hydraulic, gallop, pneumatic. Especially when you go high up North, you would never like to use hydraulic equipments on board a ship because oil spill in the Arctic area for a drillship is 1 deciliter. That's considered a major oil spill. And 1 deciliter means just that 1 pipe breaks on deck where you have hydraulic equipment, and the whole rig stops. So electrical systems. Electrical systems means also that you have -- it's easier for you to monitor your equipment, to go from an old type of ship to a new type of ship.

Continuous shift towards Asia, I will come back to that, but that's just a fact. First, the shipyards moved there. Now, we see more and more ship owners moving to Asia as well.

Business model is changing -- sorry, I have one -- the harsh environment. And harsh environment, I'm talking about the Northwest, Northeast passage, very far up North, new requirements for ship, new way of working.

Business model changing towards asset management, what does that mean? Traditional shipowner, he chooses everything. He wants to know how the piston works, he wants to know this, he wants to know how to change the piston. But the new shipowners, they have asset managers. They put in money, they want out money, so they are talking about, instead of products, they are talking about systems and solutions on board ship, can someone take care of this and so on. So it's a new way of working.

Flexibility increased in the ship design, that's just, with the new technology, you can do that. Ship sizes are growing. '88, it was a huge year because the new post-Panamax President Truman container ship started operating with 4,000 containers. Last year, Emma Maersk came with 18,000 containers. Emma Maersk is already 400-meter long, 54-meter wide. It's a huge, huge ship. And now we have the new Panama Canal coming in, which means that the Panama Canal is now 180 feet wide, so that will again drive toward some -- bigger ships.

Okay. In my presentation, I'm going to talk about Offshore, Merchant and Naval. What we in Rolls-Royce call commercial is actually the combination of Offshore and Merchant, and that's what John Knudsen is heading.

Every fifth ship has Rolls-Royce equipment. There are about 130,000 ships out there, 10,000 Offshore, 10,000 Navy -- or 11,000 Navy, and then the rest are Merchant ships.

So sometimes, when you see the market share, some companies, some statistics say that, okay, our market share is then, every fifth, 20%. Is that correct? Most probably not. If you look at the revenue in our addressable market, our market share is 14%. If you look at it per product, we just heard that on medium-speed diesel engines, maybe 5%; on some thrusters, about 60%. So the market is very complex. You will see that. And that's why calculating the market share, you see so many statistics. So I'll try to guide you through how we look at the market.

I go into Offshore first. Just to give you a picture: Exploration & Production, then comes Subsea & Construction, Supply & Service. I will explain it a bit more in detail later.

Before we go into the ship types, what's always asked about the cycle: What is the cycle? Where are you in the cycle? I have taken 2 pictures of cycles here. One is support and supply vessels. You can see, relative big number of them have been ordered the previous years. Then you look at anchor handlers, very few have been ordered. So we see now anchor handlers coming.

On previous page, I showed the different ship types. So actually, to get some kind of understanding of the cycle, you have to put all of these cycles on top of each other. And then you say that, okay, on aggregate, the market is slightly growing all the time.

For those of you who don't know the marine industry, just pictures about vessels, we have seismic vessels that actually explore the seabed. Is there anything under it? We have drill ships, drill platforms, construction vessels. That's the type of vessel that you will see today. Platform supply vessels, anchor handlers.

In John's presentation, there will be slides where you see the typical cost or price of a ship, and typically, how much we deliver per ship. So if you bear with me, then he will go through that.

So cycles. Here, it is oil field life cycle, 30 years, 30-plus years. So when we talk about short-term oil prices going up and down, it has an influence. But please remember that the oil companies, they are looking at it on a 30-year cycle. So when we say today that they cut costs, it's mainly on the survey, first survey part that they cut costs or some of them might wait with the production phase. Production phase is where you have the big money going in, big cost going in.

So you start by surveying the seabed, takes 2 months to 2 years. You do exploration, 1 to 3 years. You drill a few holes, you test how much oil is there. And many of the oil companies, they have a number of these exploration stages going on, and then they stop them and wait for the oil price changes, before they go into the construction, which can take up to 5 years. And then you pump oil for 10 to 30 years. And every 10th year, you do maintenance and upgrade because technology in the world is changing.

That's why you see, every 10th year, when there's new statistics about how much offshore oil is there out there, it's almost the same number, every 10 year. How is that possible? Because technology changes, and you can take more oil out of oil wells. So there's technology shift going step-by-step, and then new findings. And of course, then you have the decommissioning when the well is empty. We have equipment throughout the life cycle here.

So very exciting. You have to look at the circle -- cycle as a 30-year cycle. Okay. But then the big question is, do we need energy? Yes, we need energy. International Energy Agency prediction for the next 20 years, actually, nothing can replace gas, oil and coal. I mean, we are talking about solar. We are talking about -- they are still a small part of the energy balance in the world.

I found this from the same source, a very interesting picture about 2035. What's happening here? You have production 2012, you take out the consumption, then you add unconventional. Unconventional is all kind of -- it's fracking, it's making oil out of coal and so on, so many unconventional, usually the most expensive part of exploration of oil and gas. New natural gas, new onshore crude, and then a big portion must come from new offshore.

Okay. You can say that, is it 101 at the end of the period, is it 95? Still a big portion comes from offshore. Why is there also offshore? It's oil companies risk sharing, geopolitics. You have to remember that most of the onshore is Middle East.

CapEx spending. Everybody is talking about oil companies reducing their CapEx. That's why there's nothing because they've reduced the CapEx, but they are actually using [ph] it from 13% growth to, according to Barclays, to 11%. But let's say that it's 9% or 8%, but it's still a growth. It's still out there. Short term, they might stop something, but that's the way the world energy balance is working.

This year, on E&P, the world spends about USD 712 billion, might go down next year, but it's still a big, big amount of money.

Where is the offshore oil coming from, oil and gas? I've taken here a picture where you start at 400 feet, because lower than that, you have a lot of oil and gas in Middle East that is sometimes called offshore, but the water depth is 2 meters or 10 meters, so it's actually, it's just a rig staying in water instead of land. But if you look at the offshore, you can see that these other areas, more and more is found on very deep water, very complicated areas. So a good market to be in.

Let's go into Merchant. I won't go through the ship types, usually you divide the ships into cargo vessels, passenger vessels and others. Others are fishing vessels, tugs and so on.

Again, very similar picture. I've chosen 2 for us important segments: short sea cargo vessels and tugs. Tugs seem to be fairly stable. Short sea hasn't had much ordering previous years. We will see that coming up. On aggregate, again, if you add all ship types, containers, tankers, and so on, could be quite flattish on short term, but then it's going nicely up, as you will see on the next -- one of the following pictures.

You have to remember when you read newspapers, they always talk about the cycle, so the well-documented ships, container ships, tankers, bulkers, they are not very important for us. We don't have expensive or big product offerings in those ship types. So it's a complex market.

Merchant. Just a few pictures for those of you who want to -- we can explain more during the break. One question that I always get: What is the relationship? What should we look at? What are the main drivers? And I found a statistics from Det Norske Veritas, the relationship between GDP and seaborne trade. It's very interesting because they follow each other. So you could also, of course, answer that, yes, it's the GDP. But unfortunately, the answer is no. First of all, you have to look at the scale, so the scale is different on the left-hand side and right-hand side. Second thing is, this is seaborne trade, this is not ordering ships.

If you turn around, look at ordering ships, then this is the right picture, contracted ships above, scrapped below. About 3,000 ships are being built every year, about 2,000 are being scrapped. So in theory, whatever happens, there should be a shipbuilding around 2,000 ships. Technology is changing fast, that drives scrapping, that drives new ship types. Last week, China informed that they will give a special allowance to all Chinese shipowners to scrap their ships and order new ships, environmentally friendly ships from Chinese shipyards. It will have an impact on this picture.

Speculation: then ships are going -- shipbuilding prices are going down; speculators come and order ships; subsidiaries for Korean and China, the 2 big shipbuilders in the world. Shipbuilding is an enormous employer, millions of work in places. So those countries cannot really afford the shipyards to be empty. So you have all of this mechanism that affects the ordering of ship.

But I think this is far -- the best picture. Out of curiosity, you can -- there is a similar statistics done by Lloyd's, and it goes back to 1644. So that's a long trend, and you can see that it's going up.

Naval. I will very quickly go through the Naval side. These are the ship types. Lawrie was talking about the aircraft carrier. Many, many different types of ships, depends on -- if you come from a small country like Finland, then we can afford maybe a fast attack craft, and that's it. And if you come from U.S. or U.K., then you can afford aircraft carriers and frigates and so on.

The best picture I found about what is happening in the Naval market. Everybody is talking about cuts, cuts, cuts on defense spending. But look at this picture, Jane's is the best statistic there is. It's not a huge, huge cut. Maybe they go from \$65 billion per year to \$60 billion. If it's flat, it's quite a good market. The cuts that you see in the newspaper, they are actually cuts on other parts of defense spending. And one big part of defense spending is salaries. So also, navies are looking at how can they have ships that are more efficient, that have smaller crew.

You saw in U.K. when there was a debate about the second aircraft carrier, and one of the admirals said that that's fine, but we don't have crew. So even in U.K., it's a problem to find crew. So that's again driving the way of looking at. We will come back to that about efficiency and about remote monitoring of ships.

There are a large number of players. It looks, first, it looks like Aero, you have equipment supplier, you have shipyards, it could be airframe, Boeing and Airbus, and you have airlines. But this is a much more fragmented market. You have huge number of shipyards. You have a huge number of shipowners geographically dispersed, working in this field. And then behind that, you have oil companies, you have charterers, you have governments having their own opinions about it. So a very fragmented market. You have to be very customer-focused. You have to go in customer by customer. And you have to build and maintain appropriate relationships with all the parties here. And we have been very good on some -- at some areas and not so good on other areas.

Now I will dive into Rolls-Royce Marine, and I will start with a video, so I don't have to go through all this hundreds of products. So this should be 3 or 4 minutes.

[Presentation]

Mikael Makinen

Former President of Marine Business

So there, you saw our products, wide range, has to be serviced. You saw the fast attack craft there. It's being delivered to the Finnish marines. And my son is doing his military service, and he is one of the 21st skippers on one of those, so I get immediate feedback from him. Why doesn't the waterjet work? Why doesn't it do this and that? So I'm going home to Finland this week and so I will get more, more feedback again.

But let's go into Rolls-Royce Marine. We heard about Land & Sea from Lawrie. We had an important part of Land & Sea. If you look at Rolls-Royce Marine, you can see that 42% is offshore, that's why we talk often about Offshore; 12% Merchant; 36% Services; and 10% Naval.

If you look at the lower picture, that's where we have our employees. And you remember what I said earlier, where the market is growing? Asia. Where is the oil exploration happening? Many other parts of the world. So are we on the right place or the wrong place? We are in the right place because we are very good with the Norwegian owners and the Norwegian shipyards.

Here you see the top shipyards, shipowners in offshore. You can see that one of the top positions is Norway on both sides. I would say that this is a great starting point. We are very successful in Norway. When we do the same in the other areas, there's a huge growth opportunity for us. We have the technology, we have the people. We have to look at the footprint, where you produce, where you have your engineers and salespeople and so on.

You can also see why we are fairly small in Merchant. 84% of the ships are built in China, Korea and Japan. We have quite a work to do to be one of the players on the Merchant side, one of the big players. Again, in my opinion, great opportunity. I have done it before in Wärtsilä, moving it from a European company to being a global company, having a big footprint in Asia. The same we did in Cargotec. Just to do it.

Major trends. Where are we strong? You saw the major trends earlier. I think that environmental efficiency, Sauli will come back to that, we are very strong there. Ship intelligence, you will see control automation today, integrated breaches and so on, health monitoring.

Fuel diversity. We were the first one with a real gas engine medium speed. Asia, not that strong. Harsh environment, and we're talking about ice conditions, okay, we are not better or not worse than anyone else.

Business model is changing, and I think this is where we are very, very good because we understand it from Aero. How you take care of maintenance, how you load in big data. All the shipowners want to get rid of crew today. There are 2 problems: crew is expensive; and the quality of crew, let's say, outside Norway, is going down. No, don't laugh because Norway, Norway, they are -- that's a premium market, they use Norwegian crew. It's very expensive, but very, very highly skilled. The rest of the world use crew from Philippines, from China and so on. And technology is going up, the skill of the crew is going down. There's a huge gap, someone has to take care of it.

And I see this is the same development. You remember, yes, back all the big airplanes had a crew of 3 or 4. There was an engineer on board looking at all kind of meters and so on. That data is today fed to Derby, where it's analyzed, and the feedback is given to the captain or to -- and the same thing is happening, will happen on board ships. So when Sauli is talking about unmanned ships, that's long a way from now, but the first step to do the whole system analytics, maintenance, preventive maintenance outside the ship, that's coming fairly soon.

Flexibility, yes, because we have our own ship design. You heard about UT Design. 40 years, 800 ships. Just to remind you, it's not the same design 40 years ago and now. So this is kind of -- UT is almost -- it's the Mercedes of ship designs or Rolls-Royce of ship designs.

Then I would like to confuse you a bit more. We have made the -- now we have made -- to make choices. The market is there, we know how it is working. Now we have to make our choices. Which are the products, which are the markets, we have to choose which equipment we are in. We can be global. We can be local. We can be low-cost. We can be high-tech. We have to decide if we are a global company or a local company, if we are only serving a certain market or global. We have to decide which type of ships we go into. All of these choices we have made.

There you talk about the equipment. Here is a picture where we are. Light -- dark blue, those are areas where we have equipment, some propulsors, thrusters, we have a market share of more than 60%. Some engines, on a global level, 3% and so on. But you see, huge variety of products. You cannot be in all of them, you shouldn't be in all of them.

So what have we chosen? We have chosen mission-critical, integrated products with true life [ph] services. Very important. What does it mean? We take -- we look at all the equipment that are critical for the customer's task. Examples, dynamic positioning system, which means that you have a lot of propulsors under the ship or the rig and then you buy a satellite, keep it in position. Very, very complicated, mission-critical systems.

Big winches. The only reason why you have an anchor handle is the big winch, so that you can do the work of Offshore work.

With integrated, we mean not only products but they have to be part of a system. John Rishton talked yesterday about the Environship, where you have both. You have engines, you have gearbox, you have shaft line, you have alternators, you have propellers, you have rudders, and so on. So it has to be an integrated system.

And in addition to that, it has to be something that creates true life support for the customers, which actually means services and lifetime support. So those are the systems that we have decided to concentrate on.

Illustration. I tried to do it on a 3-dimensional figure. As I've said, I'm a naval architect. I have a masters degree in Naval Architecture and Mathematics, so that's why I like these kinds of pictures. This is now for Offshore. Illustrative. You can always say that should -- the dock be there, or there, or so on. But it shows that even if you are -- let's take the propulsor engines. That's where you have propellers, engines, gearboxes, rudders. You can be very good on that axis but it's not enough in today's world. But we have chosen that. That's one of our important axis.

We have chosen that the second important axis is electrical automation and control because when you go to unmanned ship, when you go to complicated ships, they will require automation and control.

Third axis, operational functionality. Those are the winches I was talking about. They are all kind of equipment. Actually, it's the only part of the ship that is earning money. They even generate revenue for a ship owner. The rest is just a platform, where you should save cost.

I've put in a number of our competitors. The picture is totally different if you look at Naval, if you look at Merchant, and so on. But just to give -- illustrate -- to give an illustration that it's not enough to be good at one axis, you have to be in this 3-dimensional field, and I think that we are very well positioned to be one of the players there.

Sizable market opportunity. GBP 94 billion OE, GBP 14 billion for the last 10 years, growing the coming 10 years. So what could we do? We have the -- we can go with the flow, and we will grow from where we are today with the same rate as the market is growing. Number two, our market share is only 14%. I just showed you that we have a lot of opportunities when we take the Norwegian success, the success that we have in hydrodynamics globally.

Last but not least, we are of course developing new products. Medium voltage engines, automation. And that means -- okay, that is 111 or whatever that additional is, so it creates a totally new market. So this is not a promise that we will go from there to there but it's -- this is how the market grows when you have a clear strategy. So I think that we have a lot of growth opportunities.

Still to remind you that when we talk about R&D, to go into that adjacent market, it's within the group frame. I actually -- not very big money. We are talking about -- you will actually not see, on a group level that we take some of the capital from air and put it into Marine. But it's not like in air, when I talk about billions of dollars to develop something new. Here, we are talking about small amounts, so you should not be afraid of that.

So increasing the market share, growing with the growing market and developing the new strategy and new product brings good growth. And keeping in mind that this market is consolidating.

Now I see Simon on the stand [ph] -- running out of time. I will end by -- looking at our integrated strategy. You will have 3 more presentations: customer, innovation, profitable growth. Profitable growth will be the third presentation. And in this picture, I would like to start with that because, as I said in the beginning, short term, it's efficiency, footprint, how can we do new things better? Driving down cost.

Innovation, real cornerstone in our strategy. And I think the real winner is the one who understands innovation and brings in innovation into a conservative market. Customers. You will hear about that. We really have to take care of our, and understand our, customers.

So thank you very much. I will sum it up. Then after this there's other presentations but now, I'll hand over to John, who is going to talk about the customers. Thank you.

John Knudsen

Good morning, everyone. I would like first to present myself. My name is John Knudsen. I'm a Norwegian, so I have some background from the district. But I joined Rolls-Royce 8 years ago. And I've had travel into telecoms and electronics. It's not the Marine background but what you heard Mikael say that China, Far East, is very important. That gives me some of the background for how to look into other regions as well.

Then I joined Bergen Engines as President of the business. And you have heard today that we are doing gas engines in the Marine side, but we have done gas engines on the land side since early 1990. So that is also what we have heard today in the Land & Sea, and how you can combine the different areas is of importance. Then I joined this year, the Offshore business. And later this year, we also said that we need to look into the cost side as well. How can we then bundle together, both the Merchant side and the Offshore side. And if I can be a little bit open, I was a little bit surprised that there were so many Directors in the company. So I think that was one of my first cut, to reduce the top heavy layers for that matter.

But to be very clear, my key responsibility is sales and bringing in contracts. That's the good fun with business, I believe.

So I will, today, talk about the Merchant part, the Offshore part, and also a little bit the Naval part. And then I will also try to explain how important the aftermarket is. Because these vessels here -- this vessel here is 168 meters long, and I will go into the details later. But if you have 1 day out of hire here, that is costly. So a typical hire for this vessel is GBP 50,000 per day.

So then you realize if that's 2, 3, 4 days out of hire, then you really want to have a global response in aftermarket for this matter.

So what I'm going to talk about today, as you saw earlier, it's market players, it's customers. And I will try to bundle together a little bit what are the total customer requirements. And they are a handful, probably 7, 8-ish. And I believe that if you want to succeed, you need to sort out all these 7-ish.

Then I will dwell a little bit about what we think our winning value proposition to us [ph] our customers. I will give you a couple of examples, and I will dig a little bit into the competition as you've just newly heard from Mikael, and what -- how we're going forward.

The first slide, you've already seen it but I think that there are 2 elements here that is important. It's the shipyards and the shipowners. And we need to be very humble when it comes both to shipyards and the owners. And to be a good salesman here is really to listen to what the customer are expecting. When it comes -- and that's on the new sales.

When it comes to the aftermarket, it's very much the direct contact with the shipowners. And again, you see the structure that is -- that are many players here. And of course, the oil companies like Petrobras or Statoil, where we are understanding the customers' customers. They are quite hard also on penalties if you don't provide your business.

If you then look into the Offshore companies, and it's a complex slide. But if there's a couple of key takeaways from this slide, I would say that the top 20 shipowners controls, within our segments, 40%, 50% of the total market. So it's very much about the people-to-people business and how you operate for that matter. And if you have a good benchmark here, then you can also go into other customers.

If you take on Edison's West here, he controls 2% of the market. That reflects circa 250 ships. And the previous ship you saw, he controls 50% of the isle Offshore fleets. So if you hit these guys, then you're going to do it quite well.

If you go to the Merchant side, as Mikael mentioned, a big amount of the business comes from China, Korea and Japan. So then you need to have the interface with the shipyards. And what you also heard is that there's a growing population of owners in that area. So there's no doubt that one of the key tasks from our side is to really make sure that we can grow worldwide.

So to have that kind of transfer knowledge is important for the business. Okay. So what are the key drivers from a customer? And I think that what you have picked up from the video seen earlier today is that, it has to be matched to the missions. One of the element is technical performance. You will never ever sell products with low quality. And that's why Rolls-Royce can be in this business. Because we have the brand but we need to stand up to that performance.

The other one is that there's a true life. So this vessel operates easily up to 25 years. And that is why we really need to take care because the vessels are operating worldwide. The second one is you need to have value for money. And then you are talking about the CapEx.

So the investment of the ship needs to make sense. You will never ever get more than a small premium for a CapEx. But then it comes back to operational expenditure. So how you can make a good, sustainable product, how the solutions are good? And also how you can maintain. And when you -- when we talk about long-term service agreements into the aircrafts, this is more when the ship comes into the docking and then you plan for maintenance. So then the squad of our people needs to be available, and I can guarantee you, if you're operating in Brazil, you do not take the ship back to Norway. Then you need to have service centers where the business happens. And you saw on the -- one of the maps that Mikael, where you start to do deep-sea drilling, that's where we need to be.

The other one is the installation availability, and it's the quality side. So when we talk about taking out cost, we also need to make sure that what products we deliver is top notch. Just referring to the day rates for this business. And again, if a thing fails. But if thing fails there's one expectation, and that is you really need to step up and make the ship operating within the next days and hours. So for instance, if you are based in Brazil, you probably know about local content and these issues, then you probably need to have spare parts inside the country. Just because of the custom issues to make it a quick turn.

The other element is the seamless -- the system side. It's the systems. It's seamless interfaces and functional integrity. And then what you heard earlier, that is to have efficiency and get value for money. So I think that these are the common requirements from a customer perspective.

So if we look into -- I've talked about what is our winning customer value proposition? And I believe there's not 1 or 2 elements. I believe there are 1, 2, 3, 4, 5, 6, 7 here. And this is one of the reasons, I believe, that to getting high barriers for coping this, you can't only succeed on 1 or 2 elements. So if I start with domain knowledge, this is about understanding our customer demand but also their customer, again. And here's a statement from one of the key guys in [indiscernible]. That is one of the -- I would

say, one of the top shipowners here in Norway. And he says, "UT 731 CD has proven to be very efficient in daily operations, reducing fuel consumption and cutting harmful emissions." And these are the statements we like to see because that has something to do with customer satisfaction.

We are, as you heard, we have been working now on LNG and pure gas. You have seen that, pictures of a big ferry, 1,500 passengers. This was the statement from the CEO of Fjord Line. "With the number of LNG-fueled ferries operating in Norway and the years of experience, the Rolls-Royce solution was low risk." And why that? Well, because you need to have the experience to do pure gas engines. And to have access of the fuel distribution here is also then important. This vessel is now operating between Norway and Denmark.

And when we talk about product quality and reliability, this is probably a massive achievement. Far Seeker is a anchor handler. Far Seeker, 5 years of operation with only 9 hours of off hire. And then we can go back and say that we're going to support your business. So out of 5 years, only 1 day with 9 hours has been out of operation.

Okay, ship integration. 40 years with UT Design. This is the intimacy with the customer, and that's where we are very focused into. When it comes to responsive global aftersales support, we have more than 1,000 well-trained service engineers in 54 service centers in 32 countries. And also take into account that the opportunity with a cooperation with Power Systems, where they have service centers around the world. That gives us a very nice opportunity for better responsiveness.

When it comes to training, later today, you will see the simulation center here, what kind of facilities there. You could just imagine that when you are doing training in harsh environment, it's much more safe to do it here compared to on a real vessel.

And last Monday, I went to Ørskog, that's the smallest, a small place outside Ålesund here. It's probably the highest density of -- at least Norwegian billionaires. There are 10 shipowners in that area. They opened a hotel, 120 beds, probably no need for more than 30. They opened a concert hall of 500 people. There's only 3,000 living in the city. And -- but on the end of the hotel, they also opened a simulation center. So then they bring in the squad and crew and train them there. And then they use the hotel and then they play music in the evening.

And then -- but this will become more and more. So training people, training crew that has about efficiency, and that's a strong value proposition from our side.

The last one, this is a pure business opportunity from my perspective, but I think that when a ship lives 25 to 30 years, you will take the opportunity to do upgrades. And when you do upgrades, you get fuel efficiency. And that will be the advantage for this one. So just to give you 2 examples of what we have achieved, and I think that this is based upon true knowledge and customer intimacy. The Unified Bridge that it was award winning just a couple of weeks back. And what we achieve here is to have a complete cockpit, if we're going [ph] to use that word. And if you go back 5 years, that was different components, each of them. So if you then start to think about big data, how you're operating the vessel, that gives us a very good opportunity for improvements.

To spell it right, UT 777 is the biggest vessel we're going to do, as leased with the contract. And they're -- we're not 100% sure ourselves what's the main purpose of this vessel, but there are reasons to believe that it becomes the most flexible vessel in the world. So when you are doing a -- this vessel should have the capabilities to do construction work at the seabed. And the seabed will become more and more important because you can operate on the seabed. When you are doing drilling and taking out the oil, then you need to refill the valves. So it can probably do something about this as well. So then you have 3, 4 different application for this vessel that will be very unique.

So this is definitely the key one forward. Then I will go into a couple of examples. I'm going to dwell a little bit on the Offshore vessel, a UT Design anchor handler vessel. I will talk a little bit about a semisubmersible rig, and I will also talk a little bit about the interconnections between these 2 types of applications. I will look into the 1,600 passengers LNG-powered fuel ferry and also a frigate.

So if I start with a large anchor handler and you watched the movie, you saw what they're doing is really to put the anchors close to the rigs. It's well positioned, the rig, when you're doing the drilling. So take this as an example.

This value, total value of this ship is circa GBP 77 million. Whereof we deliver 42% on OE equipment. And here, you can see engines only -- I shouldn't say only, but it's 6% of the total value. But of course, I will come back later to the opportunities, to the aftermarket because that's very important.

But then you have the propulsion equipment that is 14%, or we have circa 50% market share of the total fleet of anchor handlers when it comes to propulsion equipment. So we deliver not only on our own design but also for the entire anchor handler fleets.

And then when you go to the deck machinery, it's 16% of the value. And here, we are close to 75% of the total market.

And here, this is about operability skills. Operational efficiency as Mikael mentioned. Because here, the shipowners want to have the best deck machinery in the boat. Of this size of this winch, it has probably a width of 20 meters and the height is 6 meters just to put into perspective.

On this vessel, we have automation and control. The deck machinery, as you have heard earlier, this is more or less all about just making sure that the vessel fleets, and it's operating the deck machinery. Then we're doing high- and medium-speed and electrical system.

And on this one, I would also like to add that the aftermarket for this business is extremely important. So we give 24/7 technical support. We are close with field service where the customer operates the ship. We have done the availability of the spare parts. And again, that would be an opportunity with the Power Systems to have common spare parts locations, repair and overhaul and upgrades.

And then we are doing monitoring of energy. And then more and more, there will be equipment health monitoring. And that will be the next step that we're really going to look into.

And of course, the simulation center is about training. So know, we have training centers in Singapore, we are in Brazil, we have here, and you saw also that the companies are starting up in London and Mumbai.

I just wanted to show you this one. This is a semisubmersible rig. And why is this interesting for us here? Here, we are doing the engines, and we are doing the thrusters and then a little bit of the deck machinery. This is circa 7%, but you have to take into account that the value of this rig is GBP 370 million. And the beauty of this application is that if these guys start to drill with this rig, rule of thumb is that it takes 3 to 6 months, then they will be in dynamic positioning. And then they are using satellites, then they are using the engines, and then the engine runs 24/7 to feed the thrusters. So then the aftermarket becomes very important. However, if it takes more than 6 months, then you start to use anchors. You start to do mooring. So then the anchor handlers comes in, and this is just the business decision from the owner. So that's why I wanted to dwell a little bit about that.

And just to give you a feel for what are the size of these vessels. Troll A, it's a big platform. And I think I did some Googling yesterday. It's the double of the height of the Eiffel Tower in Paris. So that's what we're talking about when we start to move these things.

Here, you can see 10 vessels just operating this platform. And we had Far Seeker, delivered in 2008 or '09, where we made a world record of how much you can pull. And the record is 425 tonne. The capacity of a winch is 600. But you don't use 175, just to balance the boat.

So here, we have tonne. I think it's 6 anchor handlers, and there's 4 PSVs, so that's the scope of the game for this matter.

And just to show you the deepwater mooring. It started back in 1978. Very, very -- down to 200 meters. You saw the map where you look into where are the new oil fields. Now we are down -- we have capabilities down to 3,000 meters. So we have the equipment to do all these kinds of oil exploration as we now foresee as the future oil fields and sources.

Just to put it into another perspective, this is a picture of Rio, and I am using an example of FPSO, a Floating Production Storage and Offloading. And if you can see on the top here, that's the FPSO and this is Rio. And here you can see, the wires goes out to here, and that's the task you have to do. So yes, when we talk about, will there be space for the top end of the market? Definitely. We will do anchor handlers at this size. But also, we're going to use all this competence, and you'll probably hear some from Sauli how we can become leaner, less expensive in the design, so we can push back in the more competitive areas. And particularly, when you go to China, we need to stand up and take that competition. But then, we're going to do that by innovation and lean production.

So that was the Offshore part. Now I go into the Merchant part. And we're going to show you an example of pure gas. Why do we spend a lot of time on pure gas? Yes, because it's a matter of time before the customer says, "We're going to use gas." You will see later when Sauli, going to do his presentation, the cost of fuel. So this is about the economy but also the environmental impact on -- of ICA that will grow. And with the gas engine, we are comfortable on the Tier 3 requirements, and that's IMO, International Maritime Organization's, requirements. That was expected to happen in 2016. It was postponed to 2020, 2021. Why? Because our competitors, I assume, don't want to see that part yet. But we are future proof when it comes to new technology.

And -- so what we supply here is on the big ferry I showed for 1,500 passenger and 600 cars. We provide them 4 engines, and the tanks, and the system and that has to work. So now, we have had that ship in operation for more than 1 year and that works successfully, and it's in a daily route back and forth.

Here, we have a value. This vessel is circa GBP 80 million, and we have a value of 20%. And of course, that IPR connected to the tanks and to the gas system is one of our advantages. Then I would like to spend a little bit -- think a little bit and do a reflection of what we have in L'Orange, because the fuel flexibility will be very important. Gas has one limitation today and that is distribution of gas. So when we start to get more distribution of gas, this is definitely something we strongly believe in, and we want to be prepared for that matter. And you heard also that the new engine, you can use the same engine, either for gas or diesel, or if dual fuel comes later. So I think that's a good example of when you think about what is the customer demand, and what is possible to do on technology.

If I spend a little bit on the frigate or the Naval business, I think there are a couple of key elements that are different on the Naval side compared to the commercial side. And I think that we have -- as I said on the offshore side, on the Naval side, we are strong because we know the key customers, we know the programs and we are working very close to the customer for this matter. On this frigate, the value is circa GBP 300 million, and we delivered circa 10% of the total package. And definitely, handling system is important on a naval vessel, I would assume, power electrics and on the engine side. And I think that on the Naval side, the MTU match is very good because you need high-density engines for speed. So here's a really good match on the MTU side and then onto the Naval side. And then, again, propulsion equipment. So the key difference between a commercial equipment and a Naval equipment is that they need to do more tests but it's very, very much the same components.

And the service market again is also, of course, very important for this matter.

So there will be a coffee break quite soon, but a couple of more slides. Competition.

I think I would like to say that to win this race, you really need to be humble, really listen to what the customer requires. You need to work close as this. You're going to spend this ship vessel, the 777, we're going to spend 105,000 engineering hours. And then they work with us for that matter. So if you think about the strategic diagram that Mikael presented earlier, I would say that there are definitely players coming up and want to come up. What I've seen so far, I've seen Wärtsilä, they are there, Kvaerner [ph] could maybe come. MAN has probably an ambition to do that but this -- I probably think there's a way to go. Because MAN, and if you take ABB, if you take GE, if you take Siemens, they are strong on one of the axis on the components side.

And if you don't think about what happens in the regions, I would say that, look at Brazil. They have introduced local content. They're going to protect, they're going to do what it takes to make sure that internal thing happens in Brazil. That will happen if it's by law, or it's by trading principles. If you want to

run business in China, you need to have access to route-to-market. I know you need to be close with the yards as an example. So 1 day, you are a competitor, the next day, you are a customer or a supplier. So you need to balance this in a nice way.

Definitely, if you go into the -- if Rolls-Royce want to compete strongly in the Far East, we need to do business locally. And then I think, we really have a good opportunity because the brand, Rolls-Royce, is strong, very strong, particularly in that area.

So what I'm trying to articulate and explain, is that within this area, I really support what you heard from Mika that the winner is the one that is able to bundle together the complete system in an intelligent way. And without saying too much, but when you don't follow the application areas you want to be in. If you then are missing a couple of items, you either go for development and engineering or small acquisition could also be a feasible approach. So I think that, that's -- that element going forward.

Definitely, we have the ambition to raise the quantity of the business. And then it's to grow within global addressable markets. Then it's to grow share in the addressable markets that needs -- that means that we need to have happy customers that prefer us compared to others. Then responsiveness becomes important, and then to expand addressable markets.

But it has to be based on follow-the-money. There are some of the areas in the Marine industry you don't want to be in. And safety is one element. And if you think about how much of the investments we have been doing that is linked to safety, that's something we need to take also here.

Then it comes to raise the quality of the business. I believe that there is 2 dimension. One, is to be cost competitive and operationally efficient; the other one is to learn to really improve our strong value proposition to our customers. So if you remember the first one, I showed the 7, 8 circles, the best ones, I believe, will be the ones that succeed combined with the right cost structure. And my view is, of course, we will be the best.

Thank you very much.

Simon Goodson

Former Director of Investor Relations

Okay. The time is -- we're on time. The time is 10:00 Norwegian time, so still U.K. plus 1 hour for those listening in. We're going to take a 30-minute coffee break, tea break, water break, any other break, and we'll be back in here at 10:25, please. And then we will hear from Sauli on Innovation and Mark on profitable growth. Thank you.

[Break]

Simon Goodson

Former Director of Investor Relations

Okay. Thank you for your patience. Small technical glitch. For those listening in, watching via the webcast, you've missed absolutely nothing at all. We just had a slightly extended coffee break.

Running order from here on in, which I'll get through very quickly, you'll hear shortly from Sauli on Innovation, the Executive Vice President, Engineering and Technology for the Marine business. Then Mark Alflatt, the Finance Director of the Marine business, will talk about profitable growth. We will then have Mikael do a brief wrap up before we have all of the presenters to be grilled by you in the room, you online about what you've seen and heard and any other questions that you may have. So without any further ado, I will pass you over to Sauli.

Sauli Eloranta

Okay. Good morning, everybody, here in the room and also on the webcast, and welcome to listen to the Innovation presentation. I think we have such a level of electricity in the room that we actually caused a very rare power outage in the Norwegian hydropower grid system.

So anyway, we are back here now. About innovation, I think there were some concerns about these unmanned vessels, but they seem to be around here. I don't know when this picture was taken, but obviously, there are some unmanned vessels going around in Ålesund, Norway.

A few words about myself. 25 years in the Marine business. I'm a naval architect and have been working mainly in ship building industry, ship equipment industry in Finland, France, U.S., Norway. Most of my career working for Norwegian companies, actually, as they have been own [ph] equivalent of shipyards in Europe. And working for companies like Wärtsilä, Kvaerner, Aker, STX. It's pretty much the same story, but [indiscernible] changes their name.

So I've been 5 years now in Rolls Royce, and I wanted to join Rolls Royce, mainly I think because of the brand. Because I wanted to make sure that we can leverage the same type of brand identity as we have in Aerospace, to also Marine, which I thought at that time, was less known for the actual brand point of view.

Okay. Now several people ahead of me have been talking about the Marine trend, so I'll try to make this meaningful so that I go through this picture in detail, in sequence. And I'll then interpret to you how we see which trends are having what type of impact on technology development and product development.

So the first thing what has been mentioned today is the development of legislation. So primarily, rules and regulations related to environmental conservations, emissions and so on. Now there are a lot of rules development going on at the moment. Meaningful to note that this is the first time when the entire shipping industry is seeing a major change in the emissions levels, about a 90% cut in emissions in about 15 years' time. So before this, the Marine business was able to pretty much use whatever fuel you wanted. High -- very high sulfur content, heavy fuel oil, like residues, the least distilled fuels that you could come up with.

So what this means is that now, in the next 10 years or so, there will be some rules that are having direct impact on newbuilds, which means that they can stimulate newbuilding contracting. And they also mean that the newbuilds will be required to comply with these rules. It makes them, for example, companies that are investing in high-tech like ours to be more competitive in that race because it's no longer just a kind of commodity approach in the power and propulsion systems, going forward. And there are also some rules, like the sulfur emissions that are related to all existing vessels. So therefore, all the vessels that are used in oil shipping need to comply with the sulfur regulations later on in 2020s. And that means they have to be equipped with abatement systems or they have to change fuel or they have to be modernize to manage different types of fuel. So what we see here is that this will boost the attractiveness of newbuilds, and it will also make an attractive new market for modernizations for services business.

Then these tanks are communicating bunker fuel selection for newbuilds. So the one on the left on 2014 is showing that today, about 90% of the world vessel newbuildings are constructed so that they are using heavy fuel as a main fuel source. And then about 10% is Marine gas oil or diesel oil, as we know it. So this is the situation today.

And then the tank on the right is saying that in 2025, we anticipate still the HFO being around. So heavy fuel oil will not vanish even in 2025, but the vessels using that fuel need to be equipped with equipment to clean off the exhaust gases to comply with the new rules. Then what's important on the right-hand picture, the LNG fuel share will be up to 30% in the newbuilds. And that is something, of course, where we see a lot of opportunity in there. It's a clean fuel as we have heard today, and it will provide an opportunity for, how to say, ship equipment suppliers, shipyards, but also ship owners because this is an inexpensive fuel. So there will be different drivers for this. It's both clean and inexpensive, which is -- makes sense then to consider transforming your fleet into working with a different fuel.

And then there is a small biofuel canister on the top. I don't know if you can even see it in 2025. So what we're seeing is that, in Marine bunker fuel forecast, we don't see a lot of biofuels being a dominant source. Even though we understand that there are some shipowners opting for it and also developing that technology. And these percentages are based on studies made by companies like, Det Norske Veritas, which is a classification society, but it's our own interpretation of that.

Again then going to ship building trends, shipping trends. So the vessels will be built mainly in China even in 2025. There's also a red flag indicating a Chinese shipowner, let's say, Far East shipowner still -- you saw earlier from presentations that today, a lot of shipowners are still based in Europe and the U.S., let's say, in the developed world. Now more and more shipowners will be based in Far East, going forward. These types of vessels have quite simple machineries and they are primarily paid for their journey. So they get their income and revenue from making a journey from point A to point B. They typically carry cargo on the way where they get paid. But this is a kind of important distinction to these things. So it's very costing -- intensive, cost-focused business. So you either want to go larger in ship size to get the economy upscale to take the freight rate down or you reduce the fuel bill by making more efficient engine systems. So that is something that we see opportunities, for example, here in the life-cycle revenue. So you can refit existing fleet to be more fuel efficient with products like we have Promas, for example, in there. But that will be the generic trend in the Marine business. Fuel efficiency is important for these things -- for these vessels in the market.

Then an entirely different segment, the special vessel segment, or what we call here, Offshore vessels, typically, what are in this segment. You can see a deepwater harsh environment rig there in the center. You can see a well-construction vessel assisting those rigs, which would be more common in the future because, like we heard earlier today, the Offshore Oil & Gas exploration goes further away from the coast. You need larger Offshore support vessels than today with more bollard pull, with more functionality, with more flexibility. And you are benefiting from new designs because the existing vessels are not always matching those new requirements because it's, let's say, high-wave conditions, it's long journeys to the area where you do. It impacts the vessels specs. So therefore, this is also stimulating the demand for new technical solutions for these vessels. So not only for new tonnage, but let's say, the vessel specification needs to be adjusted to the new requirements.

And then on the lower-hand left, you see an Arctic vessel, which is special vessel as well. And I would still say that we have a good opportunity in the Arctic vessel design and machineries. They are typically complex machineries, hybrid propulsion or full electric propulsion. And that is typically -- so driving into very specialized ship designs. And as you know, ship design is one of the work we do in here. And we can deliver the whole, let's say, mechanical-electrical package together with the ship design also for Arctic vessels.

And these vessels that are in the picture now, they don't get paid normally for the journey. Icebreakers might be in some sense, but they are normally paid for their mission and that's important. So the business in Offshore is something that the journey is something like you have to do. You have to steam to bunker your vessel or get new materials on board, and so on. But where the vessel gets its income is the work. What it does, let's say, close to the oil -- oil rigs or whatever is assisting to do. So that is an important distinction from the kind of Merchant vessels that are going from A to B. So instead of fuel efficiency for the transit, it then fuel efficiency and comfort for the mission. So that means that the vessel has to be in dynamic positioning pretty much 24 hours a day. The whole propulsion system needs to work all the time.

Whereas in a Merchant vessel, the bow thrusters, for example, are run, let's say, 10 minutes in every 2 days or a week. And these vessels have their bow thrusters working 24 hours a day, 7 days a week. So that's a lot of new requirements.

Then what you will see more today also in here, is a whole, how to say, era of ship user interface, the bridge design, the operation -- operating of a vessel where we are now increasing our efforts in here. Now the vessels are more complex. And the crew has more challenges today. And we also brought up the -- in the discussion, the availability of competent crew. But if you have, let's say, a bridge design and you have a hybrid vessel with a lot of mechanical components, electrical components, you could even have batteries in the future in there, and you adjust how you operate that vessel. Then what needs to happen in the bridge is more or less what iPads has been doing for the, how to say, use of computers for all of us. It's turning this complexity into simplicity.

So all these bridge designs like the unified bridge is now actually looking simple. But actually, it does integrate all the information what there is on-board and providing the relevant information to the seafarers. But that is something that is a challenge in the business, how to make that interface towards a

ship systems from the crew, so that there -- how to say, you don't need a 30 years' experience to run the vessel because you no longer have that luxury in the Marine business.

And then last, there is also this satellite up in the sky, which is then communicating that in the future we'll see more need for -- how to say, data transfer and communication between the vessel and the onshore organization. Today, it's quite a tiny, tiny pipeline what's in there. It can be 1 megabyte or so, but if you're running a cruise ship with 1 megabyte total, I mean, 10,000 people on-board a cruise ship, you don't have a lot of bandwidth for each one of the persons to browse the Internet. But in the, how to say, professional fleet, it's more about the onshore crew being able to assist you when you do your mission, understand the equipment health monitoring, things like that. It's providing support to the vessel.

Then what we feel -- and I feel personally strongly, is that we are well positioned to meet these challenges. So all the trends what I showed you in the previous page that we have a relevant portfolio to meet those things. This portfolio is not a commodity portfolio, per se. So this portfolio is developed normally for quite high-end applications. So with safety, quality, reliability being quite essential drivers to -- in the product development. So very few of these components -- or perhaps have been developed with just cost leadership in mind. Normally, it has been something that we are engaging actively with the shipowners to understand what are the exact specifications, what they need to get from these products, and then we are doing those things. And these are all mission-critical products. So it's also that we are not in, how would I say, in some interior furnishing business or something, which is not mission-critical. So if any of these equipment fails, the vessel cannot continue its mission. So therefore, it is mission critical as the terms as all of these are.

Then we have been, many times, the first in the world with many of these things. For example, the largest controllable pitch propeller ever, largest CPPs in the Arctic conditions, largest water chest in the world, most efficient engine as we have at the moment, most power-dense engines as we have in MTU, most powerful gas turbines in Marine business with the MT30, propulsion equipment to the world's largest or most iconic vessels, like Queen Mary 2, you name it, or now -- HMS Queen Elizabeth. So that has been the driving force, and also that means that we, as an engineering population in the company, also have this huge accumulative experience of working closely with customers, tapping into corporate technology capabilities, collaborating across the sites and borders and making these things into always industry-leading solutions.

The customers in this sense are typically shipowners rather than shipyards in many of these issues. A shipowner is seeing the value of not being in the commodity business, whereas shipyard might want us to develop the world's cheapest solutions for some of the issues because it's a more cost competition. Whereas shipowners want us to provide most value. So therefore, I would say that the portfolio, which you can see in there, is a kind of value-adding portfolio. And then also the size of the portfolio is wide at the moment, but I would stress that it's wide and it needs to be relevant, so we still have some individual products in our portfolio that are not mission-critical per se, but there are quite few, so we have exited most of those. And then I think that, going forward, this concentration out of The 4 Cs, means that we are sticking into those mission-critical equipment, which are important for the system integration point of view. So then we just want to do stuff that's hard. We don't want to do the easy work. So if it's hard, that means that if any -- if we have any problems with our delivery then the vessel is in trouble. Then we kind of get paid for that certainty and reliability of the delivery. That's where we want to play.

Then if I just -- well, there is this new B33:45 engine as you see. There are complex hybrid vessels. You can see also in the upper row, thrusters. If I just take an example over the thrusters. It all started, I think, even before 1937 when Kamewa introduced the first controllable pitch propeller for the Marine market with hydraulic drive. The whole thruster kind of ecosystem is extremely wide at the moment, so it has evolved into being -- us being the market leader in large Offshore thrusters at the moment. But it also means different types of thrusters for different applications. We have Azipulls, we have UUC thrusters. And now you can see also on the right, the latest technology introduction is for permanent magnet thrusters. So we have acquired a company in Trondheim called SmartMotor, which has -- the whole organization is developing permanent magnet technology, and we have acquired it for technology acquisition point of view. Not for route-to-market per se. And we are developing a whole range of product with that technology. So that's something we believe in at the moment.

The first products are already launched like the permanent magnet tunnel thruster, which is a super silent thing and matched with the offshore rig requirement where you need to run the thruster 24 hours a day. So you don't want to be there with a normal thruster, which is creating a lot of vibrations, if you have experienced on-board a ferry or cruise ship. I'm sure you have.

A lot of prize-winning ship designs, as you can see also in there. So that has been successful, 800 UT Designs like we discussed. A lot of deck equipment systems. Those is also a mission-critical in there. So those are mission-critical, not from the transit point of view, but from the, how would I say, the value-generating point of view. So if you have any problems with your anchor handling winch, your mission is ending there [ph]. And then you start to pay whatever, \$50,000 or how much per day or so. So that is extremely mission-critical as well because that is where the Offshore vessel gets paid for. And then you also see this unified bridge, what is in there. So that is important.

So we can see that with this portfolio, relevant portfolio, we can meet those market requirements and market trends that I showed in my previous slide with the fuel flexibility of the engine answering the fuel diversity problem going forward. We don't -- we are not sure which fuel is winning, but the engine can run with both diesel fuel and gas fuel. And all the portfolio is relevant, and it's going to be more electrical going forward, as we see the trends also in there. But we are well geared to provide complex machineries for special vessels.

And then, again, if I just crystallize what we believe that the future innovation should be concentrating on. I mean, there's 2 areas in there, which is the -- being the efficiency leader in what we do. And it's not just fuel efficiency of the main engine, but this is a system efficiency, vessel efficiency. The whole operational efficiency of a vessel built for a certain thing. And then ship intelligence is something what I'll tell you a little bit more soon.

So efficiency is something that we can lean onto our relevant portfolio because the portfolio, like I said, is not a commodity portfolio. But it's more like a high-end, high technical content, high-efficiency, high-reliability portfolio. So therefore, it's a great, again, building block towards being the efficiency leader, going forward. We are leading in hydrodynamic capability in Rolls-Royce Marine, so we have our own labs and we have a lot of computational capability in the company that is also contributing, being able to make a lot of high-end hydrodynamic research into making those systems easy [ph]. But I have to highlight, this is slightly different from maybe gas turbine design, so we cannot just limit our hydrodynamic competency into the actual propulsor. But we always talk about the how -- the vessel level hydrodynamics. And that is complicated because we have a free surface and you have all the interactions with all the components in the propulsion system that we can do it.

Efficiency means also large opportunities in the aftermarket. So we have one product, for example, Promas, that is gaining, let's say, 5% to 8%, depends on the application. It's gaining a lot of the velocities that have -- you have after a normal propeller with the swirl in there, so it's regaining the swirl energy. And with that 5% to 7%, 5% to 8%, it means that if you take a large shipowner in ship building -- in the shipping business, 5% efficiency increase is worth GBP 100 million a year in money. So in the bottom line, so that's not trivial.

Now the thing is that in the Aerospace, like we heard, John Rishton was happy to get 1%. Now 5% we can get with 1 gimmick only, and there are many areas where we can play this environmental thing. We can switch over to LNG, we can repower vessels, we can get down to just 20%, 23% lower CO₂ just because of a change of fuel. We can change some of the haul forms, we can change some of these energy-gaining devices and all. It's a big saving what you can get. So 5% is something what you can get in many applications.

Moving over to ship intelligence. This is a kind of, what we say, disruptive opportunity at the moment. So what we think is that the ship intelligence is similar to, how to say, system integration, but it's a kind of a higher level of intellectuality embedded in the systems. So we have our portfolio, which is made of products that can be knit together to form an integrated system where we have been strong. We have also been able to have ship design, so far, to kind of knit those integrated systems into a seamless entity called ship design.

Now with the ship intelligence, it's something that we want to make sure that our product delivery, our system delivery is relevant, so that the intelligence is something more like big data, software built on top of the actual hardware delivery. So we believe that if we would stick only onto hardware deliveries, we would then transfer ourselves into being a, again, a commodity provider gradually, if we're not able to do it. And this also has to do with value. This is helping the customer, this is supporting the customer during the life cycle of the product. And again, I would say personally, that I think this should be turning complexity into simplicity. So ship intelligence is not making things more complex. It's actually taking all the complex things, what you have on-board. There is a lot of data on-board. But providing, let's say, intelligence and relevant information to the crew and to the maintenance of the vessel.

And then, of course, the picture on the right is also showing a kind of unmanned vessel. So I would highlight this thing of drone vessels, or unmanned vessels or remotely controlled vessels, where we have had a lot of publicity. It is a technology platform, so it is important for us to know where we're heading to, and we see that all the signs are referring to the same trend that there will be less crew on-board. And also in the Offshore vessels, we have safer deck operations. We want to mechanize the things. We want to limit the exposure of the crew on -- in harsh conditions. Take crew first from the deck inside the vessel then from the inside of the vessel onshore, and help that trend. So this is more like the endgame or long-term vision, if you may, where we're ending up. But, of course, we can do pilots with this technology faster.

And then I think this is my last slide. So best way to predict the future is to create the future, so that's what it is. So we believe that the ship intelligence is an area where we can complement our current product offering. Again, for you to feel comfortable, when you do the round later today in this building, you know what I mean. We have started this journey about creating future. From those products, from systems, if you take this intelligence, we have had product specific controls, we have had the whole automation control system for the whole vessel, which we do. The bridge designs and then remote operations that we can take remote access to a vessel from here. And you will see a room where that can be displayed with a lot of display. So we can replicate, let's say, a vessel's control room, dials, and so on and we can assist the customers.

And then finally, what I believe that the 3 big issues for us are that there is a trend from products to technology, like I said, hardware. If you stick yourself to hardware, that's risky. Hardware might not be the selling point in the future. Technology means more about enhancing the hardware with a system offering. It's about the technology, which is in the product, but it's also the technology, how you bundle products together, and ultimately, for example, what we call, ship intelligence is a technology that is a powerful thing where you need to have your portfolio to build on. But that will be a primary differentiator, going forward.

And then also, what are the building blocks or stepping stones in here? So this product portfolio was our stepping stone to system integration. How could we have done system integration if we did not have the product portfolio that we had? So that was the key to do that. And now what we say is that once we are big in system integration, that is a stepping stone to ship intelligence. Because through ship -- system integration, we have access to all our systems. So we know how each part of the vessel is working. We get the information from there, we get data from there. Ship intelligence just about then about making sense of all that data what comes out of those systems, and also about transferring that data further away from the shipments. Starting that journey that you could have, let's say, less people on -- well, more people onshore than what you have in the vessel at the moment.

And last but not least, the long tradition. I think the collaboration with leading shipowners that has been in here for tens of years, or close to 100 years in some parts of the business, that's something that you cannot really copycat easily because it's a relationship that is inbuilt. It's a kind of institutional approach to things. It's not just those individuals that are in the customer front, but this is an institutional built-in capability and built-in relationships to our main customers and stakeholders that we have in this business. So I think that people might come into our business and they might be competitive, for example, in one product. Therefore, I would say that, yes, some people say, "It's a low barrier to entry." I think, maybe in some product areas, it's a low barrier to entry. Somebody could make a strategic investment in one of our products, "I want to come in there." But it's entirely different from that player then say that they will be

as competitive in system integration because they would only have that one product. And then if you are not into system integration, they would also have a very high barrier to entry going into this intelligence, getting all the information from everything. So we are well placed in there because we have a lot of case, 25,000 vessels with our case. That's immense. So nobody can really pick it up. Just come like tomorrow saying "Well, we beat you." I don't personally think that.

So as a summary for all of this, I think -- I'm convinced that we are well placed to meet the future market trends. And then also we have already products and technology that can conquer that and we are continuously developing that also, going forward. Thank you.

Mark Alflatt

Former Finance Director of Marine Division

Thanks, Sauli. Thank you, Sauli. Good morning, everybody. I will add my -- thanks to all of you, first of all, for making the trip to come and see us over the last couple of days. I hope this morning started to shine a light on our business. Quite a few familiar faces in the audience, who I know from previous roles in the company. But for those of you who don't know me, I'm Mark Alflatt. I'm the Finance Director for the Marine business. I've been in the business about 20 years this year in Rolls-Royce. I've done a number of roles around the group, finance, commercial. My most recent role before this, I spent 7 years within the Investor Relations team, so I know many of you from some those engagements. And I've been in this role as the FD for the last 2.5 years, so I don't have a deep Marine industry knowledge compared to some of my colleagues you've already heard from this morning.

But that's given me, I think, an opportunity to ask some of the basic questions. Why do we do that? Why are we doing it there? Why is that important? And that's been, I think, quite a useful backdrop to bring to the business. And for me to challenge the business but the business to challenge me back over the last couple of years, and that's been, I think, hopefully, valuable to the team. It's been really valuable to me, and I think it's informing the way we're thinking about some of the things Sauli talked about in terms of innovation going forward.

Because of my previous role, I thought I had a pretty good view about what we do in this business. What we -- what products we make, how that fits together, what's important. But what I actually found when I got in and really got deeply into the business, and some of -- again, some of the information you've seen from Sauli and the rest of the team this morning. This really is a fantastic technology business. It's easy, and I'm sure for many of you who are not quite as familiar with the Marine sector, to sit and look at the kind of products we make and think this doesn't feel like a Rolls Royce product. It doesn't look like a high barrier to entry.

Hopefully, some of the insight from the team this morning starts to glue some of that together. And that's absolutely what I've seen over the last 2.5 years. This is genuinely a high-technology business, the kind of challenges the guys have talked about, some of the things I'm going to touch on as we go through. This is really, really complicated stuff and absolutely fits within how Rolls-Royce works together. So that's been a really enlightening process for someone who actually thought they knew this business reasonably well moving into the role.

So I'm going to pull together the third strand of the strategic framework, profitable growth. And I really want to focus my comment this morning in 3 key areas. I'm going to start in a few minutes and just contrast and compare the business model. I think many of you in this room, you're very fairly familiar with the Aerospace sector, you are very familiar with that business model and you may look at our business in Marine and think "Well, that doesn't really look like a Rolls-Royce business." I'm going to try and step through a few characteristics to try and pull out where we are very similar and actually where there are differences, an important differences. I'm going to spend a few minutes and just reflect on historical performance. This business has been transformed in a decade in terms of its scale, in terms of its importance to the group and certainly in terms of the growth opportunity we have ahead of us. Potentially, a strange thing to say given that all the challenges we talked about in the last day around the sector, the industry, overcapacity, waning oil prices. But there's no doubt there are big opportunities ahead of us. But it is worth just spending 2 minutes and looking back because this business has grown significantly and become a very important part of the Group.

And thirdly, and I guess, probably the nitty-gritty of the session and really where you want to spend most of your time, I am going to spend a little bit of time and talk about cost and competitiveness.

What are we doing today? What have we been doing over the last couple of years? And what's ahead of us? Because, again, a lot of opportunity in this business as we go forward.

So before we get into that, just a couple of quick slides, I think, to keep in contact before we really dive into the cost piece. How this all molds together. Now you've seen this slide before, I think. John Rishton have talked to you about this framework in terms of the key elements of profitable growth back in June when we did the Capital Markets Day then. And I think linking this to the conversation we've already had this morning, Mikael first then John talked a lot about the market, the customer. So I don't think I really need to dig any further there. You've just heard from Sauli and seen a lot of very, very impressive capability that we have, where the market is moving to, what we can already bring to that and where we are going to be focusing our attention going forward. And I think it's important to keep in mind that not just the Group, but Marine, has had innovation at its heart all the way through its decades of existence, whether it's been by Rolls Royce or predecessor owners. This business, I think, absolutely has adapted quickly to the demands of the industry. It's listened to and adapted to its customers. The innovation process is absolutely an intimate relationship between the customer, the operator, ourselves, our suppliers. And that's really been the heart of what's driven the business over the last few years. And finally, the cost and cash element. We will definitely get to that before I finish.

Now one disadvantage, I guess, of being the Finance Director is I don't get to use as many pictures as Sauli. In fact, I don't have many pictures at all. So I'm afraid you'll have to labor through this. We'll dig into a little bit more information and data. I don't have anything quite as glamorous as Sauli to show you, but hopefully, overall, it will be fine.

Again, just looking at the key elements of growth, because it's not just about cost cutting, it's not just about driving our cost base, our supply chain. We spent a little time this morning on the left-hand side of this chart. And I hope it's pretty clear from the conversations from John, Mikael, where we are, the capability we have, the sectors that we can address. And as we move through that, the key technologies that Sauli has talked about, ship intelligence, LNG, systems integration, the services model. Starting to pull through some of those capabilities we have in nuclear and Aerospace to help give us more remote monitoring and information from the vessel and not just the service engineers we have abroad.

So I think the team has spent quite a bit of time on that. The bottom bubble here around growth services, I think that is clearly a key part of this sector just as it is for the rest of the Group. Product and service for a very long period of time. You've seen from some of the videos we've shown you the last day or so. These things are operating in very difficult conditions. I think John talked about a PSV charter rate at \$50,000 a day, a drill ship at \$700,000 a day plus. Availability and reliability is absolutely crucial, and these things are operating well away from their domestic base, so having the capability, having the support network to maintain those vessels in-service is really crucial. And one of John's slides really struck me as sitting this morning watching it. And I've seen this slide before, but actually just looking at the chart where he said the vessel had been out of -- off hire for 9 hours in just 5 years. That really informs what this business and what this industry is all about, creating capable product that can operate in the toughest of conditions day in, day out, and earn revenue for our customers.

But clearly, growth services is a key part of our strategy. It's a key part of the model. In our business, as you'll see, it's less significant today than it is elsewhere in the group.

It's just over 1/3 of our revenues, and I'll talk to you as we go through a comparison with that model. And then, I guess, we're starting to get into the areas I'm going to focus on around rationalizing our portfolio. Sauli mentioned just at the end of his session, we have a very wide range of products and variance that fit on a range of different vessels where they've grown up over long period of time. I think as we go forward, we're starting to focus more on what are those key products we should do ourselves, what do we not need to do for the customer, what can go into the supply chain. What are those smaller segments and smaller businesses where they're not going to add significant value going forward. And we started to close down some of those businesses, exit, sell some of those businesses.

Typically relatively small I would say in the last couple of years and I think that's probably right. There are big pieces of the portfolio that we should rationalize in that respect. But there definitely is a focusing in on what is the capability we want, what are the things we want to invest in going forward, and who are the better owners for some of those smaller businesses.

Improving the competitive position, I think, then wraps up almost everything to do with cost. And as we go through here, I'm going to try and break open for you the cost base we see today, what the key elements are, what we control, what the supply controls and what we're doing on each of those elements to drive that competitive positioning.

And just finally, just to wrap up this chart, Lawrie touched on it right at the start, we are just in the early stages, I think, of looking at the opportunities, both top line, supply chain, cost as we integrate the Power Systems business into the Land & Sea. And there's definitely opportunities there, again, a couple of examples that came through, I think, in Lawrie's presentation on Slide 26, there are going to be lots of opportunities, I think, as we pull these portfolios together.

And just the final one, before we move off, I guess, the cost piece. It's not just product, it's not just supply chain, it's overheads. We've looked at and we continue to look at many of areas of our business as we've consolidated sites and businesses, we're looking at our back-office functions, and we've made quite significant steps around the cost base there, taking out, I think Lawrie probably said around 20% of our support activity more than 500 people over the last couple of years. And I think as we go forward there will definitely be further opportunities to do that -- do more of that.

So the first of my 3 key items, I just want to spend a little bit of time and step you through this. I hope it's clear from, again, the previous sessions what you've seen over the last day or so. The fundamental drivers in this business are absolutely the same as they are elsewhere in the group. Population growth, demand for energy, transportation, increasing regulatory challenges that Sauli talked about it in quite some detail, are all absolutely relevant to what's going to drive this business over time. So I think the fundamentals absolutely mirror many of the things you understand about the group when you look at the gas turbine and Aerospace businesses.

The other, I think, area I would pull out is these -- this is what's the cycles are shorter, the product cycles are shorter, this is again driven very much by things you'll be familiar with, with the group. We spend a considerable amount of time and money and IP creating new capability. We put product into the market that operates for very long periods of time. 25, 30 years, Sauli talked about, I think John mentioned 40 years of designing the UT vessels, many of which the first ones, 40 years old are still in service and then the points I've just made about the aftermarket model, these things require significant support.

So I think when you look at the nature of the model, and you look at the capability that we have in the barriers to entry that, that creates, there's no doubt that fits very well with what you know about the group and I hope none of that is a significant surprise.

However, the industry structure is very different, supply chain is very different. Mikael talked about it, I think John talked about it. It's very, very fragmented in the way that shipyards engage with supply chain, that we engage with -- like ourselves in the way that we engage with owners and operators, regulators. The framework is different in different parts of the world. So that creates a lot of fragmentation. And that indeed informs the way we're organized today, which I'll show you as we go through. So I think that is quite different in terms of industry structure compared to what you see in Aerospace and indeed what you'll see in our own Aerospace business.

John Rishton, I think, gave you a good example last night of the scale of investments we are making in this business. He talked about the new engine that we just brought to market in the last month, 3 years to come to market, GBP 25 million. So -- and I think a couple of the guys talked about it earlier on. These are not big bets. There are a number of areas we're investing in. The level of intensity of our R&D investment has typically been relatively modest in this business, and it's much quicker. It comes to market much more quickly. So 2 to 3 years is not uncommon compared to multi-years, if not more than a decade of the kind of product cycle, again, you're used to in the Aerospace sector.

So that's quite an important contrast. And I think if I pull that together in R&D terms, because Sauli showed you quite a lot of opportunity, I think, and talked more about we need to spend more on innovation, more on R&D and I think we will. We definitely will. Historically, we've probably spent 2% to 3% of our revenues on R&D in this business. In truth, that's probably a little bit low. We probably underinvested in this business over the last 10 years to 15 years, whether it's technology and probably in our footprint, which I'll talk more about. So I think that will go up. I don't think it needs to go up a lot. And as you've seen from the scale of some of the numbers, in the context of the group, these are relatively small amounts of investment to access some quite big opportunities.

So that is an area where I'd say the drivers were important, but it doesn't necessarily fit the model that you guys understand well today from Aerospace.

I think the other element, and we talked about it a little bit last night in terms of a level of visibility in the business and the level of the ordering patterns. This -- well, the lead times in our business are relatively short. On the OE side, if you're providing equipment and product to a vessel type, it can be a matter of months, 4, 5 months for some of the smaller products. The Merchant sector especially from going through the tender process with a shipyard, ordering the equipment to actually delivering, relatively short. In the Offshore sector, some of the more complex vessels that John showed you at a maximum it can be 12 to 18 months. So this isn't a business where we have multiple years of visibility of individual contracts.

To give you a sense of scale. At the peak of the up cycle, in the middle of last decades, the industry had 3-plus years of order book, and we had something similar in our business. That's unprecedented I would say. We are typically operating on anything between 9 and 18 months visibility around new equipment. So, much shorter when you're used to in the Aerospace sector where customers order significant amount of aircraft and engines which spread out over a number of years. That's not how this industry in this business works.

In the aftermarket piece, again, it's much shorter cycle. Spare parts, roughly half of our revenue in aftermarket and the ordering cycle there can quite literally be a few days to a few weeks. The turnaround time from an inquiry for customer for spare parts can be literally 2 or 3 days, a week, maybe a couple of months at maximum. And where we're doing major upgrades to our services business, you may get a little bit more visibility because it's allied to a dry-docking event so you can see when the customer's scheduling to take the vessel out of the water and do major upgrades. But again, that can be -- 9, 12 months is not unusual. So the dynamics in terms of what's in our order book and the level of visibility, that gives you, is quite different.

And I think that clearly creates some challenges around how do you think about the business, what are the lead indicators you're looking for. And I know from conversations I've had with many of you in the past and indeed in the last 24 hours, those are important hooks you're trying to get and I think we understand that. I think you have to recognize that is how the industry works. We will give you as much information as we can. But as you've seen in the last couple of years, 2 or 3 years, there's a lot more flexibility in this industry for customers to take their time, delay orders, reschedule things. Doesn't necessarily mean the demand has gone away. The fundamental driver is absolutely there, and all the stuff you heard this morning should give us all a lot of confidence around that. But on any given month, quarter, half year, things move around. It is the nature of the industry.

Just on aftermarket, I think 2 things to say. Again, both -- the model is much more flexible as I've talked about. Ordering patterns are much shorter, but also the contracting model is quite different to what you see in Aerospace. So you've progressively become much more familiar and aware of the total care of the outsourcing model, long-term support, power by the hour type models. And the Marine industry is moving towards that, and we're moving towards it, but it's a relatively small piece of the pie today. So much of what you'll see in our business is a Time & Materials ordering pattern.

Customers place demands for pricing, forget [ph] orders, it gets delivered. We're about a GBP 750 million revenue services business today. I would say something around about GBP 20 million a year is what you might consider a long-term contract. It's relatively small. There are things happening, but it's not going to be transformed in a number of years. This is a much more flexible Time & Materials industry. It's how the customer wants to operate.

And I guess, just the final one, there's no doubt I think in this business we can generate strong returns. I'll show you that in a second. I think the returns we can get in this business, whether it's margins or longer term return on capital employed, are very competitive with what we see in the sector and very competitive with what we see in the group.

So I think important as you're thinking about our business and I could have put another 20 characteristics on there, I'm sure you've probably got things you'd like me to compare, but these are important comparators and differences. I think the important one is right at the top. Absolutely, the drivers to this business are going to be the same as you see in the group and absolutely the model is very similar.

So I don't want to spend long on here. Just moving to my second point, what's actually happened in this business and I've just pulled out revenue margins, profit and return on capital employed. 2 or 3 comments, I think. I've already touched on this. This business has been transformed over a decade. Late 1999, the group acquired Vickers. We were really a Naval business then. We stepped into the commercial market. We had very significant growth, supported by the Offshore industry. But also, as you can see a little bit on the top left-hand side, significant growth in the services business. Services is about 150% today of what it was at the start of its time frame.

And that growth, an increasing capability in the market, more service centers, as I'll show you later on in the presentation, and the mix has clearly been very powerful as we've got volume and mix into the picture. So margins have grown strongly. It's fair to say they've softened in the last couple of years for many of the reasons you understand. But I think we should just stop briefly on the right-hand chart here at the bottom.

This is delivering a pretty healthy return on capital employed. This is relatively capital light business. We typically, through the cycle, operate on relatively neutral, if not negative, working capital. The cash profile is more balanced across the business and the industry. So we get pretty reasonable deposits when we take a new equipment order, we get milestones as we go through the build and delivery cycle. And then as I said, the aftermarket is a Time & Materials business. We provide the spore [ph] to the customer, we deliver the spares, we get paid. So I think the cash profile is much more balanced. So it doesn't mean that it's a relatively modest amount of invested capital in the business. Now maybe that capital increases a little bit going forward. We'll definitely aspire to spend more on innovation. I'll show you later on we're going to spend more time transforming the footprint. That's going to consume some capital. But I think that's why we need to really drive for operational efficiency elsewhere in order to manage that. And there's no doubt we can continue to deliver very strong returns on capital here.

So moving on to my third point and really what are the elements that we are going to focus on to drive growth through this business. John talked a little bit last night about what the group's doing on cost. I think he said quite fairly, Marine has made a start, but there's a long way to go and absolutely, that's true. We've been I think quite focused on this for 2 or 3 years now. It was clear that the lead indicators were telling us things were slowing down, excess capacity. And it was clear when we looked at our own footprint, that we needed to adapt to that. Not just because of the short-term issues but because of the nature where the cost base is. And Mikael, I think, contrasted that in his session when he introduced his understanding of the business when he joined from outside.

So I think we need to be clear, the last 2 or 3 years have been tough and we're already well under way with a number of change programs. And I pulled out, I guess, the way I've grouped them around the product, around business processes and systems. And then the footprint and also the source of supply.

So briefly on product portfolio, I think Lawrie mentioned in his and I touched on it at the start, we've certainly taken out some smaller businesses, some non-core product, we closed 3 businesses in the last couple of years and working on the exit of some -- a couple of others. They're not big, as I said earlier, but nonetheless, it does help us focus in on what's going to be important.

In terms of business processes and systems. We live on almost 80 different locations today. Just under half of those will be operational sites. So we got just under 30 operational sites in this business. Across those today, we have 18 different ERP systems, the legacy of historical consolidations in businesses acquisitions where we haven't successfully implemented common ERP platforms. That absolutely is a

key priority for the business. It has to be a key tool that we have to deliver, better planning tools, better ability to manage load changes across the organization. And it's a key building block for what we do next in terms of optimizing back-office support and again the next slice of overhead.

So we're about 1 year into a full year implementation program. We're going to spend about GBP 30 million on that over the time frame. And that really is a key part of the glue that helps us transition not just the business we have today, but also the transformation of the footprint going forward.

So the last 2 on here, footprint and supply chain consolidation. I'm going to spend a little bit more time on just going forward. But before I do that, just trying to unpick for you the Marine cost base.

So to keep things simple, we're about a GBP 2 billion business last year, slightly more. GBP 230 million or so of EBIT, so GBP 1.8 billion of cost in total. The right-hand chart here shows you the main categories of costs. About half of what we spend is on material costings, subassemblies, modules, gears, shafts, et cetera. And a lot of that is in the supply chain. Much of what we do in our various facilities is essentially an assembly and test business today. Indirect spend is a range of other things, whether it's subcontract labor, IT, logistics, support for the operational base. Headcount is just what it says it is, 6,500 people spread across our business and I've grouped everything else into other costs, whether it's other overheads, restructuring, R&D is in there. So that -- those are the mix.

First observation I think on the right-hand chart is our make/buy is actually pretty similar to Aerospace. It's about 80% buy today, 20% make. And as I'll show you in a second, that's quite concentrated around where our facilities is -- facilities are. And we are -- we need to progressively consolidate and relocate those and indeed we are moving on with that.

In terms of overheads, I talked about earlier. On headcount, we -- after 2 years, we've reduced our headcount where we've consolidated functions. John talked in his session about consolidating his businesses into one and taking a number of heads out. We've done that across the functions in a lot of back-office facilities. And again, I think that continues going forward.

On the left-hand chart is a couple of -- I think one of the points that Mikael talked about. 90% or so of our cost in our own facilities and our supply chain is in what we might consider high-cost territories. And as we look ahead, that clearly presents us significant opportunities.

So just a sense of the dispersion of the business. We talked about the industry being very dispersed and ourselves. This is our services network. I think you probably saw some of that on one of the videos earlier on. There's about 60 or so locations on here. They're not all fully functional -- fully functioning service and repair workshops. We've got just under 40 of those. We've got 3 customer training centers on here. The 1 you're sitting in here in Norway is our biggest one, but we've got equivalent centers in Singapore and 1 we're developing in Brazil. And then a number of service capabilities and support at a number of our manufacturing plants, you can see them in the orange and green at the top there, typically grouped around the Nordics. So that's around 2,000 people. 1,000 or so service engineers. The guys out on the vessels in the shipyards working with customers.

If I overlay where our operational base is, you can see much of that is grouped around the Nordics, Poland, the U.K., the U.S. And I think Mikael mentioned maybe in one of his charts, 3/4 of that cost is sitting around Europe and northern Europe. As I said, it's characterized by quite a fragmented operational base, which we have been seeking to consolidate over the last couple of years and much more to go. But I think this is a pretty telling chart in terms of when we think about the cost in our own business, the cost in the supply chain because much of the cost is grouped quite closely around our own facilities.

So we've made a start on this over the last couple of years. We've closed facilities here in Norway, in the U.K., we're in the process of restructuring in the U.S. and elsewhere in Europe. This year, we've announced closures of sites in the U.K. We're restructuring plants in North America, in Korea. And just last week, you have probably seen an announcement that we are closing a site just further down the coast in Bergen. So this is a significant opportunity and as I said earlier, we've got just under 30 operational sites today. I think as I look forward over the next few years, that will almost half. It won't exactly half, but there is considerable consolidation as we pull these facilities together, narrow the portfolio things we're

working on, seek to move some of that capability into the supply chain. As I said, about 80% of what we do is buy today. I think it can be a little bit higher, but not a lot. So this is significant raw material that we're working on to drive the improvement in the business and support future progress of the top line.

So just finally, what are we doing on low-cost sourcing? As I said, about half of what we spend our money on is material. So the left-hand chart tries to break that down, about GBP 900 million or so last year. And I've broken that into 3 categories. The partners in the Naval piece, there are elements of our spend base, which aren't available to be relocated. In the Naval industry, no surprise, there will be export controls that will prevent us moving some of that. And that -- so that constrains some of it for some period of time. We've got a number of partners we're working with, both within the company, an element of our supply chain is gas turbines, and outside the company, and again, that's not easily addressable in the short term.

There are some elements of spend where simply there isn't any low-cost capability today. But there is about GBP 400 million or so of that spend today, 44% where we are focusing on looking for lower-cost suppliers. And low cost to us means, the way we've assessed it, any territory where the labor cost is less than half of the labor cost in Finland. Finland is probably our lowest cost, high-cost country, if that makes sense. So that's the benchmark I guess, which we've applied to look at territories, and that's creating opportunities for us in Eastern Europe, Poland, Romania, Bulgaria. So we're looking in Europe. It's also creating opportunities in Asia. We've already got some capability today in Vietnam, in China, in Korea. But I think we need to take more advantage of those going forward.

So we started work on this addressable piece. We've actually made pretty good progress in the last couple of years. Today, it's around about 120 million of sourcing from those low-cost territories, about 30%. I think over the next couple of years, that can certainly get a 40% and 50%, certainly before the end of the decade. And it's meaningful. Our experience, as we've gone through this in the last couple of years, is that we're typically seeing cost reduction of about 1/3 compared to where our current established supply chains are. So these are important steps. And we're absolutely focused on improving that as we go forward.

The right-hand side of the chart, engineering. For everything you've heard, whether it's innovation in salaries [ph] environment, whether it's cost reduction, whether it's sustaining engineering, whether it's working with the customer to develop new product. I think John talked about 105,000 hours of engineering time to work on a highly sophisticated vessel. So engineering is at the heart of the organization. It really is the spine that binds this organization together.

Again, as you look at it, a vast majority of it is grouped around where our operational locations are today. Good reason for that, you need to be close to the manufacturing location, you need to be close to the customer, you need to understand what's driving the customer in order to make those connections. But there's no doubt we do see opportunities, I think, to move some of that more routine engineering activity into lower-cost territories. We've got a little bit of that today in India. We're in the process this year of recruiting another 100 engineers in India. And I think that certainly offers us more opportunity, and it allows us to build on the engineering capability that the group has in India over the next few years.

So I think as I look at that picture, the majority of our engineering resource today is closely costed around Europe, the U.S. Again those high-cost territories. I think over the next few years, 4 to 5 years, that could quite easily be 20% to 25% of our population should be in lower-cost, whether it's in Poland, Eastern Europe, India and other areas in Asia. And again, the gearing is pretty meaningful there. Again our experience in India, as an example, the cost of an engineer compared to one of our high-cost territories is anything between 20% and 25%. So we can do a lot more as we move engineering to some of those lower cost parts of the world.

So just wrapping up before we hand over back to Mikael. I hope you're getting the sense that this is absolutely a core business to Rolls-Royce. I hope you're getting a sense of just the complexity in our products, in the way we engage with customers on their vessels and the importance of that complexity and operating capability to our customers.

The challenges of the industry are getting tougher. John showed a couple of good charts showing just how the change in operating depth that some of our customers need to operate in. This is a business,

which has those capabilities. This is a business that's clearly demonstrated a strong track record over the last decade or so. Top line and returns, there's no doubt, this is a business where we can grow and we are delivering meaningful returns. And I think clearly, over the decade, this has become a much more meaningful part of the portfolio.

There's no doubt, the 2 or 3 years just gone and maybe the period forward, life has been pretty tough for the industry and for all of the suppliers in it, and we're no different. We're on that journey, I think, of adapting our own cost base, working with our suppliers, looking at things like engineering, looking at things like our overhead structure. We're making some progress. We've got a lot of opportunity ahead of us, there's no doubt. And I don't think we, for 1 minute, think we need to do that just because the environment is tough. We want to do it because we know if we can optimize the cost base, there's a lot more opportunity out there. And the guys have shown a light on some the market opportunities.

So just wrapping up and I'll hand back to Mikael. This business has grown dramatically over the last decade. There's no doubt as I look at the opportunities, the guys are working on, I look at the opportunity we have around our cost base, the things we can control, that we can grow at least as quickly in the decade as we have in the last. Thank you.

Mikael Makinen

Former President of Marine Business

Thank you, Mark. I only have one slide for summing it up. I think that -- at least, I hope that we have been able to give you a bit better understanding of the Marine market as a market. And also that if we -- now we're doing the Q&A, going to other questions that you have and of course, later if you have more questions about it. But I hope that this has given a foundation.

This is a very interesting business. It's a sizable business that should -- that I hope that you have understood as well during the day. We will very well understand that there's -- are short-term headwinds, and we are going to take the measures needed for efficiency, cost-cutting and so on. But at the same time good tailwinds in the medium term. That's why we were talking about innovation. We need to be prepared to be one of the winners in this game. I hope you understood that we have a clear strategy, profitable growth. The market is going from products to systems to solutions to intelligent ships. We have chosen an approach of mission-critical systems, integrated systems, true-life services. That's our choice, and I think -- or I know that that's the winning concept.

Some of you have asked about the new investments CapEx. Yes, there will be more needed in the future. But on the Rolls-Royce scale, it's still very moderate. And there's a short payback time. I'm saying that automation intelligent ships are coming. But also that the business is cyclical. You have to be in a number of ship types to counter the cyclical. You have to be -- we have to be better on the lifetime support because that also counts as the cyclical.

The Rolls-Royce Group gives us something. It gives us data analytics, products from Power Systems, service and sales network. It's a very, very good home for a Marine business to grow it into a real consolidator and winner in this market. The return on capital employed, as you saw, is very good.

So to sum it up, if you can take care of the customers, be close to them, we spend enough on innovation -- on real innovation and we think about growth as a profitable growth talking about the short term and the medium term then, 100% sure that we are the winners.

Thank you. And now I think we go over to Simon to go over to Q&A.

Question and Answer

Simon Goodson

Former Director of Investor Relations

I'm just going to speak for about 10 seconds to give the Marine team some time to get into the firing line. Just to remember for everybody on the webcast, you have the facility to ask questions as well and Jilinda will do a great job of trying to get Lawrie's attention so I'll hand straight over to Lawrie get into Q&A.

Lawrie Haynes

Executive

Okay, thank you very much. Firstly, on the panel, we've got the presenters. Also in the room, we have 2 or 3 other key executives from the Marine business. We got Don Roussinos on the far side there, who is the head of the Naval business, and Andy Marsh, who is head of the Services business. So we've got the right people to answer any of your questions. So who would like to start? There's a question there.

Charles J Armitage

UBS Investment Bank, Research Division

Two questions. One on Offshore. As far as I can see, it's gone -- it's a 3% long-term growth business. The problem is, is that if you go back to 2005, it was GBP 0.5 billion, it was sort of GBP 1.2 billion in 2010 or '11. It's now GBP 850 million in OE. What would you like us to grow that 3 -- if we grow to 3%, would you like us to grow it from GBP 0.5 billion in 2005, 1.5 -- GBP 1.2 billion in 2010 or from where we are now?

Lawrie Haynes

Executive

Okay, thank you. I think I'll ask probably Mark and John to respond to that.

Mark Alflatt

Former Finance Director of Marine Division

Okay. Sorry Charles. Do you mind just giving me those 2 data points again. You said...

Charles J Armitage

UBS Investment Bank, Research Division

You've clearly gone through a big cycle, from 2005 when you're about GBP 0.5 billion up to, I don't know, GBP 1.2 billion in 2010 and it shrunk down again. It's a cyclical business. If you're telling us to grow it at 3%, what point would you like us to start growing it from?

Mark Alflatt

Former Finance Director of Marine Division

I don't know if I can give you the individual...

Charles J Armitage

UBS Investment Bank, Research Division

Where are we in the cycle?

Mark Alflatt

Former Finance Director of Marine Division

Well, I think what you heard from Mikael and from John, in fact, there are a number of different cycles in this sector. We've -- the last couple of days you've talked to, perhaps, the oil prices collapsing. And yet what John showed you was actually we're starting to see some anchor handling ordering. So it's actually quite difficult to say this is where we are in the cycle and it's all going to follow down because different vessel types, different equipment types we have are ordered at different times in those various cycles,

Charles. So that's -- it's quite difficult to give you exact data points. You saw from some of the charts that Mikael looked at in terms of market opportunity over the next decade, we see the core part of the market we're addressing today growing by 3% or so over the time frame. I guess, from our perspective, running the business, we're here looking at that kind of time frame, not just year to year. So I can't say, "Well, you should start here, and it's going to be 3%, 3%." And I don't think you'd expect me to do that.

John Knudsen

I think the answer is you can start from today. And the rationale for saying that is there are definitely some segments that will go down. If you look into the PSVs, we think that that's been an area where there has been a strong growth the last years. But you have to also take into account that the value of a PSV compare to an anchor handler or maybe the subsea construction vessels that we really believe that will come now, has a bigger volumes. So yes, there are some headwinds coming. We haven't seen anything so far that the last oil price elements has an impact. So we believe that if we have the selected areas where we're going to grow, and that is into the subsea and into the anchor handlers, as examples, we believe that in total value there's a growth.

Charles J Armitage

UBS Investment Bank, Research Division

Second question is 6% to 32% return on capital. As far as I can work out that means you've almost halved your capital employed over that time period. Can that go further? Do you -- what's the trend on the capital employed side that you can do that?

Mark Alflatt

Former Finance Director of Marine Division

I think certainly been optimizing the working capital, no doubt about it. And as I touched on, if you look through the cycle, we've typically operated on relatively neutral, if not negative, working capital. There's no doubt, I think returns in the market are getting tougher, payment profiles are getting tougher, albeit they are still pretty positive. I think a big driver in the picture, I showed you Charles is both volume, we've seen significant growth in the base of the business over that time, and importantly, services. You've seen services grow significantly. It's about 1.5x today what it was in the start of the timeline. And I think that is an important part of that return on capital mix going forward. And I think...

Charles J Armitage

UBS Investment Bank, Research Division

Employed seems to have halved [ph]...

Mark Alflatt

Former Finance Director of Marine Division

It's come down, but again, be careful with the data depending on what you're looking at in terms of your own analysis. Remember that over time, for example, Marine used to include submarines. So there's been some changes in some of the segmental base, which may or may not be helpful to you. And I think looking forward, as we said, you should expect a little bit more money on innovation and R&D. There's no doubt we're going to be spending money on the footprint, so there will be more investment in the business. I don't think it necessarily transforms the picture I showed you. And I wouldn't be trying to suggest to you it just continues to kind of trend up from the right over the next 10 years. But all the things we're doing on footprint, supply chain, overhead structure and an investment in the portfolio, I think there's no doubt we can continue to earn pretty good returns on the capital base.

Lawrie Haynes

Executive

A question there and then we'll come over here. Thanks.

Christian A. Laughlin

Christian Laughlin from Bernstein. Just 2 questions, please. When you talk about being a consolidator in the Marine market, how much of that is through market share gains and how much through just acquisitions, say over a medium or a long term? That's the first one. And then second question, focusing on Marine services. What do you see as the main drivers of market demand for long-term service contracts in Marine. For example, in Aerospace, airlines like the certainty and predictability of what their service costs are going to be. And do you see this industry shifting into it, over the long term, just like Aerospace has grown into predominantly power by the hour structure?

Lawrie Haynes*Executive*

Okay, thank you very much. I'm going to ask Mikael to respond to both of those points. But I think one of the things, I think it was Sauli who mentioned that we've recently acquired the permanent magnets technology. That was a small acquisition, but it was a pointed, very focused acquisition simply to deal with one part of the technology that we felt was important when we're going into a kind of [indiscernible] and harsher environment. So that's the kind of, kind of small consolidation that we see, but perhaps I'll ask Mikael to respond to the wider question.

Mikael Makinen*Former President of Marine Business*

Okay, thank you. Exactly as Lawrie said. I don't think that the consolidator means that you have huge M&As, but it's technology that we have to require -- acquire. That's what I tried to say in my presentation and then you go to intelligenceship and you go to big data, that's the type. So -- and as we said on the R&D side, yes, more than today but still very moderate. So the future consolidator is not the one who has the hugest portfolio hardware. It's the one who understands how to use data to take care of that hardware. And on the service side, Andy, maybe you can elaborate a bit. You need a microphone.

Andrew Heath*Former President of Energy*

Yes, on the service question. We definitely see that, that long-term service agreements in Marine will take on the same sort of value proposition that we've seen in Aerospace. So it is risk reduction for the customer, predictability in the cost structure they'll have on services. But also some of the things that you heard mentioned in the innovation side and in Mikael's presentation about where the technology levels are going and where the crew sizes are going. So the shipowners in the future are less and less able to do their own maintenance activity on the vessels. So I can't make a prediction for whether it gets to the same level as TotalCare is in the Aerospace world, but we certainly see it to be an increasing part of Marine service market.

Lawrie Haynes*Executive*

Okay, thank you.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

Ben Fidler from Deutsche. There's 2 questions. Firstly, one for Ulrich, actually. Sort of maybe a two-part question to that. Can you outline what real tangible synergy is so far? I know it's still relatively early days but being owned by Rolls Royce has brought to you. And secondly, just looking at this year's trading pattern and actually last year's trading pattern. Your business is extremely second-half loaded. Just to understand if you can help me understand, explain to us, why it has such a second-half loading in terms of the profits compared to the first half profits? And I'll come back with the second question...

Lawrie Haynes*Executive*

First one on the integration -- maybe I'll give you an introduction and then we can ask Uli for his kind of reaction from that. And I tried to give you a bit of an outline in my kind of opening about where we see

the synergies coming and lying. And just to give you a bit of background, what we did when we acquired 100% of Power Systems, we brought together the small team. It's basically the team on this table with a couple of other people. Markus Bergmann, who is the Strategy Director here. We got together and we said "Okay, now we have 100%. What do we do about creating synergy values?" And we identified what we call lighthouse projects. We identified about 10 lighthouse projects, of which about 8 were revenue-generating projects and 2 were cost-cutting exercises. We've been working on honing those down, and we've gotten them down to about half a dozen now. And I took you through some of the ideas that came up. But let me just give you a quick picture of how I see it. The lighthouse projects, engineering, that's what we do. We've seen very clear opportunities in using, for example, the Indian tune-up [ph] facility that Power Systems has, so that we can now integrate the Marine people from Mumbai, from high-cost areas into that facility, a very clear opportunity. We've looked at technology, gas technology that's in the Bergen engine. We have got a gas engine in Bergen, Power Systems does not. So the opportunity for us to use that technology to take it into Power Systems is a very clear one. Fuel diversity, I hope you've seen this morning, is going to be one of the key issues going forward in the medium term. Injection systems, L'Orange, we've got a brilliant injection system as part of Power Systems that we can now use to influence and part of Marine. Systems intelligence, we've talked about that. Pulling the 2 businesses together with -- when we've got additional equipment in energy health [ph] monitoring gives us the level of data that we need to turn into information then to sell in terms of intelligent systems. The things that really strike me about what we've acquired as part of Rolls Royce Power Systems is we've got a Center of Excellence in Friedrichshafen for reciprocating engines. I think it's second to none. So the opportunity for us to consolidate our whole thought process towards reciprocating engines in Friedrichshafen is very clear and very key. We've also got in Rolls-Royce Marine in Norway, a fabulous Center of Excellence in terms of understanding the offshore market. So the opportunity for people in Friedrichshafen to learn on the Offshore market and look at clear opportunities there. If you look at the Bergen engine, the Bergen engine has usually been operating in the Marine market. With the acquisition of Rolls-Royce Power Systems in the landmark, it gives us a further opportunity to sell Bergen engines on land. The footprint. One thing that Power Systems has been doing is they've been developing their footprint in China. Uli is developing engines in China. Rolls-Royce Marine has a small facility just outside Shanghai. The opportunities to move those 2 businesses closer together to use those resources is obviously an opportunity. If you look at the naval business, very close similarity between the customers that Uli sells to in Power Systems -- and that Don [ph] sells to within Rolls-Royce Marine. Same customers using the same types of regulation for bidding, with the same types of product. And as I said in my piece, the admirals that I'm talking to say, "Please put them together because we'd like to have a consolidated proposal from you." If you look at purchasing and supply, we're only at the kind of foothills, now, of understanding exactly what opportunities will come from a collective business of -- on both purchasing and supply chain. Another very small area, but it's all cost, it's all saving, is marketing, joint marketing. My first kind of entry into the Marine market was to see 2 shellies [ph], there was an MTU shelly [ph] in the north shipping and the Rolls-Royce Marine. Sitting not far apart, that was when there was a joint venture in Rolls-Royce Marine. The opportunity for us to bring those together to put joint marketing opportunities out into the market but also to cut costs in only having one facility, very clear. The services, the distribution network that Uli's got, absolutely brilliant. Rolls-Royce Marine can learn a lot from that and bring those services together. And then of course, the prioritization research development and CapEx, again, clear synergy opportunities. And I think most importantly, you heard from Mikael Mäkinen, the approach to the three-pronged strategy. One thing that I've learned a great deal of over the last couple of months is to bring the team together. When you bring a team together like this, they spark ideas off and come up with the view that you could have disruptive technology if we pool our labor and pool our knowledge. It's very difficult to put a value on that, but I think we're positioning ourselves very well for that kind of long term kind of market opportunity. So that's a quick -- I'm sorry, it's a quick summary but I'll pass over to Uli, and he can put some depth into that.

Ulrich Dohle

Former Chairman of the Executive Board and Chief Executive Officer

Well then, much more to say. Maybe one small thing to add on the practical side. IT systems is also something where we -- where we see future opportunities to improve the overall set up. We have been investing in most modern SAP systems over the last 10 years, a lot of money. And I think Mark mentioned

before that in the Marine side -- Marine work, you have different ERP systems, which do not maybe communicate in all cases. So there is something that we can bring to the party also. Your second question, something more difficult to answer. Your question was why we are always so backloaded in the -- I'm 5 years, 5.5 years now with the company. It's my sixth year where I've seen the phenomenon and I really don't understand why it is that way. There are some facts, of course. We have governmental businesses, we have businesses for -- that are due to be delivered always in the last quarter. And we have Marine business where we get orders some years in advance and where we know that the ships are being ready for the engine to be built in, in certain periods, which is normally the second half of the year. So we do historically, 60% of our turnover in the second half. And this is also the -- the revenue then also the cash comes in. So we somehow balance it out in the company, in the factory by prebuilding some components so that we have a better even load distribution during the year. But we always try to better smoothen it over the year. It's very difficult to do obviously.

Lawrie Haynes*Executive*

Okay, thank you.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

The second question, which was just one, possibly just for Mark, or picking on one of Mark's summary points, which is for the future decade, you see growth continuing, kind of the implication was similar to the last decade. Just maybe I'm being a bit slow this morning, but just to reconcile. You've grown your top line 8% CAGR over the last decade. You're talking about Offshore, which is 42% of your own market growing 3%. Marine, which is 10% of your sales growing 0 to minus. I wasn't an A grade at maths, but the weighted average doesn't sound like 8. Or am I misunderstanding what you were trying to say?

Mark Alflatt*Former Finance Director of Marine Division*

No, I think you probably were in A grade at math, but I think you do yourself a disservice. The point I think that came out through the presentations this morning, the points around the opportunity and even just some of the points that Lawrie's just touched on, there's no doubt when you look at this sector, the challenges are getting tougher. The broader industry challenges are getting tougher, increasing environment legislation. Some of the challenges of operating in deeper waters are creating more opportunities for this business than we had -- when you go back to start of that timeline. There's no doubt about that. The opportunities, which we see coming out of the relationship with Power Systems as we integrate those businesses. And I think the final element we touched on a couple of times just around the services model. Services is only around 1/3 of our business today. I don't think it necessarily reaches the 60% plus that we see in Aerospace but there's no doubt it can grow. It can grow as we take more advantage of the service network, both our own and what's in Power Systems. It can grow as we get more capture rate of our own vessels and more capture on the vessels. So I think there are a number of areas where we're still in the early phases of actually capturing what's out there. So I hear what you say about the fundamental markets, it's -- those areas we're going to be able to extend into. And I think driving the services business model is clearly a big opportunity for us.

Lawrie Haynes*Executive*

I'll also go on to say that in my kind of short talk, I talked about the delivery. And 3 years ago, we're delivering original equipment at 30% and now 92%. One of the things that John Rishton's been really clear about is responsiveness in customer. If you deliver that kind of 90% plus every time, then your market opportunity goes up. We were delivering at 30% and still winning market share. So the opportunity is there, that if we can kind of continue to replicate that, which I believe we can, and improve, then that market opportunity widens. Thank you. There's a question here and then we'll come on to the webcast.

Tristan Sanson

spglobal.com/marketintelligence

Exane BNP Paribas, Research Division

Tristan Sanson, Exane. A few very basic question on the main business. In Offshore, can you give the split between anchor handling, PSVs and other business? I'm not sure I got it from your presentation. The split of revenues between anchor handling and PSVs and other businesses. Second would be can you give us a feel on the margin mix between the various activities between naval, merchants, anchor handling, PSVs? Which one are above divisional margin, which one are below? And final question on pricing in the industry. Is it a secular trend of annual small pressure on pricing? Is pricing cyclical just like volume? Is it going up every year like for spares like in [indiscernible]? How should we look at it? Thank you.

Lawrie Haynes

Executive

Interesting questions. I think I'm going to ask John to address those. I think the first one was anchor handlers and PSVs. Want to give a...

John Knudsen

In general, as a comment, it's difficult to split in 1 year. So I would say that it fluctuates from year to year. And some years, the PSV is big; and then the anchor handlers, it becomes big. What we've seen in the last year is now that the PSV has been quite big. Now we believe the anchor handlers are getting bigger in the subsea construction. So go into details and split that is very difficult. And when it comes to the margin picture, normally on the high end of equipment, then there's normally a better margin than when you come in small to the commodity. And in our world, the PSVs are more commodities than an anchor handler for instance. And your last question was...

Lawrie Haynes

Executive

The pricing trends.

Tristan Sanson

Exane BNP Paribas, Research Division

[indiscernible]

John Knudsen

To go in to do the splits here is the same answer. And when it comes into the pricing mechanism. We are definitely businesspeople. So in high peak, we definitely want to get maximized value. And of course, in tougher conditions, we take what we can. But of course, the key market share is also important. And what we have demonstrated today, hopefully, is that this is a true enough [ph] business model that goes over 25 years. And I can promise you that we do not take contracts if we don't see an overall sound business.

Lawrie Haynes

Executive

Okay, thank you. [indiscernible], you've got a question on the webcast.

Operator

Yes, a question from Nick Cunningham at Agency Partners. And it's a question on the price of oil. At what barrel price does the significant part of the Offshore ENP that is currently planned become unattractive and start to impact your end market volumes? Conversely, is there a barrel price range, which favors offshore above onshore?

Lawrie Haynes

Executive

Okay, thank you very much. I think Mikael, do you want to do that?

Mikael Makinen

Former President of Marine Business

First of all -- I mean, if you start with the oil prices, nobody can, of course, match Saudi Arabia where it's \$2.50 per barrel. So that's the lowest, lowest range. And the highest range is then the unconventional oil where it can go up to 80 to 100. And offshore is somewhere between 45, 65. Then, if you will go to Arctic, it will go further upward. So it really depends on the area, where you are. It's not only dependent on the water depth. It depends on the area. It's more expensive in -- outside Brazil because you have to drill through salt, 20 meters of salt and on the way down and so on. But we are, still today, the oil price is far above that.

Lawrie Haynes*Executive*

I think as well my response as well to this question is that we are looking at this as a kind of long term, as a 30-year program. So there are various people not just looking at the short term when it comes to investment. They're looking at a much longer cycle. So it isn't directly appropriate to say well, the oil price has come down this week, and therefore, it's going to impact on the long term.

Mikael Makinen*Former President of Marine Business*

No, I mean if the oil price would be for 2 years below 50, then it would have definitely the impact.

Lawrie Haynes*Executive*

Okay, next question.

David Howard Perry*JP Morgan Chase & Co, Research Division*

It's David Perry at JPMorgan. If I just go back to your July guidance rather than the guidance from Friday. For Marine, you were guiding to sales down 10% at constant currency and Power Systems around flat. About cellar [ph] at that stage was still guiding to plus 5. So I just -- and the CEO, your big CEO, John Rishton, made some quite open candid comments back in February about market share and the need to have more medium speed diesel to cross-sell the equipment. So are you losing market share? And does that correlate to Mark Alflatt's comment about this business, Marine business having been underinvested over the last 10 to 15 years?

Lawrie Haynes*Executive*

Okay, thank you. I think in terms of the kind of general view, what we've seen over the last few months is actually a degradation, particularly in the very short-term market, the spares market and some of the upgrade market. I mean it's very -- as Mark stated earlier on, there's a very limited visibility on that side. So that's where we've seen some of our customers, and we can -- all we do is react to our customers. We're not a market maker in this sense. So we react to our customers and that market has come off over the last few months. So I think that's one of the key issues, if you like, over the last -- from the half year to today. I'm going to ask Mark -- perhaps he could respond to the wider question there.

Mark Alflatt*Former Finance Director of Marine Division*

In terms of market share, I guess, Dave, you were getting at. One of the observations I think we've tried to get across, and it came out in 2 or 3 places today, we've got a very wide range of products that we do, more than 200 different products across vessels sections. So being able to look at individual sections and say, well, are we doing well on market share there, there or there, is quite difficult to turn that into something that's really useful to you because in any given year, you'll have a certain number of vessels ordered. Even John just touched on we've had a number of good years for PSVs, but anchor handlers have been relatively small. So you might look at market share for anchor handlers and say well, actually Rolls-

Royce did really well at anchor handlers, but there were only 20 vessels of all those [ph]. So looking year-to-year without the market shares doesn't necessarily tell you the picture. I think in terms of, at least in the Marine piece, I'll let Lawrie [ph] talk about the Power Systems piece. Within the July guidance in terms of what was happening to revenue, part of that was reflecting we could see last year coming out of 2013 that we had seen a slowdown in the Offshore sector. We could see that in the order book. We could see we expected that to hit this year. So that's been part of the picture this year. So I don't think that necessarily tells you about the market share in the Offshore piece. I think it's just telling you there was a slowdown in some of the vessel types. And we could see that coming through the OE revenue line. The other element, as Lawrie has exactly said, it's that the aftermarket piece is a Time & Materials business today. Customers have more discretion about the timing and placing of those orders. And it's been slower. And that's -- that is the nature of the marketplace. So I think it's quite difficult to say we're losing market share across these ranges, and that's impacted the 10% down. I think it -- cycle across some of those vessels types, which we could see coming at the end of last year. It was in the comments we made.

Rupinder S. Vig

Morgan Stanley, Research Division

Can I just ask one follow-up for Sauli, please? I hope I pronounced that right. Maybe I misunderstood it, but if I go back to the 4 years ago presentation and all the work I've done, I thought we were on the cusp of a big wave of new regulations on emissions coming in around 2016. And that was also why Tognum had been spending a lot of money on a new family of diesel engines. But in your presentation, you didn't seem to refer to that. You talked about something out in 2025. So have I got it wrong? Or is there some regulation that's coming right now that is going to drive demand for new equipment?

Sauli Eloranta

There was this NOx regulation that was postponed. So the whole industry was preparing for that Tier 3 introduction. And I think it was January 1, 2016 when it was supposed to come in force, and it was delayed. And that is also just for newbuilds. And today, you have a downturn in sort of merchant shipbuilding. So that's also not impacting that many. The number of annual newbuilds is lower in merchant shipbuilding than it has normally been in the peak years. But that was kind of maybe the thing. So the one in post-2020 is the global regulation for sulfur emissions that I was referring to. But sulfur emission is in a way impacting the entire fleet of 130,000 vessels in the world. So that is a massive change compared to this NOx thing, which is impacting newbuilds. But of course, for newbuilds that's a massive change if you want to go to Tier 3 compliant.

Lawrie Haynes

Executive

[indiscernible] The picture is much more diverse. We see different emission legislations in the segments of Marine, different from construction industry equipment, different from Power Generation. And again, different from specialty areas like rail and locomotive. And these emission limits and the introduction dates are again different, in the different area of regulated countries. So EPA controlled are different from the one in Europe. Basically, the Tier 4 emission started 2012 with Tier 4 interim in the EPA and then it was followed by TFA [ph] finally in '14 and '15, depending on what area you're talking about. For Europe, we just have seen introduction of emission Stage IIIB for locomotives in 2012 and for small engines now in 2014. So we had a big prebuy effect in 2013. For what Sauli is referring to, the IMO legislation that was actually postponed from 2016 to a later time, was not fully adapted by all countries. So the United States, for example, insist to have this legislation being implemented in 2016 around the coastlines of their territory. So if you want to enter the environmentally controlled areas around North America, you need to comply with the same emissions that would have been necessary for [indiscernible]. So if you're a Tier 4 -- so we have to have engines available for this emissions legislation. So it actually has been the key driver in the last, let me say, 10 years for us to renew all our engine lines, small ones, big ones, very big ones, to make them comparable with emission legislations that have been started to be implemented in 2011, '12 and will continue to '16 and now in Europe. So we have to have that -- we are talking stage 5, which would be implemented from '19, '20 and '21, depending on the power range that you are on. So we are constantly basically working on solutions to make our engines fit for these restricted markets.

Lawrie Haynes*Executive*

I think I'll just follow on from that. [indiscernible] as far as I understand it, and I'm not the expert here, Uli is. This is an on-off switch. If do not comply with the tier regulation, the IMO regulation, the environment protection area regulation, you cannot sell products for that market. [indiscernible]. So it's a necessary investment that we make in order to be in the market. It's not a question of well, we'll do this because we think the customers want it. It's a requirement.

Unknown Analyst

Just to follow up on that. Well, you said there was a lot of different regulations. It's obviously, much more complicated than I make -- suggesting it is. But it just seemed to me that a big part of the Tognum investment case, which you've clearly spent a lot of R&D over the last 6, 7 years, your new family of engines is ready now. And yet it seems as if it is not mandatory to buy those engines in large parts of the world. Is that a fair assessment? Does that change the business plan at least near term for the engines you've been developing?

Ulrich Dohle*Former Chairman of the Executive Board and Chief Executive Officer*

To the third portion, you're right. We're selling the majority of our engines into not regulated countries. So that is where, let me say, the old generation of engines are still being produced and are available and can be sold. But if you want to play in North America, in Europe, and if you want to sell your engines into these areas, you have to have engines available that comply with the latest and most stringent standards. So basically, we have everything in our portfolio. And it just a question of time when other countries like China, for example, will follow emission legislation that are being applied in Europe or in the U.S. We see this happen for unrolled [ph] applications for trucks, for passenger cars. And the same is being -- is taking place and going to take place in countries like China and India, which are big markets for us. So I think we are well equipped, and we are well invested in having the latest technology available. And the one thing is that our main competitors also invested heavily in new technology engines. So unluckily, the prices of engines go up with much more technology. But it happens to all our competitors, so I think we're in good shape there.

Unknown Executive

John, do you want to comment?

John Knudsen

Just a quick comment from the market side. I really do believe that when, in reference to China, for instance, pollution in China, that will be also a key demand from these kind of countries. So when the IMO Tier 3, or whatever we call it, kicks in, is [indiscernible] big graphical spread than what you could foresee in 2016. So to be prepared for that future, I believe is a strong benefit because it's not only about the engine. It's about the complete system that, that works proper. And then that should be operating in even harsh environment as well. So there's a pro and there's a con for this matter.

Lawrie Haynes*Executive*

There's a question towards the back there.

Rami Yehuda Myerson*Investec Bank plc, Research Division*

Rami Myerson from Investec. 3 questions. Mark, you started your presentation and you commented about seeing Rolls-Royce from the -- externally in your perception and after being here for 5 months in the business. How do you perceive the business, particularly to your competitors and to best practices? And what do think -- how do you perceived the gap to best practice to be on operations? On second question for Mark is thinking about the cost savings, you described an opportunity, which would suggest more than

GBP 100 million of cost savings. And trying to think about -- I imagine there's some pricing pressures that are going to offset some of that and maybe other things that we haven't identified that could offset some of that cost savings. And lastly, relative to the beginning of the year, your customers have deferred their services. I'm sure you have had conversation with the customers. From those conversations, what is causing them to defer some of those overhauls and some of the upgrades? If you could provide some of that quality [indiscernible]...

John Knudsen

I think what I'm going to do is ask Andy again to respond to the last question first. And on services you'll get direct knowledge from the person that's at the front.

Andrew Heath

Former President of Energy

This is always difficult because I stand up after the question's asked and I can't tell who asked the question. I don't know where to look. Okay, thank you. Yes, so, in terms of the customer feedback on some of the deferrals, I mean there's a variety of reasons, of course, that go on, and typically, it has to do with their ability to secure contracts for their vessels. So just in some cases, just a matter of timing, 2, 3 months takes us over to the end of the year into the following year. That sort of thing. So I wouldn't say there's any major trend going on in the deferrals that we've seen, where we have seen them. But typically, it is related to timing of the contract they have in the vessel that they want to get. In terms of upgrades, it's a little bit different because upgrading a vessel or a rig will sometimes take it into another category of marketability for the -- for our customer to take to their customer. And so, as Mark pointed out, I think there's a lot more discretion in how they spend their CapEx money. So on the maintenance requirements that they're differing are typically coming out of their operations and maintenance budget and the upgrades that they want to do are coming out of a capital spend budget out of a CapEx system. So a variety of reasons, but in principle, on the ones I think you're referring to, it has more to do with their ability to get those vessels on contract themselves.

Lawrie Haynes

Executive

Mark, do you want to respond to the cost savings question?

Mark Alflatt

Former Finance Director of Marine Division

Yes, I mean I guess your question was driving at, "Well, what's that going to do to margins?" And I think maybe if I can go back a stage because the things we're putting in place now are not new initiatives we've kind of chased over the last 6 months or 12 months. When we started to look at this picture 2 or 3 years ago, it was clear that we needed to transform our cost base. And we set out with a number of opportunities around the structural part of the cost base. Our footprint, the way we're organized, the elements I talked about in overheads in terms of systems and then the sourcing points I touched on at the end with engineering and purchase. And we'd set for ourselves an objective at the time around 15% of the cost base. That's what we felt we needed to do, which on the steady-state base, was somewhere around about GBP 300 million of costs over a number of years to drive that competitive offering. And that was again, some environment we were seeing, particularly on the OE side of volumes falling and prices under pressure. So that's the kind of framework we set out with. And then I've kind of showed you the progress and the various elements. Your GBP 100 million, I guess, is about right for some of the spend, for example. I guess the way -- if you look at the business today, I've said there are going to be some minuses as well as some of those positives. Pricing is not getting any easier. John talked about the environment, particularly in Offshore. I think it's fair to say the Merchant sector is still pretty challenging. Volumes are still pretty difficult, and pricing is pretty aggressive. So I think pricing is a negative this year. I think the kind of things we're seeing in the market in many of our OE businesses is still pretty difficult on the pricing environment. I think you should expect us to spend a little bit more on R&D so that will be a bit of a burden on the margin. But I guess when I kind of add them all together, the things we're doing on a structural cost, on the footprint, on the sourcing changes on engineering, on overheads and systems. I

think there are some net opportunities in all of that and then we overlay the opportunities we'll gather as we kind of consolidate and integrate our Power Systems and we'll see.

A big driver, as you'll see in this year, in terms of mix is the aftermarket and that tends to come with a higher return. So there's no doubt when we look out over 3, 4, 5-year period, that these current range of transformation programs are going to run. There are more positives than negatives, absolutely. At any point in time, frankly, it's going to be reasonably balanced by the revenue mix. And that's part of what you've seen this year.

Lawrie Haynes
Executive

Okay, thank you. Mikael, I know we are running out of time so a quick commentary on your experience.

Mikael Makinen
Former President of Marine Business

On my experience, I went through a few items in my presentation. But if you really look at it, innovation and engineering, I think -- we are world-class. Now we are talking about the Marine industry. As Mark said, we need to spend a bit more to get it, a number of new generations of our products. Agility, I think that there we have a way to go. By agility, I mean, reacting to the market, changes in the market, but also implementing effectiveness measures. I think that that's an area where we could be faster. Customer focus, very good in certain markets like Norway, for example, but maybe not worldwide as customer focused as we should be. And then we were talking about Asia that we need to be stronger there also.

Lawrie Haynes
Executive

I think we have time for one more question.

Unknown Analyst

[indiscernible] in days of yore, when we were vicars, and we had all the synergies with battle tanks and baby incubators, selling the UT design was regarded as the way of pulling through our product. Latterly, we've -- I know we're going back. But latterly we started talking about the engines as being the pull through for the product, so which of the 2 is it, or is it both, or is it some combination?

Lawrie Haynes
Executive

The answer is it's both. It's interesting when we go -- depends, sometimes if we go to the owner. They'll specify that -- they'll identify what products they want and some time it could be they want the Bergen engine or a particular high-speed engine and then the rest pull through. But quite often in the market we are finding that our tech machinery, some of the great components that we've gotten and people will see later on, that's the pull through for us and then to sell the engine. So it is both. Okay. Mikael, do you want to...

Mikael Makinen
Former President of Marine Business

Just a quick comment on that. Any shipbuilding project starts with the engineering, starts with the design of the ship. So whether you call it pull through or not, if you are into that design phase, you are interfering with the customer at a very much earlier stage than when they start buying components. So -- that might be that then the real pull through is then, the engine in the end but you'll get into the project earlier with the design. So it's both.

Unknown Attendee

This is quick. So if I sense that's there's fewer UT designs selected in a year because they've gone to Holstein [ph] or Vard [ph] or somewhere, should I be alarmed by that? Or should I sort of just regard that as life?

Mikael Makinen

Former President of Marine Business

John, what do you think?

John Knudsen

I don't think you should be alarmed at all. I think that we have 2 different approaches. One is definitely to sell the -- our own UT ship design. But the other one is that, which I showed you earlier today, that we have 70%, 75% of the winches on an anchor handler. So this is really about the blend of the margin and the volume. And I think we have to accept that yards are also building up ship designs and groups inside their yards. So it's really about making sure that you win when it comes [indiscernible] our own ship design that we win the packages. And if the customer comes and asks for you to design, we give them then the complete offerings. So to me, that is business. It's just to make sure that we are in good conditions for the 2 different business dreams [ph].

Lawrie Haynes

Executive

Okay.

Mark Alflatt

Former Finance Director of Marine Division

If we look back at John's business for the last 18 months, the tenders you've been winning have been as many about where you're designing as actually where you're providing equipment onto other designs, so you won in both of those spaces, I think.

Lawrie Haynes

Executive

All right. Well thank you very much. I'm going to conclude now. If you don't mind, I'm going to thank my team very much for their efforts both in preparing for today and the presentations. I hope you found them useful, beneficial. Part of the intent of the day was to partly educate you to what the Marine market is. I hope you found that beneficial.

So with that, I would like to now conclude the webcast and close it down. Thank you very much.

Simon Goodson

Former Director of Investor Relations

Okay. Good evening, everybody. For those that don't know me, my name is Simon Goodson. I head up the group's Investor Relations activities. Just a few housekeeping items before I hand straight over to John.

Firstly, safe harbor language that many of you have heard before. Over tonight and tomorrow, you will hear various forward-looking statements about the group and its underlying businesses. Those statements are based on our current view of the future and, of course, can change over time. So please take them in that vein.

A couple of other housekeeping points that you should be aware of, particularly relevant for people in the room. Although some may think that we would have planned it, there is no fire alarm planned. So if the alarm goes, please make your way out of the room and exit the building left or right, and we will gather outside as soon as possible.

Normal mobile phone protocol applies. So please put mobile phones and other equipment into flight safe mode or even switch it off would be even better. In terms of the running order this evening, John is going to speak for a few minutes before John and Mark host the question-and-answer session. We will be done by quarter past 7, 19:15 local, prompt. For those around the world, that is U.K. plus one hour.

One final thing that everybody should be aware of, that we will be, over the next day and a bit, filming the events. So please, smile for the cameras, if you can. If you are asked about the event, we would welcome your honest views about the event or otherwise. So thanks very much, and thanks for coming to Norway.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Simon. Good evening, welcome, thank you very much indeed for joining us here in what is probably the wettest part of Europe. I am told reliably that Bergen, it rains 362 days of the year and maybe 1 or 2 days less here. It's really good to see everybody here. We do appreciate the amount of effort that you've made to come and visit us.

Earlier this year, we were criticized about our communications, and we committed to try to improve those communications. And if I talk about communications, I'm going to split it into 2 parts. The first part is really about helping you understand our business better. And clearly, bringing you to Alesund, clearly, getting our Marine team here with the events that we've got planned over the next day, is part of helping you understand our business better. The second part around communications is updating you on the business and how the performance is going. And as you are all well aware, on Friday, we issued a trading statement, which covered the current year 2015 and the medium-term outlook.

We had a lot of feedback from the announcements that we made on Friday, as you would expect, and we will reflect carefully and thoughtfully on the feedback that we have received. We are trying to go from providing only in-year guidance, to providing a lot more information. And I know, because you've told us so, that you want more information, and that we didn't fulfill everything you expected us to do last week in terms of the information requirements. We understand that, and we will reflect carefully, as I say, and thoughtfully, on how we can improve that.

The fundamentals of this business are strong. You are aware of that. You're aware that on the civil aviation side, the demand for aircraft in the future is underpinned by growth in emerging markets, where we're seeing 100 million people a year enter the middle classes. We're seeing huge population growth over the next 10, 15 years, 1 billion more people on the planet by 2025.

You're also aware that the carriers today, with the fuel costs, are looking for all ways that they can to reduce that primary cost of their business. And the way that they do that is by replacing old kit with new kit. So the demand on the civil side of the business, the fundamentals there are strong. The fundamentals

on the land and sea side of the business are different, but equally strong. The demand for energy in the world will increase, and it will increase significantly in the coming years driven by the same or similar factors: population growth, urbanization, increasing affluence. So any forecast you look at for energy growth, you will see an increase. But in the short term, we are being impacted by the economic environment, and we have seen that deteriorate quite quickly in the recent months.

And the thing that you have all seen, for example, is the reduction in fuel price, oil prices, over that period of time, from around \$100 a barrel, down to, I think I saw it at \$83. I don't know what it is today. Significant reductions there. That says that we have to focus on the things that we can control rather than the things that we would like to control. It says that our revenue line is going to be impacted, which means that we have to put more effort into accelerating our focus on cost, and that's what we will do.

Let's move to land and sea. Let me show you a video.

[Presentation]

John F. Rishton

Former Chief Executive Officer and Executive Director

The anchor handler. I've been on one of those. Fortunately, I have to say, it was in the harbor, not out at sea. I have the greatest admiration for the people that go out there on those ships. It doesn't look particularly attractive to me.

Tomorrow, we're going to get you out on a ship. You'll be delighted to know that in your packs, when you get to the hotel, you'll find a poncho and a warm hat. I would advise you to bring them tomorrow.

1904 was a big year for Rolls-Royce and a big year in Alesund. 1904 Rolls, Henry Rolls -- Charles Rolls met Henry Royce in the U.K. and they formed this company. In 1904, in Alesund, the town burned down. It was made of wood, entirely of wood, and a cow kicked over a lamp, burned the whole town down in January. It was completely rebuilt from stone, and is pretty much as you see it today. It is a very attractive town, and one that I would recommend that if you get any chance, you have a little look at.

Norway is about 0.1% of the world's population. It punches well above its weight in terms of the maritime industry. It controls the second biggest maritime fleet in the world, and it has leading technology in this country.

We have an important place to play -- part to play, in Alesund. We are an important business in this area. If you look around Alesund, you will find 14 shipyards. You will find over 100 suppliers. You will find 22,000 people employed in the marine industry, about 3,000 from Rolls-Royce.

We have this center, which is our technology and training center, which is where you're sitting now. And here, you're going to find and you'll get a chance to see some of the most sophisticated simulators that there are in the world. I would encourage you to have a look at them tomorrow, because if you don't get sick on the boat, you'll probably get yourself sick in the simulator.

We have a factory at Ulsteinvik, which is a ferry ride away from here, about 30 minutes' drive, where we make thrusters. Our steering gears are made in another factory in Brattvåg, which is about a 30-minute, 40-minute drive around the fjord. And we have, on an island called Longva, our automations and control business. This is an important center for Rolls-Royce, an important center for maritime and the industry. Very important in terms of the Oil & Gas business.

Tomorrow, one of our most important customers, Island Offshore, is lending us one of their vessels, Island Pride, which is a PSV. It's a UT-designed vessel. UT is Rolls-Royce designed. There are 800 UT vessels that have been made. The first one was made 40 years ago. It is still in service today. We get decades of revenue from these vessels. The original designer worked for this company, his son works for this company. His son is currently designing the most complicated and sophisticated UT vessel that we have, the UT 777. I was delighted to learn that, because I reckon it's the only way I'm going to get an engine on a 777.

These are the mega trends that drive our growth. As I've mentioned, 1 billion more people on the planet by 2025. Urban growth, 1.5 million people more per week moving into the urban areas. 100 million people a year join the middle classes. Climate change, a major issue. 90% of the world's trade is by sea. Much tighter regulation on emissions in marine.

Rather surprisingly, other areas, whether that's cars or aircraft, had much stricter emissions controls for much longer. But emission controls is a huge and changing issue within our industry, and we have the technology to address that.

Huge increase in energy demand, and say 30% increase in demand for energy around the world in the future. So these are the global trends that are driving our business. And there are very few companies in the world that have the capability to be able to address these trends. We are a complex, integrated power systems business. That is the common spine across the whole of the company. It's what we do. And what you're going to learn over the next day is how complex some of the business is that we do in Marine that many of you will think is fairly straightforward.

This is a complex, integrated power systems business, with an original equipment and aftermarket market. That is a common element across Rolls-Royce. And what's interesting in the Marine business, particularly in the Oil & Gas business, is that oil finds are further out at sea and deeper down. The environment in which the oil companies have to invest is getting more and more challenging, and that plays to our strengths. The original oil and gas vessels that we use in the Gulf of Mexico proved useless in the North Sea because they couldn't cope with the conditions. That's why Norway became the center of expertise for developing those vessels that could cope with harsh conditions, that could manage deep sea exploration. That's what we do. That's what we are, and that's what's there's going to be more of in the future.

We know that the oil companies, whilst they are reducing their investment at the moment, will inevitably have to increase their capital expenditure in the future to explore those deeper and more difficult to get to fields. That plays to our strength.

Innovation also plays to our strength. This is a picture of something that's called an Environship, and there's one operating just down the coast from here. The second one will be in China. 90% less NOx, 40% less CO2 than its predecessors.

In the Aerospace business, I'm spending billions of pounds employing brilliant people, and they are driving 1% fuel-efficient improvement in a year on average, 90% reduction in NOx, 40% reduction in CO2. That is an extraordinary transformation, relies on 4 critical parts to it: the engine; the hull; the Promas propeller and rudder system, and fortunately, there are people in this room that can explain those far more articulately than I can; and the hybrid shaft generator, which I'm sure you're all very familiar with.

That is the kind of technology that we do that transforms the business that is demanded in the new world where the environment and emissions are getting more and more important to the industry.

This is the Bergen B33:45, named by our marketing department that spent years trying to come up with a catchy name. The 33 is the diameter, the 45 is the stroke. We are not imaginative, but what we are good at technology. 20% more power per cylinder, significant improvement in fuel, reduced service cost. And here's the thing to put it in perspective of people who are used to the aerospace business, this took us 3 years and cost GBP 25 million. Now it comes off the block -- or it comes off the basis of the existing engines. So if we developed a completely brand-new engine, and Uli will talk about that -- Uli Dohle, who is the CEO of Power Systems business will talk about that, certainly, a little bit maybe tomorrow, but certainly, when we get out to Germany next year. 3 years, GBP 25 million, 20% improvement power per cylinder.

Designed in conjunction with our customers, who decided that was the kind of engine they wanted. The block can use gas or liquid. It doesn't require any change at the block. Very sophisticated, brand new, 3 years.

So let me just conclude this brief introduction with 3 things that I think will be helpful that you remember, because over the next day or so, you're going to get bombarded with information about our Marine business from a number of people that I'll introduce to you over dinner tonight.

The medium and longer-term demand in this business is strong. The fundamentals are strong. We have intimate relationships with our customers, particularly here in Norway. We know them very, very well. They know us very, very well. They talk to us all the time. We are aware of what they want and why they want it. That's why we can do the kind of things that we do. We work hand and glove with them. The underlying fundamentals of the business are strong.

We have some extraordinary technology. It is complicated and sophisticated. It is not quite as many of you, I'm sure, imagine. When you get to speak to the guys on the ship tomorrow, when you talk to them about what they do, how they do it, and how they rely on what we do; when you talk to people about the integration of those systems within the vessels; when you understand the critical nature, the mission-critical nature, the safety elements of them, it is extraordinary. A winch, which many of you will think of as being a simple item of technology that just winds in and winds out. Let me tell you, when you get to see the winches on an anchor handler, they take you to a different place. These are sophisticated winches, incredibly complicated.

Our head of innovation will talk to you tomorrow about what we're doing in innovation. So the fundamentals of the business are strong. Intimate customer relationship, strong technology, which sounds pretty much like our strategy: understand your customer, make sure that you satisfy your customer. Understand the technology, deliver superior technology that the customers want and need and are prepared to pay for. And in combination, we will drive profitable growth.

This is an exciting business. This is a really exciting business. This is a business with a wonderful future. This is a business that has grown up over many years. Norway is the heart of the marine business for oil and gas. Norway understands the complex nature of getting oil out of the sea in harsh conditions. Rolls-Royce understands that intimately. This is where we're from. This is what we do. And as the world wants more oil from difficult to get to places like the Arctic, this is the company they're going to come to.

Now Mark and I are very happy to take questions on anything you care to raise. Tomorrow, you will have a chance to ask questions specifically around the Marine business. But we'll take questions on anything you have today because we've got experts in the Marine business sitting with us tonight.

We've got microphones around. As usual, if you could wait for the microphone, if you could say who you are, and then we can take the questions. We also have the WebEx, and people on the WebEx can also ask questions. And I think, Jilinda and Simon, you're going to handle those, so we'll make sure that we come to you as necessary.

Mark, why don't you come on -- come and join us?

Question and Answer

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, questions. We have one just here. I think, it's a half-raised hand or fully raised? Fully raised. Just here in the front -- or in the front, the middle, on the side. Thank you.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

Jeremy Bragg from Redburn. I'm afraid I'm wanting to go back to the guidance, the medium-term guidance.

John F. Rishton

Former Chief Executive Officer and Executive Director

I guessed you might do. Fortunately, I've got Mark with me, so we're okay.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

I just wanted to understand about the decision not to guide on revenues, specifically civil revenues. I understand that the short-cycle industrial businesses are volatile, but you should have a pretty good idea of your revenue number in 2018 or whenever the medium term is defined as for civil, which has allowed you to give the margin target. So I wondered if you might comment on where you think civil revenues would be then, please.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, I mean, clearly, one of the things that we've disappointed people with is the absence of revenue information across the piece. And if I split that into 2 parts, there's the part -- the civil part, which you're talking about, and there's the Land & Sea. We reflected on that, and we decided that we wouldn't give revenue information at this time. I think that it is, at least to my mind, understandable on the Land & Sea side, which is the point that you're getting to, in the sense that trying to predict exactly when the economic recovery and who's going to spend what and those kind of things. Shorter cycle businesses are more difficult to predict, but we've been criticized for not giving that, and we've heard that criticism. On the civil side, certainly, one of the reflections we can give, is should we give some guidance on civil revenue? And I'm not clearly going to answer your question sort of off-the-cuff tonight, as you would expect, but what I am assuring you and everybody else of, is we are very clear on that kind of feedback and we listen to it. We are working hard to make the transition from providing only in-year guidance, which is what we've done for the last 30 years or whatever, long period of time, to in-year, next year and medium-term. And whilst that sounds relatively straightforward, it is -- it's a journey, in my view, and we know that we've got some way to go on it. But I take your point, we reflect on it, and we won't ignore the point. We'll reflect carefully on it. We'll come back and explain what we are or not going to do. Mr. Perry, right in the front.

David Howard Perry

JP Morgan Chase & Co, Research Division

David Perry, JPMorgan. So John, on Friday, you painted this dystopian view of the world: China's bad; Brazil's slowing; Russia's bad; commodities are down; Eurozone's weak; but your guidance seems to imply that all 3 of your industrial divisions are going to have rising profits in 2015. If I've understood that correct, can you try and square that circle for me?

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, I don't know, you want to comment a little bit on that? [indiscernible]

Mark Morris

Former Chief Financial Officer and Executive Director

I think in terms of -- this is 2015 you're looking at. No, I don't think you can infer that in terms of what we said so far.

David Howard Perry

JP Morgan Chase & Co, Research Division

You said civil's down, clearly, on the call. Defense, or maybe it's not down, but trending -- mid-teens margins is your trend and this year 40 and 70. To get to your profit guidance, MIPS has to be up significantly, and yet all this recent macro [indiscernible] that John talked about is going to be much more [indiscernible] in the next year than it is this year.

Mark Morris

Former Chief Financial Officer and Executive Director

Well, yes, I -- your math doesn't quite work...

David Howard Perry

JP Morgan Chase & Co, Research Division

Well, if my math doesn't work, can you clarify? Because I think everyone in the room shares my math. And we've all been on the same plane, we've all talked about the same thing.

Mark Morris

Former Chief Financial Officer and Executive Director

Well, first of all, we haven't guided any segment level. And of course, when you try and add up segment numbers which we haven't even given you for 2015 yet, other than some inference about direction of travel on civil relative to 2014, you can't conclude that assessment. And it's also just worth recognizing, obviously, when we talk about group and with the segments themselves, you can't just do a straight add up from segments to group because there is some intergroup trading as well that comes through. So some numbers need to get stripped out of there, but I don't think there's anything in there that suggests for a second that -- and we haven't given guidance on any of the divisions yet. So when we get to 2015, we will give guidance on 2015 by segments.

John F. Rishton

Former Chief Executive Officer and Executive Director

What I would say, Dave, is clearly, we've seen a weakening in those divisions during the course of this year. So you've got to get to what '14 is, then you've got to get to what '15 is, then we've got to understand what the civil growth is in terms of what's happening, what we think is going to happen next year. So there's a combination of moving parts there that make that the conclusion that you've reached, which I understand, but we'll reflect -- yes, we'll reflect on it. Then there's the range that we've provided clearly, which is a fairly broad range on revenue and a fairly broad range on profits coming off the forecast that we've got for this year. But again, I understand the point that you've made, and we need to reflect a little on that as well. Yes, let me go back over here.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami Myerson from Investec. Two questions. I appreciate that it's quite difficult to provide a number or a range 3 or 4 years from now, particularly given the volatility in the markets, but it would be helpful potentially to try and talk particularly in maybe the Marine business about sensitivity, particularly to the oil price, going -- moving from \$100 to \$80 or maybe different direction, how that would potentially impact the revenues, as annual expectations for growth in OE and services. And the second question is just on technical. The 80% cash conversion, because you've changed the definition, the cash guidance, can you just clarify what exactly that implies?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Okay. Let me -- maybe I'll get Mark to talk a little about cash. In terms of the oil price, clearly, a reduction in oil price will inevitably force oil companies to reflect on their cash flows and what it is they're going to spend and how much they're going to spend. And clearly, that isn't something that I control or isn't a direct tie between a price of this and the investment spend of that. But clearly, it's an important consideration. One of the things that Mikael Makinen, who's the President of Marine, is going to talk to you a little bit about tomorrow, is the cycle that we see in Marine and where we play in those different cycles. So what you see in the Marine business, the Oil & Gas business is, first of all, you've got the exploration part, so where is -- so there's the seismic vessels that we play a part in. Where is the oil? Then you see the development into platforms, supply vessels, anchor handlers. So you've got this cycle going on. So one of the things that makes it slightly more complicated, and Mikael, as I say, will talk some -- quite a bit more about this tomorrow, is where exactly are we playing in those cycles? So where's the value for us? And where do we think we are in those cycles? Because one of the things that may be slightly surprising, and again, I'm looking at Mikael, is that we've got orders for anchor handlers, which surprise a number of people, because people say that, "Well, anchor handlers should be down." But actually, we've got new orders for anchor handlers coming in because of where companies are on the cycle. So you've got the oil price, which determines in some shape, size or form, how much the oil companies are going to spend. Then you've got the decision in the oil companies about where they're going to put that spend. And that, to a certain extent, depends on where they are on the projects and what they're trying to bring online. I'm not an oil and gas guy, but if I understand their kind of business, the thing that they know about and understand the best is oil under the sea. They know that, they get that. That isn't where their major capital expenditure is. That tends to be in the big LNG and some of the more challenging environments. So there isn't, in my view, an absolute direct link that says if the oil price goes from \$100 to \$80, then this happens and this happens and this happens to us and vice versa because of the different cycles that we operate in. But this clearly is a linkage because it affects the total spend. I don't know if, Mikael, if -- you're going to cover a little bit more of that tomorrow, but I don't know what [indiscernible]. Is -- yes, okay. And on the cash conversion, Mark?

Mark Morris*Former Chief Financial Officer and Executive Director*

Your -- sorry, your question was about?

Rami Yehuda Myerson*Investec Bank plc, Research Division*

What's the definition of the cash conversion rate [indiscernible]?

Mark Morris*Former Chief Financial Officer and Executive Director*

It's versus EBIT.

Rami Yehuda Myerson*Investec Bank plc, Research Division*

Free cash flow...

Mark Morris*Former Chief Financial Officer and Executive Director*

Free cash flow of EBIT, yes.

John F. Rishton*Former Chief Executive Officer and Executive Director*

And again, if I just pick up on that, because it's a point that I made, and was made in the press release, but I want to go back to it. What we said in the civil business is as the OE levels off, you get the shift

between the aftermarket and the OE, which you're all familiar with. As the products mature, you've gone through parts of the launch pricing, you've gone through parts of the launch cost. As the volume increases, we utilize our capacity far more effectively. And what I said in June was, based on our view, that happened -- started to -- I used the term, inflection point, was 2018. I think a couple of people have said, "Well, is it really an inflection?" But what I mean by that is it starts to level off, and that's when you start to see the change in the dynamics of the things that I've just talked about, in terms of the financials, including the cash conversion. Yes, shall we come right to the front here? We've got 2 in the front.

Mark Morris

Former Chief Financial Officer and Executive Director

Ben, John.

Unknown Attendee

Sorry, can I just be precise? When you say free cash flow, you mean after interest, after tax compared to EBIT, that's what your -- or did you mean cash flow?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. Free cash flow.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Ben Fidler from Deutsche. Couple of questions. The first one is just coming back to your comment, I think, one of your opening comments, John, which is it's time to focus on the things that you can control with your costs. So forgive me, have you been 2.5, 3 years -- 2.5? We're 2.5, 3 years, whatever, into the The 3 Cs, The 4 Cs, or 3 of them that are cost, cash, customer.

John F. Rishton

Former Chief Executive Officer and Executive Director

"The 4 Cs," yes.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Your guidance for Civil Aerospace 2015 is back to historical average margin of 12%. History didn't actually have the IE [ph] earnout in so maybe we're slightly below historical average. What does that imply about the real tangible progress you've seen on costs in terms of thus far? And why, physically, we're not seeing it in that underlying Civil margin?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, I understand the question. So let me talk about a couple of things. I think that in some parts of the business, we've made good progress on cost. In others, we've made okay, and some, we've made less. So one of the things that people have said about defense is irrespective of the fact that the balance between OE and aftermarket has shifted to manage with a 15% to 20% reduction in revenue and manage to maintain the margin, is generally a good indication that we've made some progress on cost in that part of the business. In other parts of the business, we made less so. I think in Marine, we've started, and in fact, we made the announcement last week that we were closing one of our plants down the road in Bergen, which also makes steering gear, and we will consolidate that into Brattvåg. We have made a number of other announcements of plant closures in Marine. In Civil, we've got a couple of things going on, and that makes it complicated. And I understand that, that's not particularly helpful for anyone. What's going on? Well, first of all, we've got a significant amount of capacity that's been put in place, and you've all heard me give the example of Singapore in terms of the capacity that we've put in place there and the utilization of that capacity. Secondly, we've got load which is not increasing as much as we

would have anticipated. And at least part of that is good news because a part of that relates to the fact that we're increasing the life of our engines on wing, which is saving us cost. So the example that Tony Wood gave in June was the life on wing of the Trent 700 has increased. That's a good thing for competition reasons, obviously, and also for cost reasons, financial reasons. But what that means is I need less spare parts, which means that we need the factories to produce less for a period of time. The third thing is that we've got inventory buffers in place that we were using historically to protect the customers, which as we improve our customer performance and we improve our performance to plan, we can start to reduce, which means that we need to lower the load because I don't need to rebuild those buffers. So I've got those headwinds coming towards me in terms of the cost performance. The other things that are going on, for example, when you start talking about 2015, again, things that you're familiar with would be the launch of the XWB, which is a lot of launch cost, lowish volumes and unlinked contracts. Against that, as I said in June, what we're doing on the Aerospace side in terms of the cost performance where we've got hundreds of engineers working on it is that we're offsetting the escalation that we're seeing on the OE and we're making good progress in terms of the aftermarket. A lot of that is being masked by some of these other things. So in the current year, we're getting some benefits from that, and Mark talked a little bit about that on Friday in terms of the specific cost benefits that we've got in 2014, and how some parts that relate to the catch-up from previous years because of the way the TotalCare accounting works, which you're familiar with. You don't get that again or you don't forecast that we're going to get that again next year. So there's a combination of factors that are taking place here. None of which, by themselves, cause any specific problem. But in total, those are the headwinds that we're running against in terms of cost. So in order to get to the improved margins, and one of the things, again, that you've given us strong feedback on -- you probably as well, is how do we get from here to there? What's the bridge? And again, we're reflecting on that, is the increase in volume, the better utilization of capacity, the continued work about extension of life on wing, the greater focus in terms of all the cost associated with the direct and indirect labor. All of those things, we're working on all of those things. So I understand your question completely, and that's the answer that I have. Good progress in some parts, okay in others. In Civil, lots of work going on. Evidence of some progress in parts, particularly the aftercare. But because of the increase in capacity, because of the load, because of a number of other specific civil factors, you're not seeing it immediately flowing through into the bottom line. Mark, is there anything you'd like to add?

Mark Morris

Former Chief Financial Officer and Executive Director

I think you covered it fairly eloquently there, so...

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Are you able to shape in any way what...

John F. Rishton

Former Chief Executive Officer and Executive Director

Ben, can you just please use the microphone because other people need to...

Jilinda Crowley

[indiscernible]

John F. Rishton

Former Chief Executive Officer and Executive Director

There's one coming.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes, sorry. Just are you able to shape in any way what you think that cost drag is from capacity underutilization either in a margin basis-point number? Just, I mean, it helps your story if we have some shape around that.

John F. Rishton*Former Chief Executive Officer and Executive Director*

And again, it sounds defensive, and I'm -- reflecting on what help we can give you and how we can give you the feedback [ph]. We in the business, from the board down, listen to -- read your -- what you say to us and discuss those things about how best we could help us. And as I say, and it sounds as though -- I'm not trying to be defensive, it feels that way. The transition from where we were, years and years and years of only giving in-year guidance enough to where we're trying to get to isn't as straightforward for us as you would like it to be, and we're struggling with that. But again, we're reflecting carefully on this kind of feedback, though.

Christian A. Laughlin*Sanford C. Bernstein & Co., LLC., Research Division*

Christian Laughlin from Bernstein. Just 2 questions for me, please, on Civil. So going back to the medium-term guidance and the period you refer to as the bridge between now and then. Just in -- and I'm not looking for a '16 or '17 guidance, but in trying to think about '15, '16 and '17, can you point out a particular year where you think there will be a trough margin? That's the first question. And then the second question is just coming back on Friday's call, that Mark had mentioned something about one of the drivers behind the free cash flow guidance cut for 2014 was inventory management or a drag or a headwind from slower, I guess, inventory turns. If you could just add any comments or color on that, because I thought that was one metric in particular that had been positively trending in recent periods.

John F. Rishton*Former Chief Executive Officer and Executive Director*

Yes, let me start with the second one, and maybe ask Mark to comment -- and then comment on the first one, if that's okay. In terms of the inventory, we've seen improved turns performance. So we saw quite a significant improvement in turns during the course of last year and we saw some improvement during the first half of this year. But going back to the point that I was making to Ben in terms of the load, as we've pushed out the life on wing and as we're trying to reduce the inventory, we've got the different pressures on us, which is we can keep putting stuff in the factories or we can try and take it out. And we're just struggling with that balance. So we've got that, again, working a little bit against us during the course of this year. So whilst I'm sure we're going to make progress in many parts of the business, it isn't as much as we wanted. Part of the problem in terms of the inventory is with the revenue being lower. So you're not shipping as much so you get that drag as well. So you've got a combination of factors. But Mark, do you want to comment on that and the Civil question?

Mark Morris*Former Chief Financial Officer and Executive Director*

In terms of the cash flow, as I sort of covered on Friday, about GBP 200 million was due to low revenue, about GBP 100 million has come from lower deposits, just reflecting order intake after deferrals that we're seeing and people not ordering at the time. And then the other GBP 100 million again was inventory. And again, that reflects this -- the ramp up of load, and that's what's stuck in the system effectively. And that was broadly the sort of criteria that's meant that up. In terms of the civil question, again, I think, rather than trying to go up now and talk about where's the trough and where's the inflection points, like I said, we will reflect on building that bridge that gets us from A to B. And as we reflect on that, we'll include that certainly in one of our thoughts as to how we move forward. But again, I did guide on Friday where we saw Civil margins going for next year and the reasons behind that. And I guess, there was one other item obviously, which is R&D capitalization, which I referred to, which maybe we can talk about just now. So...

John F. Rishton*Former Chief Executive Officer and Executive Director*

I think what is clear to us is there's 2 questions associated with the Civil margin. One is the trajectory between now and the future. Is it straight? Is it down? Is it up? Where is it going? The second one is the bridge between how do you get from here to there in terms of the drivers within the business? That's how

I would summarize the 2 primary questions that we've been -- we've got around the Civil margins. And that's what we're reflecting on. We have a question on the WebEx.

Jilinda Crowley

A question from Jonathan Bloom from Fiduciary Management and it goes back to the medium-term outlook. Providing margin guidance without revenue implies that margins may not be dependent upon the company's revenue trajectory. How can investors reconcile this disconnect?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, I mean, I think that really goes back to the, I think, the first question that we had here in terms of revenue guidance that we're going to reflect on that, and it's clear feedback again. I mean, the elements of feedback in my head are Civil trajectory; civil building blocks; revenue, split Civil, non-Civil, total; and cash flow [indiscernible] Those are the sort of 4 primary bits of feedback in terms of the level of disappointment that we're reflecting on. There are some other elements as well in there, but I think it's within that is the same answer. Sandy, did you have a question?

Sandy Morris

Jefferies LLC, Research Division

Well, sort of. Just going back to this cash thing. Just so that I get it clear. We took at least GBP 500 million out of our revenue guidance for 2014-ish, most of which must arise in the fourth quarter. It's a natural industry thing, therefore we end up with too much inventory. And your decision is when you take it out. I mean, isn't that just how it goes? This is a typical industrial slowdown.

John F. Rishton

Former Chief Executive Officer and Executive Director

That's it, Sandy, you're exactly right.

Sandy Morris

Jefferies LLC, Research Division

And then, at some point, the cash corrects but at the cost of profit.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. So we've got a combination of factors which is as the revenue slows, you -- the lead time for the inventory continues to push through. Therefore, you've got to take that out as well. And in addition, I go to the Civil one, because we've been extending the life on wing, we've been reducing the spares requirement as well, as an example. So we've got a combination of factors which are headwinds that we're facing.

Sandy Morris

Jefferies LLC, Research Division

Right. And then if I can just be really boring before we set another rabbit off. I mean, if deposits are down GBP 100 million, I know we've always had substantial deposits because we can see it in the notes to the accounts. I shouldn't be panicking that GBP 100 million reduction in deposits means a GBP 1 billion reduction in order intake somewhere. I mean, I'm assuming we do get substantial deposits and then prepayment. So it doesn't work quite like that arithmetically.

Mark Morris

Former Chief Financial Officer and Executive Director

No, no, it doesn't. I mean clearly, there is a connection with order intake and deposits. And clearly, as we move forward, certain parts of our business collect more progress payments than deposits. So typically, our Marine business, our Energy business, typically big working capital sort of comes through.

It comes through at all of the businesses but much more on those 2 businesses. And in particular, it's our Energy business, in this particular case, that has been affected by the downturn in the markets. And it is slowing orders down. And no doubt, there will be some element due to the fact that the transitioning arrangement of our Energy business can generally put some dampeners on ability to secure business as the transitioning effects -- people go into sort of wait-and-see mode. So there's an element of that as well.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes.

Sandy Morris

Jefferies LLC, Research Division

We've seen it before. And then I'm going to -- just 2 quick things. From June, just when we are doing our models in the absence of revenue guidance and everything, it is plain that an unlinked delivery generates much less revenue or less revenue than a linked delivery. And we just have to try and work around that in our models, yes?

Mark Morris

Former Chief Financial Officer and Executive Director

Correct, yes.

John F. Rishton

Former Chief Executive Officer and Executive Director

I want to talk a little bit about -- sorry, Sandy. Go ahead.

Sandy Morris

Jefferies LLC, Research Division

Sorry. And then the second of it just was if we don't take a profit on an unlinked engine, presumably, there's more profit in the aftermarket revenues when we're doing our models as well, yes?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, of course, there is. Yes. Because again, what's happening in a normal linked contract, if we go back to what we were talking about in June, is that in effect, there's an averaging going on, on a linked contract, which is OE, much lower margin, aftermarket, higher margin. It effectively balances the 2. And this is why it obviously builds up the debtor. On an unlinked contract, of course, what we do is if there is any wreck or car to be booked, contractor of aftermarket ride, it's put on the balance sheet, and the aftermarket is at the margins, the aftermarket. And again, because it's a forecast and these contracts are 10, 15 years sometimes, there will be an estimation, evaluation risk in that part. But generally, on an unlinked TotalCare contract, you don't get such big movements in the trade debtor and creditor build up. They track much closer to each other.

John F. Rishton

Former Chief Executive Officer and Executive Director

Anything on this side of the room, yes?

Andrew Chambers

Cantor Fitzgerald Europe, Research Division

Sorry. Andy Chambers from Cantor Fitzgerald. I've got 2 questions please. I don't if this has been answered and I've just missed it, but is there any way you can split the cash flow shortfall for the current here between Aerospace and Land & Sea, just as a guide to which division really did the damage?

John F. Rishton

Former Chief Executive Officer and Executive Director

You haven't missed anything and we haven't broken it, no.

Andrew Chambers

Cantor Fitzgerald Europe, Research Division

Would you like to?

John F. Rishton

Former Chief Executive Officer and Executive Director

No. Not now, no.

Andrew Chambers

Cantor Fitzgerald Europe, Research Division

Okay. And the second one was just we're quite a long way into your part ownership, at least, of Tognum and certainly, you're now, I believe, in full control of it. Can you just maybe talk about where you are in terms of integration plans? Because I would have thought, with the amount of time you've had with the business, you'd have been very well advanced at the time you took full control. And yet we still haven't heard anything really meaningful about what you intend to do and how you intend to take cost out. And indeed, I understand the business has changed it a bit in the short term and maybe you have to tweak that a bit, but do you have a well-established plan to actually take significant cost out of that business, now you have full control? Or does it remain a fairly autonomous situation as it was historically?

John F. Rishton

Former Chief Executive Officer and Executive Director

Lawrie and Uli, Uli Dohle is the CEO of our Power Systems business formerly called Tognum, will talk a little bit about that tomorrow about where we are and what's going on. We see significant revenue and cost benefits of that. And I wouldn't -- this is more an internal point than external point, which is I don't think we're taking huge costs out of Tognum necessarily, but I think, out of the combined business, we see opportunities to reduce our costs. And Lawrie and the team are working on that. That is something that we are absolutely all over. Mark, do you have anything you want to add to that?

Mark Morris

Former Chief Financial Officer and Executive Director

No, the only thing I would say is that obviously, it's been a joint venture until September. Our ability to start extracting some more of the -- much more of the cost synergies have only come when we get full ownership. So the sort of clock has started ticking and absolutely, we've got clear plans on how we integrate, get costs out and improve the revenue synergy opportunities, certainly.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, and I think the teams are working much more closer together now. I think you'll see some evidence of that and we'll go and have a visit to there next year. The other observation I would make is we've got distinct businesses. But if you look at the Power Systems business, the Marine business that we have, they fit very, very nicely together. We're already getting benefits in terms of the B33:45 that I talked about, the help that Uli's engineers gave us in developing that was extremely useful, and we'll get some -- we'll get benefits about that. But we'll talk more about that, well, a little bit, just a little bit tomorrow but we'll talk more about that certainly in the future. Yes, we'll stay on this side. There's one more for -- yes. And then we'll come back over here to the WebEx, yes?

Zafar Khan

Societe Generale Cross Asset Research

Okay. This is Zafar Khan from Soc Gen. Mark, you've kindly given the profit profile of a linked and an unlinked and I think most of us understand that. Could you please do that on the cash phasing as well between a linked contract and an unlinked contract in terms of how the cash comes in over the life of these 2?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, on a linked contract, I mean, the cash is the cash. It doesn't get affected by the accounting. So obviously, engine -- so if we just think about where the cash flows are going, you've got engine flying hours and, obviously, the sale of the original equipment. So we've got cash from selling the engine and then we get cash for every flying hour, which generally is billed monthly. And then, in effect, we make a cost accrual, and then eventually we spend some cash on shop visits, and those are the cash-moving pieces, effectively. And the difference, obviously, is the cash margin at the end of the day.

Zafar Khan

Societe Generale Cross Asset Research

So in effect, the TCP accounting, the cash flow in there is much better than Time & Material in that sense because if you have...

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. I mean, again, if you park the accounting for a second, what we've always liked about the contract or TotalCare is that the economics sort of give a couple of benefits, both to us and, we believe, to our airlines. And looking at the penetration we have would suggest they agree with us. And that is, they know how much it costs them to fly for every hour they operated. And we, on the other hand, know that we're receiving a certain amount per hour, which is billed every month. And then effectively, once or twice a year, there's a square-up against actual hours flown. So it gives us a much better cash profile in terms of rather than waiting for Time & Material, which may be 3, 4, 5 years, cash is coming in every month, effectively.

Zafar Khan

Societe Generale Cross Asset Research

So having clarified that, if I then look back and read your statement from Friday, John, you said that the OE deliveries accelerating relative to the aftermarket has an impact on cash flow. Mark's just explaining to me that actually, you're being paid by the hour after you've received the initial cash for the delivery. So how does that kind of make sense? I don't understand how this reconciles with what was said on Friday.

Mark Morris

Former Chief Financial Officer and Executive Director

So well, again, there's lots of moving parts to cash...

John F. Rishton

Former Chief Executive Officer and Executive Director

But I think Mark, for me, it's the shift in the balance. So the issue is, with the OE growing strongly, the cash generated and the way that we account for that, you get a different profile. As the OE levels off, you're getting a change in the dynamics associated with the actual cash here so in other words, the aftermarket is becoming more and more significant in that versus the OE.

Zafar Khan

Societe Generale Cross Asset Research

But that's in Time & Material. That's when you're doing Time & Material, you're getting money paid when the lump -- when you've supplied the spare. In the accounting that you're doing, which is 90% of your deliveries, the cash profile is based on the flying hours, as Mark has just explained to me. So where does the OE come into this? It's a different -- you've moved the cash profile in TCP quite significantly from what it was in the Time & Material. Time & Material, you deliver the engine, you get a lump sum. Now you're doing that with the TCP as well. But then you're only getting cash when you deliver the spares. Engine comes off the wing 7 years' time, 6 years, maybe 8 years now because they live longer on the wing. So you're getting those lumps coming in under that. But under the new accounting and the cash that you

just explained to me, you're getting cash on the hours flown. So I don't understand where the OE and the aftermarket in that scenario has that kind of adverse impact on cash.

Mark Morris

Former Chief Financial Officer and Executive Director

Well, okay, let's go back. First of all, OE makes much lower margins and certainly, in launch phases will be -- can be and will be at a loss because you've got the learning curve. I'm talking cash. Yes. But at the end it doesn't...

John F. Rishton

Former Chief Executive Officer and Executive Director

It's the conversion percentage that we're talking, not the cash flows. So is it -- it's -- as the weight of the aftermarket and the profitability improves and the margin improves driven by the shift of the mix and the cash conversion percentage in changes. But can I suggest that we -- maybe Mark talk to you a little bit about that afterwards specifically? Because we could go through that in some detail. Yes, one more from the WebEx.

Jilinda Crowley

Sorry, go to someone else, mine just went off.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, let's go back.

Mark Morris

Former Chief Financial Officer and Executive Director

Just [indiscernible]

Sash Tusa

Edison Investment Research Limited

Sash Tusa from Edison Research. I'd just like to come back to Andy's question on Tognum, now Power Systems. It was quite noticeable in the Friday segment that, that was the one business that actually was -- you brought guidance down for both 2014 and 2015. Mark just mentioned you've only taken control of it since September, having initially invested 3.5-plus years ago. I wondered whether you could just give us some sort of assurance that this sort of period of limbo that Tognum lives in between your initial investment and buying out has not actually caused the business just to drift and, therefore, to have quite a shock when you finally consolidated it. And secondly, could you possibly give us some assurance that you won't do another joint venture that takes quite so long between the initial heavy investment and actually starting to manage the business?

John F. Rishton

Former Chief Executive Officer and Executive Director

The business hasn't drifted. I think the market environment has been unhelpful, if I put it that way. So if you looked at the primary competitors, you look at Caterpillar, you look at Cummins, you look at MAN, the environment has not been conducive to the kind of progress that we would have liked to have seen. In terms of assurance about future joint ventures, the seal of the Tognum joint venture was one that was a challenge from the start in the sense of it took a long time for the majority -- minority squeeze-out to take place. Across the business, joint ventures in our industry are more prevalent than in many other industries and have been pretty successful with varying degree. So I'm not going to rule out doing joint ventures, but I don't want to go through the pain and grief that we went through with some of the joint ventures that we go through. So we've learned things, but there are joint ventures that work -- have worked and do work very well for us. Could we go to discuss the WebEx yet?

Jilinda Crowley

A question from Celine Fornaro of Bank of America Merrill Lynch. I'd like to know what assumptions on CapEx and R&D have been made to establish the midterm guidance, a trend either in absolute or as a percentage of sales.

Mark Morris

Former Chief Financial Officer and Executive Director

Well, again, as we covered in our June Investor Day, we talked about R&D being around about 5% and trending lower as we got the benefit of leveraging an increased volume. And on CapEx, we talk about driving it towards 4% of sale. So again, no change from what we've said. Now that won't happen necessarily of the space of a year as we talk over the medium-term. And of course, in any one year, sometimes they will go up or down slightly. But the general trend is where we're heading on this.

Jilinda Crowley

And there's a follow-on question here, which is, will there be big volatility in those assumptions if there's a launch of a new engine program?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, let me just answer that in 2 parts. Let me start with R&D first. So when we think about R&D, we're always thinking about how we utilize our engineers because that's generally where the bulk of the R&D is spent. So they are looking at current -- there'll be a section looking at research and technology, there'll be those that are working on program upgrades, there will be those that are working on unit cost, there will be those that are working on potential new programs. But what we look at is, as we go over time, their -- the load capacity balances, I'll refer to it, will change and it frees up engineers. And of course, within that affordability, we figure out whether we can do new programs. And then the question is does a program come along or not? Or do 2 programs come along and then we take the decision as to which ones we're going to be on or not. So don't expect you'll see [indiscernible] float around the sort of 5%. I mean, it may -- it'll be either side of that. But that is driven mainly by our load capacity balance. We can't just double the number of engineers and build aircraft engines. On CapEx, it really depends on where we are. And again, it's a sort of step curve is what is it that we can do with the capacity that we had. We've invested a lot in capacity. And John, you just heard John talk a little bit about the fact that we have excess capacity and how we make that more efficient, which we're focused very heavily on at the moment. But again, we have been expanding for rising load as well on our newer factories. So to the extent it can be covered off, then CapEx generally will fall within those bounds. But CapEx is driven on new programs, primarily by things like new tooling. And of course, in any given year, that will oscillate around. But again, I wouldn't see significant movements in CapEx. Charles?

Unknown Attendee

Presumably, life on wing shouldn't be a big surprise as it's been on the wing for a while. What's caused it to suddenly get longer? I'm presuming there's something you did 5 or 6 or 7 or 8 years ago? And how much longer has it got?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, life on wing, we're always looking to try and improve the reliability of our products. And that happens at 2 levels. One, the longer we can keep them on the wing, obviously, the less number of overhauls. But also, when they come in, the amount of cost that we put on those overhauls. So a lot of work is going on. And again, when we talk about unit cost engine is, it's about looking at finding parts that can -- ways for keeping the engine on, on-wing for longer, improving the reliability. And that could be by parts that have longer lives. It can be by how the engines are operated. And it's not just life on wing. I mean, I think we need to be careful. Life on wing is one way of extending and reducing cost. The other way is, of course, making sure the work scope is accurate and that we're sweating all the assets. So don't just assume that the only way that you get reliability is increasing life on wing. Sometimes, it's an appropriate time to take engines off wing to get the sort of perfect crossover between cost of overhaul and too much

extension. So there's some quite complicated dynamics that go on about what type of materials you use. But in general, what we're trying to do is to sweat our assets, which is make sure that every component is burned down to the end of its life, that we only scope the engines where they need to be and we pull them off at the right time, utilizing the wide array of shops that we have. So that's what's driving cost down or cost improvements on life cycle cost, along with obviously just making parts cheaper and last for longer.

John F. Rishton

Former Chief Executive Officer and Executive Director

We have time for one more question before we finish our WebEx at 7:15. We'll just take the one on the right-hand side. Thank you.

Olivier Brochet

Yes, good morning -- afternoon. Olivier Brochet, Credit Suisse. On Defense, if I may, please. You said that you are well into your cost-cutting in this -- on this side and that you've made good progress. Can you just tell us how much remains to be done and can be done in Defense before you've reached your -- the lower level of cost that you can be comfortable with? That's the first part. And the second part is on the V-22 engine. Just to try to understand what's going on there with the DoD having put an RFP for a replacement engine and how comfortable we are that you are not going to lose this platform?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. I think, based on my experience, I don't think you get to a point when you run out of cost ideas, and there are things that you can always, always do and we will look at them. And a significant part of the Defense engineering cost reductions have been associated with productivity, labor performance, and we've taken out quite significant amounts of headcount over the years to reflect the balance. So getting that balance right as well as working on the productivity, the improvement in terms of the materials that we use. How do we make them last longer? Et cetera, et cetera. So I would always argue, and certainly, the Defense guys are not pushing back, that there's more to do and more that can be done. In terms of V-22, we have been asked to rebid, which -- by the DoD. We're not alone in being asked to do that. This is part of the pressure that's being exerted by all the defense agencies, particularly the U.S. and [indiscernible] Europe, in terms of can they get better deals. In terms of the V-22, that was a program that has had a -- I'm sure you're aware -- a difficult birth, but which the customers are now very satisfied with. So the positive part of the story is that our customers are very pleased with the performance of the product or whether that's the end customers or the manufacturer, we will be competitive in that area and we're determined not to lose that product.

I think that now takes us to the end of the scheduled time for the WebEx. So that will be the close of the WebEx. Simon, I think you're going to talk to us a little bit about the logistics that we now have as we close the WebEx down. Again, for everybody who joined us on the WebEx, thank you very much for taking the time this evening to join us. If you have questions, I'm sure you have some more, please let us have them and we can try to answer those indirectly. Thank you very much for your time. Thank you very much for all those who attended here this evening. I will see you all a little later for dinner.

Operator

Hello, and welcome to today's Rolls-Royce Guidance Update and Medium-Term Outlook Investor Presentation and Q&A. [Operator Instructions] And just to remind you, this call is being recorded. Today, I am pleased to present John Rishton, Chief Executive Officer; and Mark Morris, Chief Financial Officer. Gentlemen, please begin.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks very much, Hugh. Good morning, and thanks for joining us at such short notice this morning. A couple of comments from me and then Mark will talk about the numbers. It will come as no surprise, I suspect, to anyone on this call when I say that economic conditions have got worse. In fact, they have deteriorated quite quickly, and we, like many businesses, will see our revenue impacted. So while in July we believe that we would have growth in 2015, we're now revising that view. And while I'm disappointed with the change, I will continue to keep you informed about what our best view of the future is.

We've also announced today our medium-term outlook. We've recently been through that with our board. It is clear that the fundamentals of the business remains strong, and our prospects for medium-term profitable growth are unchanged. The demand for air travel will increase, and you will all have seen the most recent Airbus outlook. This is driven by demand from emerging markets and the need for more fuel-efficient aircraft. As you all know, we have a very strong order book.

For our Land & Sea businesses, the demand for power was driven by population growth, increasing economic activity, urbanization and increasing affluence. Energy demand will grow strongly in the future. These fundamentals are unchanged. We know that there will be growth in the medium term, but the road between here and there is going to be bumpier than I had thought, which means, of course, that we have to focus even more on the areas that we can control rather than the ones we can't. So we will continue to focus on the 4 Cs: customer, concentration, cost and cash, and we are going to accelerate progress, especially on cost. Our strategy is unchanged because the medium-term outlook is unchanged, because the fundamentals are unchanged.

Now Mark, maybe you could take us through some numbers. Thank you.

Mark Morris

Former Chief Financial Officer and Executive Director

Thank you, John. Good morning, everyone. I'm going to provide you with the guidance for 2014 and 2015 as well as for the first time, our medium-term outlook. You'll appreciate that this is a trading update and not a results announcement.

So I'm going to start with the 2014 trading update and go through each of the businesses, followed by a summary for the group. It is fair to say that at a group level, we are experiencing some softening across all our end markets on revenue. In Civil, our revenue guidance is unchanged, but is now towards the lower end of the range. On profit, we are now expecting a 15% to 20% increase, which is driven mainly by an improvement in life cycle costs. Remember, and as I explained at the Capital Markets Day back in June, these changes, whilst economic in nature, also create a catch-up adjustment to reflect the improved costs that would have otherwise been taken in prior years. This catch-up will flatter Civil's 2014 margins. Over the last 4 years, Civil's margins have averaged around 12%, and you should expect Civil margins in 2015 to return to this sort of level.

Similarly, in our Defense business, no change to our revenue guidance here, but again we expect to be at the lower end of the range. On profit, we're expecting some improvement compared to our previous guidance, but this is driven by better OE to aftermarket mix.

Turning to Marine, we see no change from the guidance which we lowered at the half year, reflecting the challenges we see in this sector. Our second half performance is underpinned by good visibility of OE revenue.

In Power Systems, our revenue guidance remains unchanged, but as with the other businesses, we are now trading lower within the guided range. This is primarily due to the impact of Russian sanctions, which has stopped the sale of finished products. In addition, we anticipate lower diesel land power sales than previously expected.

Turning to profit, we now expect a 5% to 10% reduction in Power Systems' profits relative to 2013, mainly due to the loss of some high-margin business, along with some warranty costs.

In our Nuclear & Energy business, we're experiencing harsher conditions this year in both our Oil & Gas and Power Gen markets. As you know, this business is characterized by relatively low volume but high-value units, and consequently, results can be more volatile. A number of contracts that we expected to conclude have either been deferred or lost, and the transitioning process of the sale arrangements has not helped. We're also seeing some customer deferrals, particularly around spares, which carry higher margins and so have a bigger impact on profit. Performance in our Nuclear business remains on track, and we continue to expect the sale of our Energy gas turbine and compressor business to Siemens to conclude by the end of the year.

Now turning to the group. We previously guided flat revenue, but the deteriorating market conditions have clearly required us to lower our revenue forecast for the year. All businesses are down since the half year to varying degrees, particularly the Energy business, which has required a lowering of its guidance. We are maintaining our guidance for profit in 2014, reflecting improved performance in Civil and Defense, offset by lower profits in Power Systems and our Energy business. On cash, we've guided around a GBP 780 million inflow similar to last year. We are now guiding at GBP 350 million inflow, reflecting the impact of lower revenue, worth about GBP 200 million; lower deposits in Energy, Marine and Power Systems, worth about GBP 100 million; and slower progress on inventory than planned, worth about another GBP 100 million.

Okay, since we are likely to conclude the sale of our Energy gas turbine and compressor business to Siemens by the year-end, I thought it would be helpful to show some -- show good guidance, excluding our Energy business, as this will form the basis for 2015 guidance. The guidance, excluding Energy, is shown here on the chart.

Okay, now turning to 2015 guidance. Since our interim results, the economic outlook for 2015 has become more challenging. These conditions are clearly being felt by a number of our customers and may affect the timing of their investment decisions, particularly in Power Systems and Marine. In our Civil business, we expect some softening in our Trent 700 sales as we move ahead with the launch of the new Trent 7000. We previously said that we expected the resumption of growth in 2015. However, in light of these uncertainties, our current best estimate is the group underlying revenue will be in the range of plus to minus 3%, and profit will be in the range of 0% to minus 3% compared with our expected outcome for 2014. The asymmetry between revenue and profit guidance is mainly due to us having reduced our 2014 revenue guidance but having kept our profit guidance flat. So all else being equal, revenue growth for 2015 will be higher than profit growth because it's starting from a lower base. On profit, we also expect some adverse mix effects since previously guided.

So we've talked about the short-term challenges, but let's remember that this is a long-term business and the fundamentals remain compelling. Back in June, we said we will provide a medium-term outlook to give some directional context around our expected progression on a few key metrics. A number of important assumptions underpin our expected progress. To the extent they change, this will change the rate of progression. It is the characteristics of our maturing Civil business that will influence most progressively the movements at the group level, too. The key drivers of change are the relative mix of new engine sales to aftermarket sales, the maturity and size of the installed base and new program opportunities. We currently expect new engine deliveries to level off around the 2018 time frame. This inflection point will start to see a greater weighting towards more aftermarket revenues from the larger installed base as we move into a period of harvest, which will drive up margins and improve cash conversion.

Based on our current view and assumptions, we expect performance in this period for the following metrics as shown in the chart.

The medium-term prospects for our Land & Sea division remain attractive and are supported by the investment in power, transport and infrastructure that will be required to support population growth and increasing affluence. Key growth drivers include global trade, regulation and capital investment in the oil and gas, mining and construction industries. We are confident in the future growth of revenue and profit in this division, but the timing, given its shorter cycle, is difficult to predict. Consequently, we've decided not to provide a medium-term outlook to group revenue.

Just turning to the TotalCare net debtor. You'll remember that there are a number of drivers that will influence whether the debtor is increasing or decreasing, as I explained at the Capital Markets Day back in June. The ramp-up in OE deliveries, where linked, will naturally increase to debtor as do shop visits, which reduce the creditor. So a key point to note is that the peak debtor will start declining as OE deliveries level off, and cash conversion will improve. The buildup in Contractual Aftermarket Rights, formerly known as RECs, reflects rising unlinked engine sales, which we discussed back in June. With that, I will turn it over to Q&A. Thank you.

Question and Answer

Operator

[Operator Instructions] Our first question is from the line of Rob Stallard of RBC.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Just a couple of questions on the 2015 guidance you provided. I was wondering if you could comment on what your expectation might be for cash flow next year and also if your profit guidance includes any additional cost for restructuring or whether that will be cast as a non-underlying item.

Mark Morris

Former Chief Financial Officer and Executive Director

Rob, thank you. No, we haven't even cash flow guidance for 2015. We will be giving that guidance when we obviously get to the prelims next year. We haven't given it early this year and we're not planning to give it now. In relation to the additional restructuring, that is excluded from the results we've given at the moment.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Can you give us an idea of how much that might be?

Mark Morris

Former Chief Financial Officer and Executive Director

When we're ready to talk about it, we will discuss it.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Okay. And then just finally, on the medium-term outlook, obviously some uncertainty on the shorter cycle area. Would you expect the profile from here to 2018 to be more like a J-curve, that we see, say, material improvement in 2017 into '18, so that the profile in '15 and '16 is pretty similar?

John F. Rishton

Former Chief Executive Officer and Executive Director

I think it's very difficult to answer the question on the shorter cycle business. If I split the business into 2 parts: the Land & Sea business, the Marine and Power Systems business, clearly, it affected one of them by a shorter cycle; and two, by more directly by what's going on, particularly in certain industries, the oil and gas industry, mining and construction industry as well as government spend. So trying to predict that is extremely difficult, but Mark has talked to you a little bit about what we see in terms of '15 in total. And going out beyond that is very, very difficult. I mean, trying to forecast exactly what the economic environment is going to be and how things are going to change is extremely difficult. The thing -- the point that I would make though is, again, as I said in my introduction, is the fundamentals underlying that business are strong, but exactly when they return, we'll see. The world is going to need energy. If you look at anybody's energy forecast for the next 10, 15 years, it shows significant growth, and it shows the growth because of population growth. There's going to be another 1 billion people on the earth by the middle of 2020s. There's going to be 100 million more people joining the middle class each year between now and then, so increasing affluence. All of those factors lead to more power. And if we need more power, it's got to come from somewhere, and that's where we play.

Operator

Our next question is from the line of Harry Breach at Westhouse Securities.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Can I ask you just 2 questions? Mark, can I just ask you to just recap on what you said about Civil margins? I think beyond this year, just to recap, I think you said return to around the 12% level. Was that accurate?

Mark Morris

Former Chief Financial Officer and Executive Director

That's accurate. Yes, that's correct.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Good, great. And the second question was just in terms of the economic impact that you referred to in the release and the conditions deteriorating and clear mention of delay or cancellation of orders. Just wondering, when we think about the changes to your guidance, I suppose, this year and next year, sort of is it possible for you to give us a sort of sense of how much of this is existing deferral activity you can see in your order books right now and how much is anticipatory?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, I mean, Harry, there's a combination of both. I mean, 2014, there is obviously some element of deferment on OE, but actually services revenue, again, which is much shorter cycle, especially on the spare parts, can -- lead times can be anything from sort of 24 hours to 30 days. So it's more prevalent in our Energy, Marine and Power Systems businesses because of the shorter cycle nature that John was talking about. But actually, when any area's looking at preserving cash, they will try and delay activity where they can. I mean, obviously, as we get on to 2015, I think the fact that we've widened the guidance, at least for the first time, provided some ranges around the guidance early than we would do normally, I think that's reflecting the current lower level of visibility and greater uncertainty that we have. And like I said, nothing is a foregone conclusion, and that really reflects the range that we've highlighted.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

And just wondering, guys, if you can -- if I can just touch a little bit more on the Civil side there. Are you seeing overhaul deferrals at the moment?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, like I said, in 2014, Civil remains within its guided range. So it's like all things, there's always puts and takes on anything. When we look, you can't land exactly on a dollar amount or a pound amount.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. What I would say, Harry, it's not significant. And as you know, in our model, we have the TotalCare model, which is driven by flying hours. Flying hours are fine at the moment. So my overview would be, no, we're not seeing any particular issues in terms of servicing associated with TotalCare or anything unusual on the Civil side. As Mark said, on the shorter cycle side, we are seeing and we have been seeing the services, and we've talked about this before, being weaker than certainly we had expected.

Operator

Our next question is from the line of Ben Fidler at Deutsche Bank.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

I had a couple of questions, the first of which was if I could just drill down again a little bit more into Civil margins, maybe between the 2015 and 2018 period. So your guidance is Civil margins sounds like around about the 14%-or-so level in '14, drops to 12% in '15, and then we're back up to 15% or so by 2018. It's -- the first point is to understand that if you can help me with the trajectory at all between that 12% point in '15 and the 2018 number. Is it quite back-end loaded? Or should we see it as relatively linear? The second question around cash conversion, that 80% cash conversion, which again, am I correct in understanding that is a 2018-type of number in your mindset? Just to understand what the path looks like for cash conversion, again, how linear that looks as we go through the sort of '16, '17 period. And then actually, sorry, another question that's come to mind, it's a quick third one, maybe a rather dull accounting one. But just to understand, a lot of your OE growth is coming on unlinked contracts. I was surprised that the growth in RECs is relatively low, and at the same time, surprised that the growth in TCP net debt is so high. The TCP net debt is probably doubling from the current level. My assumption is the OE losses these days on XWB and Trent 7000 engines will be put into RECs. Have I misunderstood that?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, thanks for your questions. Let me -- a couple of observations, a couple of comments about margins and cash conversion. Firstly, as Mark outlined, as we outlined, I think very clearly in the press release and as I explicitly said in the June investor meeting, the improvement -- the sustainable improvement in Civil margins is the consequence of the products maturing, OE leveling off, the balance between aftermarket and OE shifting or a combination of those kinds of factors. And at the moment, we forecast that to be happening around 2018. So the first thing that I just want to be absolutely clear on is it's that combination of factors that drives the margin, and at the moment, 2018 is the date that we've indicated, and we -- that's what I showed you in June. That was our -- that is our best view -- that was our best view, and that's what drives it. The cash conversion is similar, so it's driven by those events, not the date. The date is when we think that's going to happen, but it's the events that drives the outcome. So the second part of that is the trajectory in terms of margin. So what Mark said is, what we've seen, if you look back over recent history and if you can average, the average Civil margin is running at around 12% with variations, obviously, amongst that. This year, it's going to be stronger. So in '15, what we're saying is we're seeing a return towards the more average levels that we've seen in Civil margins. So nothing in margin particularly surprising. I'm not going to get drawn into '16 and '17 because we kind of keep getting sucked into, well, what, what, what. But the point I'm trying to make is the reduction in '15 is a combination of the factors that have driven '14 higher and then all the other things that are going on, whether that's launch costs, launch pricing, unlinked, offset by cost reductions, et cetera, et cetera. But I'm not going to get into a trajectory from there into '16 and to '17 and then into '18 at this point in time. The key thing for me to use to think about is the events that relate to the sustainable improvement in Civil margins are the ones that are outlined and our belief that, that is in 2018, as we explained on that chart, and to understand that '14 is strong, and we're going back to more normalized levels in the period of time and then in '15. Mark, I don't know if you want to talk a little bit about the CCAs and...

Mark Morris

Former Chief Financial Officer and Executive Director

Oh, you give me the easy one, yes? So let me try and -- there's a couple of sub-questions to your third question, Ben. So let me start with the easiest one first. Trent XWB and Trent 7000 are predominantly unlinked, and I think that's just the easy part of the question. On the growing TCA net debtor and RECs, remember, there's a lot of moving parts here. So Trent 7000, in the time frame that we're talking about, really doesn't have a lot of impact in terms of its ramp-up. We're only start -- this will start to come into service in 2017. So what you've got is just a movement of existing Trent 700s and shop visits, which obviously naturally drive an increase in the debtor. So OE deliveries plus shop visits plus, of course, any improvements we plan to make or assess in our thought process around improving life cycle cost, be it extra time on wing or continue to take cost out, the natural retirement of estimation risk, and again, another area that we talked about back in June, those will drive the debtor. So that's the math that we're seeing currently. And the reason I've given a range is, as you just -- because there are such many moving number of parts, it's difficult to sort of pinpoint it so I've got to give a bit of a range around that. On the REC side, again, it will -- sorry, the CARs side, shall I call it, Contractual Aftermarket Rights, that

again is driven by unlinked. And as we make -- continue to make progress on costs, particularly on OE, that will help to suppress the amount of CARs or/RECs that we take on. So I think that's a sort of broad background, Ben.

Operator

Our next question is from the line of Ed Stacey of ESI.

Edward John Stacey

Haitong Bank S.A., Research Division

Just one for me, which is the Energy & Nuclear business. Wondering if you could just give us a bit more color on who's cutting what, which industries, which geographies, where is the weakness coming through from in terms of this year and as we look into 2015. That's it.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. I think -- sorry, on the Energy business, it's where is the weakness, I think, is the question.

Edward John Stacey

Haitong Bank S.A., Research Division

Yes.

John F. Rishton

Former Chief Executive Officer and Executive Director

Look, I think there's been sort of 3 elements, as far as I'm concerned. First of all, orders are down in total and what we're seeing is deferral of orders. So whilst our business in Russia is small in total, I think around, for the sake of argument, around GBP 100 million a year. So the direct consequences of Russian trade sanctions have been fairly small and actually primarily focused around our Power Systems business. The indirect consequences are that some customers are deferring orders for their Russian projects because they're subject to the same sanctions. So what we've seen is the level of business dropping, pipeline and Oil & Gas business being deferred, and your guess is as good as mine as to whether that -- when that will happen. My view is it will happen because the pipelines are there, they're being built, but exactly when is the challenge. So we're seeing quite a number of deferrals. So we're seeing the total business down and deferrals moving -- coming in as well in that business. But don't forget, our Energy business, as Mark said, is one -- it's a small business, and it's -- for us, it's low volume, high value, relatively few contracts. So that's what we're seeing. You would need to talk to some of the bigger companies to get a better overview about what's going on in Energy in total, but you're well aware that oil and gas companies have cut back significantly on their CapEx, and you're also well aware about Russian sanctions and some of the implication of those. So that's what I'm seeing.

Edward John Stacey

Haitong Bank S.A., Research Division

If I can have a quick follow-up actually. As we look into 2015, it's Power Systems, so I guess in the forward-looking way, I need to think more about Power Systems rather than Energy.

John F. Rishton

Former Chief Executive Officer and Executive Director

That's right because Energy, as we said, we ought to complete that by the end of the year. I think it's likely we'll complete by the end of the year.

Edward John Stacey

Haitong Bank S.A., Research Division

And so then in Power Systems, as we look to 2015, you're saying the worsening conditions are being felt and may affect investment decisions, particularly in Power Systems and Marine. So in Power Systems,

is that versus off-highway? Is it industrial? Or is it pretty broad spread? What -- anything particular we should note?

Mark Morris

Former Chief Financial Officer and Executive Director

I think, again, it's a shorter cycle business and they go into a lot of vertical markets: construction, rail, mining, naval, oil and gas, agriculture, et cetera. Again, I think John summarized quite neatly at the front of this conference call the general macroeconomic pressures that we're seeing and you read about in the papers every day, be it deflationary areas in Europe, in South America, lower raw material prices, et cetera, et cetera. And of course, that ripples its way through as people look to understand what it is. And of course, generally, we are providing equipment that goes into some other equipment. It's a power system of some kind, particularly obviously in the Power Systems business, diesels and gas engines that are going into various applications. And whilst there's a big installed base that will drive spares, looking at those orders and where we see there may be some softening, I mean, absolutely, there are some uncertainties, and across all of those markets, they aren't [ph] being affected: rail, mining, construction, et cetera.

Operator

My next question is from the line of Christian Laughlin at Bernstein.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Just taking it back to Civil margins, if I could, please. I was interested in -- or -- and trying to draw you out on the exact margin trajectory over the next few years. But in terms of just operationally speaking, if you could just talk about the mix in the sense of the operational drivers that bridge from where we are now in Civil margins to the medium-term guidance in the sense of -- so obviously, clearly, it's been defined some near-term mix headwinds from delivering new engines. But if you could talk a bit about the timing, the phasing, the magnitude of contribution from various investments and initiatives you've taken now to improve the cost base, manufacturing costs and supply chain costs and improvements in capacity utilization, et cetera. If you could speak a bit about how you expect these benefits or positive offsets, if you will, to phase into to get to your medium-term guidance, please.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Well, look, just firstly to get it in context, this is a trading update and outlook about the medium term, so I'm going to keep this relatively high level. We're not going to get drawn into quantifying every piece. I mean, you've highlighted a significant number of the drivers. As I covered off really and particularly explaining what were the key drivers around the sort of thing that would get us into the sort of margins that we're talking around, around the 2018 time frame, which is when engine production starts to sort of level off. And again, that's the key thing to recognize, which is those 3 drivers that I talked about, which is the OE to aftermarket sales; the maturity of the installed base, which obviously drives higher numbers of engine flying hours, which have much better cash margin and that drives the cash conversion as well as the profit margin; and of course, new programs, and the reason I mentioned new programs, new programs, naturally, certainly at the front end, will depress margins because we're spending money on CapEx and R&D, but nonetheless where we see there's a good business case. And again, if I go back to what I said in June, think about the life cycle of an engine. We get about 20% of the revenue on the OE, and it's much lower margin; 80% of the revenue, much higher margin on the aftermarket, so that makes attractive sense. When see these opportunities, we'll continue to make those investments. On the cost side, we continue to talk about -- and John has been very clear and I'm very clear, that we've got to accelerate cost. We're making good progress in cost, better in some areas than in others, and we're focusing on those other areas as well. And we've talked and clearly indicated already that as we start to look at restructuring and rationalization, that is all about improving efficiency and capacity in our factories. So there's a number of things as to why we're confident that we can get those sorts of margins, driven by what we're doing on cost and efficiencies, but also the mix of product and where we are relative to sort

of sowing versus harvesting, if I was to use an agricultural phrase. And I think that's about as far as I'm prepared to go at this stage.

Operator

Our next question is from the line of Nick Cunningham from Agency Partners.

Nick Cunningham

Agency Partners LLP

A couple of questions. First of all, in terms of getting that medium-term guidance of the margin expansion, given the headwinds that you've got from the OE mix moving to XWB and Trent 7000. I assume that you're -- you are assuming some unit cost reductions on a continuing basis. Is that the case? And how do those unit cost reductions compared to your, let's say, track record over the last 5 or 10 years? Second question, we've focused very much on Civil, but are you looking for margin delta in the other businesses as well when you look into medium term? And is there any -- are there any big features in terms of where you expect that to come from? And the final point, you talked about OE flattening off in 2018 also, but that's very early in the ramp of A350. 787 is still supposed to go from 10 to 14 rate, and neo will only have just -- A330neo will only just have entered service. So I'm wondering that doesn't seem to accord with the way air freighters see it. So I'm wondering where that outlook is coming from.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. Let me try and answer the first 2 questions. Unit cost, let's just be careful when we talk about all the costs that we look at, it's not just unit cost. Of course, we expect to make progress on unit cost. We've got about 600 engineers at the moment working purely on unit cost reductions. And generally, we know we have very good payback on those. Of course, while you have to make an investment upfront, on average, we see an IRR, in many cases, in excess of 40% in payback in sort of within 2 to 3 years. But just as importantly, when we talk about product cost, about half of it is unit cost and half of it is what we refer to as life cycle cost, which is aftermarket: improving reliability; being clever about the work scopes; sweating the asset; using serviceable use material; and basically, ensuring that we utilize all of the remaining life on our parts more efficiently. And there's a lot that we can do there. And much of the improvements that we're seeing in our cost is all about being much clever and smarter around how we put works scopes, how we drive upgrades and things that are keeping engine on wing for longer. So there's 2 elements to that part as well as, obviously, what I'll call the other stuff around efficiency of the fixed overhead in terms of better utilization from factories, keeping control in place on C&A and so forth. So all of those, and again, we said right up front of this conference call that we are going to go hell for leather on the cost side, fix the things and control our cost, which are the things that we can control when we have a less certain revenue environment given the market conditions at the moment. But the fundamentals are good. So on unit cost, I think we're confident we'll continue to make way. You then -- the second question was switching from Civil to our other businesses. Of course, there are no exemption. We are looking to take the same sorts of cost and make improvements there, so we're expecting margin improvements in those businesses. And some of that will come from the integration as we start to move Power Systems and Marine and exploit the opportunities we've got there for both revenue and cost synergies. Now your third question, I must admit I didn't quite understand it, Nick. Can you just say it again?

Nick Cunningham

Agency Partners LLP

Yes. Sure. The -- you're saying that you expect OE volumes to level off in 2018. However, 787 is still supposed to be ramping. A350 will be quite -- probably only halfway through its ramp. And A330 nears service in Q4 of '17. So one would -- well, I suspect Airbus would hope that their volumes to be going up.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. Sorry, Nick. Just to make -- when we talk about OE deliveries, we don't make a general distinction in descriptions between value and the unit. You've got within our Civil business, you got all our corporate and

regional sector as well. So you've got maturing products in some areas that have volume that is retiring and you've got volume that is increasing, so that's reflecting currently where we see our OE leveling off at the moment. And that reflects, obviously, the Trent 700, which will be retiring and slowing down as the 7000 starts to ramp-up.

Nick Cunningham

Agency Partners LLP

Okay. And so the indication would be that, say, the Tays go because Gulfstream's moving and the BRs are full in volume?

Mark Morris

Former Chief Financial Officer and Executive Director

Right.

Operator

Our next question is from the line of Olivier Brochet of Crédit Suisse.

Olivier Brochet

Natixis S.A., Research Division

I have 2 questions. The first one is to ask you how comfortable you are that current trading would not lead to further cuts to your 2015 view. And basically, the idea is what assumptions have been baked in there in terms of the main drivers that you look at like, for instance, oil price. That's the first one. And on the second one is how -- you sound confident that Siemens does not walk away from the Energy deal. How confident are you that the price conditions will not change to reflect the current trading that you've disclosed today and that the price is revised down?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. I'll answer the first question and John will take the second one. So on 2015, I mean, clearly, in laying out the guidance we've given, we've reflected our latest view of the market and the underlying assumptions that would underpin that. I think it's not quite as pointed, but you can just point to an oil price or a point in GDP and sort of say, well, if it moves by delta basis points, we need to revise it downwards because there's always a lead lag on these things. So whilst there our drivers and the correlation may be positive, it's not 100%. So I think what I would say is that we thought long and hard about where we have order cover, as we look in the business. And again, some parts of it have a higher order cover than others. Of course, we haven't got to the beginning of 2015. We're still 3 months to run in 2014, but this is our best view at the moment. And again, it's reflected a lowering from where we were previously. We said a resumption to growth and now, of course, we've given some guidance around those numbers of 2014 expected out turn. So that's the first question. John, do you want to...

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. I think the point that Mark makes is exactly right, which is it's our best view. And that's what we're trying to make sure you're clear on, our best view. And that's why we wanted to bring you update today ahead of when we plan to do it. In terms of Siemens, we believe that we'll complete the transaction by the end of the year and the price is agreed. And I know that in the short term, there's ups and downs in any business, the purchase is really for them a long term -- based on the long-term outlook.

Olivier Brochet

Natixis S.A., Research Division

So no risk there?

John F. Rishton

Former Chief Executive Officer and Executive Director

Well, the price is agreed. And we believe that we're complete with -- we see no reason why we shouldn't complete, really, by the end of this year.

Mark Morris

Former Chief Financial Officer and Executive Director

And we think Siemens will be a great owner for this business going forward.

Operator

We now go to the line of David Perry at JPMorgan.

David Howard Perry

JP Morgan Chase & Co, Research Division

I've got a bunch of questions, please. The first one is just your reluctance to give revenue guidance in 2018. I mean, you knew you had 30% of your portfolio in short-cycle businesses back in May. Nothing's changed there. So at that time, you committed to give revenue and margin guidance, and now you're saying you won't. Can I not push you and say why not, and why not give us a range at least? Shall I give you all the questions at once or do you take that?

Mark Morris

Former Chief Financial Officer and Executive Director

Give them all at once, David.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay. Well, Civil Aero -- sorry, Mark, at the very beginning of your speech, I was scrambling to keep up with you, and I wasn't quite sure -- if you could just repeat the explanation you gave for why the Civil Aero margin is better in '14. I wasn't quite sure I understood. And then if you can just tell me that sort of main things that would explain a 2% drop in '15. I'm still not sure I fully understand that. And then my third question is just to be absolutely clear, I know a questioner asked it earlier at the beginning. Are you suggesting there could be restructuring charges below the line and -- because that's something you haven't done for probably a decade. And what would be the scope or potential scope of those, if that's what you were suggesting?

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, David. Let me to take the first one. You're right, we said in June that we would provide some [ph] group revenue guidance. And I have to say that we stated that, because of the challenges particularly associated with predicting revenue on the shorter-cycle businesses related to economic recovery, my conclusion was that we were not going to provide anything that would be in any way helpful to you because the range that we will provide will be very large and the provisos that we put on it probably wouldn't help. So that was my decision. We've probably got a little bit of ahead of ourselves on reflection in June in terms of committing to do that, which I apologize. But I genuinely don't think it's something that would -- we could provide anything that's going to help you with because of the -- there's a -- variabilities around the economic environment. So what we tried to do is provide a level of help around the other areas and in particular, around the Civil where we're trying to keep as much as we can [indiscernible] so the events that's tied to that. It's more -- it's much more difficult to do that, as I'm sure you will understand. That's really why we haven't done it.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. So if I pick up your next 3 questions, David. Civil Aero, and I think you wanted explained the sort of flattering of margin in 2014 versus what we may head back to in 2015 being sort of more to normal levels. So again, this come back a little bit to the stuff we went over in the TCA presentation in June. And

if you will recall, when we do total care contracts and look at any particular program or a big contract, but mainly program, over time, we get experience as to what the cost of maintenance schedules of those engines are. And obviously, the more evidence we get and of course, we were not just standing still, we're looking to make improvements, be it through cost reduction, improving reliability and time on wing and so forth. And when we get to a point where we are confident that it meets all the required gates and the hurdle process that we're sufficiently confident that we've captured that and going forward we will have a lower cost of accrual effectively or lower cost rates going forward, we need to make an adjustment in terms of the margin that we're taking. Again, if you remember how the contracts work, in effect, what we're doing is we're balancing up the margins between OE and aftermarkets. And if we think we're going to make a margin of X, but actually when we look at our cost base, it's got -- it's improved and now we're going to make a margin of Y, which is higher than X, then, of course, we need to collect that difference in all the previous years that we would have collected if we would have been bang-on it day 1. Again, this is a sort of -- it's a bit like a pension fund as you get more actuarial experience, as you make fine adjustments as you're going through. So we get -- so this is an economic benefit. So going forward, we are forecasting lower cost through improving reliability. So we get the benefit in year, we also get the benefit next year. But importantly, we have to look backwards over the previous years and say, right now, we need to make an adjustment, so we call that a catch-up and we take it in the year that we recognize it. So that gives you a sort of bump -- a benefit bump in the year that doesn't then repeat because you only get to catch-up once effectively, unless there's another round of improvements and then, of course, you'd get it again. You're probably going to ask me, "Well, what is that for 2014?" I'm not going to give you the number today because, first of all, we haven't concluded the usual process that we go through. We just know that it's coming. And of course, we've got the full year to run before we can lock down the numbers. But that's the main reason as to why we've got the flattering in '14 and will return to more usual levels for '15. A long wait [ph] reversal of R&D capitalization. And again, if you remember, this is another one of these tools that creates a bit of accounting P&L volatility, which is when you're capitalizing, it effectively embellishes your profit. And the moment you stop capitalizing, you go straight back to expensing and you carry the amortization with it. And that's put you the other way around, so you ultimately get a headwind. So those are the 2 main driving features of why you see that return to margins over the last few years that we've seen. So I think that covers 2 and 3. I think your question 4 was about restructuring and would it be below the line. So let me just sort of step back. So first of all, restructuring is restructuring. And we can debate whether it's above or below the line. That's really driven by a set of clear accounting rules and what's defined whether it's above or below the line. How you choose to interpret it is obviously up to you. What we said is that we are looking at additional restructuring as we seek to rationalize and control our costs. And when we're ready, later this year, we will come back and tell you what they are and whether it's below or above the line, effectively.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay. But just to be clear then, it is not in the guidance.

Mark Morris

Former Chief Financial Officer and Executive Director

It is not in the guidance, no.

Operator

Our next question is from the line of Tristan Sanson of Exane.

Tristan Sanson

Exane BNP Paribas, Research Division

Tristan from Exane. A couple of follow-up questions on the life cycle cost improvement on your Civil businesses. I would like just to understand, without having a total number, can you tell us on the 2014 improvement that you are seeing today, both what you had in H1 and the further one you're announcing today, how much is recurring improvement? And how much is a catch-up effect on the revenues already booked on your TCA contract? And second, as I understand, the increase in -- or the additional

improvement that you're booking, reflecting the progressive revision of your sanction on all your Trent 700 contracts. So can you tell us how far you are in this process? And are they further contract to be relative [ph] next year that could drive further life cycle cost improvement assumption?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Like I said to David or one of the previous questions that we had, I'm not going to break out, at the moment, what the catch-up adjustment is. When we've got the full year, we've got the numbers and we get the prelims, we'll highlight what that is. Generally, it's a sort of a rule of thumb. It really depends where we are on these programs. Normally, when we look at any uptick include in the RPA, typically, about 1/3 will be the in year in 2/3. But it really depends where we are in the processes. That's just currently where we are, but -- so...

Tristan Sanson

Exane BNP Paribas, Research Division

I'm sorry. You said [indiscernible]...

John F. Rishton

Former Chief Executive Officer and Executive Director

[indiscernible] It depends on the nature of the cost reduction as well.

Mark Morris

Former Chief Financial Officer and Executive Director

It does.

John F. Rishton

Former Chief Executive Officer and Executive Director

So there's no -- I don't know...

Mark Morris

Former Chief Financial Officer and Executive Director

So what -- I think it's based -- when we get to year-end, then we'll have where we are.

Tristan Sanson

Exane BNP Paribas, Research Division

Okay. And the assumption of having further life cycle cost improvement going forward, is that a possibility? Or are you -- is there's another process?

John F. Rishton

Former Chief Executive Officer and Executive Director

Absolutely. Look, as Mark have said, we've got some 600 engineers working on cost reduction. And we're looking to how we can extend the life on wing of our products, which is obviously what our customers would like and what we would like as well. So we've been pretty successful on that, as you reminded everybody in terms of the Trent 700, and we've talked about that. In fact, Tony Wood talked about that a little bit in June. So we're seeing good progress on the Trent 700 during the course of this year. We continue to work on that all the time, and we have all of these engineers that are helping us to do that. But as you also know, it isn't a linear thing. These things take time, energy and effort that we need to make sure that we're doing the right thing in the right way all of the time. So it isn't possible to say, well, we're getting [ph] more next year and year after. What this is, is we continue to work to improve the life of wing. We continue to improve the life of limited parts so that we can extend the life of wing. We continue to look at how we repair, rather than replace parts. We continue to look at how we can use serviceable material, et cetera, et cetera. And that's just ongoing, Tristan, all the time. So one of the earlier questions was around driving further cost savings in this area. Clearly, that's important to us.

Someone was asking about future unit cost reductions, and Mark was saying, "That's exactly what we're driving to." And I guess what I would say is, based on the level of improvement that we've had this year, certainly, we have got increasing confidence about our ability to drive these cost savings. Now I think one of the realities, and we've talked about this a couple of times on calls in the past is the progress that we've made across the group in terms of costs has been variable. So you're all aware that Defence has made good progress on cost. So I think there was some level of surprise when we announced that the revenue and profits will be down by similar percentages this year, which clearly meant that the margin was unchanged, which clearly meant we did a lot of work on cost on Defence. So the Defence business has done a lot of good stuff on costs, and we made progress there. We've made less progress in the past on the Civil side and the Marine side. What I'm encouraged to see is we're starting to make more progress in those areas. And certainly, on Tuesday, we'll talk a little bit more about that in Marine. My suspicion is that with the outlook -- not my suspicion, my knowledge is that with the outlook that we've got now in terms of the economic environment, that will really capture everyone's attention and will probably -- I'll have more momentum in terms of cost reduction going forward than I have been in the past. So what I've been saying is, while I'm confident we can accelerate cost reduction in total across the businesses, is that because of the deterioration in the economic environment, everyone kind of gets that and understands that. And therefore, the urgency of the need to see ways to change what we do and how we do it becomes apparent to everybody, therefore we'll make good progress as opposed to where we've been in the past, where we've seen mixed progress. So for me, we're going to have accelerated cost reduction in the future. As a consequence of the confidence that we're creating across the business with the successes that we've had to date, and as a consequence of the deteriorated economic environment in the short term, which brings this into even sharper focus and makes it more obvious to everybody. So I think it as a whole -- that's the good news as far as I'm concerned about this. That's the area that I -- we can control, and we're really going to get attention on to that as a consequence of those 2 things: improving levels of confidence about the success we've had and the deterioration of economic environment, which is really making people clear on the urgency and the need for this.

Tristan Sanson

Exane BNP Paribas, Research Division

So do we just -- so to be totally clear, that means that your total portfolio of Trent 700 contracts has been currently revisited under your current assumption for maintenance cost for these? And any improvement will come from new cost savings? Or does it mean you still have more Trent 700 contract to analyze and to see whether you can recalculate your recurring profitability on this?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. Okay. Just -- I mean, it's not program-specific. I mean, of course, we look at programs where we can take costs out. It's an ongoing -- I mean, as John has just alluded to, it's ongoing. We only make those adjustments when we are confident that we've gone through all our processes that we can deliver and we got some experience and track record that supports it. And of course, that doesn't happen sort of every time. When we get it, we see a step-down in terms of the costs that we've got, and we're confident about it, then we'll recognize it. So yes, of course, we expect we continue to focus that we'll continue to drive costs out of all of our products, including the Trent 700 as we go forward. It's not just about at point do we decide we want to think we feel confident we can just -- there has to be the underlying backing and supporting evidence behind that, that says, yes. We've got the improved reliability. We've got the improved cost. The upgrades are improving reliability, et cetera, et cetera but it's -- across all our programs, and the Trent 700 is no exception.

Operator

We now go over to Harry Breach at Westhouse Securities.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Just 2 quick ones. Mark, you said earlier, Civil Aerospace revenue this year 2014, the range maintained at 2% to 5%. But I think you then said, maybe towards the lower end of that range. Can you just clarify, is that just due to the cumulative impact of currency this year? Is there something else going on? And then just secondly, just on T&M spares flow that we've seen in the third quarter going into the fourth, is that what you'd expected 6 months ago? Or is that sort of the demand pattern, the flow rates have changed negatively?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. Look, so not due to currency effects, it's constant FX. This is more to do -- I mean, the trading range is just the basic ebb and flow that we have that we can't land on a sixpence. Let's not forget, we're talking about large expensive pieces of capital goods here. Some might deliver before year-end, and some might not deliver before the year-end. And some might deliver before the year-end, but we don't get paid for them until slightly after year-end. So there's always some balancing movements that we've got that we need to understand. So that's just what I would call sort of wiggle room in terms of the rate that we can't predict through the dollar or the pound exactly what it's going to be. But there is nothing -- like I said, there's been some softening but it's nothing specific that would take us out of our guided range. So I guess, that's the comment. Sorry, your question 2, I completely forgot what it was.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Question 2 is just to understand in the time and materials' spares revenue stream. Is it sort of following the trajectory that you would have expected sort of 3, 6, 9 months ago, maybe beginning of the year? So the trajectory, particularly the RB211-524, coming down being maybe the dominant influence this year? Or is that sort of trajectory, as we've gone through the last quarter, has it deteriorated in the time and material's spares side?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. Generally, its performed as we said. I mean, I think we highlighted H1. We saw a bigger reduction in RB211s, but actually for H2 it's performing pretty much as planned.

Operator

We now go back to David Perry at JPMorgan.

David Howard Perry

JP Morgan Chase & Co, Research Division

So 2 questions. The first one, you may be reluctant to answer, but I'll try. In 2018, in Civil Aero, can you just tell us what you're assuming your payment out of IAE will be in terms of the royalties you're getting? And the second one was just your guidance implies another record high in 2014 for Defence margins, clearly, above 17%. Just wondered if you could give your view of what may happen in 2015 there.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Well, you're right. I'm not going to answer the question 1. I mean, first of all, I haven't looked out that far on that particular piece to just tell you what it would be, even if I were prepared to tell you that. I mean, like I said before, on the V2500, that continues for many years to come on the royalty. And obviously, the OE piece will certainly slowdown as the new neo comes in. And I don't think there's any surprise there, but I'm not going to get into breaking out on that. On Defence, look, I think as John said -- look, Defence, austere times in terms of governmental expenditure on defence budgets. Business, I think, has done well in terms of keeping its costs under control and maintaining its margins on the lower revenues compared to last year. I think as we've said before, we continue to expect some downward pressure on Defence margins pointing to around the mid-teens, I think. But I'm not going to get drawn into '15 at this stage as to exactly what the margins will be, other than to say that the Defence business

is working hard to maintain its margin and take cost down. And we've got good evidence of that when we look at both what we've seen last year and this year.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, David. I'm going to wrap the call up now as we are at just about at 9:00, and we said we would go for 9:00. Look, I really appreciate everyone joining the call this morning at such short notice. We are working hard, and at times I'm sure it doesn't seem that way, to provide you with our best views on the outlook for the future in a way that we hope you will find helpful. I recognize that we are at the start of that journey, not at the end of it. And I recognize that, at times, we are inevitably going to appear slightly defensive whilst we're not even trying to. And I apologize for that. We are in a transition period here between providing only in-year guidance, and we're now trying to provide guidance in year, following year and for the medium term. And whilst that may seem a straightforward exercise, it clearly isn't as straightforward when you get into it as it maybe it first appears. So we are working as hard as we can, really, to try to provide the information that is helpful to you and our investors in a way that is helpful to you, our investors, and at a time that is helpful to you, our investors. I am sure that you will all like more. I am sure that you would all want more details. But we are working hard on this. So, thank you, again, for joining us.

I'm just going to repeat what I said at the start, which is the fundamentals of the business are unchanged. We know that there'll be growth in the medium term. And we know that the drivers behind that are sound, the growth in the air travel and the growth in the demand Energy. And that means that the strategies are unchanged because the medium-term outlook is unchanged because the fundamentals are unchanged. And whilst we're going to have a bumpier time in the short term, that doesn't change those fundamentals.

Now because we've had a call this morning, we will not be having a call on Monday morning. But we will have a session on Monday evening up in Norway that Mark and I will host which will be WebEx-ed. We're looking forward to seeing you in Norway, and Mark and I are looking forward to welcoming you there on Monday evening. On Tuesday, we will have a complete day on Marine, which I hope you will all find very useful, helpful and the team are forward to hosting you, bring your sea legs. Thanks very much for joining us this morning. We'll speak to you soon.

Operator

This now concludes the WebEx. Thank you all very much for attending. You may now disconnect.

Operator

Hello, and welcome to the 2014 Half Year Results Conference Call for Rolls-Royce Holdings plc. [Operator Instructions] And just to remind you, this conference call is being recorded.

And before we start, some words about Safe Harbor. Please remember today's call will include some forward-looking statements about the Rolls-Royce's group and its businesses. These statements are based on the management team's current views and assumptions but, of course, change over time.

So you should consider the statements in this light.

Today, I'm pleased to present John Rishton, Chief Executive Officer; and Mark Morris, Chief Financial Officer. Gentlemen, please begin.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks very much, Hugh. Good morning, everyone. Thanks for joining us today. It's good to have you listening in.

I'm going to give you the headlines, and then I'm going to hand over to Mark, who's going to take you through the details. Mark will speak probably for about 15 minutes or so, and then we'll go straight to Q&A or wrap the Q&A up no later than 8:25 and then I'll wrap the call up -- at 9:25, I'm sorry, I'll wrap the call up.

So looking at the headlines, first of all, the first half performance was in line with guidance. And we maintained our full year guidance and continue to expect growth in 2015. We increased the shareholder payment by 5% to 9p, so I think the key financials where we said we would be.

In terms of the first half, we delivered our first XWB engines to Airbus for Qatar Airlines, launch customer -- to launch later this year. We've run, for the first time, the large XWB engine, the XWB 97K that will power the A350-1000 aircraft and we'll also run the Trent 1000-TEN engine in the 787.

And you also all will be well aware that at Farnborough, Airbus announced the launch of the A330neo. And we're the exclusive engine provider with our Trent 7000 engine, with draws on technology from the Trent 1000 and the Trent XWB engines. And I'm delighted we already have 127 aircraft commitments, and that provides even more confidence about strong growth in the future.

Now I hand over to Mark, who's going to take you through the details of the first half and our views about the second half. Thanks, Mark.

Mark Morris

Former Chief Financial Officer and Executive Director

Thank you, John, and good morning to you. So we'll start with some of the key group highlights in the first half. Let's just remind ourselves of what we said at the prelims: Revenue and profit for the group will be flat with a similar free cash flow for the year, and that our performance will be weighted to the second half.

As John has said, our H1 results are largely as we expected. As usual, my comments will be restricted to the underlying performance. Now we will go through these results in a little more detail. But before we do, it's worth mentioning foreign exchange as the pounds has depreciated against a number of currencies, which has impacted our results. You can find a lot more detail in our press release, but across all our currencies, the strengthening pound has reduced revenue by GBP 226 million and profit by GBP 21 million.

Turning to our order book. It remains strong and provides good visibility, over GBP 70 billion, albeit a slight reduction from the year end. Revenue and profit, I will come unto shortly.

On cash, we started the year with GBP 1.9 billion and ended the period with GBP 1.2 billion, a reduction of GBP 762 million, which reflects growth in working capital, continued investment and shareholder payments. And finally, we've increased the half year payment to shareholders by 5% to 9p, reflecting our continued confidence in the business.

Let's take a look now at group revenue. I've broken down here the 3 main components of the change in revenue. Original Equipment is down around GBP 200 million, driven predominantly by our Defense and Marine businesses. Defense is down 40%, and Marine is down 15%, mainly on Offshore and Merchant. This is partially offset by OE growth in civil.

Services were also down GBP 57 million, and reductions in every business except Defense, which saw good growth of 9%. And finally, FX, which I've mentioned already.

And as we look at it to the second half, we're looking at around 20% increase in revenue from both higher OE deliveries and a higher run rate of services. And we'll come back to this later on.

Turning to group profit. Volume is down 4% in constant FX, and that's reduced operating profit by GBP 89 million. You're aware of the Marine one-off charge relating to a product quality issue. R&D is GBP 36 million higher, reflecting increased spend in civil programs and lower capitalization as the XWB and 4K [ph] approaches entry into service.

Within other trading, we see the benefit of C&A as a result of indirect headcount reductions made last year, some trading mix impact and aftermarket life cycle cost improvements in Aerospace.

Restructuring spend was GBP 67 million in the first half, which is a GBP 32 million increase over last year as we continue to improve operational efficiency and reduce both direct and indirect costs. These costs are mainly severance costs and site restructuring.

Turning to cash flow. As usual, I'll just pick out the major [indiscernible] themes in this chart that you're all familiar with. Networking capital increased by GBP 634 million, which is about a GBP 200 million lower increase than we saw in the first half to 2013. This reflects higher inventory of GBP 195 million, as we prepare for the increase in H2 volumes. The TotalCare net debtor has increased GBP 165 million, reflecting the sale of engines we linked to aftermarket contracts, mainly Trent 700. Deposits were also lower in Defense and Marine, reflecting deliveries in the period.

Cash outflow and CapEx was GBP 303 million, up GBP 20 million on last year as we continue to invest in capacity and capability. Intangibles of GBP 239 million primarily includes GBP 40 million of software; GBP 28 million of contractual aftermarket rights, formerly known as recoverable engine costs, and again, mainly Trent 1000; GBP 91 million of participation payments on civil programs; and GBP 57 million of capitalized development costs.

Pensions and tax comprises GBP 109 million of tax and GBP 80 million of pensions contributions, which brings us to a free cash outflow of GBP 432 million, which is better than guided. Cash continues to remain an area of significant focus. We continue to expect free cash flow to be similar to 2013.

So now we're going to take a look at each of the businesses. The following figures and commentary in this section reflect the underlying performance at constant foreign exchange, unless otherwise indicated. In Civil Aerospace, whilst the number of engine deliveries was down 1% in the period, OE revenue grew 5%, reflecting 16% higher Trent deliveries, partially offset by 10% lower business jet engine deliveries. Services were down GBP 38 million, and there are a number of moving parts here. On RB211s, we are seeing a combination of lower utilizations as aircraft are converted to freighters and more retirements. Revenue is down about GBP 70 million, and we expect an over-reduction RB211 revenue of about 25% for the full year.

Life Limited Parts are also down, also known as LLPs. LLPs are high-value parts and many of them are not covered by TotalCare. So we get this as incremental T&M revenue at the shop visits. As mentioned at the recent investor briefing, we continue to improve the reliability of our engines, which increases the time on wing and delays the overhaul. This improves overall margins, but delays the LLP sale creating a short-term

timing issue. This was particularly relevant to the Trent 700 in the period with the number of shop visits deferred. Importantly, our wide-body LTSA revenue continues to grow and is up 9%.

On profits, we are seeing a small benefit from volume with the majority of the trading improvement coming from better life cycle costs and a lower C&A. As guided, the R&D charge was higher as a result of higher spend and lower capitalization.

Looking to the second half, we expect higher OE deliveries, particularly Trent's engines, supported by 95% order cover. We have 100% order cover for installed engines and a few open orders for spare engines, better aftermarket driven by higher LLP sales and higher T&M, further cost reduction benefits, particularly in the aftermarket and lower restructuring costs.

Turning to our Defense Aerospace business. On revenue, we've seen a 40% decline in OE, mainly on engines to power the Typhoon, Hawk, C-130J and V-22. Services increased 9% with growth from the LiftSystem as it enters service and continued to mark demand for parts and services from our large installed base of 16,000 engines.

Turning to profit. We trade in -- within trading, we see the impacts of defense having done a good job taking cost out of the business, and this will continue. Defense reduced headcount by 900 since the year end. We've also made good progress on life cycle cost reduction.

Margins also benefited from higher aftermarket sales, which was 62% of Defense's revenue in H1, up from 47% this time a year ago. This proportion will be lower in H2, as OE deliveries increase, particularly on the TP400 and the LiftFan system. So we'll see some downward pressure in the second half but in line with guidance.

So moving on to our Marine business. We've had a challenging first half in Marine. OE revenue was down off the back of lower order intake in 2013, mainly in Offshore. And we had a disappointing performance in services, which is down 9%. Some of this reduced deferrals invested with utilization was also down. On profit, in addition to the negative impact of volume, we also booked a GBP 30 million product quality charge in H1.

Looking to the second half. We've reduced our services outlook based on the lower run rates we've been experiencing, but this has been offset by a higher order intake of OE. We have 98% OE order cover, so our confidence there is good. And our guidance reflects a mix shift towards OE. That's why our revenue guidance is stable, but we have reduced our profit guidance. We are making progress on cost reduction in Marine, but it's been slower than we would have liked. So that's also reduced our expectations for full year profitability.

Consequently, our full year guidance has been revised downwards for a 15% to 25% reduction in profit, prior to the GBP 30 million one-off. This now makes it consistent with the way we have framed group guidance.

Next, let's take a look at our Nuclear & Energy business. OE revenue was higher as we completed several major programs. We had high deliveries in Oil & Gas and nuclear subs. Aftermarket revenue was down 5%, largely driven by reductions in our Oil & Gas business. Profits were lower, driven by adverse mix between OE and services. The small trading benefit includes some product cost reduction and C&A improvements, offset by GBP 10 million charge in the first half to resolve contractual disclosure issues.

In the second half, we expect higher OE and aftermarket sales, in line with traditional phasing. On OE, we have 73% order cover. Aftermarket is an area where we have less visibility. We have about half of this covered on the energy side and an 85% order coverage on the nuclear side.

As you know, we've announced the sale of the gas turbine and compressor business to Siemens. They are making good progress, but there's a lot of work to do to prepare the business to separation. We expect this to close around the year end, so our guidance still assumes full year contribution of this business. Following the sale, the retained business will represent around 40% of underlying revenue and profit.

And finally, our Power Systems business. Power Systems had a similar first half to last year, with OE sales up 5% and aftermarket sales down 6%. Naval and defense sales were higher, while oil & gas, mining and power plant sales were lower. Profits were lower in the first half due to a small mix effect and higher restructuring costs. Looking to the second half, we expect higher OE deliveries, particularly coming from higher sales in Oil & Gas mining and power generation, supported by 80% order cover. Better aftermarket, reflecting the traditional second half weighting to spares and firm orders from naval and defense customers and cost reduction benefits and lower restructuring costs.

Turning to financial strength. As you know, we continue to place considerable importance on maintaining an investment-grade rating and strong liquidity. There's been no change to our credit rating during the period.

Now turning to the guidance. Group guidance is maintained. Excluding foreign exchange translation effects on the one-off charge in Marine, we expect revenue and profit to be flat for the full year with free cash flow similar to 2013. The impact of foreign exchange at current rates will be around GBP 500 million on revenue and GBP 70 million on profit.

It's worth mentioning the EPS impact from our purchase of the remaining 50% of Power Systems, which we expect to complete towards the end of the year. Daimler relinquished its economic interest in the 25th of March when it exercised its put option. The underlying earnings per share increased 100% of Power Systems profits from that date. In the first half, this improved the underlying EPS by just under 1p.

Turning to segment guidance. As I said at our recent Investor Day, we will provide a new format for guidance that give ranges for revenue and profit. Segmental guidance is maintained except for Marine profit, which we have lowered as mentioned earlier.

The change in Marine profit will be compensated at the group level by improvements in the other businesses.

So some final thoughts to leave you with. Our interim results are as expected, we continue to make progress on the 4Cs with more to do. The reasons we're confident about a much better second half are high OE order cover, higher OE services, higher OE and services volumes that we see across every business, traditional second half weighting and further benefits from cost reduction.

Finally, shareholder payments are up 5% to 9p, reflecting the continued confidence we have in the business.

With that, I'll turn over to Q&A.

Question and Answer

Operator

[Operator Instructions] Our first question is from the line of Robert Stallard of RBC.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

First of all, I wonder if we could start with the Aerospace aftermarket on the RB211 and these other life limited parts. What gives you the confidence that these will recover or stabilize in the second half?

John F. Rishton

Former Chief Executive Officer and Executive Director

Well, thank you, Robert. I suspect this would be a question. Yes, some of it is just phasing, so we know when we look going forward we have a high number of shop visits scheduled. And that's why we have the confidence. And the impact from both is about 50-50 between LLP sales and the RB211 revenue.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

And I was wondering if you could also give us what the Trent aftermarket on the TotalCare did in the first half in terms of revenues?

John F. Rishton

Former Chief Executive Officer and Executive Director

Well, we don't break them down by various programs. But I mean, the Trent wide body generally continues to grow, reflecting the growing installed base.

Operator

Our next question is from the line of Christian Laughlin of Bernstein.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Just one question or a couple of questions, I guess, around Trent 7000. If you could just provide some additional detail on the amount of incremental R&D spend in phasing for the engine. I mean my understanding is it's on the order of GBP 200 million to GBP 300 million or so. I'd just like to understand how that kind of overlays from -- I guess the spend begins in 2014 through EIS in 2017? And then also, as a kind of corollary to that, if you can give any color on some of this R&D spend actually diverted from other planned work in the future. In other words, it's not truly incremental beyond what was already in your R&D budget plans or outlook for several years.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. So first question is the high level, it's not incremental to our R&D plans. If you think about how R&D operates, it's predominantly people. And we have a finite number of people that are working to consume the bulk of what our R&D spend is. And as we go forward, obviously, to the extent there's no problem -- no programs, what would happen is obviously, we free up obviously loan or capacity in terms of what we can do. So this has been factored in within the balance of our affordable R&D. It's worth saying that this is not a completely new center line engine. We're taking a lot of Trent 1000 architecture. And as you rightly said, we said that R&D will be around GBP 200 million to GBP 300 million between now and EIS and very little CapEx other than for tooling. So we're looking in the low tens of millions for that. And again, that's factored in to our guidance both for next year and for this year.

Operator

Our next question is from the line of Ben Fidler at Deutsche Bank.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes, a few questions, please. Just the first one on the level of confidence, I suppose, and what gives you that confidence over the recovery, specifically in the industrial businesses where Marine and Power Systems have both got a lot to do in the second half. I know you stepped through some of the drivers of that, but just -- still struggling to understand what gives us that scale of H2 weighting in those businesses this year? The second question was on the specific guidance -- and thank you for the increased clarity of the division by division level. Obviously, I don't know what your old growth rates were in terms of the profit growth. We only have the old language to refer to. But I'm just struggling to see the cut that you've made to your Marine profit guidance, what else has gone up significantly on the other side to counterbalance that? I'm struggling a little bit to see that, but I'm cross-referencing percentages with language before so you have the privilege of more information. And the third question, I know you're no longer revealing what the IAE benefit was, but are you able to share, even if not the absolute number, just the directionality of that IAE benefit in the first half of this year from the earn-out payment?

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Ben. Thanks for your questions. Well, I'll talk a little bit about sort of the first couple, maybe ask Mark to talk about IAE. In terms of confidence, I think what Mark has outlined, I think, in more detail in his presentation than we would historically have given. We are trying to help as much as we can. We heard very clearly the comments that have been made about providing more information. And it clearly revolves around 2 things, which is the OE order cover, which is Mark has said is strong in both Marine and Industrial Power and in those businesses where the weighting is in terms of services cover, varying levels of services cover so stronger in naval, less so in Rolls-Royce Power Systems. If you'll look at the weighting, for example, between last year and first half and second half of Rolls-Royce Power Systems, you would see a lot dissimilar pattern. So this isn't something that is exceptional or particularly unusual. I think that what I would say is we have really gone around again on the Marine services side because we were too optimistic in the first half on Marine services and have reassessed that position completely. And we've actually got some additional people working in that area. We're addressing a number of aspects of that business to make sure that we can deliver on the services side. So as we sit here today, we're pretty confident about that step-up in the second half. In terms of the reduction in Marine, as Mark said, whilst it isn't precisely clear to you, its improvements across the other businesses that compensate for that within the guidance ranges that we've already issued. And it's across all of those other businesses. In terms of, IAE, Mark, this is a recurring question, and I know that you are keen to answer this one.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, look, the short answer, Ben, is that we stopped giving the relative move from what I'll call, old world to new world, just because it gets difficult. But the absolute contribution is not dissimilar to H1. And just so we can be clear, there is no sudden drop-off of the V2500 business. And as we look forward over our 10-year forecast, it will continue to contribute to part of the portfolio for many years to come. So I think it's probably what I'll say at the moment.

John F. Rishton

Former Chief Executive Officer and Executive Director

In terms of 3 sources of income that we've got there, Mark...

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, yes. I mean, Ben, I think you probably know this already. I mean there's sort of 3 sources of income that come from V2500. There's the fact that we manufacture parts and assemble engines. We do overhauls, and obviously, sell spare parts. And then finally, we continue to collect a number of dollars

per engine flying out that will go into -- which will carry on, on every engine service that will go for many years to come.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

And actually, do you expect any upside over your original expectations in the scale of that earnout? Just looking at some of your competitors who report numbers on the V2500, the aftermarket growth there has been probably stronger than we were expecting. Does that generate upside for you, or is there a capital limit that's part of the agreement of the scale of that earnout with Pratt?

Mark Morris

Former Chief Financial Officer and Executive Director

No, I think it's fair to say, and as we reflected actually over the last couple of years, we have seen better trading from V2500. And of course, it's got a big installed base. So we'll continue to see that coming.

Operator

The next question is from the line of Celine Fornaro of Bank of America Merrill Lynch.

Celine Fornaro

BofA Merrill Lynch, Research Division

I have 2 questions, if I may. The first one would be just to clarify, on the division of guidance, which you now provide and the trends there on the revenues and profit. Does that include the effects, or are those guidances based on the current spot rates really for the year? And my second question would be if you can comment your progress on the cash. You seemed to be fairly pleased with that, although it still's down compared to last year by GBP 100 million. And if you could comment on your inventory turns, especially on the Aerospace business but also in the industrial businesses. And if we -- and how do we think about that into H2? Are you going to start to ramp up again for next year? So how do we think about the inventory turns then?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Why don't I get Mark just to comment on the FX and the guidance? I'll talk a little bit about cash.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. So Celine, just to be clear, the guidance that we are giving and have given is what we refer to as the constant FX, so that's at the same level as 2013 FX. And in the press release, and as I've also provided in the presentation, the impact of the current effective average rates for the year, if they were to stay exactly the same -- we've talked about it if they will or not, it will impact revenue adversely by GBP 500 million and profits by about GBP 70 million, which obviously has sort of gone up a little bit from where we were in Q1. And that's purely the movements in average exchange rates on the translation effects as we call it.

John F. Rishton

Former Chief Executive Officer and Executive Director

In terms of cash, and specifically, inventory turns, what we've seen in the first half is an improvement in terms -- turns compared to the same period last year from 2.8 turns to -- sorry -- yes, from 2.8 turns to 3.2 turns. So that's a good improvement. Now, it's slightly more complicated. And I'll just explain a couple of things. First of all, that is down from year end when it was 3.4 turns. As Mark has explained, that's been one of the reasons for some of the cash out fleets [ph], he talked about the increase in working capital. But it's an improvement compared to the same period last year. So at year end, we said we'd improve by 0.4 turns to 3.4 turns, which is good improvement. The improvement of 0.4 turns versus the same period last year is true for the half year, but it's now down at 3.2. So we're making good progress against the same time periods last year, which reflect the same kinds of movements in the working capital

flows. So we're expecting improvements again in the full year in terms of inventory turns. Now the only other point that I would make, and this is one that I do want to make sure we're clear on is that those turns exclude, at the moment, Rolls-Royce Power Systems. But we will include those when I next talk to you, and I'll tell you what those numbers are. In detail, the Power Systems numbers' turns are lower because of the nature of the business and the way that they carry, particularly service parts. And they're in the low 2s. They have been fairly flat year-on-year, but we'll bring those to your attention at the end of this year. I'll make sure I bring those. But in terms of the numbers that we've talked about in the past, we've seen good improvement in turns in the course of the year.

Celine Fornaro

BofA Merrill Lynch, Research Division

But John, thanks for the answer. But just to follow-up on this. Is it that the H1 you actually were expecting to make a little bit maybe of progress compared to the year end, or it was as planned all in line? And also, if you could give just a little bit more color on the inventory turns, what was the division that maybe continue to do better or improved or disappointed? And how is Aerospace tracking in that or Marine?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, yes. So it was actually, the turn rate was better than we -- it's slightly better than we expected. We made more progress than we expected. And again, this is where it gets slightly -- maybe more complicated. But to make it simple, the answer is it's better than we expected. The primary improvements that we've seen have been in civil, particularly civil large engines. So we're seeing good improvements across the board, but particularly in civil, civil large. And one of the ways that we've been doing that across is we've been rebalancing the total inventory position. And one of the drags that I've currently got is that increased some of the burden allocation costs of my fixed cost as I reduce production to take out inventories to drive turns, which is something that I talked to you a little bit about at the Investor Day.

Operator

Our next question is from the line of Harry Breach at Westhouse Securities.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

I've got 4 fairly brief questions. I'll start with the simple one, numeric one, if I can. Firstly, just in the first half, could you give us the percentage of Civil Aerospace aftermarket revenues from TCAs? I think it's probably somewhere in the low 70s. Second one, in the past, you've commented on the movement in a period on the achieved rate. Perhaps there wasn't any movement in the first half of 2013. But could you just give us some indication of that both for the first half and what you expect for the full year this year? Third question, the dividend increase, looks like lowest since 2009, but hopefully, the outlook's a bit brighter since then. Can you just help us to understand how you're thinking about that sort of pacing of dividend growth? And the last question is about Marine. Can you give us, 2 things really, firstly, a little bit more color about the quality issue? Historically, thinking back to times with Mermaid, and I believe, other issues. These things have occurred, and they weren't just entirely one-offs. It would be great if you could give us some reassurance and confidence about what happened and the fix. And the other thing is about services. Can you give us some sense about why things have fallen down? When I look at day rates for Offshore Vessels, I can't see collapsing numbers there. Can you give us a feeling about why the services part of Marine has come so short this year, and how you're feeling about it going forward?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, sorry, Paul [ph], why don't you take the first -- the numbers questions, the first 3 maybe. And I'll talk a little about Marine.

Mark Morris

Former Chief Financial Officer and Executive Director

Certainly, John. Good morning, Harry. Our Civil Aerospace TotalCare revenues first half of total aftermarket, and this was 72%. That's a nice and easy one to get out. Achieved rates -- so this is transactional exposure, very little movement. And for the full year again, pretty, pretty, very negligible movement on achieved rate from '13 to '14. Sorry, the third question, here we are. Dividend, yes, look, I mean you're aware and as I said at the Investor Day, that our dividend policy is really a progressive policy that moves broadly in line with earnings growth, I mean mechanically from that, you could infer that we should have no increase on the grounds that we've guided no growth for this year. But again, we said this is temporary, we expect to resume growth next year, and that really reflects our confidence. And clearly, we're confident about H2. And obviously, when we get to the NDA, we can see as the next staging post what we'll do on dividends really.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. I'll talk a little bit about Marine. I'm not going to get into the details of the specific part of quality issue, but what I would say is a couple of things. First of all, this goes back quite a way, and it's something that we could investigate in and try to unravel some time. At quality in Marine is something, as we did across the entire business, we measure and are focused on this part of our customer focus. So if you think about the, what we call, the customer DNA, the very first item in there is quality and delivery responsiveness and reliability. And I'm pleased to say that the way we measure quality has improved across the business and across all parts of the business, including Marine. So this is something that has, is historical and is something that we are working to fix, and we will fix. In terms of services, I think a couple of things. First of all, as with many of our parts of our business, it really depends on exactly what businesses you're in, what you've actually seen going on in any particular period. So you can talk about the Marine business as a broad business. You need to then go down into exactly what part of the Marine business you're in or what's going on in them. So whilst, as you say, you haven't seen significant change in some of the vessel rates, we've seen reductions in utilization of a number of vessels. And we've continued to see that. And in some of our parts of business, we've seen some reduction in rates as well. So with the naval business, for example, we've seen good services, that's been far, that's been as predicted. But in Offshore, we saw it coming down. Now I would say that I think we were overly optimistic in our forecast, and that's part of it when we started off the year. And part of it is what's going on in the market. And that's what we've been reassessing, and we've been reassessing that for what's happened, what we think has happened. We've also been getting some more expertise into the business in this particular area, which I think will help us in the future.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

And John, can I take just a tiny stage further, which is saying, do you think that for that Offshore business for services, demand is something where rationally, we might think about it coming back or rebounding next year or beyond, or are we kind of rebasing to a lower level of offshore activity?

John F. Rishton

Former Chief Executive Officer and Executive Director

No, we don't really base it to a lower level of offshore activity. As Mark said in his presentation, we've seen actually a higher order intake for offshore in the first half, which gives us more confidence about the second half. It was actually, we actually believe, as Mark has said, that we're going to have more OE sales in the second half, which will eventually flow through into more services. So I think there will be some services uptake. And it's there, but we are spending more time on -- as I said, getting more expertise on it. I think I mentioned at one of the calls or maybe the Investor Day that we've signed our first long-term service care agreement in the offshore market earlier this year with one of our main customers. That's a very important step, very big step, but a very small part of the business. So I think as I look to the future, our increasing focus on services, both in terms of getting the service centers into the geographies that they need to be, in terms of building the organization behind that and the structures and processes behind that. We've got more work to do, but it is the right direction of travel because our services business is and will be very important to us and to the Marine business in the future, particularly I think, at Offshore because that's where our strength is.

Operator

Our next question is from the line of Rami Myerson at Investec.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Two questions. Short one and longer one. Could you provide that similar color on the Rolls-Royce Power Systems on the trends in markets, and why you expect a pickup in services and in which markets in H2? And just to clarify because there has been some ambiguity in the past. In the statement, you talk about growth in 2015. Does that imply revenue and profits?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. So '15, again, revenue on profits, we expect growth in that year in both of those areas, those at Rolls-Royce Power Systems. A couple of things, again I think, their services has tended to be more in the second half than the first half. But again, it depends explicitly on the markets that we get into. So they serve a wide variety of markets in different requirements in terms of servicing. What we saw is a weakness in Oil & Gas and mining in the first half, which we think will strengthen in the second half for a variety of reasons. So we believe that the services will include in that business in the second half, one, of a basis if that's what they've done in the past; and two, because of the mix of the business that we see strengthening in the second half.

Rami Yehuda Myerson

Investec Bank plc, Research Division

So you expect Oil & Gas and mining to pick up in H2?

John F. Rishton

Former Chief Executive Officer and Executive Director

I think we'll see some strengthening in that, certainly, in terms of the OE and also in terms of the servicing part of those businesses.

Mark Morris

Former Chief Financial Officer and Executive Director

I mean, it's also worth saying that generally, where we're dealing with governments and public sector bodies, we do see buying patterns growing in the last quarter as they look to spend their budgets so they reset at the same level. And that's generally, we see not always a much higher uptick in Q4. And as I said in the presentation, obviously, we tend to get higher -- we got quite high order cover actually on Power Systems when we look at our naval and defense parts of the business as well. So that's why we have the confidence.

Operator

[Operator Instructions] And we now go to the line of Ben Fidler of Deutsche Bank.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Sorry to come back with another question. Just a quick follow-up having read a little bit more in the statement. Now I've had some time. I'm still struggling, I suppose, to understand and drill down into some of the margin performance in defense and also Civil Aerospace in the first half. And I know in the -- you refer on both commercial Civil Aerospace and defense to reduce maintenance cost on the Trent 700 and to improvements in some of your long-term service agreements in defense. That -- presumably, this led to some sort of cumulative capture type of profit effect. And I just wondered how significant that was both within the defense business and in the commercial business in the first half? Do you see those cumulative catch-up effects continuing in the second half?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Ben, I'm, I was quite impressed when you said the cumulative catch-up. Obviously, the Investor Day has done its bit on highlighted. But yes, there is an element. And again, if you remember when I was talking about the fact that we make an estimate about costs and as reliability improves and we've seen that happening in a number of our defense and civil engines, obviously we will release effectively margin as part -- and that obviously adjust the revenue as well. So the short answer is these things only arise when we come and do 2x a year where we do these follow-up reviews. And once we can forecast what we might think, and only once go through that process because there's quite a few moving parts so it's difficult to say. What we have done there is, in our view and looking at where we're seeing our progress in costs and reliability, we do bake that in. And that's reflected in our overall guidance for the year for civil and defense. But like I said on defense, there are a number of moving parts, which is why I said don't sort of -- whilst we'd like it to get used 19% margins on defense, we think longer term, there's probably more like the midteens for defense.

Benjamin Philip Fidler*Deutsche Bank AG, Research Division*

And presumably, the effects of those must have been -- how significant were those effects in the first half, of significance or not materially?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Of significance but not materially.

Operator

Our final question is from the line of Sandy Morris at Jefferies.

Sandy Morris*Jefferies LLC, Research Division*

I'm still going to come back to Civil Aerospace which is what I think Ben was asking about. I mean it's funny, isn't it, when we get a good result, it worries us. Bluntly, the decline is due to restructuring and higher R&D. Then we have adverse mix in theory because we've got fewer corporate engines and more Trents, although Trents are linked, I guess. And I understand that there's a lot of variables washing through here. But my impression is that something must be going right in the business in the sense that the new facility is, must be coming onstream smoothly or something. And so without wishing to sort of go through -- did that go up or down a bit? I mean, how are we feeling about the ramp up, albeit we're still at a relatively early stage?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Thanks, Sandy. Yes, your description is a good one. I think we're feeling very good about it actually, Sandy. The new facilities that we're opening are opening -- and I'm touching wood now very smoothly. We're getting very good performance out of all of them. So I think at the Investor Day, I used the example of our new facility in Washington where we've improved productivity by 50%. We're seeing right first time, pretty much all the lower time compared to the old facility where we were because of the nature of the facility and processes. So we're seeing really good progress. But it's not just the new facilities that are really starting to improve. We're seeing the benefits starting to flow through from the focus that we're putting on and the team we have put on manufacturing processing capabilities. So as an example, this morning, this is sort of an embarrassing example in many ways, at Barnoldswick, which is one of our oldest facilities. We have, for the first time in one of the areas of production, eliminated all of the arrears. So arrears are things that we're supposed to produce, but we're behind time. And that's one of the things that affects our production rate. So for the first time in the history of the plant, we have no arrears on structures, which is one, extraordinary in the sense it's the first time ever. But two, it's brilliant

because we've managed to get there, which will help improve our performance to plan, which will then help improve our performance to customer, which will then help us reduce our cost and our inventory in cash. So we are seeing good progress from the new facilities that are coming onstream smoothly and much better performance from many of our older facilities as we drive standardization, lean production, new production methodology into those plants.

Sandy Morris

Jefferies LLC, Research Division

Yes. I mean my sort of impression is that what you've just described is just as important as any of the other ups and downs and i.e. or whatever. Am I right in sort of thinking that?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, you're exactly right, Sandy. It's things that I was trying to emphasize at the Investor Day. It's what I talked about is growing pains, which is there's a cost associated with getting this in. But once it's in up and running, then we're in good shape. So it's getting through that hurdle. So it's getting the new facilities in, getting the production processes operating smoothly and efficiently and effectively, getting the capacity utilization up, which is going to come as we grow the business, and the growth is there. Exactly how it falls, we'll see it over time, but we know it's there. And then we've got to restructure, which means reducing some of our facilities. And we said -- I said at the Investor Day, reduce the flow of footprint by 20% by 2020 to make sure that we have the lean efficient machine that we need with the right capacity, the right processes that delivers production according to plan and to the customers on time, the right quality at the right cost at the right time. So it is exceptionally important that we get that right. And that is the large part of the transformation that's going on at Rolls-Royce as we go from a low-volume engine manufacturer, bespoke tailors, as I've said to many of you, to a high-volume producer where we absolutely have to have the production disciplines in place. And that is a tough journey, but we're making really good progress.

Sandy Morris

Jefferies LLC, Research Division

A tedious a question just on Marine services. I mean I suppose if there is an area of disappointment, it's only because services did so well for us for a good few years, but then we were opening the service centers. And just sort of idle curiosity, whether there's any particular weakness in any region, if you see what I'm driving at, whether it's Gulf of Mexico or Brazil or whatever, or whether actually, for some reason, it's just slow everywhere?

John F. Rishton

Former Chief Executive Officer and Executive Director

I think it's reasonably slow as far as we're seeing everywhere. We're seeing large sales of upgrades, large sales of spare parts. And again, in the specific areas that we've been servicing, we've seen better utilization and rates below historic averages, and people being more cautious about services and spares. And as I said, I think we were overly optimistic at the start of the year on the services side. It is an important area for us. It is an important area in terms of revenue and in terms of margin. And it's an area that we'll continue to invest in because there is growth in the future.

Sandy Morris

Jefferies LLC, Research Division

Forgive me because it was more of an observation than a question. But the vessel utilization on offshore seems to be going up, if anything. So this all seems sort of, slightly sort of odd trend in services. But maybe it's because they're out there working that the surfaces have gone down.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, well, there's an element of truth in that, Sandy, which is very true. But if you look at historic rates and where we are now in some of the areas that we've been in, the rates are lower. But certainly, if they're on job, the last thing they want to do is to pull them off job to do spare parts. So if you're earning reasonable rates and you've got them working, keep them working.

Sandy Morris

Jefferies LLC, Research Division

Thanks ever so much.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks very much, indeed, for joining us this morning. It was good to talk to you again. If you have any views or comments or feedback about the way that we've managed the presentations today and the information, please do let us know as we are working hard to reflect the comments that you make. And we'll look forward to seeing you, of course, at our Investor Day in October. I think before we finish, though, if I scan back and look sort of beyond the half 1 results beyond '14 and now to the future, if I conclude with what I really said at the Investor Day in June, we have a very strong position in markets that are growing. We are really concentrating on doing what we know and doing that better than we've ever done it in the past. And there are significant opportunities to improve our business internally and significant opportunities to grow externally everywhere we look.

Thanks for joining us today. Look forward to speaking to you soon.

Operator

This now concludes the call. Thank you, all, very much for attending. You may now disconnect your lines.

Presentation

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, I make it 9:00, so we can make a start. So thank you very much indeed for joining us today. It really is terrific to see so many people here to come and listen to what we have to say about Rolls-Royce. As well, I always wonder, when I issue these invitations, whether many people are that interested or whether people are going to turn up, so it really is terrific, really terrific to see so many people here. And I know we have many people joining us, listening in on the phone lines, and we will be WebEx-ing the whole presentation. So thank you very much indeed.

First of all, let me introduce my colleagues on the podium here. I think you probably know most of them, but just to make sure: First of all, Mark Morris is our CFO; Tony Wood is President of our Aerospace division; Colin Smith, who's our Engineering Director; and Lawrie Haynes, on the far right, who's President of our Marine & Industrial Power Systems business. And they're here, Tony and Mark, to make presentations; and Colin and Lawrie and the rest of the team to answer questions a little later.

First of all, I should read our Safe Harbor statement. Please remember that while today is not a trading update and while we are not issuing any new guidance, we will be talking about the future and our view of the group's prospects. This includes our current assumptions that, of course, can change, and therefore, any forward-looking statements should be considered in that light.

The purpose of today is to start to address some of the issues that many of you have raised about Rolls-Royce. Rolls-Royce is a complicated business. We understand that you need help understanding it and we know that we need to give you more help so that you can understand us better and do your jobs better and help us do our jobs better. So the purpose of today is to start that. And I say the word start because I know, you know, we all know that we're not going to answer everybody's questions in a single Investor Day meeting, but I believe that we can make a good start today. And with that in mind, we have already planned another date for a second investor meeting this year. So the date for your diaries would be October 21 when we'll have a meeting in Norway in our Marine center in Alesund, where we'll focus primarily on our Marine business. And then next year, we'll have another 2 sessions, 1 of which will focus on our Aerospace business. And then I think everybody will be pleased to learn that we're going to take you all to Friedrichshafen and talk about our high-speed reciprocating business Rolls-Royce Power Systems, formerly Tognum, out in Germany. So we're going to make a start today. We've got plans for the future to help you get more familiar with the company.

Today, I'm going to discuss something around strategy. Mark will talk about capital allocation and guidance. Tony and Mark will talk about TotalCare accounting. We'll take a break after Mark Morris has talked about capital allocation and guidance, about 20 minutes. We'll come back, talk about TotalCare, and then we'll run a Q&A session up until lunchtime.

A couple of headlines from this morning, which you will all, I've no doubt, have read but worth saying. First of all, we said in our RNS that we have no plans for any material M&A at present. Secondly, we said that we would return the proceeds from the sale of our Energy division by way of a share buyback, and Mark will talk a little bit more about that later on. And thirdly, we confirmed the guidance that we'd issued to the market.

Now I'm going to take you through a number of slides that talk about our strategy, but I thought, before I do that, I'd just start by saying how I would reflect on our business in a few points: concentrate on what we're good at and where we add value; concentrate on supporting our customers through the life cycle of the product; invest in technology; concentrate on growth markets with barriers to entry; create a portfolio of products that have some common and some complementary characteristics; execute effectively and efficiently. I would say we've got plenty of opportunity in the future.

So strategy. Evolution, not revolution. We started to use some new words to describe our strategy which are -- we've changed, and we've changed them for a number of reasons to try to simplify so that the

organization understands it but it doesn't change what we're trying to do, just how we talk about it. And we're talking about our strategy now really around customer innovation and profitable growth. Customer, the heart of the business. Understanding intimately what our customers need and requirements are is essential. It's essential for any business. We have to absolutely be clear on what our customers want, what they need and how we can help them.

Innovation. The company has built its strength on innovation. The position that we have today has been earned because of the technology, the way that we do things. We are terrific in innovation. The great trick is to make sure that the innovation we do is what customers want. It's to link those 2 things closer together; that if we innovate to provide customers what they want, it will be successful. If we just innovate for the sake of doing something new, it is unlikely to be. So the important link between the 2 is that they're connected, and that's why understanding our customers is so important.

And profitable growth, both words being important. It isn't just about profit. It isn't just about growth. It's about growing profitably. It's absolutely essential.

So nothing particularly new, just a different way of expressing our strategy compared to the past, and what a past.

In the last decade, order books have grown from nearly GBP 19 billion to nearly GBP 72 billion, up nearly 4x. Revenues increased nearly 3x from GBP 5 billion to GBP 15 billion, and profits up about 6x from GBP 0.3 billion to GBP 0.6 billion (sic) [1.8 billion]. What intrigues me a little bit is, if I went back to 2003 and looked at our position there, I suspect that most people wouldn't have believed that, that was possible. I suspect that. And what I would suggest is that we have a stronger portfolio, a stronger position today because of the work that's been done, so that we should look forward to the future with greater confidence than we would have done in 2003.

Who are we? Rolls-Royce is a complex Power Systems and services group. That's what we've done. That's what we do. That's what we will do. We've always done it. We are doing it. We will do it. We haven't changed. If I go back to our original memorandum of understanding, it was to provide powerful vehicles for use on land or water or in the air, and that was in the memorandum in 1904. That's still what we do today. It's what we've done, what we do, what we'll continue to do. We're not changing.

The power come from 3 sources: gas turbines; reciprocating engines; and to a small extent, nuclear. That's where our power comes from. And again, if you went back in history of the company, the very first engine that Rolls-Royce produced was, of course, a reciprocating engine. So whilst we all think of Rolls-Royce as being gas turbines, actually, if you look at the history of what we've done and where we've been, reciprocating engines and gas turbines have been a common theme for many, many years; nuclear, since the middle of 50s.

Systems. We don't just do power. We have a number of other products, LiftFan, for example, and Joint Strike Fighter. In Marine, we probably have the best portfolio of systems products, whether that's propellers, thrusters, waterjets, winches, deck equipment, dynamic positioning systems, ship shift design, of any one in that market.

And of course, services, services right across the whole of the group, very, very important to us. Look after the product through its life cycle, provide those services.

From an organizational perspective, we've divided ourselves into 2: an Aerospace division and Marine & Industrial Power Systems. And underneath those, we have the businesses of Civil Aerospace; Defence Aerospace; Rolls-Royce Power Systems, formerly Tognum; Marine; and our nuclear businesses. If I look at it looking across some of the connections between Aerospace and Marine, there are many. So in the Marine business, we learn a lot from our aerodynamics in terms of propeller, how we could improve the propellers. We designed and invented a counter-rotating propeller, but that was based on our knowledge of aerodynamics. In our Aerospace division, we learned from cavitation in the marine industry about how to improve our aero fuel pumps. We learn a lot across the 2 between bearings and seals from Marine to Aerospace. We learn about composite materials, bonding processes between the 2. Underneath this, we have an infrastructure which supports both, the Advanced Manufacturing Research Center. The way that

we analyze the methods that we use, the processes, the production systems, all those are common across the group.

So whilst we organize ourselves in this way, there are strong links between the 2. And we foster those strong links by moving people across the organization to bring learning and different thinking from aero to Marine -- or to Marine & Industrial Power Systems and back and the other way. This is not just 2 separate businesses completely separated. They are together.

I've already said we've grown revenue a lot. If I look at 2003, our Marine & Industrial Power Systems business was 27% of the total revenue, not small. It's grown since then. I would say we've got a better balance in revenue. We've grown our revenue hugely, got a better balance. If I look at profit, it's the same story. Back in 2003, small profits, mostly Aerospace. But then, MIPS was 16%, 30% today. Over that period of time, not only have we grown the profits, but the margins have almost doubled. And in every single business unit, the margins have gone up. So I would suggest that we've done well in terms of growing the business and improving the business' financial performance. We've been pretty good owners of those businesses.

In terms of where the revenue comes from, as you would expect, in this chart, mostly gas turbines. Reciprocating engines is about 19%; marine equipment, 11%; nuclear, relatively smaller, 4%. Nuclear is an important business for strategic reasons, I think, within Rolls-Royce, lots of growth opportunity in the civil side of nuclear as we look forward in terms of the U.K. civil build, but the strategic business is very important. In the last couple of days, the Chinese Premier was discussing nuclear, and we were involved in those discussions. It has a bigger impact for the group and size of the revenue. Marine equipment, very important.

If you look at it in terms of OE and aftermarket, again no surprise for you. You're familiar with this roughly 50-50, but the Marine & Industrial Power Systems part is relatively small compared to the Aerospace. We are learning from Aerospace into here to grow this business. And in fact, Lawrie and his team in the Marine business sold their first equivalent of TotalCare package to one of our customers about 3 or 4 months ago. Again, we learn across the business.

Now if I look at our civil gas turbine business and our reciprocating businesses and just look at what I call some of the characteristics of those businesses. It was quite interesting. First of all, I would say that return on capital employed is about the same, and this isn't just ours. We've looked around the industry. We've looked at the market and we've created an assessment in conjunction with some outside help. So we've got a common, similar return on capital employed, but the characteristics are very different, again no particular surprise to anyone: barriers to entry in this market, very high; investment, high; time to earn cash, high. No surprises. Different in this one, shorter. And when I come to look around the industry, it comes as no particular surprise to me and, I suspect, nor to you that there are no pure-play civil businesses when you look at these kind of characteristics.

So let me sort of pause for a second there. I thought I'd give you an overview of where we've been, what we've been doing and why and to give you some indications of the characteristics in the business. And I guess what I'm saying is we're doing what we've always done because there's been quite a lot of speculation or feeling in the market that we're diversifying or doing something different, and we're not. We're doing more of what we've always done. And then we're going to talk about our priorities. Again, these should all be familiar to you. I will be astonished if you were surprised by any of these.

The top 2. Fix the basics, the 4Cs. Everybody in the organization is familiar with them. I think most people here will be familiar with them. And culture -- I call those the bedrock. In some ways, they're not strategic, but if we don't get them right, delivering the strategic investment choices is more challenging. And the bottom 3: wide-body gas turbines; narrow body; and medium speed reciprocating engines. I think I've talked to all investors. I think I've talked to everybody about this list in the list of priorities that we have. Let's just run through them.

4Cs: customer, concentration, cost and cash. Let's just run through those. I'm going to just run through this chart. I'm going to start on the right or your left over here and then come back to here.

On-time delivery to customer. In the past when we were making very few engines, this was not a particularly important matter. It was always sort of important, but it wasn't a hugely important issue. As our volumes have increased as a consequence of our success, it becomes really important. We're improving across the business. And as I've said to many of you last year, for the first time ever in civil large engines, we were 100% on-time all through the year. In the other businesses, it's improved through the year. So these are year-end numbers, but the story is the same whatever numbers I use. The good news is we're improving. And this is absolutely essential because it transforms the discussions that I have with customers from discussing problems of the past to talking about opportunities in the future. And it's not just in delivery that we're changing it. We have what we call the customer DNA in the organization, and those are just over there. It sort of shows the 4 things that we worry about: quality, delivery, responsiveness and reliability. And we're improving in all of those. In fact, we won an award from Airbus, and Boeing have really been complimentary most recently about our quality, terrific improvement.

Delivery, I'm showing, is improving. Our responsiveness to issues has improved. And our reliability, as Tony will talk about, is also improving. So we're making very, very good progress in terms of satisfying our customers, which means that we can focus on what I would regard as more important discussions for Rolls-Royce, how can we do more to help you, how can we win more business. Clearly, if you're not satisfied, then winning more business is a problem. So that's really good.

This side, internal plan delivery. What I've said to many people is the only good news that I can find in these kind of numbers is that they're improving, but none of them are acceptable. Changing this is very hard. It drives back into our supply chain. It drives back into the way that we manufacture. Everything about it is hard to change, but it is heading in the right direction and continues to head in the right direction.

So when some of you say, "Well, why aren't you making more progress on cost and cash?" I'm afraid this is one of the reasons. We've got to fix this to make some progress on cost and cash. And we are fixing it, but as we fix this and drive this towards 100%, what we've also then got to do is narrow the gap between the plan and the delivery because the only way we get to the delivery to a customer on time when you've got this kind of numbers is by having a big buffer of material, time and everything else you can think of. You can't do it any other way. Now again, to give you some encouragement and give me some encouragement: We're making progress. On our Trent 700, we've improved our lead time by about 19% in the last year. So we're about 19 days compared to 20-odd, and we're targeting to get to 15. We're making progress, a lot more work to do.

Concentration, something that I feel very strongly about. Making sure, as I said at the start, that we concentrate on what we're good and where we add value, that's what this is about. We've gone out of some businesses for a variety of reasons that you're familiar with, whether it's to do with scale or lack core competency, and we're focusing on businesses where we have core competency and where we're good at. Our business is complicated enough without being distracted. Don't get distracted. Focus on what you're good at.

Cost. We are attacking cost across the organization everywhere all the time. I've said to many of you when I first started talking about this, it took a while for the organization to get its head around it. And that was, in my view, because we sort of had record revenue, record profits, record order book, record share price. We're a successful company. What are you talking about? We're making progress on that. If you went anywhere in our organization now, people get the cost message. They've got it. They understand it's important. We're making progress.

So I'll run through a couple of these things on the slide. We've got about 600 engineers focusing on cost reduction; about 400 on original equipment looking at our existing products, driving costs down in our existing products. And they're making good progress. And what we're finding is we are offsetting the escalation that we're getting through the supply chain with the cost reductions that these guys are generating. We got a couple-of-hundred engineers working on the aftermarket, and they're actually driving costs down in absolute terms. We've got a lot of people working on this. It's really important to us.

Low-cost country sourcing. We're about 20% at the moment on average, slightly higher in the Marine & Industrial Power Systems business than in the Aerospace business. We're targeting 40% by 2020, 20%

lower footprint by 2020. We've opened a lot of new plants, a lot of -- a lot more capacity as a consequence of the growth that we've got -- we know is coming. And we're driving performance in those plants as we planned. So let me give you an example: In Sunderland, we used to have one man looking after a machine. We've now got one man looking after 3 machines. For our fan discs, we have reduced the lead time from 60 days to 10 days in the new plant. The new plant in Sunderland has about double the productivity of the old plant, and that is consistent with many of the manufacturing facilities that we have created, the new facilities. So that's fantastic. It's exactly what we wanted to do. It's why we've been investing money in new facilities. But what we're going to have to do is now close out the old and tired estate because that is clearly a cost that we're carrying at the moment. So over the coming years, we think we will take out 20% of our footprint.

We've got many new projects in our Advanced Manufacturing Research Centers, whether that's around additive layer manufacturing or it's metal injection, molding, many, many new projects coming to help improve our productivity.

Our logistics costs. Total logistics costs for Rolls is about GBP 300 million. I think we can reduce that by 20%. Again to give you an example: In our large engine business, what we found we looked into the detail of it is that many of our inbound components of visiting 3 or 4 warehouses are being handled 12 to 14 times. Nonsense. We need to change that. We can do -- there's lots of opportunity in the logistics costs.

We'll continue to improve inventory turns. We need to reduce our time to market of new products and, as it says here, adopt automotive industry practices, which is a long way ahead of us.

We reduced our indirect headcount. Business process optimization, this is the transaction processing stuff. Again, big opportunity for us there in terms of transforming what we do, whether that's outsourcing, offshoring, making more efficient, rationalizing, lots of opportunity, working hard on that.

So across the business, there are opportunities, frankly, everywhere, and we are making progress on those opportunities.

Cash. We've got to drive our CapEx down, and we're talking about 4% rather than the current 4.9% in the 3- to 5-year time period. In terms of research and development, I think I've said to everybody who's asked me I would expect it to ease as a percent of revenue but nothing more than that. It's our lifeblood. It's what we do. It's really important to the future of the group. And inventory, we're driving inventory turn rates. As you saw, last year, we went from 3 to 3.4 turns, from 3 in '12 to 3.4, which is the biggest increase we've had as an organization. And we improved across many of the divisions. We're driving further improvements in inventory turns. This year, we'll increase it again.

Culture. There's a quote that I like. I'm not certain where it came from, but I've said it many times. It's somewhere from the U.S., which is culture eats strategy for breakfast. The culture in Rolls-Royce, I've sort of referred to, which is we're a really successful company, why do we have to worry about cost? Well, we have to worry about cost. We're getting it. We're changing the culture in the company. Traditionally, we've been great in innovation, and we've got to retain that culture, but we need to become, if you like, more business orientated, a more business-focused culture, one that understands our customer and our costs. And we're making progress on that. We're changing the way that people think about the business act and behave. Culture is just about behavior. It's what's important.

Clearly, we've got some ethics issues that you're all aware of with the SFO. We are working hard on those. We've got a new code of conduct. We've got something what we call the passport, which is describe what is or isn't acceptable in terms of behaviors, what's important around here. We management team spend a lot of time in the organization because those kind of unethical behaviors are completely unacceptable to me, to the board, and we will not tolerate them. We've hired Lord Gold, who's helping us make sure that we have the right policies and procedures in place and has been a terrific help over the last year. We're addressing this issue. It's a serious issue. We're taking care of it.

Okay, wide bodies. This is an external wide body forecast. I think, if I pick most wide body forecasts for the next decade, they would be something pretty similar to this. The headline number that gets me is, in the last decade, about 2,000 deliveries; in the next decade, 4,000 deliveries, so a huge growth in this

market. It's an important market. And people and you may ask there, what about cancellations? We just Emirates here [ph]. Yes, there'll be cancellations and there'll be new orders. But the scale of the change and the scale of delivery is significant. And I would suggest that this is not a bubble. It's driven by real demand.

So what's happening in the airline industry to create this? Well, I would suggest 2 things really. First of all, the huge increase in fuel prices, which means that fuel for wide-bodied aircraft carriers is now the most significant cost item they have to deal with, whereas historically it was always labor. So what they're looking at is replacing their old kit with new kit and some capacity expansion because of the cost of fuel, and the new kit is much more fuel efficient than the old stuff. So fuel drives part of the change.

The second one, of course, is our emerging markets, huge demand for growth now. So if any of you go on holiday anywhere, you'll be meeting Chinese people. 4 or 5 years ago, you wouldn't have met them on holiday. How -- you will now because they're traveling more and more and more. Huge growth in China, as an example, but it's, across the emerging markets, huge demand for travel, huge growth potential, huge demand. So I don't think it's a bubble. I think it's real, and I think we will see this kind of growth.

So what does that mean for us? Pretty similar really. In the last decade, we delivered about 1,600 Trent engines. We think, in the next decade, we're going to deliver about 4,000. So that's consistent with us having about 50% of the market, consistent with the growth of the wide-body aircraft.

So let me talk a little bit about this chart. And this chart attempts to sort of show the trajectory of our Trent deliveries from where we are today here in 2014 to where we'll be in the future, few observations about this. Growth in 2015, starts picking up in '16 and '17. You know why? XWB ramp-up. So we're the only engine on the A350. The A350 enters service at the end of this year, slow ramp-up in '15, not -- really starts growing in '16. 1,000 comes in, in '17, more ramp-up, more volume. That's what's driving those changes. So that's the first observation that I would make.

The second observation I would make is that within this ramp-up, there will be ups and downs. And there'll be ups and downs because things happen. So the A350 program is going really, really well. Certainly from the engine perspective and everything I hear from Airbus, going well. Great level of confidence, but if there was a slippage, that will shift that, that way. And because the ramp-up happens through the year, you get more volume of XWBs, as far as we're concerned, in the fourth quarter than you do in the first or second quarter. So it moves to the right. If we were looking at this chart 5, 6, 7 years ago, we wouldn't have the kind of number of Trent 700s in there for the A330 because everyone thought the Trent 700s and the A330 would have finished production because the 787 was coming. The 787, as you all know, was delayed, therefore, we still got Trent 700. And then delivery in the A330 is going well. So this changes. It changes year-to-year.

A380 is for us. We were more optimistic about sales, I think, of that, in terms of volumes, last year than we are at the moment. We'll see how that plays out.

So over this period of time, we'll get some volatility. We still get to this because the volatility that I'm talking about is around the ramp-ups. It's around short-term changes. It isn't around the long-term direction of growth. So put a different way: We've got sustainable growth in our business, but it doesn't mean that it's going to be consistent year-on-year-on-year.

This is where we will end up because that's the volume of wide-bodied aircraft. We're the only engine on the A350. We're 1 of 2 on the 787. We're 1 of 2 on the A380. We are the primary seller on the A330. So the direction of travel is clear. The exact route to get there, we'll have some bumps on it, I'm sure.

One other observation. I've talked a little bit about cash. I've talked a little bit about some of the work that we're doing on costs. If as -- all of you are interested in is sort of cash conversion, as we get through that peak, that is really where I'd be looking at for a change in the level of the rate of cash conversion, dependent, of course, on whether we have another huge program at that point in time.

If I look at this in terms of installed thrust, again a chart that many of you have seen before. Huge growth in thrust over this period. And here, I'm going to give a couple of observations that you're well aware of. The longevity of these programs, this is where real value is in Rolls-Royce. So this light blue here is

the Trent 700 in the A330, still there in 2023. And whilst the RB211 is going down from here to here and changing, there'd still be RB211s in 2023. We've got nothing on the XWB today. This projection says it's going to be about 34% at that point in time. So when I was saying earlier if you go back to 2003 and look at the platforms and the position that we had then and you look at where we are today with the XWB, the Trent 1000 in particular, in terms of volume growth, coupled with the success that we have in the Trent 700, we're in a very different place. So we're going to get lots of growth. And the relationship revenue-wise from OE to aftermarket, again, as I think you're familiar with, is about 4:1, 4 for the aftermarket, 1 for OE. And thrust is not a bad proxy for revenue.

Future products. I've said couple of times that R&D is essential for the company with great innovation, with great -- and the technical side. We announced in February 2 new products. And I think that whilst we're not a marketing company, the names of them are quite marketing. Advance and UltraFan sounds impressive, at least to me.

We're investing in new technology, and we have to do this. There are -- sometimes, some people I meet, they think we can stop and start and stop. You can't in this game. It is a constant requirement to remain what we term internally as being match fit. You've got to keep training. You've got to keep the capabilities. You can't afford to lose it. Most of the capabilities is people, our people. You don't lay them off and bring them back. And even if you could do that, they would only remember what they had in the past. They need to constantly be learning, constantly developing. So these 2 new engines, they've got a variety of new technologies in them from composite fan cases, fan blades, advanced ceramic matrix composites, lean burn technology and, as we go out to the UltraFan, power gearbox. This drives fuel efficiency, which is what the carriers crave. We'll continue to invest in new technology. We will not get behind. We will stay in front.

Narrow body. About 7 or 8 years ago, Rolls was faced a difficult decision, which is there were 4 new engines required, which turned out to be the Trent 900, Trent 1000, the XWB for the A380, 787 and A350; and there was one called the neo for the A320 family. And Rolls sort of looked at this and said, "Actually, we've only got the resources to do 3 of the 4. Which should we do?" We chose to do, obviously, the big 3, not the 4. So we didn't have the resources, capability and capacity at that time to do the neo. Fast-forward to a couple of years ago, we exited our joint venture IAE. And we exited because, in all joint ventures, you need to have alignment between the partners, and because we were only on the old engine and not on the new engine and the other partners were on both the old and the new, we no longer had alignment. So we had to get out of the IAE, but the decision was much, much earlier, and that was a consequence. So getting out of IAE was a consequence of the earlier decision. So that's how we've ended up -- that's why we've ended up in the position that we're in, in the narrow body market.

If I look at the narrow body market. Again, it's huge. You're all familiar with that, significant growth. It's about 71% of the volume and about 50% of the value. So wide body, 50%, narrow body, 50% approximate value, volume more in the narrow body. We're going to get back in this market, but it isn't an issue for today or tomorrow because I don't think anybody here would expect a new narrow-body aircraft before the middle of the next decade at the earliest. But from my perspective, it's a great opportunity for us. It's a great future growth opportunity for us because if I'm not in it really today, I'm in little bit, great opportunity in the future then for growth.

And it also brings a lot of other things. Customer intimacy: If we're only talking about wide body, it's just part of it. If you're talking about the whole wide and narrow, it's -- you're much more into it with your customer. It's a great volume market. Technology goes up and down from the wide, from the large to the small, from the small to the large. It's a good place to be. Oh, by the way, it's what we do, so why wouldn't we want to be in that market? But it's not a decision for today or tomorrow, but it's something that we're going to do. We're going to get back in that market.

Medium-speed reciprocating engines. I've got a couple of slides that I'm going to skip through. We've put them in the deck to try to help you understand a bit about this market because I recognize that many people are less familiar with these markets than others. So I've got a few slides which I will really whiz through.

Low-speed, 2-stroke engines, different technology. It's a higher medium speed. Think huge cathedral engines, mostly in the Merchant vessels. High speed, this is the business Tognum that we bought, Power Systems, much more wide range of applications: marine, land power, off-road vehicles. For Power Systems, about 1/3 of our revenue there is marine related. About 1/3 is off-road. And about 1/3 relates to Power Generation. Good business. As I said earlier, we're going to take you over there next year and we're going to give you a deep dive into that business.

Medium speed is what we've done, quite small and medium speed, land and sea, marine and land power, common-ish technology to the high speed. Having Rolls-Royce Power Systems is really helping us in our medium speed capability, provides power to all Marine segments. Anyway, I've given you a list of some of the characteristics of those.

Let me talk a little bit about the industry. A number of people have said, "Well, why would you want to be in this kind of business? Sort if, indeed, it hasn't grown. It's not doing anything this part of the world." Certainly, it was growing, and now it hasn't as a consequence really of the global financial crisis. If you stand back and look at it, the industry grows at around about GDP over a long period of time. It's not just me that thinks that, if you talk to other providers, it would -- they would say, those are it. And there are a number of other drivers of it but GDP being most significant. It's a pretty big market, GBP 35 billion to 2023. So it's a growth market. The growth may be a little more volatile recently than it was in the past.

Why engines? Why, why engines? We, as I said, have got a terrific equipment systems base. We do a lot of other things very well, whether it's the electronics, the complex deck machinery, the propulsion systems, the vessel design. We've got a good portfolio, a very good portfolio, but relatively weak in engines. Engines, for many decisions in this industry, are the heart of the vessel. And rather like in narrow body, it drives a level of customer intimacy.

Early customer engagement, you get access to other opportunities to pull in the other equipment as it helps the pull-through. The engine tends to be at the heart of a vessel. It helps the pull-through of the other equipment. So if you can be in that discussion with the operator, the vessel owner or the shipyard early on and the engine is the prime decision that they're making, if you got the engine equipment to offer them, you can use that to help sell the other equipment. That's it in a nutshell. The engine also happens to be where most of the aftermarket lies, as you would expect.

So if I look at our traditional Marine business. So this is our traditional Marine business rather than a MIPS business, where we've taken out submarines, have taken out Power Systems. If I look at our traditional Marine business, that's how the revenues breaks down. Almost 90% is related to marine equipment, where we have a terrific portfolio. Medium-speed engines is actually sort of our weaker part in that portfolio. So medium-speed engines, in terms of the Marine sales, is interesting to us because it completes the portfolio and it's a powerful driver for the rest of the equipment. It's a virtuous circle. I can make it a lot more complicated than that, but that's it in a nutshell: completes the circle, virtuous cycle; helps drive pull-through. And it's a growth market and it's something that we understand and know. And with the help of the people in Power Systems, we are well placed in the medium-speed reciprocating business.

Interestingly, in high-speed reciprocating business in our Power Systems business, what we're finding, of course, as you would expect, is we're selling marine equipment off the back of their Marine sales. So the pull-through is real. It does happen. Early days yet. We've got lots more to do in that, but we are already doing that.

So those are our priorities: fix the basics, the 4Cs; culture; wide body; narrow body; medium-speed reciprocating engines; as I said at the start, concentrate on what we're good at and where we can earn value, concentrate on looking after the products through the life cycle of the product; invest in technology through the portfolio of products that have common and complementary characteristics; execute efficiently and effectively; and being growth markets with barriers to entry. That's what we are doing. That's where we are. That's the strategy.

And that's really my final slide, strong position in growth markets, concentrating on what we do, significant opportunities. Now I'm going to hand over to Mark, who's going to talk about our capital allocation, of use of capital allocation and guidance. Thanks very much.

Mark Morris

Former Chief Financial Officer and Executive Director

Well, thank you, John, and good morning, everyone.

So John has talked to you about our strategy, our business model and our market opportunities. What we want to do in this session is just talk about how we link, how we think about strategy and opportunities to our internal decision-making processes and sort of financial discipline and talk a little bit about our capital allocation drivers and then finally our financial -- or future guidance framework.

So as John said, our strategy has evolved. And over the last decade, we've invested, we've acquired, we've disposed of things, but fundamentally, our DNA is the same. We're a high-technology, complex Power Systems and services company, and that informs everything that we do. And on the left there, you'll see the 3 lenses that we look through when we think about strategy: customer, innovation and profitable growth that John has talked about.

Basically, customer plus innovation equals profitable growth when we get it right, when we understand our customers, the right innovation. And when we don't understand our customers, of course, we don't always get it right, and that informs our decisions about why we may dispose of or get out of certain things.

So where are we today? And as we look forward, what are we focused on in terms of delivering shareholder value? Well, there are 6 things up there on the right-hand side, and let me just go through each of them. It's important.

Executing on our organic growth programs. Again, we see ourselves as a growth business, first and foremost. We see great opportunities, and they sit predominantly around our Trent programs at the moment. They're obviously absorbing a lot of time and effort as we ramp up and make sure we deliver our commitments to our customers, huge order book giving us that great visibility.

Exit non-core and underperforming businesses. Of course, we've been doing this steadily. You've seen more recently the sale of our Energy business; and a part of that, some of our lower-carbon businesses; and our recent joint venture on the RTM322.

Closest to my heart as CFO, of course: driving financial performance, the 4Cs. And in particular, 2 of those Cs, cost and cash, as you'd expect to see, both are dear to my heart and things that we are relentlessly focused on. And of course, we're strongly focused on closing the margin gap with our competitors, as we have talked to you before.

Integrating Rolls-Royce Power Systems, a big acquisition for us, formerly Tognum. I'm encouraged -- we've been the management control for about 18 months, and I'm encouraged with the process so far in terms of where we are in integration, but there will be more to do when we become the 100% owners. And we see more opportunities coming from that.

We reorganized ourselves into 2 clear strategic pillars, a Power Systems company that takes itself to its markets through 2 main platforms: gas turbines and reciprocating engines. And again, John, I think, has talked at length to you on those.

And finally, disciplined M&A. We've been a significant acquirer in the past and at certain times, and we've moved the company on. And we will continue to look at M&A. It doesn't always mean it has to be large M&A; can be product and technology bolt-ons, but it forms part of the makeup of who we are and ensuring that we stay ahead of the game, particularly around our technology and products.

I've put this chart up here because I just want you to really understand how the Rolls-Royce mindset works. This is how we look at things when we're trying to evaluate where we invest, which is the sort of strategic framework, which is on the left-hand side. And again, I think John has given to you insights into where we see the opportunities. And of course, at the middle there, technology products and route to market, where we see ourselves. And again, high technology, this is our lifeblood. This is where we invest. The barriers to entry, they keep us where we are. It's important that we stay match fit.

Looking at opportunities for products and where the growth markets are because, ultimately they manifest themselves in those 2 things at the bottom: either organic growth, R&D and spending on CapEx; or M&A to acquire technology, products or routes to market.

Let me now focus a little bit on the right-hand side, which is sort of how we think about and decide about investing. This is our financial framework. And we look at that, again, through what I call sort of 3 main filters: growth metrics, capital efficiency and financial strength. And I've put up a few of the main sort of KPIs and metrics that we look at. And this gives us the discipline and, as you'd expect, a lot of focus around the cost and the cash side and driving financial performance and, again, how we focus on closing the margins with our competition. But both those sides need to be balanced with those 3 criteria in the middle. And they will drive different behaviors and different thought processes depending on whether it's strategic or financial in nature, short versus long term, and of course growth versus profitability. And interestingly, I put those 2 up there because, quite often, when you're growing, it's quite difficult to grow profitably. Now I'm not saying you can't, but it's sometimes a tradeoff going here. But all of the time, what we're thinking about is how do we maximize long-term value creation for us and our shareholders.

Importantly, whenever we look at any form of investment and look at minimum requirements that we have an IRR that exceeds our WACC, of course, we expect it to be considerably higher than that. And WACC, I carry a number of about 9% around in my head, post tax. I mean, clearly, there's an element of subjectivity around some of the assumptions. And we're all familiar that there's generally a range, if I was to go out to the markets and asked what I thought or what you thought our WACC was.

Now underpinning our financial framework, there are really 2 key drivers: credit rating and capital allocation discipline and thought process, which I'm going to come on to in a minute. Now the reason I say credit rating is it's not a negative constraint but it's an important consideration for us in our business. You're familiar with us and the type of business that we are. It's important that we have a good credit rating. We're a long-cycle business, capital intensive, sometimes decades to realize some of our investments. We entered long-term contracts with governments and customers sometimes as long as 20 years. We commit to aircraft programs with people like Boeing and Airbus that will run for many, many years. We need to make sure they have the confidence in us that we will be around to fulfill our obligations and processes over that period. It provides access to long-term finance through the debt capital markets, which is far more in keeping with our investment cycles.

But importantly, the reason I mentioned it recognizing this is predominantly about equity rather than debt today is that the credit rating starts to define the architecture and capital structure that we can live within around the various ratios the rating agencies look at and you're all familiar: net debt-to-EBITDA; funds-from-operations EBITDA; leverage, liquidity ratios; et cetera, et cetera.

So where do we sit in this? We're very clear we want to maintain the investment grade rating, and we target a range between A- and A+. That's a generic range. Of course, the equivalent to Moody's would be A3 to A1 and similarly. So when we look between S&P, Moody's and Fitch, that is the sort of thing that we're thinking about. Of course, we recognize it's not our gift to give. It's one we need to earn and convince our rating agencies of, but it is very focused in our agenda on how we look at things. Currently, we're A with S&P and A3 with Moody's.

So let me now just turn to capital allocation. We think about capital allocation at 2 levels: at the group level and those 4 things John has cited and I'm going to come to talk about in a minute; and at the divisional level, which is once we thought through the group level, how do we allocate capital within our businesses, how do they all compete for capital in terms of where we see opportunities. And it varies through the cycle and depending on what the dynamics in the markets are.

So let me just start at the group level and go through. As I said before, first and foremost, we see ourselves as a growth business. So when we look at our capital allocation, we look at it sequentially, starting at the top, which is what is most dear to our heart, which is investing in our own business, organic growth; R&D, the lifeblood of what we do. The reason there are high barriers to entry in this business is because of the technology and the superiority of that technology that keeps us where we are. But of course, the important part is, in order to stay where we are, we need to keep investing to stay match

fit and stay ahead of the game. Obviously, when you do R&D, it generally generates CapEx, which is an enabler. And of course, that's a part that again moves through the cycle.

So let me just talk a little bit about R&D, currently around 4.9%. As John said, at best, it might ease as we grow over time, but we're not ashamed to say that is. It's a vital part of our business. It's a going concern. We continue to invest heavily. But as revenues grow, we do see the opportunity of some easing, although in absolute terms, we expect it to continue to grow.

R&D takes a number of forms: research and technology, which is much more generic; R&D on new programs; product upgrades; as well as cost reduction. And of course, John mentioned to you the 600 engineers that we talk about, 400 on OE and 400 -- and 200 in the aftermarket. And again, this is another way in which we grind out costs, improve reliability, very, very important to us.

On the CapEx side, we typically run between about 3% and 5% through the cycle. We're currently around 5%. And as we've said, we're going to drive towards 4% as we go forward over the next 3 to 5 years. And again, when I think about CapEx and look back over what we've got, we've done a lot of growth for capacity requirements. We've under-invested historically in IT, and we've been catching up on that in that it's a very important enabler in our business. But a large part of it is around the maintenance of the estate, as I call it, and John referenced to the driver and opportunities that we see in rationalizing our footprint. We've got a number of old factories that we're getting out of, a lot of work to bring down the sweat part of the footprint as we go forward, which will drive efficiencies and drive costs out. So we're very disciplined in our approach on how we look at both R&D and CapEx, much more dynamic and intelligent decision-making going on around scale and themes that we can bring together. And there are some really exciting things that we're doing there and that we're looking into.

Of course, once your market grows business, we understand it's important that we reward our shareholders. And as you know, we have committed to a progressive dividend policy in line with underlying growth. We've returned over GBP 1.65 billion to shareholders over the last 5 years.

Now C shares are maintained. I know there's a relatively complex dynamic. It's maintained predominantly for some tax advantages and obviously some optionality it provides to investors in terms of receiving a capital or income distribution return. And we plan to carry on with that.

So of course, as we go through investing in our business, creating a regular return to our shareholders, we also have opportunities elsewhere to invest where we see opportunities. And of course, we have a disciplined approach to M&A. And this is, wherever we are in the cycle, we think about this.

So when I talk about M&A, let me just be clear. It can also mean partnerships. It can mean joint ventures. It can mean small acquisition or CapEx acquisitions, typically as I call them. Or it can be larger ones. And it can be in relation to either technology, product or routes to market. And that middle column there, the sort of areas of focus that you might expect us to look at. I don't think many of them will be a surprise to you, but they are just ongoing parts as we keep recognizing the need for technology and products or routes to market.

But I want to focus a little bit more on the criteria side. As I said before, we define ourselves as a complex Power Systems and services company. So that defines where we have the strategic fit. We're not about diversification. It's all around Power Systems. We are relentless when we look at the synergies that we can quantify them and commit to them both on the cost and revenue side. We have a number of targets that we look at. And of course, there are additional ones to these, but these are the ones that we target. Return on invested capital to be greater than our WACC within 3 years and obviously, as a minimum, that the IRR would exceed WACC. Now generally, we look at, focus at -- longer term much more on IRR than WACC because they sort of compare each other. WACC is a bit more of a transient where return on invested capital is so -- that you do in a given year. And of course, we think about our integration capabilities, how much have we got on our plate at any one time, can we accommodate. Some deals are resource-intensive on the human capital side. Some can be more resource intensive on the financial capital side. And we have to balance that. And of course, we have to think about the sequencing of things that are going on because things change over time.

And I've talked about the importance of having a strong and efficient balance sheet. And one of the reasons that we start to define ourselves through our rating is that's important for providing us competence that I relayed to you earlier on. So that's a sort of key part for us. But obviously, within that, we can see that when we have either surplus cash or cash that's come from the discrete source such as the sale, we will certainly think about returning capital to shareholders. And of course, that's exactly what we've done and what we announced this morning. But I don't want anyone out there to think that we've run out of ideas. It's about balance sheet efficiency and the fact that we've had some discrete proceeds from a sale, but as we currently sit here today, we'll put cash onto the balance sheet; that when I look at our organic investment opportunities, the human capital, that we just have not got enough people at the moment to go and spend some of that. So again, we're committed to be sure that we have a strong but efficient balance sheet. And what I would say is it's something that we review at the board regularly.

So we've announced a GBP 1 billion share buyback. We think about a number of things in terms of how we return capital to shareholders. We think about the makeup of our register, the type of shareholder, the level of our share price, the ability to defray dilution from any disposal and, of course, some of the tax restructuring -- tax structuring opportunities.

So to summarize. CapEx, 3% to 5% through the cycle. We're driving to 4% over the next 3 to 5 years. Net R&D, around 4.9% currently. We said you can expect it to ease, as revenues grow, over time slightly. We will continue with our progressive dividend policy in line with underlying growth. We will focus on medium-term M&A and again some of the targets around that. And we've announced a GBP 1 billion share buyback in relation to the sale -- or the Energy proceeds.

So that covers the capital allocation portion. So let's just turn to future guidance framework. Now just to be clear, we are not giving any medium-term outlook guidance today. So what I'm going to talk about today is the framework and how -- what we will give, how we will give it and when we will give it going forward.

So if you just look at this chart up here, I've put up in year, next year and medium term, looking the next 3 to 5 years. The left-hand column, you're all familiar with it. It's what we currently give already, so the stuff we give at group and at the segment level and a few of the other criteria around things like CapEx and R&D spend and charge and so forth.

We provided for next-year revenue and profit guidance. And if we look at the medium term, that is what we are going to be giving as we go forward.

Of course, most of you are familiar with that, when we talk about guidance, we've typically in the past used words like modest, strong, good, et cetera. We're going to go away from that and move into percentage ranges or absolute ranges or numbers, and they're listed up there for you. So that's how we're going to give it.

And this is when we will give it. So obviously, the in year, we'll provide it regularly at the prelims and interims and at the IMSes. In relation to the following year, we will give you that at the November IMS. Normally, I'm going to come back to say something in a moment, but just follow my train of thought for a second: Annual budget cycle normally finishes around the end of October, early November, so in time for the November IMS, we will give you update on the following year. And this, so when we've gone through our annual 10-year planning cycle, we -- it typically ends around the end of September or October time. We will provide you with the medium-term outlook, which will be our sort of best view at the time that we will update annually.

Now in relation to the medium-term outlook, this time around, when we get to our October day, which I think is the 21st of October in Norway, if we're ready then, which we should be, we will provide that to you in October. But normally, it will be the November IMS.

So to summarize. We are clear on our strategy, a complex Power Systems and services company. We're clear on our priorities going forward. We have a disciplined approach to capital allocation, and I think you've seen some of that in action to what we announced this morning. I'm going to give more guidance going forward.

Now I guess you've heard John and I talk for probably about 1 hour and 10 minutes, so we're probably all gasping for a cup of coffee. So we're going to have a 20-minute coffee break now. And after that, we're going to come back and we're going to talk about TotalCare. Tony is going to talk about the economics and logic and rationale and why we like TotalCare. And I've got the really interesting bit of doing the accounting on TotalCare. So make sure you'll have plenty of coffee, and we'll see you in about 20 minutes. Thank you.

[Break]

Anthony Wood
Former Executive

Okay. Well, welcome back, everybody. Nice to see some familiar faces again. And thank you, Mark, for teeing us up so beautifully at the move into the coffee break.

On TotalCare. So John's spoken very much about our strategic priorities and how we see the evolution of the company, the evolution, not revolution, over the long term. And Mark's talked about how we decide and think about capital allocation and the disciplined processes that we apply right away across the business. But this morning, I'm going to talk about TotalCare. I know, certainly, I spoke to some of you in Paris last year about the Aerospace business. I'm going to really try and unpick for you in more detail than I think we shared before the economics and the strategy behind TotalCare, and then I'm going to be followed by Mark, who's going to do the really interesting bit on picking and clarifying some of the accounting in direct response to some of the questions that many of you have raised over recent months.

So what is it that we're trying to do with TotalCare? Well, it's very much about trying to maximize the value that we create for customers. And you'll see that in terms of how TotalCare has evolved, the market has voted very positively on that, but also how it works for us as a business and how it works for you, as shareholders, in terms of creating and releasing the value -- the embedded value that we get from that growing installed base of products that John spent quite a bit of time on this morning, explaining how we see that evolving. And this very much underpins our confidence in how we see earnings and, ultimately, cash flow coming out of the business from the services business model that we've been working at for a large number of years now.

So I'd like to start by going right back to the overall group and then working, as I've said, specifically into the TotalCare piece of it. So we are, as you've heard a few times this morning, a high-technology, complex Power Systems and services company. And we have products that have very long in-service lives in all of the divisions in which we operate. They're measured in decades rather than in years. And we have very strong positions in all of those products and the growing markets in which they're positioned. And the company is being built around 2 very strong, but connected, pillars. And we allocate capital, obviously, to both technology and to develop products, and then we build the services opportunity on the back of those products as we build an install base around the world. And that's true in every one of the markets that you see up there on the slide. And then we support those customers and those products through life in terms of the -- both the opportunity and the commitment that we make when we put products out there in the market. And that can be done through either long-term service agreements, of which TotalCare is clearly a very familiar and a very well-known brand within the market, but equally in Aerospace, Mission care, corporate care, for the military and the corporate and business aircraft sectors, also very well-known and very successful. But equally, it's not just about long-term service agreements. We equally have a very important business. And for some customers, the Time & Material model still works and generates significant value. And half of the group's revenue and a very strong contribution to both earnings and cash came from our services business model and our services sales in 2013, and this line shows some of the numbers there. So my focus, today, is going to be on Aerospace, and it's going to be on TotalCare. And 90% of our Trent fleet is now covered by TotalCare long-term service agreement-style contract, and that very much speaks to the value that exists for customers from the way in which we package that service offering for them. But also, I think, as John mentioned early on this morning, the opportunity that the group has from what we know about doing this to start to build further on some of that opportunity in Lawrie's business on Marine & Industrial Power, building capability and a similar approach to that business model and very telling and appropriate that we've just gained our first opportunity on marine vessel on a

TotalCare-style construct. So LTSA's already represent about 45% of the total services revenue across the group, so becoming an increasingly important part of services.

So just to start with a very basic look at just how significant services is for a typical gas turbine now through life. And at constant economics, the services revenue annuity stream is worth more than 4x the OE net selling price. That's a fairly conservative view relative to other numbers you may see out there in the market, but a very significant multiple, obviously, the benefit of getting an install product out there in service. We invest, obviously, prior to that, so between 5 and 7 years to the initial program creating the product. We invest about GBP 1 billion of R&D every time we launch a new product and about GBP 0.5 billion of CapEx for a complete new engine and setting up the infrastructure and the supply chains to deliver them. And entry into service occurs around about 7 years after the launch of the program. And those products then are out there in service around the world for some 20 years or more. And it's interesting if you were just to compare where we sit at the moment with the various engine programs, we literally have the Trent XWB on the A350 right at the left-hand end of the chart in front of you there, just about to enter service at the end of this year, set fair and very good progress so far on that program. The Trent 700 in a 1995 AIS are already some 20 years into its life, but still selling well and a big part of our delivery order board this year and into next. And then the RB211 is very much -- if you take the 535 on the Boeing 757, 1983, is already some 30 years into its service life, and those aircraft will continue to fly for quite some time yet, as you've seen on some of the earlier slides today. And first-tier operators are typically contracting for between 10 and 15 years, one of the questions I was asked in the coffee break. But then there's always a second-tier opportunity, and we're typically contracting for between 5 and 7 years for the second-tier operator of those aircraft. And really, just to try and put in perspective the value that both TotalCare and Time & Material solutions creates. So we offer TotalCare packages on a full-term basis. We also -- for the full life of the engine, we also offer them on a term basis. And as you get towards the end of the anticipated life of the platform, we start to look at tailored solutions with some of the airlines that are operating older assets. And that's very true of the approach that we're taking and how we're keeping flying and keeping those products competitive on some of the older RB211-powered aircraft that are out there. But both TotalCare and Time & Material and tailored solutions are important to us in terms of that relationship with the airlines of keeping efficient and profitable aircraft flying for them around the world. But what's important here is that we have defined terms in our OE contracts, under which Rolls-Royce sells and the operator buys spare parts either from Rolls-Royce or from a Rolls-Royce-approved vendor. And that's irrespective of whether the contracting terms are TotalCare or the Time & Material support model that you see there.

So this is the value creation. This is the embedded value story that whilst the install base will grow by around 50% over the next decade and the direction of travel is clear, despite the sort of perturbations that can happen on any individual program, that by 2023, the install base is 50% bigger. But behind that, Rolls-Royce sees a doubling of thrust in the same period. And that really is the engine room of growth for us in terms of how the Trent engine success, the light blue in the middle of that slide, is far more than offsetting the reduction in the older RB211 fleet and, obviously, the thrust very much driving that opportunity. And there's confidence behind that chart underpinned by the GBP 60 billion order book that we have in Aerospace -- Civil Aerospace, of which some GBP 30 billion is related to the Trent XWB. And the speed at which this grows, the cadence is changing in terms of how we're ramping up production. So it's taken us 18 years in the company to deliver the first 2,000 Trent engines. We'll deliver the next 2,000 over the next 5 years. The factories are largely in place. We've made significant strides, significant investments around the world in Singapore, in the United Kingdom, in Crosspointe in North America. But we will be continuing to go through the process of transitioning from older facilities to fully load the new facilities as we move work through into new processes and also to accommodate with the growth, obviously, that's coming through. So there will be a process of investment and upgrade, and it continues over the next 2 or 3 years, as we work our way up to peak capacity. This is the largest expansion in the wide-body aircraft fleet of the world in history. And obviously, that's a very big part of the Rolls-Royce Civil Aerospace story.

So thrust is a very good proxy for services revenue. And of our order book, we only take about -- there's only 29% of the total order book because it was represented by civil services because we only take 7 years, a fairly modest portion despite those contracts being between 10 and 15 years, typically, when

we contract them. And the RB211, interesting statistic that it's 20% of the install base in 2013, but only 13% of the thrust. And that's largely because the older aircraft are starting to be used less or being used on freighter operations. But the light blue Trent fleet, very much the install base is driving thrust, and the thrust is a very good proxy for us. So a lot of what Mark and I are going to focus on will be about the large engine business and what sits behind us. But I'd like to start by just reflecting on the fact that services for Rolls-Royce and supporting our large and growing install base is nothing new. This is a world-leading capability that we've spent the last 20 years investing in. I've been with the company for some 15 years in various divisions, and this has been a consistent, enduring theme of how we position ourselves to take the services opportunity that's represented by our install base. It's taken 20 years to develop. It's very hard to replicate, and we're uniquely positioned, I would argue, as the original equipment designer and manufacturer of these products to support them. And we see services on what I describe as a 4-center model. So the big piece of the activity where most of our people, people and cost is based, is in our service delivery centers, the overhaul centers that are supporting these products around the world, some 8,000 people Rolls-Royce or joint venture employees. And in addition to that, we have independent shops -- licensed shops around the world also supporting our products. So that's where the real work gets done of overhauling and repairing engines. We have operation centers, 3 of them around the world in the United States, United Kingdom and Germany that are monitoring the fleet. That's where the engine health monitoring and the management of very large volumes of data, some 22 million health -- engine health monitoring reports that we're dealing with every year, and around 5,000 overhauls that are being supported in the overhaul bases as those engines are pulled off wing. We also have data centers, something we've been focusing on a lot for the last 3 years or so, having 1 version of the truth, where all of the data associated with our products, the configurations, the data that we're extracting every day from products and services, collected, which is all necessary to optimize both the performance of the product, but also the cost base that we require to support it. And then we have the business centers, and that's where a lot of the capability, and some of the things Mark is going to talk about, happens, where we manage the contracts and the very detailed work that goes on that sits behind each and every one of these TotalCare contracts and a very large and disbursed number of line maintenance and on-wing care activities, the very small dots, as you'd expect, at all of the major air hubs and airports around the world. So it's a scalable infrastructure. It's a very significant capability, and it's a scalable business model to address the growth that I showed you on the previous chart with a growing install thrust.

And this chart is my best attempt to try and just get a layer underneath what we're actually doing in services and doing in Rolls-Royce. So there are 3 points at which we get a very deep and detailed understanding of the products that we have in service around the world. And it's a unique and unparalleled piece of capability that supports those products through life. So the design information that we collate for the 18,000 components or so that go into every one of the Trent engines and all of the detailed design data and performance data that we derive from owning and developing the intellectual property behind the design. The validation process is whether through testing engines on wing, through test aircraft for A350 test aircraft flying around the world today, test bed engines running in many continents as we validate the product, but increasingly so using supercomputers to actually model the performance of the product, reliably using computers and validating models at lower costs, a very big part of how we create data and the knowledge of that validation process for the product. And then the data that we collect every day from engines in service, and literally building terabytes of data as we extract the information from the engine health monitoring and engine control systems.

So if we look at this from the lens of the airline in terms of where does the conversation start on how will I support the engine on the airframe that I've selected, and these are some of the typical operating costs for a power plant in service. And an airline has to choose how to manage the list of items that you see on the left-hand side there. And you clearly need to invest to maintain both the performance and also the availability and reliability of these engines through service. And it's a balance of risk, of capability in terms of just how much infrastructure and capability the airline has and, ultimately, cost and cost efficiency. And TotalCare has become the model of choice for customers, and that's really because it underpins -- it transfers risk to Rolls-Royce because we guarantee the availability of the aircraft, and we also have very predictable costs for the airline through \$1 per hour revenue stream coming to Rolls-Royce from them. And Rolls-Royce is taking and is best placed to manage the risk through a focus on the reliability and the maintenance cost footprint as we look at these engines on a fleet basis worldwide.

So what is in a TotalCare contract? I don't think we've perhaps shared this level of detail before. So the core TotalCare offering, all contracts have the same foundation for core services, so the engine overhaul costs, the reliability improvements that we are always working through and seeking to insert in the in-service fleet. Engine health monitoring, if you have a TotalCare package, you're getting both trend monitoring and a very proactive approach to life management and the logistics issues that an airline has to manage to keep aircraft available, whilst aircraft are going through the hangar through -- for maintenance. We work and provide a fleet optimization and logistics service, the fleet management part of the package. And we provide a through-life warranty. When you sign with Rolls-Royce for 10 to 15 years, that is a through-life warranty on that product as opposed to the normal warranties that you'd get in the Time & Material world, which actually lapse quite quickly, reverting back to, obviously, those cost risk being borne by the airline. So it is absolutely a lower-risk package for the airline with very predictable costs. And we support full-service carriers right through to low-cost airlines. But they're still an option for those airlines that have large maintenance businesses, the Lufthansas, the Singapore Airlines, to participate in the maintenance activity, the labor associated with the overhaul. But TotalCare is one unified price of contract. And beyond the items that you see with a tick in the core packages, there are many upsell opportunities as well, things like life-limited parts or even spare engine support services that we can sell as a Time & Material package, the operator, the airline still needs them, or we can incorporate those within \$1 per hour rate. And increasingly, we're seeing some of those items transition to within the TotalCare package. I think the reason for showing you that is that we have a very good track record of being able to trans -- manage the risk, deliver on those cost assumptions. And as the fleet matures and our portfolio matures, we get better at this every time. And with 20 years' experience now on fleets like the Trent 700, this is really the heart of the capability and the confidence we have in being able to manage and get it right on our cost assumptions. So very simply, looking at the revenue and the cost side of the equation, what underpins our confidence in revenue? Well, global RPK, revenue passenger kilometers, the global fleet is being pushed at about 4.5% increasing in revenue passenger kilometers, and every airline around the world's working very hard on their load factors and their aircraft utilization. So that's the main underpinning. An engine, typically, around about 4,000 hours per year that we would expect to see on a wide-bodied aircraft. And we have arrangements and contractual thresholds in there for minimum utilization. So quite a few protections around that. And should those change or should the way in which the operator, the airline uses the aircraft change, that the route structures, the stage lengths, the derate in terms of the operations they're using it on, then it's relatively easy and straightforward conversation for us to adjust the pricing model around that. The rate per hour is very much about the harshness of the model and a very precise pricing based on a unique knowledge of the usage impact on an engine's life. I mean, that, again, is a unique piece of our intellectual property as to the way our mechanisms and how those engines perform in service. And the rate is inherently related to our understanding, obviously, of cost. And probably, the simplest way you can think about cost is the most powerful determinant of cost in a service and support contract under TotalCare, is time on wing. It is extending that time on wing, which delays the maintenance event and the cost to do the overhaul. And I'll come back to this later from an engineering focus on improving this. But otherwise, cost is well aligned with our pricing approach and is very much based on usage. And the cost per shop visit, we determine the work scope for every one of those engines as it comes to the overhaul shop, what the work is that actually has to be done with a very close focus on the reuse of parts -- serviceable used parts. On repair, and we invest quite heavily in repair technology, it's an important part of driving cost out and also the replacement policy, ultimately, which is in every part being fitted to an engine. And from a labor perspective, that's the productivity drive within our overhaul shops or the joint venture relationships around the world.

So I'd like to go one level lower in terms of -- so what's behind time on wing and what really gives us and, hopefully, you the confidence of what we know here. So every engine has many parts in it. But about 15 to 20 of those parts -- the critical life-limited parts are mapped onto this chart. And this shows the probability of the engine being removed as a result of that part reaching its life limit versus the time on wing. And what we're trying to do is obviously move these red lines to the right-hand side here because it's the statistical probability distribution that the life characteristics of each of those critical parts. And this drives the decision, ultimately, on when to remove the engine for overhaul and, obviously, therefore, the point at which time on wing is considered. And when you take all of these components in aggregate, you end up with a probabilistic line combining those component characteristics to determine the whole engine life. And it's by improving those individual component lives, changing the angle of those red lines that you

saw on the first chart there through experience in service, through upgrades, through improvements that we can insert into the fleet, that really has given us a very powerful point of leverage in extending time on wing. And it's the unique and the deep design knowledge and the in-service experience that we have that enables us to do this. And it's not just theory, doubling the time on wing on engines like the Trent 700 and Trent 800 since they entered service is real, as well as upgrading and improving the fuel burn and the overall reliability of those products in the same period. And the Trent 700 is a very good example to pick with some 92% of the engines that we deliver from new only being removed from wing at the point of which we expect it to be removed as a result of reaching a life-limited part overhaul condition. So it's a very predictable and planned approach to maintenance that enables us to have the confidence in the TotalCare commitment that we're making for customers. It benefits the airline, and it obviously has a big benefit to us in terms of the cost and the competitiveness.

And the cost focus is broader than just time on wing, improving inspection criteria, some GBP 11 million on the top example there, on the Trent 700 turbine inspection criteria being saved as a result of being able to reinstall a part on some 12,000 refurbishments that we see over the next few years and, obviously, the accounting opportunity and the cost opportunity from having the confidence to do that. On engine health monitoring, we started working in early 2000 with a biotech company looking at algorithms to try and predict the onset of a cardiac arrest in a cardiac patient by monitoring various of the vital signs on a human. We bought the industrial rights to some of those algorithms in that technology in 2009. And the very latest versions of the Trent XWB and the Trent 1000 have those algorithms within the control systems. It gives us an even better capability to predict and avoid in-service disruption and the expensive in-service events from an unplanned removal. And an engine removal incident is somewhere between \$0.5 million and \$1 million every time it happens. And a very significant one on the bottom from repair technology, that's a GBP 200,000 roughly component, a bearing housing on one of our engines. We found a mechanism, invested some GBP 14 million in a repair technique. It's a big investment in repair technology to find a way to repair that unique component. It delivered a saving of some GBP 56 million by avoiding the need to replace that component at shop visit on some 350 engine overhauls. So it's real and it's a big focus, and John mentioned at the start, 400 engineers on original equipment cost reduction, 200 on services. This is the power of some of the opportunities we identified to take cost out of our service package lines.

So I hope that's given you a clearer view of both the embedded value within our business model, but also how we focus on continuing to reliably deliver this for both customers and for you, as investors. And that's how we look at and how we create value, the economics of the model, the most important part of the business model for me.

And it now just leaves me with the chance to pass over to Mark to talk about the -- what he sold as the most interesting of this in terms of the accounting bit. So Mark, over to you.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Thank you, Tony. I can tell the excitement is mounting. So this is the pointy-head accounting piece that I'm going to try and make simple. So I'm going to talk about 3 things here. We're going to build up as we go along. I'm going to talk about the commercial arrangements and how the accounting principles relate to them. I'm going to talk about the accounting mechanics, and we're going to build up slowly. And then I'm going to talk a little bit about the portfolio dynamics as we start overlaying various programs and where we are on the cycle.

So here it goes. And then, before we start, it's just important to remind ourselves that the commercial arrangements that we have in this business. So we deal with 3 types of customer: Airlines, that would include freighter operators and VIP aircraft, the high net worth individuals; lessor, as you're all familiar with, they can bank style lessors, the financial lessors or operating lessors, such as ILFC, AerCap, TMIT, et cetera; and of course, airframers, such as Boeing, Airbus, Onbro [ph] and so forth. On the aftermarket side, there are 2 types of contract: The first one, you're all very familiar with, Time & Materials, or T&M, as it's often referred to in the trade; and the second one, TotalCare, which is what we're going to be spending our time on the particularly around the accounting. Let me just talk a little bit about this, so

just for a second because it's quite important. In the Time & Materials, the airline takes the risk of time on wing and the risk of the shop visits and doing the work scopes, putting them to shops, whether it's their own or others. In the TotalCare, there is a risk transfer. We take those risks, and we provide them with the service. And arguably, we are the logical risk-taker on the grounds that we build the engines. We have more data and information than anybody else. We have the scale of economies around us, the spare engines, the networks to sweat [ph] our assets properly and share some of those benefits with our customers to incentivize them to go down the TotalCare path. And again, as Tony talked about, very important to understand because this is just basic math, our business model is a very simple one fundamentally. As you grow your install base, you drive an annuity, which runs for about 25, 30, 40 years, depending on the type of product that we're talking about. Tony made it very clear to you that generally we generate about 20% of our revenue on the OE and about 80% on the aftermarket. We make much better margins in the aftermarket, as you're all familiar with. And the reason I laid this out is important because this is going to drive the accounting, the different types of arrangements. And importantly, only the airline enters into either T&M or TotalCare. Lessors and airframers do not. They may be involved in us selling engines to them, but they don't operate them.

Okay. Let's start with the accounting principles. So when we start thinking about the accounting, we go through a flow diagram process basically of asking ourselves some basic questions. And I'm going to build this flowchart up. So the first question we ask is, when a new piece of engine business is done, so when we sold some new engines to someone, the question we ask ourselves, is there a TotalCare contract accompanying it? If the answer is no, they can be for any of those customer cases that we know that the aftermarket by default is Time & Materials. On the right, you're seeing an orange box that says contractual aftermarket rights. Now I'm just going to explain this. Those of you who are the more pointy heads who follow this stuff, you normally would see that as a recoverable engine cost. You are aware we've been having discussions with the FRC about our accounting, which they conclude that our accounting is correct in terms of how we look for it. But they made a good suggestion to us, which was, we don't understand why you call it a recoverable engine cost because, ultimately, it's a contractual aftermarket right, which is what allows you to create the intangible asset. And we agree with them. They're right. It's a much better explanation because when we sell an engine, there's a requirement for the airlines to buy spare parts from us, to keep their warranties and guarantees in place. Now I'm going to explain a bit more of it later, so just park that one for a moment. But contractual aftermarket right exists to the extent there is a loss on the sale of original equipment because we don't always lose money when we sell original equipment. But when we do, it creates something called an aftermarket right, formerly known as a recoverable engine cost.

Next, so if there is a TotalCare agreement, the next question we ask ourselves is, is it negotiated with the same party? Now let me take a simple example. Lessor buys an aircraft, he leases it to an airline. So he's entered into a deal with us to determine the commercial terms of original equipment. But the airline is going to negotiate with us the TotalCare contract. So we have 2 contracts, the TotalCare contract with an airline, the original piece of equipment with a lessor. If he's taken a TotalCare contract, we now have 2 pieces. On the aftermarket, we call it an unlinked TotalCare contract. Just bear with me, I'm going to build these all up, just remember the boxes, unlinked TotalCare. And again, if there's any loss on the OE, we generate an aftermarket right. Okay. So if it is negotiated with the same party, we have to get on the next level of filter, which is, was it negotiated at the same time? So it is quite possible for an airline to buy its aircraft and decide that it's not going to make a decision about whether it goes T&M or TotalCare. If 1 year into the contract it decides that it wants to go TotalCare because it actually likes what it sees, you've got 2 contracts that were effectively entered into at a different time. So again, we treat them as unlinked because they were not done at the same time, hence, the unlinking. And again, if there is a loss on the OE, we've got an aftermarket right. And finally, the case where we have a total air care agreement is with the same airline, and it was done at the same time. Okay? So airline x comes and says, "I want to buy some aircraft. And at the same time, I want to enter into a 15-year TotalCare agreement with you, Rolls-Royce." We refer to that as a linked contract and the ones that most of you are familiar with. Okay. So those 3 things important: contractual aftermarket rights, formerly known as recoverable engine costs; unlinked contracts, when either we've got different counterparties are not negotiated at the same time; and linked contract, same counterparty, negotiated same time. So far, so good.

Okay. I'm going to keep diving. Contractual aftermarket rights. Very, very simple example is illustrative. I don't want you to think for a second that we're always losing money on OE. But this is an example where we do, so it might be launch-phasing, where learner curve is high and launch conditions and so forth. In this simple example, we have a unit cost of a phantom engine that cost us \$5 million. The customer has a net selling price of \$4 million, so we make a \$1 million loss in this example. This is the way the accounting starts to come in now. Under IAS 38, something referred to as intangible assets, what this says is, look, businesses aren't generally in the businesses for giving away their products below their cost. You must be doing it for a reason. You think you're going to make some money somewhere else. Correct, we are. So what are they looking at when they say, well, can you value it? And the answer is yes, we can value it to a certain extent, but we can't value with a high degree of accuracy because under something like T&M, we do not know exactly the flying patterns that they can operate. But what we do know is it is definitely in excess of the size of the loss on an NPV basis. So when you're sure it's bigger than the loss, but not sure exactly that you can value it down to the level of a dollar, we are only allowed to take the loss element. So effectively, we sell it at cost-effective is how we'd account for it. We create an intangible asset on the balance sheet. In this case, it would be \$1 million, and we amortize it over 15 years. So that's what we do with customer aftermarket rights where there are OE losses.

Okay. Unlinked TotalCare. And let's remind ourselves, unlinked TotalCare is different counterparties were negotiated at different times. We can't link them under IAS 11, which is all about construction-style accounting, because they failed the test of not being negotiated together. Clearly, 2 independent parties cannot be 1. And if you're doing it at different times, you can't negotiate it at the same time. And again, we have an unlinked TotalCare contract, which is governed by revenue recognition rules under IAS 18. And there, the revenue and the costs are going to be recognized in line with flying hours. Okay? We've talked about the aftermarket right. So let's just do an example on unlinked to make sure we're all clear. So in this simple example, it's a single engine. It's got a 10-year contract, 10-year life, 10-year length. It flies 4,000 hours a year, sort of numbers that Tony was talking about, just to put it into perspective. So 40,000 hours in total, \$10 million of revenue over the 10 years, and that's driven by in our simple example an engine flying hour rate of \$250. I'm sorry, I'd get the laser to work here for a second. \$250, we've assumed a cost rate of \$150 in this and, therefore, a margin of \$100 or 40% in this particular example. So what happens at 1 year on? So we started the contract. We've got a 10-year contract. It's running 4,000 hours a year. At the end of 1 year, he's done a year. He's done 4,000 hours. $4,000 \times \$250$ gives you \$1 million. You can do the math for the rest. And we end up with our \$0.4 million margin based on the \$1 million of revenue that we've got. Okay? Now just to be clear, if he only flew 3,000 hours, we actually book the actual hours they've flown. But remember, he's entered into a contract to say he's going to fly 4,000. If he puts that right the following year, nothing really changes. But to the extent he doesn't, we have to make adjustments, which I'll talk about in a moment. But keep -- let's assume that he's doing what he says for the moment. Okay. So this is the graph that unfolds for a single engine when we look at an unlinked. So again, laser time. We start at 0. So 3 curves here: cash revenue, cash costs and the margin. So let's just take them each. And so let's start with the costs. On unlinked, remember, we're just talking about an aftermarket contract, we start off on a cost side. There are no costs at day 1. Okay? On the cost side, we're not -- we haven't built an engine. We've done nothing. We haven't turned any spanners. Nothing's happened. So we don't do a lot. In this simple example, we assume we do nothing. In reality, we do small minor checks. But the big things happen around 4 or 5 years, which is the first overhaul and then the second overhaul around 8 or 9 years, and these things can be quite lumpy anywhere between about \$3 million and \$5 million on a big engine.

The revenue line, nice and simple, straight line, he's flying \$250. He's flying his 4,000 hours a year. \$250 is just a straight line, keeps going up. And of course, we account for the margin, which is an output of the cost and revenue recognition, 40% in this case, just runs along here.

So let's just move to the next graph. Now this may be a bit of a surprise to some of you because you normally always think about debtors and TCAs. When we do an unlinked TCA deal, generally, we never have a debtor -- it can be down here in sort of the smaller parts. But let me just -- now why -- what have we got on this list? We've got here the net cash position, the black line; and the margin, which was just transferred from the other graph. We build up a creditor position because what we're doing is we're collecting cash every month at $\$250 \times$ the hours flown each month. We're not turning any spanners until

we get to about year 4 or 5. We do a big overhaul. And in this case, obviously, we generate a small debtor position. Again, just remember, creditor and debtor, we talk about it, it's just where the profit is ahead of cash or vice versa. And of course, they end up together mathematically at the end.

Okay. That was unlinked. So we've done aftermarket rights, unlinked. And now here we go into linked. So let's just remind ourselves, linked, negotiated at the same time, has to be with the airline, he's bought the OE, and he's doing the aftermarket. Definition around linked is all driven by IAS 11 constructing -- construction contracts, and there are 3 criteria that you have to satisfy that are written up there. Negotiated as a single package, closely interrelated, contracts performed concurrently. That's the language that we look through. Okay. Let's go on for an example on this one. So this is the starting point before we start overlaying the accounting dynamics of margin adjustment. So on the linked TotalCare -- sorry, we start with the OE on the left. So in this simple example, again, single-engine example, show a list price of \$10 million. We take off some concession, the discount, net selling price of \$4 million in this example, assume the cost of \$5 million and negative OE of minus \$1 million in this example. TotalCare, 10-year contract, generate \$8 million of revenue, no concessions here. But obviously, we have our costs, so we assumed \$4 million. And again, you can do the math, a 25% blended margin in this example. Of course, the previous one was 40%. Just for illustrative purpose, here 25%. Now under the rules of linked accounting, we treat everything as one. And therefore, we have to look at smoothing the margins. And this is what happens. You can see that, obviously, we're making no margin on the OE or loss on the OE, and we're making good margin on the aftermarket. And what we do is we balance the 2. Now we don't do it on the cost side because if we think about it on the cost side, it is actual cost on the OE, that's our unit cost. We know that an estimate -- our best estimate on the aftermarket. Now I hope you can trust me that I've done the math right here, but what I've done is just even them up to get you to 25%. And as you can see, the output here is, obviously, we still have the physical cash loss of \$1 million, but we created a profit of \$1.7 million. So we've now got profit ahead of cash of \$2.7 million, which is our friend, the debtor that we talk about. And of course, the math corresponding -- must create a corresponding creditor on the other side to create this flat at the end. So again, simple example, but just to get the point across on how it works.

So again, let's just take some lines. So you remember, on the unlinked one, we started at 0 in both cases. In this one, we don't. So if I just take the cash cost line, the reason it starts off below 0 is, of course, it's just our unit cost of the engines, as it's just purely the cost side we've incurred the cost of building the engines. It's a linked contract. Don't really turn any spanners until we get to about here and then the same thing happens again. And this is the net revenue we've seen at the front, that \$4 million that we talked about. And this is the margin take. So again, we're recognizing revenue and costs in line with flying hours. In this example, it's a 25% margin realization.

So our friend, the debtor. As you can see here, I've just transferred the margin 25% line -- straight line, and then this is the net cash position. And of course, what you're seeing here is the unit cost of the engines, followed by some of the cash we've got from the front end. And then obviously, as time goes up, we're generating cash every month. We're invoicing for cash. We do some work in the overhauls, and you get this sorted and back where we started. So that is linked. Okay. So these are single-engine examples.

Now in the simple world we've just gone through, we have assumed that the assumptions we made at day 1 are right through the entire 10-year period. I wish that was always the case because it would make our life a lot easier. So let's just think about something. We've entered into a contract for 10 years, where an airline has told us they're going to do x flying hours, y stage length and various other criteria that will affect both the cost and what we charge as the revenue flying hour. We've made assumptions about cost and reliability going forward on our engine programs. Where we have a mature program, we have a lot more empirical data to support it. Where we have a new program, we have algorithms and architecture to tell us how we think it should behave. And then, of course, we've got the performance litters, I'll call it around our customers actually doing their part of the bargain over the next 10 years. So what can change when we talk about these? And let's talk about each one. So the revenue forecast. The revenue forecast can only change by the customer. If he tells us he's doing 4,000 hours, and then he goes 3,000, that will adjust the revenue forecast. Obviously, whenever you change the revenue forecast, it creates a corresponding change in the cost forecast because, clearly, if you burn less hours, you'll do less on the engine. And therefore, it will take longer in terms of time period for you to have your overhaul. If we look

at the cost and reliability forecast, this is down to us. We look at our programs, we look at what they're doing and decide a best estimate of what we think is happening. Now importantly, we factor a number of things in when we look over a 10-year period. Our best estimate of what it is that make some assumptions about either improvements we're going to bake in from engineering or experiences that we're getting through. We include something called an estimation risk at the early point of any program, and that is that whilst we've given our best estimate, we put an element of cautiousness over it that sort of says, we not -- might not be exactly right, and that unwinds over time, all other things being equal. Of course, we could go 2 years into the contract and actually find our experience is getting better or worse, and then we make an adjustment. That's called estimation risk. I'm going to comment a little bit more on those in a minute.

Asset recoverability. This is about performance of the contract. In very simple terms, if I put it into banking speak, when you look at AAA counterparty versus a CCC counterparty, generally, you either give a bigger NPV upfront, if you're looking to discount cash flows or whatever it is or sign less risk, or you create more of a reserve for a riskier counterparty. We do not take as much margin on a higher-risk transaction as on a lower-risk transaction. It's driven predominantly around the counterparty risk and the fleet fit, importantly, which is how essential are the aircraft that we are providing to the fleet. Is it not feeder traffic but the mainstream traffic or whatever? So that creates a valuation allowance. And again, that unwinds over time. Again, counterparty risk tends to reduce as time decreases. And of course, that unwinds as well over time. Just to put it into perspective, if I talk on costs and our assumptions, what has our experience been, if I look back on average, if I look at in-year civil profits, the impact of adjustments to cost have been around plus or minus 4% on in-year civil profits. A 1% change on our portfolio in cost assumptions has an in-year impact of about GBP 30 million. Now let me just come on to the next slide. This is an important point just to recognize here. The governance around this. Every balance sheet date -- before every balance sheet date, we do a process review of every contract we have, and we update the revenue and cost forecasts. If there are some changes, we revise the margin because the margin is an output of those 2. And obviously, the debtor and creditor, an output of the margin versus the cash. If there is a change, it's going to impact the current year. It's also going to impact the prior years because, in very simple terms, if I've been taking 12% for the first 3 years, and all of a sudden I should be taking 13% through life, I need to catch up 1% on the previous 3 years. Now under the rules, we do not restate our accounts. We make an in-year adjustment, which we refer to as a true-up or a catch-up. So the in-year impact can have a multiple impact, depending on how mature your portfolio is. At the moment, like I said, it's about 30 million for 1% move, and that includes the in-year adjustment and the prior -- sorry, prior year and in-year adjustment. And obviously, if you make a change, it will have your future margin impact. But that's a sort of non-balance sheet item at that stage.

Okay. Summary. So let's just remind ourselves. Unlinked TotalCare, we recognize revenue in accrued cost in line with flying hours. The same applies for linked contracts, but we equalize the margin, again, under the construction contract of IAS 11. We factor in what we call an estimated risk in valuation allowance. And of course, what that does is it basically suppresses the margin at the front end. It's an element of cautiousness, prudence, if you will. Relevant standards we talked about here are IAS 18, revenue recognition; IAS 38, intangible assets; IAS 11, contract, contract-- sorry, construction contracts. We renamed RECs to contractual aftermarket rights, and we've agreed our accounting treatment with the FRC. So this was single engines.

And let's start making it a little bit more complicated now. So that was a single engine. And I think it was quite easy to show the picture. And now as you know, we deliver many engines over many years. The ramp-up rates vary. The volumes to programs can vary. We have 8 programs in our civil large engine business just at the moment. But I'm just going to talk about 1 program at the moment. This is a generic program, could be some other Trent 800, just to give you an example of what happens. So all I've done here is I've taken the profit take and I've assigned them. And again, we're talking about a linked contract, so equal margin now between the OE piece, which is the red dotted line, the aftermarket profit, and then I've added the 2 together with a green line here. So as you can see, what you'd expect profit is taken. It's been equalled out. And as deliveries eventually fall away to nothing down here. And of course, the aftermarket just keeps growing because, of course, the engines are installed, and they keep driving for their useful life. That is a typical profile of what we see in terms of profit. So what I've done is I've taken the combined line that green line that we had there, which is this one here, and then compared that with

the net cash line. And again, with a linked contract, as we all know, we have a rising debtor position at the middle of the -- at the beginning of the program, point where we get peak net debtor, and then the debtor is decreasing and as we go over time. Now again, let's just refresh ourselves that sometimes people panic around debtor positions. And I will tell you that debtor positions can rise or sink for various reasons. But let's get the math right. You all understand our business model, which has is we install engines, grow annuity. There's a 4:1 ratio in terms of revenue and better margins. If we -- It is given math that if we make better margins on the aftermarket than we do on the OE, we are always going to have a debtor. So the question is, we're building up a base. And as we're in a growth phase, of course, we will have a growing debtor position. Eventually, obviously, the cash will start to catch up.

This is a corresponding unlinked one. It's a fairly boring chart because it tracks each other far closer. So it's just the aftermarket. But again, this is a sort of thing that we would see on a program where they're close together. So drivers of TotalCare, net debtor, and I guess, creditor as well for that matter. Obviously, as OE rises, if you get a ramp-up in OE with linked contracts, you're going to drive up the debtor. As shop visits take place, we will also increase the debtor because, of course, we are retiring the creditor, and when we talk about a debtor, we talking about a net debtor, which is, obviously, the gross debtor and the gross credit positions coming together. So shop visits, obviously, we've reduced the creditor, and it has a habit of increasing the debtor. When the contract outlook improves, so we talked about margin take. If we were taking 20%, and actually, based on our cost progress and margin improvement, we actually thought -- and reliability, we thought, actually, it should be 21%. That 1% increase increases the margin and helps to increase the debtor because it's just the difference between revenue and cost being accrued. On the other side, obviously, as we do flying hours, we get the cash in, and it retires down the debtor. And interestingly, if we worsen the contract outlook, we have the reverse, obviously. So results on the debtor reducing. Again, on the valuation allowance, it changes. And it can result in a rise or fall, depending on where we are. A steady state valuation allowance has come down over time and, again, as time reduces counterparty risk.

So let me just take you back to John's chart. So before I just go into this, let's just remind ourselves. I've just given you 1 program. We've got 8 programs, all at different points in the maturity cycle.

You start laying those all over each other and you can see that the modeling gets very, very complicated because there's many, many moving parts and thousands of engines, all at different points in their life cycle. On top of customers who are changing their flying patterns and habits, us working our way diligently to improve reliability and cost, all those things keep going in as we update. And the point is, are we getting the math right? The answer is yes. Of course, the important point is, understanding where we are in the cycle, and that drives the cash position.

So John was quite clear in his chart in telling you where we are, we're seeing some big ramp-up certainly as we get into '16 and '17 periods. And of course, this isn't just XWBs. Trent 700s continue, Trent 1000s continue and the various others that are going here. But as you can see, that revenue is rising. So generally, we're going to increase -- there will be an increasing debt as we go forward. Of course, a number of things, I've talked about a total debt when we look in the entire portfolio driven by what is linked versus what is unlinked. The differential margin between the 2. And of course, as we get around to these sort of areas, we get the benefit of volume, learning curve gets underway in some of the new programs, in the 1000, the XWB. Volume is our friend, we're rationalizing the footprint. All of these things are going to improve cost and cash and, obviously, margins, too.

So that's just what is coming. This is just a picture of where we are. So to me, it's an embedded value chart of where we are. So these are our 8 programs, showing their various points in terms of relative scale and contribution and size, just on TotalCare. It does not include T&M. It does not include non-contracted business or speculative business. Our position as we stand today, just on our existing TotalCare contracts. As you can see, at the end, with RB-211 programs, generally, these guys are running -- together, they combine in there about sort of 35% to 40% on TCA. They're still very T&M-weighted, this part. And as we go across, these are much more on TCA. And again, as we go forward, sort of in the high 80s, 90% and across the fleet, about 70-odd percent. The dark blue is just saying where we are in terms of what we banked and what is to come. And this excludes speculative business and, of course, the negotiations

of TCAs beyond their initial term. But the point here is there's a huge amount of embedded value with the best of margins.

So let's just summarize where I think we are and what we try to do in a relatively short space of time of understand the principles of the accounting complexities as we build up single-engine into programs, so running multiple programs over each other at multiple different points in their life cycle, lots of moving parts, and driving where we're going and why we're confident about what we're doing is the right thing.

So earnings are ahead of cash, plus OE is growing, you can see it growing. So in effect, we're sowing more than we're harvesting at the moment but, obviously, we see the strong annuity is driven off by the installed base. The significant value embedded in the aftermarket, of course, as iterated before and John has, we're strongly focused on cost reduction and improving reliability. And again, as last point, really, as I finish up here is the accounting follows the commercial substance of the transactions, which is why I talked about the various contracts at the beginning. And our treatment has been agreed with the FRC. So that's the end of the accounting session. I'm now going to hand over to John. So thank you.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Mark. It's very helpful and clear. So let me wrap things up. And I expect you all expected me to give the usual wrap-up that you would turn off for because you know what I'm going to say. So excuse me if I do something different. I'm going to tell you what I feel rather than a recap of the business, but one of I feel is privileged to lead this organization. Great people, wonderful products, terrific company, a company that has done extraordinary things over many years. I'm in awe of the people who did this in the past because they focused on the long term not the short term, because they recognized the long-term success that this business could have, and it's a long-term business. I'm thoughtful about the growing pains that we're having and we will have. The growing pains that are a consequence of the success that we have, not of the failure. The growing pains that we'll experience, whether it's transforming the operational performance or the financial performance. We are going to feel those, but it's a consequence of success. I'm confident that we have sustainable growth. But that does not mean year-after-year consistent growth, it means long-term sustainable growth. And I, and I hope you, are excited about the future of this great company.

So thanks very much indeed for coming today. We're going to take questions now, and we'll finish no later than 12:30. So what we're going to do is we've got a number of people that are watching this on the phone lines, on computers. If you could type in your questions, we will pick those questions up during the course of the Q&A session and I think, Jilinda, you will read those out as we go across. What I'm going to ask is if you put your hands up in a normal fashion if you want to ask a question, if you can say who you are and the institution you represent, that would be very helpful. And if you could wait for the microphones to come around because the session is being recorded, then we can make sure that we all hear the questions as well as, hopefully, the answers.

Okay. Let me try on being the ringmaster of this. And just to make it easy, we'll start at the front here, work back and around. And when we come to, Jilinda will pick up some of the not-in-the-room questions.

Question and Answer

Nick Cunningham
Agency Partners LLP

It's Nick Cunningham from Agency Partners. I've got 2 sort of slightly different questions, one going back to the early part of the morning. I think you said that unit cost reductions are effectively offsetting increased input costs. I was wondering if you can give us something behind that as to what's happening to both gross numbers, if you like, and how you see that playing out over the near to medium term. And secondly, coming back to the more recent part, I believe that Trent XWB sales are going to be unlinked, perhaps all of them. I'm wondering if you could possibly explain why that is, contractually. And also, looking forward Trent 1000, 900 and the remaining 700 contracts, are those all going to be linked or going to be unlinked? What sort of proportionality are we looking at within each program?

John F. Rishton
Former Chief Executive Officer and Executive Director

Certainly, thanks, Nick. I'm going to pass a couple of those questions probably to Mark, if I could just give a couple of comments first. What I said was we had about 400 engineers working on our existing products and they were finding ways to reduce cost, and that was offsetting the escalation that we were seeing as part of the passage of time. So as you know, in our purchasing through into our sales, we have escalation clauses. So they're finding ways to offset that escalation. You're right about XWB, they will be unlinked contracts in simple terms. And Mark will be more specific, I'm sure, because we're selling, as we said, Airbus and then because we're the only engine on the aircraft. But Mark, maybe you want to make a couple of comments about both of those questions as well, and the Trent 1000.

Mark Morris
Former Chief Financial Officer and Executive Director

So let's just start with the linking, unlinking. So XWB is unlinked because it's sole source or single source, should I say, and is done through Airbus. So we've got 2 separate contracts because we're negotiating with Airbus, we're doing the aftermarket contracts with the airlines. So it doesn't pass the IAS 11 test. On 1000s and 700s, the majority are linked. We do have some unlinked. We have customers who have gone T&M and changed their minds further down the road. So you can have both, but the majority are linked. I think on the cost side, I mean we've talked about this before, Nick, there's an array of activities that are ongoing. And it's a journey we're on sort of in the foothills of where we think we can get to on cost, but a lot of activity, be it low-cost country sourcing, designing to keep those and renegotiating our supply contracts, and some of that's coming through as well. So while some are beating the headwinds, there's other activity which will continue to drive those cost down. And of course, some of that we're talking about which is included in our guidance for this year as well.

John F. Rishton
Former Chief Executive Officer and Executive Director

Okay, we'll just go with a couple, that's it. Thanks, Emma [ph].

Robert Alan Stallard
RBC Capital Markets, LLC, Research Division

A couple of questions.

John F. Rishton
Former Chief Executive Officer and Executive Director

Could you say your name?

Robert Alan Stallard
RBC Capital Markets, LLC, Research Division

Sorry, Rob Stallard from RBC.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thank you.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

First of all, maybe we'd stick with the TotalCare accounting. The estimation risk that you take on the contracts, probably give us what sort of percentage you're talking about here and how the profile is expected to develop on this going forward? And then the second cost -- question is actually on the RB211. You've said that the thrust profile is a proxy for revenue. Personally, I'd be getting this idea of whether that's also a proxy for profitability as well?

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, I'm going to throw both of those at you because you will be accounting them for this month.

Mark Morris

Former Chief Financial Officer and Executive Director

So estimation risk. I think I gave you some insights into the impact, our experiences. I mean our experience has been pretty good. We recognize that there has always been a small lower bar around what's actually happening. Like I said, 1% is about EUR 30 million in terms of where we are in the portfolio and the impact today, we see that there are plus or minus 4% on any profits within Civil. I don't -- I mean we're not going to reveal what the current estimation risk that we're holding among them, but it's -- I think within those bounds, you can see, as we track through what our experiences are to date. So what I would say is that, when I look back and see if I were talk to the businesses is, say, well, how confident are we about our cost modeling. When I say, actually we're tracking pretty good. And generally, the curve has been one of it coming down, so improved reliability in some of the things that, Simon, you talked about. Now your second question, I think, was thrust, a good proxy for value. I think the rawer sense, absolutely, it is. I mean, clearly, a bigger value of bigger thrust engines, but then you have to be a little bit more explicit about what's happening within any engine program. So if I took RB211, for example, it's about 20% thrust. And I think last year it's somewhere around sort of 14%, 15% of -- sorry, this year is what we said, of revenues. Why is that? That would just reflect the flying patterns potentially of the airlines. So in the RB211s, there's a lot of freighters. They don't tend to fly quite as many hours. And I thought, because it's a longer point in the cycle, there's an element of us trying to make sure we incentivize people to stay on so we can be something like reducing our margin as a way of making sure that we keep the fleet flying for longer. And that's just sort of our core efficient frontier analysis, which is how do we keep it running for longer while still making margin. So that's the driver. So first order, yes. Second order, not necessarily.

John F. Rishton

Former Chief Executive Officer and Executive Director

I'm not sure, Mark, whether the -- I think the question was more about the -- is the thrust also a proxy for profit as well as revenue? Just to be difficult.

Mark Morris

Former Chief Financial Officer and Executive Director

I mean, yes. The short answer is yes, again, it is. But again, depending on where we are in the programs and where we are the cycle, that will vary it.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. And if you -- anybody else on -- I'll come back, going to come back. Let's just go -- yes, that's great, I will come back, just for a moment.

David Howard Perry

JP Morgan Chase & Co, Research Division

It's David Perry from JPMorgan. Tony, can I ask you, if you had one company, Civil Aerospace, can you just give us a feel for roughly what percentage of the profit is coming from the 3 segments you talked about? Just for example, in the annual reports, if we were think about large engines, medium engines and small engines, can you just tell us roughly what profit contribution to, say, in '13, each make to the business?

John F. Rishton

Former Chief Executive Officer and Executive Director

David, thank you for deciding who will answer the questions. But I've got to impose a slightly different view, and suggest that Mark starts off with that and then maybe Tony has something else to comment.

Anthony Wood

Former Executive

Good question.

Mark Morris

Former Chief Financial Officer and Executive Director

David, I mean we don't break out sublevels, we give it at the civil division level where -- and civil defense is what we give within aero. We're not going to start breaking out our various programs.

David Howard Perry

JP Morgan Chase & Co, Research Division

If I may ask a follow-up, I think your communication around IAE has been very confusing. I think you've sought to rectify it with a slide today where you've added a dotted piece for IAE to show it's still sort of part of the business, although it's not your official thrust, which is a changing out in your previous slides, so thanks for that. Clearly, it is still contributing revenue and a very lot of profit, but it is extremely hard to know the outlook for that. And before I even begin to think about TotalCare on the Trent, it'd be quite nice to know what's going on with IAE today and in the future, please.

John F. Rishton

Former Chief Executive Officer and Executive Director

Comments on that? Mark, do you want to make any comments on that?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, look, I mean we said, as we go forward, it gets to be more and more difficult to make, relative impacts of old versus new. We've been clear in terms of the guidance we've given in the past about the contribution it's made and the numbers that you've got. And it will continue to contribute, certainly, for the foreseeable future, certainly in the next decade, but it will decline over time. But we're not going to break out sort of forward guidance going out for one piece of the program, it just becomes part of the portfolio, eventually, which is where we are.

John F. Rishton

Former Chief Executive Officer and Executive Director

Tony, you've anything to add?

Anthony Wood

Former Executive

Yes. I mean it's real value. We sell engines still on the V2500 to Pratt & Whitney, we sell spare parts, and we have 5,000 engines at the point at which we exited IAE that generate a \$1 per flying hour going forward. And that's what the shaded line in that graph represented.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. To finish on a positive note on that question, again, I would remind everybody that the value that you -- generally was assumed by the market for our IAE business was a little lower than we actually realized. And that, again, is the installed value, the value of the installed base within this business, which is a large part of the value of the company, and that's where we spent so much time explaining where we think the thrust is going to grow. That is a huge value to this organization.

Rami Yehuda Myerson

Investec Bank plc, Research Division

Rami Myerson from Investec, 3 questions. At the beginning of your presentation, you talked about the taking out of costs, but then you presented a slide with the ramp-up in the Trent engines, which presented a number of headwinds to profitability. Is it right to think that talking about -- and of course, you also talked about closing the margin gap. But that is something that's probably going to happen towards the back end of this decade, it's not going to happen over the next few years. The second question is on medium-speed reciprocating engines, given that you announced this morning you don't plan on making significant M&A, how should we think about the R&D profile in the Marine business? Are we going to see a big ramp-up? And just a short one on the ROIC over WACC comment on Tognum. Can you just update us on where we are in that process, given we're 3 years post -- since the acquisition?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. I'll take in the first couple. I want to ask Mark on the third and maybe [indiscernible] the other ones. In terms of the ramp-up headwinds -- I used the term growing pains when I talked about it and Mark has spent some time explaining linked and unlinked, and we just hopefully clarified around the XWB in terms of the fact that that's unlinked so is the whole raft of things going on in that mix. That's why I talked about growing pains in terms of operational performance and financial performance, so how do we address those issues? How do we address the consequences of our success? How do we drive through to the, if you like, the promised land out in the future when we've got strong growth and more stability? And it's an issue for all growing companies or companies that are growing at a significant rate is how do you keep pace with that? Because it's not just the points that you made, it's also some of the other points I made earlier in terms of the investment in new capacity. So if I look back at some of the margin progression from '03 to '13, a large part of that was on the back of the revenue growth. But it was also on the back of the fact that we under invested, if I can be slightly critical, in the infrastructure of the business and we're having to catch that up now, which is one of the growing pains that we're going through. We will give you, in October, as Mark has said, our view about the medium-term outlook in the form that he's talked about, which I believe will help address some of your questions. And clearly, as Mark has also explained in terms of guidance, we're going to be giving more in the future than we have in the past, which will help you and hopefully manage expectations. But your point is the right one, and it's one that we are reflecting on, which is why I've made the points I've made, why we've talked in the way that we've talked, which is we're grappling with the growing pains of the current because of the success that we've had to get to the future where we've got this sustainable growth and a more steady-state position. In terms of medium-speed, if I look at the total business, as Mark and I have both said, what we expect on research and development cost is, at most, an easing of those as a percentage of revenue and we can rebalance where we spend our money. So if I break it down, our civil spend runs what, Mark, about 5% or so?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes.

John F. Rishton

spglobal.com/marketintelligence

Former Chief Executive Officer and Executive Director

Net?

Mark Morris

Former Chief Financial Officer and Executive Director

Net.

John F. Rishton

Former Chief Executive Officer and Executive Director

Marine has been much lower than that, about 2.5%.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, 2-ish.

John F. Rishton

Former Chief Executive Officer and Executive Director

But our new acquisition, Rolls-Royce Power Systems, will be running about 7%. And what I would say is, in our medium speed, a lot of the investment understanding, knowledge, technology capability is within that Rolls-Royce Power Systems where they've been investing a lot of money whether it's to address emissions concerns, more power, et cetera. So one of the big advantages we've got with owning that business is that we can use that knowledge, experience and wisdom to help us grow the medium-speed and invest organically, whether that's in new products with more power, more fuel efficiency, different fuel types, all of which we are doing. So you shouldn't expect sort of some huge increase in R&D as a consequence of organic growth in the medium-speed business. It's part of the total and it's really a question of how we balance that total across the whole business. And Mark, I don't think you put in some perspective. I mean, the Marine R&D is actually very, very small relative to, for example, the civil business. So even if we were to double the Marine R&D, frankly, it's still relatively small in terms of sums of money.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. I mean that is sort of around GBP 30 million or GBP 40 million.

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, do want to talk a little bit about return on invested capital and WACC?

Mark Morris

Former Chief Financial Officer and Executive Director

If I have to, yes. I thought I'd get this question. Let's just remind ourselves on Tognum. We only took management control of this over a year ago and would only take 100% ownership, probably at the end of Q3, Q4 this year. And again, that's subject to regulatory approvals and it's just whatever their case load is and then how stuff goes through. Obviously, where we get a 100% control then we can really start to grind out some of the efficiencies. It doesn't mean that we haven't been doing stuff. Like I said, we're encouraged by what we've seen, we're excited by the business. Both John -- John has talked about some of these sort of cross-selling opportunities that we're getting already, certainly, our Naval, Marine business and sort of the high yacht end and so forth. So there are things going on already, we haven't been sort of resting on our laurels. We're saying that obviously it's been a relatively tough market, I think, for that part of the market, but we see good prospects going forward, so certainly encouraged. From where we are at the moment, we haven't gotten to the point of my -- end of my test yet as it were, and we'll be growing the stuff out as soon as we get them.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. I think what I would say is we're moving a joint venture before the squeeze out, yes, we were looking at really revenue opportunities and we always said when we announced the deal. Now we're going to own 100% of it, we're going to get the revenue opportunities and we'll be able to manage those more directly and -- and I talked a little bit about some of those revenue opportunities when I was talking about maybe there's a bit of pull-through working that way. And now we've got the opportunity to get cost initiatives we didn't really have in the past because we're going to own 100% of the business. Please, can we just -- say it again with the microphone again?

Rami Yehuda Myerson

Investec Bank plc, Research Division

On Tognum, just to clarify, the moment -- ROIC on Tognum is not higher than WACC on...

Mark Morris

Former Chief Financial Officer and Executive Director

Not on the deal, no.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, we're going to move to the back or let -- Jilinda, why don't we have a question from outside of the room?

Jilinda Crowley

So we have a call -- a question from Toby Cramm [ph] from Debros [ph], and it's a 2-part question -- or 2 separate questions. Cash conversion is low, you indicated, until the inflection point in 2018. But what about absolute free cash flow growth given that revenue growth should be coming on the steeper ramp of the Trent? And the second part of Toby's [ph] question is R&D declined as a percentage of revenues, is that true even with the narrow-body push?

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, do you want to talk a little bit about cash conversion?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. I mean, obviously, that was referred to just at the -- in relation to civil wide-body part of the program. Of course, across all other businesses, I would say that when we talk about our Marine and obviously engine at the moment, all that goes in our power systems and nuclear businesses, generally they're much more what I call traditional industrial businesses in terms of when you look at the revenue, the percentage you get on profit and the cash conversion, they move far more in sync, and we then obviously move with some cash conversion. On the Civil business and particularly, most acutely, in the civil wide-body part of the business, we do get much bigger swings just because the investment cycles are far longer and far deeper. So in terms of cash conversion on that part, again, as John alluded to, we see that coming out in sort of towards the 2018 period. But obviously, ongoing activity across all the other parts of the business of the group that are driving cash, so we're not going to give medium-term guidance today but, obviously, direction [indiscernible] we're very focused on driving both cost and cash.

John F. Rishton

Former Chief Executive Officer and Executive Director

Do you want to answer the R&D one as well?

Mark Morris

Former Chief Financial Officer and Executive Director

So I think the R&D question, just to make sure we've got it full, the question was that we said currently at 4.9%, it will ease gradually over time as revenues grow. I don't think it will be linear, it's a function of activity. But when we think about R&D, it is predominantly people. It's our sort of 18,000 engineers, what they're doing, plus some hardware. When we normally look out over the radar in terms of what we can do from our human capital, we end up with what we call an R&D wedge which is, today, the low capacity balance which has all of Colin's engineering, he's working on various programs, be it civil or any other parts of the business fully conceived. And as we look forward, obviously, if nothing else happens, they'll run out of things to do. And of course, those wedges are what we're filling out with potential new programs and which will, obviously, include narrow-body which, realistically, we sort of say middle of the next decade, would sort of start in terms of the sort of '18, '19 period. But let's just remember that NPI, the R&D, the research and technology part of that is very generic and compliant with multiple programs. And the R&T line, of course, in terms of what we do in there, continues. I don't know if Colin would like to mention anything on R&D in terms of what we're doing there?

Colin Peter Smith

Former Group President and Executive Director

Well, only that, broadly, the R&T, research and technology programs, that we're doing for the big, big engines flow down to the small or the middle of the market engines as well, so there's no duplication, just decide how -- which product we point people and our technology to.

John F. Rishton

Former Chief Executive Officer and Executive Director

If I could just add. What I said when I was talking with cash conversion. I pointed to 2018, a couple of things I said: delivering the cost and the benefits that we get through that, driving through the changes that I talked about when I talked about cost. And I said, as we start to stabilize, we'll see an improvement in cash conversion. I also said seeing no new major program which I, in some way, you could say, the narrow-body potentially is. And the issue there is, are we spending it on our existing programs or new programs, similar to our existing programs? And is it additional or is it substitution? So the point that I would make, and I make it whenever I speak to you, because I know that cash conversion is a critical point, it's as we are growing and investing for growth, in simple terms, that clearly uses up cash. As we get to a steadier state, the cash conversion will improve. So the challenge there is how much can we grow in the future, where you're spending that cash versus reducing the growth relative to the cash. That's the only point that I would add. Okay, let's go right to the back of the room and then we'll come down to the front.

Charles J Armitage

UBS Investment Bank, Research Division

Charles Armitage of UBS, 2 questions. First of all, on accounting for long-term contracts of TotalCare, I understand that a conservative company, when you're accounting for long-term contracts, would start with lower profits or lower margin recognition and end up with higher margin recognition. Normally, I'd call the difference of that contingency. Is that what you call estimation risk or is there a contingency in there as well?

Mark Morris

Former Chief Financial Officer and Executive Director

No. We don't refer to it as contingency. I mean there's lots -- I mean, it is a cautious best estimate of what we put aside to recognize that there will be a small level of error and the level of estimation -- so I mean if I just separate the 2 out. Valuation risk -- valuation allowance, it's different. Estimation risk will vary depending on our experience. So clearly, a very mature program like an RB211, frankly, the estimation risk is very small and, of course, it's slightly larger that we allow for -- on a new program like -- whether it's XWB or 1000. And again, we have sort of -- we track the behavioral characteristics, the architecture, the similarities, how it will respond, and that's what sort of Colin and his team along with the people in Civil will work out carefully, following these various algorithms that we use. So I mean I guess

contingency is one word that you want to use, it is not a word that we would use, just the contingency doesn't exist in accounting.

Charles J Armitage

UBS Investment Bank, Research Division

And just to follow that one on. The 25% illustrative margin on a linked contract, orders of magnitude, are we talking 1%, 2%, 3%, 4%, 5% estimation risk on a -- and I understand, in XWB, for instance? or is it half your margin?

Mark Morris

Former Chief Financial Officer and Executive Director

No, no. It's certainly not half the margin, it's a number of percentage points, but I'm not going into detail.

Charles J Armitage

UBS Investment Bank, Research Division

And the second question is on medium-speed diesel. Now you've said there are no material acquisitions planned, medium-speed diesel is 7% of GBP 2 billion to try and make GBP 140 million. So it's less than 1% of your overall business, yet it's top -- the fifth of your 5 priorities. So what is the strategy? A fifth -- #5 of your 5 priorities seems to be quite important, but under 1% of your overall sales doesn't seem very important at all.

John F. Rishton

Former Chief Executive Officer and Executive Director

Well, as I tried to explain in the course of the meeting, the reason we are concentrating on it is it fills the -- completes the portfolio in many ways and would help us drive sales and revenue across the Marine business and, also, it creates opportunities in land power as well. We see this as a growth market, we see this as an opportunity, that's why it's there.

Charles J Armitage

UBS Investment Bank, Research Division

But the 3% GDP type growth, it's going to take an awfully long time for that to become, organically, particularly meaningful things. How big do you see medium-speed diesel in 2020 or a number of years?

John F. Rishton

Former Chief Executive Officer and Executive Director

If you look at how you can address these issues, you've got sort of 3. You've got organic growth, and we're doing that as I said. You've got partnerships. We've had a partnership in the past with [indiscernible] as it happens to be, or you can do nascent acquisitions of varying sizes. You can look at any of those as -- in terms of how you can address that gap in our portfolio. So I guess all I'm saying is the reason that it's important for us is that it's where we are weaker. So the numbers you're quoting, let me say, is only a small part is exactly why it's important because it completes the circle of the product offering that we have, and we have the capability to do well in that area. That's why it's important.

Charles J Armitage

UBS Investment Bank, Research Division

If I could just follow-on on one more. I think you said in the past, 65% of the Offshore Marine vessel is your components.

John F. Rishton

Former Chief Executive Officer and Executive Director

It can be opportunity.

Charles J Armitage

UBS Investment Bank, Research Division

It can be. How much of that is the engine?

John F. Rishton

Former Chief Executive Officer and Executive Director

How much is the engine? Lawrie, did you hear that?

Lawrie Haynes

Executive

GBP 1 million.

John F. Rishton

Former Chief Executive Officer and Executive Director

How much percentage is it?

Lawrie Haynes

Executive

In percentage terms, it's a very small percentage, but it's the pull-through that's very important from that engine that builds up to the 65% is the depth machinery. For example, it's the kind of supply systems on a ship design that we pull through. It's designing the auxiliary system. It's designing the stabilizer systems. That engine pulls through quite a lot of content.

John F. Rishton

Former Chief Executive Officer and Executive Director

It also, as I said when I was presenting, is where you get the aftermarket far more importantly. Okay?

Charles J Armitage

UBS Investment Bank, Research Division

Final thing. How much -- GBP 1 million on an engine is 10% of an OPV typically?

John F. Rishton

Former Chief Executive Officer and Executive Director

What is it?

Lawrie Haynes

Executive

So can you -- I can't...

Charles J Armitage

UBS Investment Bank, Research Division

GBP 1 million on the engine, what -- I haven't bought many OPVs recently, what's a typical...

John F. Rishton

Former Chief Executive Officer and Executive Director

It depends on the type of vessel that you buy and the complexity of the vessel. So an anchor handle will cost an awful lot more than a supplier ship, et cetera, et cetera. So what we talk about is -- the 60% that we generally talk about is a fully loaded anchor handle or vessel is where we've got winches onboard, we've got our thrusters onboard, we've got our power system onboard, where we've got the captain's chair, we've got the dynamic positioning system onboard and the engine. And what we've got, if you look back in history, is we've had a very strong position within Norway because that's where our strength in history is. As the industry expands and changes and diversifies, it's been important and will be important to get a broader engine offering than we have today to help drive the pull-through that we've had successfully in Norway in the past. And that's why we want to address that gap in our portfolio. Yes?

Zafar Khan

Societe Generale Cross Asset Research

So it's Zafar Khan from Soc Gen. I've got 3 questions, please. The first one is just a follow-on from Charlie's question on the medium-speed. And I just want to ask in very simple terms, what Charlie was asking in a very kind of long-winded way, if I can put it that way, can you achieve your ambition in medium-speed diesel without M&A? That's the first question in very simple terms.

John F. Rishton

Former Chief Executive Officer and Executive Director

Give us all 3.

Zafar Khan

Societe Generale Cross Asset Research

The second one, I just want to say, Mark, thank you very much for an excellent explanation on the accounting, but I think I've fallen on the final hurdle on that one. It's just the conclusion on Page 24, the debt arising due to shop visits taking place, isn't that debt falling if there's a shop visit rather than rising?

Mark Morris

Former Chief Financial Officer and Executive Director

No, the debt will rise because...

John F. Rishton

Former Chief Executive Officer and Executive Director

Let's take all 3. You've got a third one?

Zafar Khan

Societe Generale Cross Asset Research

Yes, please.

John F. Rishton

Former Chief Executive Officer and Executive Director

I'm learning.

Zafar Khan

Societe Generale Cross Asset Research

The third one is just on the confirmation of the 2014 guidance that you've given in the statement. And I remember from the IMS, you suggested that there would be a 1/3, 2/3 phasing in that profit this year. Historically, we've never been that wide within the 2 halves. I can understand some of the shortfall, if I can put it that way, in H1, against H1 in '13, that in order to get to the full year guidance you've given, and then the H1, H2 split, I can't make the numbers add up at all. So I'd be very grateful if you could provide a little bit of color in terms of the divisions on how we get to that 1/3, 2/3 split based on the full year guidance you've given.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Let's go back to the first one, organic growth. The short answer is yes, so if we were sitting here in 1990 and talking about wide-body, we said that we're going to have 50% of the wide-body share, I suspect there would have been a level of skepticism. But here we are today with 50% of the wide-body share and we've done that organically from about sort of 2%. So yes, you could do it. And sort of the question is, are you determined to do it? How long does it take? That's all it is about. So if you put the investment in, you could do it. But there are other methods by which you could do it. So the fact that it's a priority doesn't say it's something that I must resolve tomorrow, the day after, or the world comes to an end. This is a long-term business, and I'm looking at long-term issues. The narrow-body, similarly, is not

an issue for today or tomorrow but, as I explained in my presentation, it's an opportunity I think for us for significant growth. It's a market that we should be in, we're going to get back in. So it isn't something that I have to fix today, but is certainly something that I and others worry about in terms of the long-term thinking of the business. Mark, maybe you want to talk about debtor shop visits and maybe something on guidance?

Mark Morris

Former Chief Financial Officer and Executive Director

Right. Okay. So Zafar, just to make sure I've got your question, I think you're saying that debtor rises as shop visits take place, you don't think that's correct? Let me just explain. So net debtor, gross debtor, creditor, before we start, we think about what's happening on the cost side, we're building up a creditor, we're accruing costs and then when we spend the money, the creditors retire. So when you take that away from the gross debtor position, before you were taking a creditor, let's say, of 192, you'll overhaul, the creditor's reduced to 0, you got nothing to take away, so the debtor will rise, all things being equal, that's all it is. Yes? Okay? So that was that one. Now sort of easy one, H1, H2 guidance for this year, I think is what you're -- so let me just try to remind everybody what we said with just in terms of guidance this year, we said that broadly 1/3, 2/3, H1, H2, a bit more acute than usual. Revenue, just to be clear, is about 15% higher in H2, a little bit higher than last year, so volume is driving parts of it. And again, much of that driven by -- actually, all of the divisions but more specifically on the niche of our business, Power Systems and Marine. Cost reduction, we're seeing more cost reduction coming in as contractual cost reductions kick in and the volume benefits kick in, in H2. You heard me talk about restructuring back at the prelims, it's about GBP 90 million, so about GBP 30 million higher than last year, all happening currently weighted towards the front end. That's mainly in aerospace, both indirect and directs. R&D is the other one, again, I sort of signaled. And again, that's predominately been driven by spend patterns around the Trent program being a little bit more weighted H1. And then, finally, on the Marine side, of course, we took a product cost charge of GBP 30 million. So that's sort of where we are. And like I said that's -- we've maintained our guidance, you can confirm that today. So I don't want to break out all the separate divisions but you've got an idea in terms of where the main things are coming from.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, let's continue to circle down this side.

Unknown Attendee

[indiscernible] Capital. Just looking at the benefit of TotalCare, can you quantify what benefit, if any, you get from the fact you have such a high market share on maintenance on a program? That's -- it's got 90% on the TotalCare, making it -- eventually making it harder for third-party overall, those [indiscernible] in that program to compete, given you've taken all the used parts fairly often. And related to that, can -- to give some numbers around that, on the TotalCare program, maybe an engine or as a program as a whole, how much more money would you expect to make off a Trent XWB because it's got such a high TotalCare versus an RB211, if it was here today all the time on materials? That doesn't need to be per an engine, it could be just looking at the program as an overall...

John F. Rishton

Former Chief Executive Officer and Executive Director

So I'll try to make a couple of comments. I think the first thing to say is that this is a really competitive market, and the reason that we and the airlines like TotalCare is it aligns our interest and their interest together. That's the attraction for both parties and why airlines would generally want to choose that, it's a level of risk, but our interests are aligned. What do I mean by that? I mean we both want to keep the wing -- the engine on wing for as long as possible. The airline, for obvious reasons, in terms of operational performance; us, for obvious reasons, in terms of cost performance. But this is a very competitive market, so when we sell these products into the market, this isn't about trying to control the market in some shape, size or form. Competitive in ways that we're selling other engines and other products. Our

competitors sell them, how do you sell them? How do you compete against them? So there is quite intense competition around these markets. Tony, do you want to make any comments?

Anthony Wood
Former Executive

I think in terms of how the maintenance is provided, there's a number of options. So there's Rolls-Royce wholly-owned facilities, there's joint ventures in which Rolls-Royce is involved, and there's also independent shops. So there are independent shops in Japan, in the Middle East with our relationships with some of the Middle Eastern carriers, and Air France, there will be for the future. So I think there's a number of options independent on what the airline strategy is. Are they going to have a big maintenance infrastructure and want to participate in that, or are they happy to come to a Rolls-Royce facility or a Rolls-Royce joint venture? It depends what the airline strategy is, but there are options, those 3 options.

Unknown Attendee

What I'm trying to get to is, I mean do you think you'll make more money, profits, from a total -- from a program that's got a high TotalCare penetration, absolute dollars, versus if you didn't have TotalCare, I mean do you have to sacrifice something in profits to drive stability?

Anthony Wood
Former Executive

So I think it's quite clear that there is risk transfer going on, as John has explained, on a TotalCare contract. And for that, we seek to generate a better margin and the focus within the business, is on having the most efficient maintenance footprint in terms of driving productivity, driving repair technology. That's the focus, that's the bit where our intellectual property sits that gives us the confidence that we can deliver those margins. But absolutely, we seek and should secure a better margin as a result of that risk transfer. That's the primary.

John F. Rishton
Former Chief Executive Officer and Executive Director

Okay. We'll come all around, I think, just up here at the front, in a bit more one at a time.

Unknown Attendee

I guess, 3 quick questions. You guys keep on...

John F. Rishton
Former Chief Executive Officer and Executive Director

Name and...

Mason Thalheimer

Mason Thalheimer from Samlyn Capital. You just keep alluding that 2018 being sort of maybe a pivotal year. Is -- are we supposed to understand that as maybe 2017 is when we see the peak in the total of the net debtor and direct engine loss account or whatever you're calling it these days and that, going forward, after that, cash will be above earnings as we draw these balance sheet items down? That's the first one. Second one, it sounds like you guys are committing to, in October, giving us longer-term guidance. You guys, in the past, talked about, over the medium-term, margins expanding. Could you at least give us a teaser today? Could you commit to margins expanding over the medium-term without giving the exact numbers as maybe you've done already the past? And the third question is it would seem logical that the contingency on a linked program would be much higher than in unlinked program as you're recognizing more of the profits upfront? Is that true? And is there a way to think about, on an order of magnitude, between the 2 of them?

John F. Rishton
Former Chief Executive Officer and Executive Director

Okay. Let me deal with these. As I said about 2018, that's when, according to the chart, the projection that we've got, we start to see things evening out. We've gone through a number of years in, I call growing pains. We've done a lot of the work that we're doing on cost. And I said that that's the kind of year that we would expect to see an improvement in cash conversion subject to not having any major new programs that would change that, that -- and that's the only comment that I would make on that topic. In terms of margins, October is not too far away. We'll wait till October, teasers or otherwise. And Mark, you want to address the linked and unlinked?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. The short answer is the math and the accounting drive for what we do. So the estimation risk, when we look at it, is we treat a linked contract as a whole. So when we assess what we think the estimation risk is, we then obviously apply it to the entire contract. So by definition, if you've got an OE element in terms of the indication, in terms of dollar terms or pound terms, yes, it has a bigger impact because we treat it as one. [indiscernible] with a pure unlinked aftermarket, you haven't got the front-end revenue and cost to consider. But this actually affects our margin in terms of -- no, it's how we think -- we think you have costs looking through it. I mean, the OE is delivered and the cost is known, so the driver of the estimate is driven by our cost assumption or what I'll call the sort of small error requirements in terms of how we try and make sure we've got a sensible line going forward as our best estimate, and that's because it is an estimate looking forward 10, 15, 20 years. So once we've assessed that, we're going to apply it because the rules require us to apply it in terms of leaving the margins unlinked. And therefore, we take the margin based on flying hours flown, and that's all factored in.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Could you pass a microphone one to the left and then we'll go one to the left again, and we're done with. Okay?

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. How successful have efforts been so far to extract cost and better terms, out of your supplier base? And related to that, do you expect to find greater success in newer engine programs like XWB versus a Trent 700 or because of supplier overlap, you're able to exert some leverage on both? And then finally, relating to that, in terms of the timing or phasing, just realizing that these sort of cost improvement efforts do take time, what you're sort of general view on how the phasing or the positive impact or the benefit will be resulting in or ending up in the financials?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, thanks. I think your second question is, could you give me medium-term guidance today? Again, we'll deal with that in October, we'll give you some clues around that and we'll reflect on these questions. And I'm not trying to be flippant about it, but I understand -- we understand the question, the interest. In terms of the supplier base, we're going to make Tony -- ask Tony to make a few comments because he's been involved in this. I think my summary, it will be mixed, and it's mixed for all the obvious reasons. If I put our suppliers into 3 unfair buckets, sort of one where we got good negotiation leverage, one where you've got some negotiation leverage and when we've got no, guess where you make progress and where you don't. So if you look across the supplier base, it's always easier to make more progress in the first part. So we are making progress. If we look at our programs, in terms of the numbers of suppliers that we have, we've reduced significantly. Go back in history, hundreds and hundreds of suppliers, XWB less than 100, that changes the negotiation dynamics significantly. And yes, where we can link past and future together, it gives more volume, and that then helps into the first bucket of suppliers. The other thing that I would say is, having worked in the car industry and observed the car industry, they went through a whole raft of relationship issues with suppliers about how they could or couldn't manage it. And what I would say is, we should learn from that, and we're learning it, I would suggest to that, and others may disagree. I'm

certain there's at least one person, they've got a lot more knowledge they carry in their sleeve than me, is to make sure that you have firm relationship, a partnership with your critical suppliers where you both benefit rather than trying to push them underwater for a period of time just to get ahead of price now. The other complexity that we have is around the length of the program, the old programs, the nature of the beast, the regulatory environment that makes it a more complicated and generally longer discussion. Tony, do you want to add anything?

Anthony Wood
Former Executive

I think you've covered most of it, but I think the point on reducing the number of suppliers -- I mean Rolls-Royce Aerospace today, 135 suppliers, is 80% of the value of equipment that we buy in our engines. That is a dramatically smaller number over the last decade. I can get them in a room and have this conversation with the aerospace team. We did it in Heathrow a few weeks ago. It's a continual process. It does require us to be a partner, to look at the specifications. We get into a lot of detail to liberate cost out of every component in every system that we buy. But there is the reality of the complexity of the different parts in the engine versus the competitive position. We do have those suppliers who have proprietary equipment and systems and capability in our engines. And those are the ones where we have a much deeper and more partnered relationship to drive cost out. But it's very much a 2-way relationship that we're developing. And I think our posture is really important in that, and that -- and we're getting traction, we're working our way through offsetting the escalation piece that sort of pressures that our suppliers face as well and then getting beneath on the real things that drive cost, inspection requirements that we put on for our engines and the other elements of the design and really working much more closely with them. So it's a long-term drive to get cost.

John F. Rishton
Former Chief Executive Officer and Executive Director

Let me go one fellow to the left, and then we're going to go to the back for an external question and then we'll come circling around again --

Benjamin Philip Fidler
Deutsche Bank AG, Research Division

Yes. This is Ben Fidler from Deutsche. I've got 3 questions that may surprise you. The first one was just a fairly simple one on the buyback duration period. This GBP 1 billion, just to help me understand your intention as to how we should think about the time period over which you will execute that. I know some of that maybe out of your control in terms of market volumes and price volatility, but do you see that as a 2-year program, is it a 5-year program, that will be helpful to bound it. The second one is just on CapEx. Thank you for the additional detail you've given us on the rate of decline in tangible CapEx, down from the 4.9%. You spent about GBP 500 million the last year, intangible CapEx was GBP 500 million, could you help me understand how that will progress the intangible CapEx line over the next 3 to 5 years in that corresponding period, that'd be very helpful. And the final one is just coming back maybe to the supply chain cost reduction activity, and just so I understood the messaging correctly. You're saying your 400 engineers and the activity that you're undertaking at the moment with supply chain cost reduction is basically going to see flat, which I think flat procurement cost, we shouldn't think down. And that I think, a while ago, my understanding was you're talking 15% reduction in both in customer supply chain, which is about GBP 4 billion in cost item over a 3-year period. So I just want to know should we think about that, that would be helpful.

John F. Rishton
Former Chief Executive Officer and Executive Director

Okay, yes. Let's start with the buyback, Mark. Do you want to make a comment on the buyback time period?

Mark Morris
Former Chief Financial Officer and Executive Director

So just on the buyback. Again, it's subject to the Energy deal concluding and getting regulatory approval it needs, which we are -- our working assumption is that will be sort of by the year end. If that goes according to plan then, again, I think you believe that some of these things are out of our control. But our -- certainly, our plan wouldn't be looking at sort of the many years, it would be at a sensible level, a sensible run rate. Like I said, it's a discrete set of proceeds, and we'll do it in an orderly manner through the various exchanges and the usual sort of mechanisms that we stick in place. But like I said, some of it is out of our control, so I can't be explicit, but certainly we're not looking to announce [ph] over many years. That's not our intentions.

John F. Rishton

Former Chief Executive Officer and Executive Director

CapEx, Mark?

Mark Morris

Former Chief Financial Officer and Executive Director

So total CapEx, total -- on intangible CapEx, of course, one of sort of big drivers there really is RECs. And we're still going to start to get into medium-term guidance, so please, we're sort of holding off more for September. There are obviously other areas, but we haven't given any guidance at this stage on where it is, but obviously a scenario we look at as well.

Unknown Attendee

[indiscernible]

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, we withdraw the CapEx guidance. Does that help? I mean, I think what I would say there is sort of damned if you do, damned if you don't. We're going to drive that down and that's quite clear. And that's something that we could do. And one of the deals, especially, I mean all companies is actually I can control CapEx spend at the center and we can achieve and we can look at that quite comfortably and work at what we're going to do. For the more specific guidance that we've talked about that Mark has outlined, we want to go through a much more thoughtful and rigorous process, and consider what this, we think, is right to do there. That's the difference. In terms of the supply chain, you mentioned you have 15%. And certainly, that was a sort of a headline number a year-or-so ago. Yes, we could have go out the supply chain and say, what we want a big reduction sort of -- yes. And anybody who sits here and thinks that all these supplier say, oh, yes, sure, no problem at all, it's 15% or whatever it happens to be, obviously, hasn't been in a supply negotiation. But what it does is it sets the bar in terms of saying, we're serious about this. This isn't sort of a 0.5% or 50p off kind of thing, it's a big program. And then you get straight back into what I described as the 3 buckets. And also, the suppliers that we talked to at that point in time were fewer and we now expanded those discussion that Tony was saying. Tony, anything you want to add?

Anthony Wood

Former Executive

No, I think, we're tackling it. So we started with the top 50 suppliers with the 15%, 5% per year over 3 years. We've made good traction on some areas of that. We're still working on some of the more complex relationships with the more complex systems, and we're making traction. It takes time to deliver these programs and it is related to some of the engineering work that we're doing as well in terms of looking at where we can put easements. And that help suppliers take cost out as well as the commercial leverage in the negotiation, like volume and some of the other growth that we're seeing brings.

John F. Rishton

Former Chief Executive Officer and Executive Director

Lawrie, anything to add on the MIPS side?

Lawrie Haynes

Executive

Yes, I will. I'd say that the discussions we've had with our suppliers about cost cutting have been improving over the last 6, 9 months because we've been able to demonstrate that we are cost cutting. And I think that's an important part of the relationship that John talked about is relatively demonstrated internally. We're taking the appropriate actions, as well as asking our suppliers to do that. So we're getting more traction because we're able to demonstrate our own position.

John F. Rishton*Former Chief Executive Officer and Executive Director*

Good point. Let's go to the back to Lindy [ph], from outside of the room.

Jilinda Crowley

We have a question from Tal Eloya at Integer Asset Management. Two questions, can you please discuss the risk associated with the XWB program as the large portion of your future growth? And the second question from Tal is what are the risks of further meaningful decline in defense profits?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Okay. We could talk about risk from a number of different perspectives. What I would tell on XWB, to cut that kind of short is, we're in very good shape on the XWB. Colin, you want to make a few comments about where we are in terms of that program and what's going on?

Colin Peter Smith*Former Group President and Executive Director*

Well, we certified the engine late last year. We're in the middle of the endurance program to make sure that we got to maintain ability and the reliability that we're predicting, and it's looking very good in the line with prediction. We are half -- just over halfway through the flight test program. It's a 5 aircraft, I think, we're currently flying. And by the way, we're tracking them all the time in the data being streamed off the aircraft bringing it back in, and as Tony said showing how it validates against their design models. So everything's looking extremely good.

John F. Rishton*Former Chief Executive Officer and Executive Director*

And we've delivered, I think, Tony, the first 2 production engines.

Anthony Wood*Former Executive*

We have next to...

John F. Rishton*Former Chief Executive Officer and Executive Director*

To lose [ph] for Qatar, which is the launch customer for the A350, which should be going out later this year. So I think we're in a pretty good place in terms of XWB. Risk in terms of defense, where we're kind of getting back into guidance there. I'll go back to what we said, yes, we've confirm the guidance for this year, what we said about 2015. But I'm not going to get drawn into more detail at this stage. Okay, let's go to this gentleman here, because we're circling around.

Stephen Lawrence Farley*Farley Capital L.P.*

Steve Farley from Farley Capital. A question regarding the relationship between improving your on-time delivery and your cost structure. What is the relationship between improving the on-time delivery to internal plan and reducing costs? In order to improve the on-time delivery to internal plan, do you first need to increase cost or are they going down as you're improving?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Okay. It's a great question. What I showed you was that we don't deliver very well to our internal plan. On the way that we then get from our internal plan to deliver customers on time is that we create a buffer between the 2. And the buffer is, for the sake of this discussion, time and material. So you create time, by which you get the material coming in, by which you get a chance to finish the engine so you can get to your customer on time. So if the buffer is this wide, and at the moment, I'm only delivering 25% to the internal plan and the rest is coming in over the course of this buffer, then I have one financial effect. If I get this to 100% and leave the buffer the same, that will increase my cost and increase our inventory, because I end up holding 100% for longer rather than 75% for less, to use my numbers. So the challenge is, we've got to get stability into the supply chain and into the delivery to plan, so we get towards 100%, and then you close the gap. So it's 2-stage process. We can and we will do that, and all businesses go through this as they mature from a low volume to a high volume, and that ripples around the supply chain. So as I was saying, it's an important element of our cost and cash in terms of inventory turns, in terms of the cost that we're building to the systems, the consequence of the buffers. And it takes time because you've got to get the stability of this level and then drive it through in terms of reducing the buffers you get confidence. But as I also said, we've already reduced the lead times, for example, on the Trent 700 engine, so we -- this isn't sort of you get everything right and then you can do it. This is the stability and competency you have in individual program. And as you know, the Trent 700 is our largest volume program and we've made very good progress on that, but there are other programs, there are new engines, for example, where we are down where I'd like us to be. So it will take some time. Okay, go with the follow-up?

Stephen Lawrence Farley*Farley Capital L.P.*

Are you saying you've stopped increasing the buffer, or is the buffer still increasing?

John F. Rishton*Former Chief Executive Officer and Executive Director*

We have started to reduce the buffer. So we have started to reduce the buffer in terms material, and we started to do that around the whole supply chain. So if you would talk about supply, we would have reduced load, we take load out, so we reduce the buffer. So we started that process already. We've been doing that now for, I don't know, for 9 months or so.

Anthony Wood*Former Executive*

Yes, over a year.

John F. Rishton*Former Chief Executive Officer and Executive Director*

I'll just say gradual process. So as an example, if I've got a 3-months buffer, I could turn everything off for 3 months if I'm confident. But that doesn't make any sense, you bring it down slowly, and that's what we do. Yes, will run the very front here.

We're going to get -- for the next to last question, so we're going to have the last question after this.

Tristan Sanson*Exane BNP Paribas, Research Division*

Tristan Sanson, Exane BNP Paribas. I have a few question on TCA accounting for Mark. So first one, TCA or TotalCare life, should we care on in sort of accounting compared to a traditional TotalCare agreement, is there any difference from profit and cash recognition? Second, if we look at renewed TotalCare agreement, should we just see that as traditional unlinked contract or should we look at difference cost and revenues assumption for it? And then the third one, you gave a margin and cash profile for the traditional linked contract, but if we look at the total traditional linked program, if we look at the total life of the program,

which would start with linked contract that's within renewal of this year as unlinked, what would be the total, the adjustment we should look at to the margin and cash profile of that program to get a competency [ph] review of what's happening really on program like the Trent 700 or something like that?

John F. Rishton

Former Chief Executive Officer and Executive Director

Well, a pretty detailed questions. Mark, I don't know if you want to give a high-level answer to those or maybe we -- I suggest you talk with the IR team afterwards. But I think we're probably going into too much detail if we try and address those specifically. So any high-level comments, Mark?

Mark Morris

Former Chief Financial Officer and Executive Director

I didn't quite get your first question, but let me start with the other 2, and I'll maybe take it offline because I didn't quite catch it completely. I think when we look to the life of our engine, we assume sort of 25 years. They can go on for a lot longer than that. And a normal TotalCare pretty much is going to be sort of through 10 and 15 years. Our experience, generally, is that where we've got to the end of TotalCare, generally, they're renewed. And they're renewed on new set of terms to the cost, depending on where it ended, the number of overhauls that would occur in that period, in the flying hours that either the next operator can do or indeed the same operator will be different, which will set up a different set of criteria in terms of engine flying hours and cost rates. And of course, the estimation [indiscernible] valuation will still then apply. Generally, as you get further down, the number of overhauls can get larger because you have to factor in some sort of LLPs, life limited parts, that Tony has talked about. Sometimes they're in contract, sometimes they're not. And that will drive the mechanics around that, but we have good experience on that. The same logic in modeling applies. Your last question when was -- yes, I did a very purist view which sort of said this was just a 15-year TotalCare on those linked diagrams that I gave you because it's generic. You did not then say, what happens afterwards with the next, call it, 10, 12, 15 years? And you just add in a linked -- an unlinked program, it should be the other graph again that would kick up in the same way. And the 2 would merge depending on the conversion rate from one to the others. I forgot your first question, because I'll be honest, I didn't quite get the detail and we're running out for time.

John F. Rishton

Former Chief Executive Officer and Executive Director

We'll pick that up after some because we're going to now take the last question, just the gentleman at the front there, and then we'll close.

Timm Schulze-Melander

It's Timm Schulze-Melander, JPMorgan. It's a 2-part. Maybe a very simple question, you've given us a lot of detail around TotalCare, you've talked about your non-civil aero business as being sort of standard industrial and you've got a sizable but growing installed base with some good revenue and cash visibility. I guess I'm still struggling to reconcile the half-on-half cash variation just in terms of the 2 or 3 really big blocks. And you gave some detail to Zafar's question in terms of half-and-half profitability. And then looking forward, is that half-and-half variation something that investors should expect to diminish over time?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, obviously, the future guidance -- it's future guidance. But we generally have, even historically had a historic profile of cash improvement throughout the year and phases of what I would call sort of buckets as we go through our working capital cycle. It's more acute, for the reasons that I've given this year in terms of some of the money we're spending on rationalization, higher R&D, some of the CapEx phasing that we've had. And again, this comes back to also where we are in terms of the CapEx cycle, what CapEx we've done, credit is outstanding paid in the year, so it's just where you bring the 4 colors down to the balance sheet date. So it highlights me to just say that sort of no one panics and sort of, for us,

it's business as usual. It's just what we're going through the cycle. And we're just reflecting to make it clearer for the market that, actually, this is what it is and these are the reasons behind it. I think as we look forward, and without getting into medium -- to term guidance, we have always, traditionally, had an H1-H2 profile that's been loaded predominately to H2 to H2. And progressively, as we go over, our view is that we'll start to balance more.

John F. Rishton

Former Chief Executive Officer and Executive Director

So ladies and gentlemen, thank you very much, indeed for joining us this morning. We hope that you found today helpful, useful and addressed some of the concerns that you have. As I said at the start, we recognize that we're not going to get there in one go. But if you give feedback to our IR team about what works, what didn't work, what you'd like to see the future, that will be very useful and we'll try to make sure we address those concerns and thoughts and issues. We are, as we said, going to have another day, October 21 in Norway, we look forward to seeing you there. There is a buffet lunch, I think, outside. The team will be out there for a short period of time, we can take care -- take some more questions from you individually. Again, thank you very much for your time today and your attention.

Presentation

Operator

Hello, and welcome to today's Rolls-Royce announcement of the sale of the Energy business to Siemens. [Operator Instructions] And just to remind you, this call is being recorded. Today, I am very pleased to present Simon Goodson, Director of Investor Relations; and Mark Morris, Chief Financial Officer. Gentlemen, please begin.

Mark Morris

Former Chief Financial Officer and Executive Director

Good morning, everyone. I'm Mark Morris. I'm the Chief Financial Officer. You would have seen our press release this morning announcing the sale of our Energy gas turbine and compressor business. This outline's an important step for us in concentrating our activities where we can add most value. We believe this is good news for Rolls-Royce and good news for Siemens. We've made it clear to you that we would address the performance of our Energy business, which has been an underperforming part of our portfolio. While it has excellent products, technology and people, it lacks scope and scale to compete effectively. The sale to Siemens has clear industrial logic. Siemens is a global energy player with the necessary scope and scale and can provide better reach to market. Our Energy business is highly complementary to the Siemens portfolio. Siemens is a leader in power generation, and our industrial Trent gas turbine will close the gap in Siemens' portfolio.

Our position in the offshore and pipeline compression and oil and gas sectors will strengthen Siemens' existing offering. The sale addresses one of our 4 Cs: concentration, where to grow and where not to, and reflects where we want to focus in markets with good growth potential and where we can best compete. The total consideration is GBP 985 million paid in cash at closing. This is split GBP 785 million for the acquisition of the business and GBP 200 million in relation to a 25-year licensing agreement, granting Siemens access to relevant aero-derivative gas turbine technology for use in the energy sector.

Siemens is acquiring our business with the intention of growing it. They will provide financial stability and additional scale and resources to drive growth. For us, it will provide the opportunity to concentrate on our Marine & Industrial Power Systems businesses in the areas where we can add most value. It will also provide additional capital to invest for our future growth.

Now switching to the key salients of the deal. We're selling a majority of Oil & Gas and Power Generation business. The sales to Siemens have 3 key elements to it. The GBP 785 million sale of our Energy aero-derivative gas turbine and compressors business, a GBP 200 million IP license for 25 years to provide the relevant aero-derivative parts and technology and supply agreement covering transition arrangements, supplying parts to Siemens until they transfer. Included in the sale is our joint venture with Rolls Wood Group, which provides maintenance and overhaul and repair services in the Oil & Gas sector. Excluded from the sale are some of our smaller power-generating assets, our 7 Trent power stations in the U.K., our Trigno power station in Italy and our fuel cells business.

The deal has been approved by the boards of Rolls-Royce and Siemens. The transactions are 13.7x multiple and compared favorably with other transactions in the sector. The transaction is expected to complete by the end of the year, but it's subject to antitrust and other regulatory approvals.

Finally, just some further details on the business being sold. Full year revenue last year for the business being sold was GBP 871 million and profit of GBP 72 million. There's a difference of reported full year segment profit of GBP 26 million due to a range of central allocations, other costs and, of course, the businesses that we haven't sold. The business being sold is about 2,400 employees and operates from 30 sites across the world, the main locations being the U.S., Canada, U.K. and Brazil.

With that quick summary, I thought I'll just open up to the -- to questions-and-answers of any of our investors and sell-side may have.

Question and Answer

Operator

[Operator Instructions] Okay. Our first question is from the line of Jeremy Bragg at Citi (sic) [Redburn Partners].

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

I wanted to ask a bit about the gap between the 26 and the 72. I understand what it is, but it's got a big gap. And can we assume that if central costs are commensurately lower because you're disposing a business, which consumes some time [indiscernible]? You know that you'll lose that 46 at some point or should we literally be thinking about taking 72 off profit from now on, which makes -- I don't know if makes sense?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, I think there are a number of components just to think about from what we reported to what we've actually sold. There's obviously the businesses that we haven't sold. They tend to be the less mature ones where we're investing, so they've typically been a drain on, particularly Oil & Gas segment, which has been the profitable part of the Energy business as I've outlined on a number of occasions. But that make up -- makes up really 4 things. The businesses we haven't sold, central allocations and again, a number of those as we look across the headcounts, they're not insubstantial. There are a number of one-offs in there. And of course, that makes the moving pieces of -- that makes it up effectively. So that's -- I don't think you could -- I don't think you should assume that the 72 of the profit going forward. But of course, we haven't given 2015 guidance yet either so...

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

And you might give an indication of that at the Investor Day? Or do you want [indiscernible] results, please?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, I think we'll give it when we are ready. Obviously, the Investor Day went fine, provided a little bit more color on the number of things as we've outlined in the communication we've given you. I mean, obviously, in the case of the Energy business, until we're ready, until the deal has completed, I think we just need to sort of weigh up and see where we are, sort of the timing of it will also affect a number of things as well.

Operator

Our next question is from the line of Robert Stallard at RBC.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

First of all, I was just wondering if you could touch on the -- any other disposals you might have planned. Are you looking to get rid of some of these smaller, non-core businesses while going forward?

Mark Morris

Former Chief Financial Officer and Executive Director

I mean, we generally don't talk about our disposals and M&A until we're ready to. I think it's fair to say that when we look at the small ones, we're being quite clear in stating where we're looking to focus.

The industrial sites that we talked about and haven't sold really are standalone and not part of Siemens' strategy. And at the right point, I think it's likely that we will look to dispose of those. Fuel cells is an option. I mean, it's a relatively low amount of investments. And of course, civil nuclear, which is the other larger part, is clearly an area that we are looking to grow.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Okay. As a follow-up, I was wondering if you could let us know if you've been exploring the sale with other potential buyers or was Siemens the only people you're talking to?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, the deal with Siemens has been running on for a number of months. Certainly, in -- we've had a number of discussions with other parties in connection with this transaction. But Siemens for us was the preferred candidate and provided certainly the greater synergy, scale and confidence in getting best value for both of us and, we believe, for the future of the Energy business.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Okay, and maybe just a final technical one. How do you expect to present this in the half-year results? Is it going to be discontinued?

Mark Morris

Former Chief Financial Officer and Executive Director

I think it depends where we are as it -- that we've been asking ourselves internally. It will depend where we are in the transaction, as to whether it can be assets and disposal held for sale. And that really depends on where we are with regulatory approval and various other things. So the short answer is I'm not quite sure yet.

Operator

Our next question is from the line of Zafar Khan at Société Générale.

Zafar Khan

Societe Generale Cross Asset Research

I was just unclear on your answer to Jeremy's question regarding the difference between the underlying profit you've given us from the GBP 26 million reported. That GBP 46 million loss, or the implied loss, how is that looking this year? Are those businesses still losing sort of that much money or are they on an improving trend?

Mark Morris

Former Chief Financial Officer and Executive Director

Look, like I said, there's a number of things. I'm not, sort of, going to breaking each one out, but there are a number of one-offs. And obviously, because they're one-offs, we wouldn't expect them to rematerialize. There are a number of associated central allocations, which obviously as we strip those down and those will start to vanish, whether we can get all the stranding costs out is something we're looking at. But obviously, there'll be a big focus on that. And on the other businesses, we don't break them down at that level. But obviously, there is focus on making sure they get their costs down and their margins up. And obviously, our civil nuclear business is an area where we continue to invest.

Zafar Khan

Societe Generale Cross Asset Research

Okay. And on the fuel cells, this is the stuff that came into Tognum or is it the venture you had with Singaporeans?

Mark Morris

Former Chief Financial Officer and Executive Director

No, it's a venture we had to the Singaporeans.

Zafar Khan

Societe Generale Cross Asset Research

Why is it [indiscernible] I was under the impression that you've sold most of that to the Singaporeans.

Mark Morris

Former Chief Financial Officer and Executive Director

We have. We still have a holding in it, though.

Zafar Khan

Societe Generale Cross Asset Research

I see, okay. And these industrial sites, are this essentially sale and leasebacks, if you like? Are these where you've installed your kit and the customer is actually just paying you? You own this, but they're paying you rentals, something like that. What are they?

Mark Morris

Former Chief Financial Officer and Executive Director

Effectively. I mean, that they are a legacy, Zafar, from when we were much more on that business. We had a venture many years ago called Rolls-Royce Power Ventures.

Zafar Khan

Societe Generale Cross Asset Research

That's right. I remember that.

Mark Morris

Former Chief Financial Officer and Executive Director

Owned and operated. These are a number of sites and, of course, you will recall that at the time, when the industrial trend was in its early days, we had a number of operational problems, which meant that we have to continue owning them. But certainly, as we look forward, at some stage, we will look to dispose of those assets already.

Zafar Khan

Societe Generale Cross Asset Research

And the bulk of those, as you say, they're in the U.K., are they?

Mark Morris

Former Chief Financial Officer and Executive Director

They are. They're all in the U.K. There's 7 of them.

Zafar Khan

Societe Generale Cross Asset Research

And how much NAV is allocated to those?

Mark Morris

Former Chief Financial Officer and Executive Director

Sorry, how much?

Zafar Khan

Societe Generale Cross Asset Research

What's the kind of asset values are these in the books?

Mark Morris

Former Chief Financial Officer and Executive Director

Off the top of my head, I don't know, Zafar. We can get that for you. Don't worry.

Zafar Khan

Societe Generale Cross Asset Research

It's not a critical element, but the 905 gross assets that you're selling...

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, just...

Zafar Khan

Societe Generale Cross Asset Research

You mentioned that was gross. What would be the net? You're selling some...

Mark Morris

Former Chief Financial Officer and Executive Director

It's about -- it's a peculiar number, but we're required to put it in because it's a Class 2 test. The net assets are around about GBP 600 million.

Operator

Our next question is from the line of Harry Breach at Westhouse Securities.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Just a quick couple of questions. Mark, can you just give us a little bit more color on the retained businesses? I'm assuming that over time as you mentioned, given the legacy of the early industrial Trent, that hopefully, they've been improved and cleaned up to some degree. Are they in aggregate, the retained businesses, profit-neutral or profitable?

Mark Morris

Former Chief Financial Officer and Executive Director

No, I think -- let's just be clear. The biggest parts to retain business is the civil nuclear business, and we are continuing to invest for growth in that area. And our civil nuclear business really encapsulates sort of 3 elements: instrumentation and control, nuclear engineering services and newbuild and/or components for newbuilds, to be a lot more precise. We have an established I&C business, instrument and controls business that makes a profit. Engineering services is sort of -- as we invest and move this from sort of profit to small losses and the newbuild is very much an investment phase at the moment. But I mean, these numbers are pretty small in the grand scheme of things, so we just still to drive -- put this all into context. The other businesses, that the 7 sites, I mean, in terms of whether you said they're pretty small, and I said we're getting them ready for sale at some stage. I mean, fuel cells is what it is. It's really an option for us. We've diluted down our shareholding and possibly [indiscernible] some exciting technology, and sort of solid oxide fuels really the processes involved -- the chemical processes involved, they're not our strong point, which is why we brought in LG where they have some more expertise in that area.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Great, that's very helpful. And can I just go off roads for a minute? Yesterday, you announced, together with Weir, a joint venture relating to frac systems. Can you just give us a little sense of how much

revenues Rolls-Royce Power Systems made in that area last year? So we can also have a sense of sort of where or what base that's coming from, which hopefully, the new joint venture will build upon.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. I mean, I think we're very excited about the new joint venture, and I think it just highlights how we are looking to create our focus around, obviously, our 2 main technology platforms, the gas turbines and reciprocating engines. I mean, we're very pleased with our investment in Rolls-Royce Power Systems. This just highlights the growing market in frac-ing and how we can leverage those positions with our other equipment suppliers, so we see a big market there. I haven't got to hand exactly the related stuff that we've had on power systems in relation to frac-ing previously. But again, they're numbers we can get you. I just haven't gotten back [indiscernible].

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Mark, if I can just follow that a bit -- is there any way you can give us a sort of sense of how the new joint venture sees the annual market opportunity for these frac systems?

Mark Morris

Former Chief Financial Officer and Executive Director

The short answer is when we are ready to do so, we will provide that. I mean, it's early days. Obviously, we're not one to be bringing on this combination of things till about 2,000 and -- '15, '16, was it? -- so it's early days. But we see, as CapEx starts to rise in that area, which is again the sort of signals that we're starting to see, we do see great prospects for it. So early days yet for me to start giving you some numbers, Harry.

Harry William Freeman Breach

Stockdale Securities Limited, Research Division

Okay, I appreciate. It'd be great if you guys can keep us in or give us some sense of that at some point going forward because I knew it's something that we'd like to keep an eye on broadly.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay.

Operator

Our next question is from the line of Nick Cunningham at Agency Partners.

Nick Cunningham

Agency Partners LLP

Yes, probably a fool to be -- to ask some technical ones towards the end of the process. Are there any balance sheet implications beyond just the disposal proceeds? Is there any cash or debts associated, any significant move in the working capital? And then a further, a P&L question, is the GBP 200 million, which is associated with the IP license treated in any way separately, was that just got accounted as part of the lump disposal proceeds this year?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. 2 questions, Nick. The first question is, I mean, yes, there will be some working capital movements as we get to the end, but we don't think they can be particularly material in terms of the movement. On your -- sorry, so the limited balance sheet implications. On your second question, yes, in relation to the IP and some parts of the supply chain agreements, there are -- there is an element of the profit that will be deferred, so there will be a profit of disposal and continuing profits over time.

Nick Cunningham

Agency Partners LLP

And will those be treated as disposals profits, i.e., generally ignored for underlying EPS? Will it be included in EPS?

Mark Morris

Former Chief Financial Officer and Executive Director

Profit on disposal for the proceeds will be non-underlying, obviously, in the sense that we'll see those as disposal. And the other stuff will be an underlying, unless it will be [indiscernible], I think.

Nick Cunningham

Agency Partners LLP

And any rough idea about how many years this will be spread over? And will it be all of the GBP 200 million or more than the GBP 200 million?

Mark Morris

Former Chief Financial Officer and Executive Director

No, no, no, it won't be. It's a portion of the GBP 200 million and it will run -- well, I guess, ultimately run the length of the licensing agreement but I think there are bigger announcement [ph] in the first 10 years. Because it relates to the -- it relates also to the supplier arrangements as well. And again, as they transition, that will come down so it gradually reduces. But there'll be, obviously, a tail that reflects the licensing term.

Nick Cunningham

Agency Partners LLP

Sorry, just from a forecasting point of view, will you be able to, at any point, give us some sort of indication what the scale of that will be in the sort of the nearer term?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. So I think we can give you the scale of that later on, yes, when we do get to concluding the deal, yes.

Operator

We now go to the line of Andy Chambers at Cantor Fitzgerald.

Andrew Chambers

Cantor Fitzgerald Europe, Research Division

Sorry, Mark, I just wondered if you might be able to give us some help on the visibilities on the nuclear and how you see that developing in terms of orders starting to come through over a time frame until what moment? So you've been investing for several years now and it's sort of one of those things that's going to happen tomorrow. But I'm sort of lost track as to when you actually expect to start see some activity coming in from the U.K. market.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. I mean, I think just to put it in context. I mean, our investment in the civil nuclear business runs around sort of GBP 15 million to GBP 20 million a year typically and sometimes less. Again, when I talked earlier about the 3 elements to it, the I&C business is a bit consistent in making profits. It has a number of contracts and continuing to get new contracts, a number that are sort of in tender at the moment. Engineering service businesses -- I mean, again, there's been areas we've made a number of small acquisitions as you'll be aware of over the last 2 years, and they continue to perform well as we aggregate some of those services and provide a wide array of services to sort of -- to many of the operators and utilities. It's really the newbuilds. And again, that's a relatively slow burn. But I think in the context of

things, the investment is a minor drag for the auction value it presents to us. So I don't think the numbers are really big enough and detailed to really warrant too much deal being concerned about.

Operator

[Operator Instructions] Okay. We go to the line of David Perry at JPMorgan.

David Howard Perry

JP Morgan Chase & Co, Research Division

Can I just go a little bit off piece to the IMS last week and perhaps, it'll be helpful if you could just offer your views on the seasonality that you've guided to this year, why the H1-H2 split is more -- much more marked than usual, both for earnings and cash. If you could add some color on that and then why you're confident on the H2 rebound, that would be great.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. You are going off piece, David, because there's really a call about the sale of our Energy business. But yes, just roughly on the H1-H2 split, a number of things, higher restructuring charges, obviously, the impact on our Defense and Marine businesses on the OE in the first half of the year. Also some FX and also the R&D charge and another part through also risk and revenue sharing partners. There's a number of moving elements, which when we get to the half year, I'm sure we will explain in more detail. But again, as we signaled very early on and again, we've signaled to the IMS, this year was going to be a more peculiar year than usual in terms of the loading because of those reasons that I've given you.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay, and so that's on the earnings. And on the cash, where it looks like there are sort of GBP 600-odd million outflow in H1 if I recall, and then a huge inflow sort of 1.4 or something in the second half. Can you just explain the reasons for that, please?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, a lot of that relate to the things I've just given you and at some loading on revenues sort of H2 and particularly, in our sort of mixed businesses. That's what's driving it. But again, we'll come to that, David, when we get to the half year.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay. But for now, you feel comfortable with your full year guidance. I mean, there's an unusually large amount you left yourselves to do in the second half and obviously, you have far better visibility than we do.

Mark Morris

Former Chief Financial Officer and Executive Director

Nothing's changed since the IMS I gave, whatever it was, over a week ago.

Operator

[Operator Instructions] We go back to the line of Jeremy Bragg at Redburn Partners.

Jeremy David Bragg

Redburn (Europe) Limited, Research Division

Just one follow-up. Sorry, it's a point of clarification. But the GBP 200 million that you received from selling this business as part of the technology deal, did you get that in one go? Or is it -- it's put out? I'm sorry if this was what I'm asking.

Mark Morris

Former Chief Financial Officer and Executive Director

The GBP 200 million cash receipt is received at closing.

Operator

At this stage, there seem to be no further questions in the queue. So gentlemen, may I please pass the call back to you?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Well, thank you, everyone, for attending. We are very pleased about the transaction. Obviously, we need to go through the usual Reg financing trust approvals, but we will -- hopeful that we will have more to say before the end of the year. And we look forward to catching up with you on the 19th of June, if not before. Thank you.

Operator

This now concludes the call. Thank you, all, very much for attending. You may now disconnect your lines.

Presentation

Operator

Hello, and welcome to today's Rolls Royce Holdings PLC 2013 Full Year Results Fixed Income Conference Call. [Operator Instructions] Just to remind you, this call is also being recorded. Today, I'm very pleased to present Mark Morris, Chief Financial Officer. Mark, please begin?

Mark Morris

Former Chief Financial Officer and Executive Director

Thank you, and good morning, good afternoon, good evening, wherever you are. I thought I would just provide quickly some key messages on 2013 progress and a couple of highlights, and then open it straight to questions on the ground. So I'm sure you've seen the press release or maybe have heard or seen the presentation.

So just some quick key messages. 2013, good progress for us. Order book up, revenue, up. Profits all grew. Our focus remains on the 4 Cs of customer: concentration, cost, and cash. Our cash performance all for the year was also very pleasing, ending with GBP 359 million including Tognum, or GBP 312 million excluding Tognum. It's also the upper end of our guidance.

Of course, you'll recognize that Tognum, or Rolls Royce Power Systems, as it's now known, was consolidated for the first time last year. And that's made some of the comparisons in our results a little bit more complicated on a like-for-like basis. And we've broken that out where appropriate, to try and make that easier for you.

It's just worth remembering that we are a high technology power systems business, and we invest in 2 strong technology platforms, being gas turbines and reciprocating engines. And those products take us to the various markets in which we play: Civil defense, energy, marine and industrial power.

I guess it's just worth highlighting, given all the press on Scylla. Just to be clear, talks have ended. We still aim to grow our reciprocating engine business, but I think that's all I want to say on that. And then in terms of the guidance for 2014, what we've been keying to try and point out that this is a pause for growth before growth resumes in 2015.

In terms of the progress, order book was up 19% to GBP 72 billion, and that gives us great visibility. About GBP 60 billion of that is civil business, predominantly Trent engines. Revenue was up 27% to GBP 15.5 billion, 6% excluding Tognum. Profit before tax was up 23% to GBP 1.8 billion, or plus 11%, excluding Tognum. And margins, 11.8%, or 12.1%, excluding Tognum.

Now in terms of our 4 Cs. Customer. On-time delivery improved, which has been really, really great work from our civil, large and our -- particularly, our corporate private jet business as well. The trend XWB powered A350 has done its first flight, and there's now over 1,600 current XWB sold. Our first environment ship on the marine side set sail with Holland engines and propulsion, reducing CO2 emissions by 40%. And the MT30 and MTU power packs have been selected to power the U.K.'s new type 26 frigates.

Cost. At a group level, the pace of progress has been slower than we would have liked. Aerospace actions have been taking time to feed through. But we are, in terms of the new efficient factories that we're getting, we still not -- haven't got the benefit of the ramp-up, so we've got some, what I'll call, under recovery occurring there. A lot of work going on with our supply base and low-cost country sourcing. And it's a continuing journey, but it just takes a little more time because in most cases, when we design or manufacturing new parts, it requires us that be recertified and of course, that takes time. But we've made good progress in our Marine and Energy and Power Systems business on unit cost reduction.

But more to do. On cash, like I said, I was pleased with cash performance. It reflects basically flat working capital on a higher volume, improved inventory turns, rising from 3x to 3.4x. And it signifies, really, that

we're starting, along with meeting our deliveries on time, that we're starting to get the process better as the volumes start to ramp up.

On concentration, which we really refer to is where we invest and where we choose not to invest. As I sort of laid out before, we continue to look at how we grow our gas turbines and reciprocating engines. We made a number of smaller acquisitions last year, predominantly technology acquisitions, which are really sort of CapEx stalled, but these are continue little Phillips that we fill in to ensure that we get the technology or additional products or routes to market.

Guidance for 2014. As we've said, flat revenue and profit with cash flow similar to last year. And I think just a bit of an explanation, and I'm sure most of you have this already. And it's being predominantly driven by our Defense business, which we are guiding as being sort of 15% to 20% down lower on revenues and profits. I think it's just worth putting this a little bit into context. In some respects, we've had 2 record years in Defense, when in some respects we sort of defied gravity a little to the rest of our -- of the market trends. And what we will see from the drop predominantly in OE, original equipment, is a rebasing in 2014 back to about 2010 revenue levels from which we will start to grow again. So in summary, good progress in 2013. Mixed progress on costs, but good progress on cash. And 2014 is a pause before growth resumes in 2015. And with that, I will open the floor to questions.

Question and Answer

Operator

[Operator Instructions] Our first question is from the line of Nick MacDonald at Barclays.

Nick Macdonald

I just wanted to ask in light of the acquisition news at the start of the year, whether you'll be able to provide any more detail with regards to your financial flexibility within the current rating. And if you were to pursue sort of large deals, whether you'd be keeping the current rating or making efforts to keep the current rating that you have at both S&P and Moody's at the moment?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. As I've affirmed this morning, and we'd always say almost every time we do some results. Look, we are a company that is committed to maintaining a strong investment-grade credit rating. It's more than just a sort of nice academic thing for management. This is a long-term business that has quite big capital cycles. More importantly, our customers, be they governments or airlines, or various other customers around the world, marine customers, where we enter into long-term contracts, sometimes 10, 15, 20 years, or some of our big airframe customers, they want to know that we're going to be around. So it's a position that we certainly ensure that we want to commit to. And what I would say is what you're driving here, really, is what is our sort of capital allocation process and thought process. When you think around that, maintaining a rating, obviously, start to define the source of leverage that we can take the cycle. And I sort of won't really go any further than that. In terms of M&A, of course, we don't comment on any M&A type of activity for obvious reasons.

Operator

Our next question is from the line of Paul Brennan at Guggenheim Partners.

Paul Brennan

Could you please confirm your liquidity position? On your balance sheet you have GBP 4 billion in cash, but you mentioned -- I saw in the press release that cash availability is GBP 1.9 billion. Also, could you please confirm the total amount of revolvers on the current availability, please?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. So in total, liquidity at the year end was about GBP 5.5 billion, which comprised of net cash of GBP 1.9 billion and facilities of about GBP 3.5 billion. Some of those -- there's about GBP 1 billion in terms of a revolving credit facility, the rest is capital markets debt.

Paul Brennan

And what's the minimum liquidity that you think you need for operating purposes on an ongoing basis?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, we don't divulge that externally. But certainly, sufficient to ensure that we don't have unnecessary calls on cash that we can't fund.

Operator

[Operator Instructions] Mark, there seems to be no further questions in the queue. May I please pass it back to you to close.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Well, thank you very much for attending and listening. We look forward to talking to you at the next interim results. Thank you.

Operator

This now concludes the call. Thank you, all, very much for attending. You may now disconnect your lines.

Presentation

John F. Rishton

Former Chief Executive Officer and Executive Director

Good morning, everyone. It's 9:00, so I'm going to suggest that we start. Thank you for joining us today. Let me start by introducing my colleagues from the board. Mark Morris, Chief Financial Officer; Colin Smith, Director of Engineering and Technology; and Jim Guyette, President, Rolls-Royce North America. I'm pleased that we are joined by our Chairman, Ian Davis, who is in the audience. I said that rather hesitatingly because I haven't actually seen him this morning. I'm pleased that we are not joined by our Chairman. I think our Chairman, Ian Davis, is going to be here. For those of you who haven't met him, you know that we replaced Simon Robertson, since Simon Robertson retired last year, and Ian Davis replaced him. I know that he'll be joining us shortly. And what I would suggest at the end of the presentations, Q&As, you don't all flock around me and Mark. Ian Davis, our new Chairman, who is not here, well, is the person you really want to speak to.

So I'm going to give you an overview of our performance in 2013 and provide some longer-term context, and then I'm going to cover guidance for 2014.

This forecast of pausing growth for reasons that are particular to this year, and I'm going to spend a few minutes explaining them. Mark will then talk you through the numbers, and then we'll have a Q&A.

So let's start with 2013, which I would describe as a good year with plenty of positives and, as always, some areas where we need to improve. This performance required a great deal of hard work by our staff and by our partners and suppliers, so I would like to thank everyone who contributed to these results.

I suggest that the first number on this slide is the most important one. Our order book increased by 19% to GBP 71.6 billion or up 16%, excluding Tognum, that is now being renamed Rolls-Royce Power Systems, a division that also includes Bergen. This record figure confirms our trajectory for significant long-term growth and demonstrates the confidence that our customers continue to place in our technology. The book includes orders for more than 1,600 XWBs, our best-selling Trent engine. But of course, that is in the future.

Group revenue was up by 27%, 6% excluding Tognum. Profit was up 23%, 11%, excluding Tognum. The 13% increase in payment to shareholders reflects the belief we have in the fundamental strength of the business, as well as its future prospects.

I hope by now you are familiar with the 4Cs that provide the focus for our business: Customer, Concentration, Cost and Cash. Each of these is a journey rather than a destination, and our mindset needs to be one of continuous improvement. On Customer, we've made big improvements, with plenty more to do. To give you some examples, in 2013, we achieved 100% on-time delivery in civil large engines for the first time ever, the first time ever. By the end of the year, our corporate and regional jet business also achieved a 100% on-time delivery. And in Marine, delivery was 96% on-time, up from 55% last year and just 10% 2 years ago.

There has also been progress on quality. With Airbus, one of our most important aerospace customers, registering improved quality metrics. And BP, a major customer in our Energy business, now placing us among their most highly-ranked suppliers.

Tangible progress on quality and delivery strengthens customer relationships and makes discussions about future business much easier. It is also an essential first step to achieving better financial performance, as delivering product on-time and at the right quality reduces inventory and lowers costs.

I am delighted with the progress on our biggest program, the Trent XWB, that has completed more than 200 test flights and more than 6,000 testing hours. The engine is performing well and will power the Airbus A350 into service later this year.

Concentration means deciding where to invest for future growth and where not. I am completely clear that we need to stand on 2 strong legs, and that requires continued investment in both of our technology platforms: Gas turbines and reciprocating engines.

We clearly have a strong Civil Aerospace business that is already assured of substantial growth. In 3 years time, we will be producing twice as many Trent engines as we are today. So while we need to keep investing in gas turbines, and we also -- we'll also look for opportunities to expand in reciprocating engines, both to maintain balance in our portfolio and to generate the cash required in the much longer-cycle gas turbine business.

Back in 2011, we invested in Tognum to add scale, reach and capability to our reciprocating engine business. This is an important business and has proved a good investment. I spend a good deal of time there, most recently last week. I had been extremely impressed by Tognum's quality of management, customer insight and high-speed engine technology.

It will not have escaped your notice that we also entered preliminary talks about the acquisition of Wartsila. This would have added to our portfolio of medium-speed engines, with applications in marine and land power. On January 9, we announced that these talks have ended. We aim to strengthen our medium-speed engine portfolio, and we will continue to look at options to achieve that.

Turning to Cost. You have heard me say before but it's worth repeating. The Aerospace industry is, quite rightly, strictly regulated. That means it takes both time and tenacity to drive cost out from the business. And you will not be surprised to hear me say that we are not where we need to be.

But while the pace of change may be slower than we would like, there are a number of areas where progress is being made. We have reduced indirect headcount by 11%, beating our own target of 10%, with more to come from the current year. Unit cost is down in Marine, Energy and Power Systems, although slightly higher than our Aerospace divisions. We are building new, more efficient facilities and capacity that will support a doubling in production of Trent engines. We are moving production away from high-cost countries, negotiating to -- we are improving productivity and designing cost reduction into our engines.

Our cash inflow was GBP 359 million. We have a great full focus on inventory, so it's good to see stock turns improving from 3x to 3.4x. There's more to do, but by way of context, this is among the largest 1-year improvement recorded and the highest stock turn we have yet achieved.

All of these actions will develop -- deliver benefits in time. So overall, we've made headway on the 4Cs, and these are the areas where I will continue to focus.

Because this is a long-term business, to understand it properly, you need to take a long-term view, looking back as well as forward. So for example, in 2003, it is interesting to note that revenue fell by 3%. But taking the long view, you can see that revenues have almost tripled in a decade since. Profit growth over the same period has been even stronger. And of course, the order book, that has quadrupled, now stands at record levels, underpinning growth for years to come.

So we turn to 2014, where we've guided for flat revenue and profit. This is a break in a 10-year trend that will be followed by a return to growth in 2015, so it requires some explanation. Let's look at revenue and profit in turn.

On revenue, there are 2 main drivers: first, after 2 years of impressive growth, we will see Defence revenue decline by between 15% and 20%. This will take revenue from its current record back to 2010 levels. Growth will return in 2015. This 1-year decline is the consequence of well-publicized cuts in defense spending among major customers and completion of the delivery phase of 2 important export programs. The \$1 billion multi-year agreement announced yesterday with Lockheed Martin to supply nearly 600 engines for Super Hercules aircraft underpins our confidence that growth will resume from a new base in 2015.

Second, the largest part of our Marine business offshore will not produce the growth we've seen in 2013. This is because customer investment decisions are being deferred, and I do believe that they're being

deferred rather than lost. In terms of profit, Defence profit down 15% to 20% clearly has an impact, but we also find ourselves fighting headwinds of lower capitalization, lower entry fees and negative foreign exchange, alongside higher restructuring costs that will produce cost benefits in the future. The combination of these events produces a result for 2014 that goes against the long-term trend. But for the reasons I explained, and supported by our record order book, we remain confident that this is a pausing growth, not a change in direction.

So in summary then, 2013, a good year with a healthy increase in order book underpinning long-term growth. The 4Cs, a big improvement on Customer, Concentration, making sure we have 2 strong legs to stand on. Cost, not good enough despite encouraging progress in places; Cash, an increase in stock turns and a cash inflow. 2014, a pause before growth resumes in 2015, as our Defence business rebases and as orders in Marine Offshore take longer to come through.

Now Mark will take you through the numbers.

Mark Morris

Former Chief Financial Officer and Executive Director

Thanks, John, and good morning to you all. I'm going to talk about the group highlights and business performance, and then I'll move on to provide some guidance for 2014.

You will recall, for most of 2013, we guided Tognum separately to the rest of the group. Today, we have split out Tognum so that you can make the right comparisons in our key metrics. As usual, I'll restrict my comments to the underlying performance.

So as John says, 2013 has been a good year for the group, with some mixed performances in our businesses. As I step back and look at the progress that we've made in some of the key areas, such as on-time delivery, inventory and headcount reductions, I'm really pleased. But there are some areas like unit cost where progress has been slower than I would've liked, and we'll touch upon those areas in just a moment.

But first, looking at the financials for 2013. We've made good progress with growth in the order book, revenue and profit, and generated a cash inflow of GBP 359 million. The order book stands at a record GBP 71.6 billion, having grown 19% during the year, with a record order intake of GBP 27 billion. This includes a GBP 2.55 billion order intake from Tognum and GBP 18.9 billion from our Civil business, and reflects a very successful year for our Trent XWB program.

Our order book provides good visibility of future growth and underpins our confidence to invest. Order cover for 2014 is around 75% and similar to last year. Revenue increased 27% to GBP 15.5 billion, GBP 2.6 billion of that was Tognum. The remaining 6% increase reflects 7% growth in OE, with good revenue growth in Defence and Marine and a 4% growth in services. Profit is up 23% to GBP 1.8 billion, including GBP 180 million from Tognum. 11% growth, excluding Tognum, reflects strong margin in Defence, the benefit of IAE restructuring and a lower R&D charge.

These positives have been partially offset by price pressure in our Marine business and slow progress on cost reduction in our Civil business.

Tognum did well in a challenging environment. The management team demonstrated strong market insight, calling the market exactly right and hitting guidance. Remember that Tognum's profit contribution to the group reflects transition from a joint venture in 2012 to full consolidation in 2013.

I'm pleased with our cash performance, particularly the improvements we've made in inventory turns rising from 3x to 3.4x, excluding Tognum. We've had a good flow of deposits, and overall, broadly flat working capital and higher volume. We still have more work to do on working capital, and I'm confident we can get our inventory turns even higher. Finally, we've increased the full year payment to shareholders by 13% to 22p, reflecting our confidence in the business underpinned by our record order book.

So now let's turn to the key components of profit growth. Our trading performance was mixed. The benefit of volume growth this year has been eroded predominantly by higher cost in Civil, price pressure in Marine and a number of one-offs. I will talk about these items as we go through the segments.

The year-on-year benefit of the new trading arrangements with IAE, which you will recall was effective from the end of June 2012, was around GBP 112 million. On entry fees, you will remember that the half year, the year-on-year increase was GBP 76 million, and some of you may be surprised to see only GBP 26 million today. We have changed our accounting policy to match our policy for capitalized development costs, so some of those entry fees have now been deferred.

You'll see the impact of this accounting change when we look at our Civil results, and you can find all the details on this change in Note 1 of the press release.

On R&D, although we spent slightly more in 2013, our R&D charge was down by GBP 56 million. This was primarily because we started capitalizing the XWB development costs following certification. This will reverse in 2014 as the XWB enters service, and we continue to invest in R&D, so you can expect a higher charge in 2014. Restructuring costs increased by GBP 37 million to GBP 54 million, reflecting indirect headcount reductions and facility consolidations that will improve our future financial performance. This will continue in 2014. You can expect a similar increase in restructuring charges as we drive down costs.

Turning now to cash. I'm going to pick out the major themes in this chart, which you're all familiar with. Net working capital improved slightly, reflecting a good second half performance on inventory and higher deposits from our growing order book. We've made good progress on inventory, and we will build on that success again this year. For 2014, the phasing investments and trading will be weighted towards the second half, so expect a cash outflow at the half year. CapEx in software was GBP 650 million, and included major projects such as new test beds in the U.S. and Germany, new blade and disc facilities in the U.K. and U.S. and a new test and assembly facility in Brazil.

The remaining balance of our GBP 400 million relates to higher development certification and recoverable engine costs. We expect CapEx to be flat in 2014. So the result is a free cash flow of GBP 669 million prior to the payment of dividends. Our focus will be to further improve working capital as we drive inventory turns up. As I said earlier, we are pleased with our cash performance, GBP 312 million, or GBP 359 million including Tognum. Our Tognum cash flow of GBP 47 million is after paying a GBP 60 million dividend to our joint venture partner, Daimler.

So turning to the Civil businesses. Our Civil business has seen strong order intake, confirming the confidence our customers have in our technology and products. Our biggest program, the XWB, is performing well and will go into service in the fourth quarter of 2014.

Revenue increased 3%. OE growth of 3% reflects a 20% increase in business jet engines, and a small increase in Trent deliveries. This was suppressed by Trent 1000 launch pricing and lower V2500 revenue, mainly as a consequence of transferring more parts to Pratt & Whitney. Aftermarket revenue increased 3%, slightly lower than a 5% growth in the installed thrust. This reflects a 20% decline in RB211 revenue, as these engines retire or fly fewer hours, resulting in fewer shop visits and part sales.

Now turning to profit, which increased by 14%. This reflects a number of things: Higher volume; the benefit from IAE; a lower R&D charge, as we capitalize XWB costs; and higher entry fees, although this benefit was reduced by our new accounting policy. The improvements were offset by higher unit costs and costs to support the XWB's entry into service.

On unit cost in Civil, the performance in the year has been slower than we would've liked, but we are confident that the actions taken in 2013 will yield savings in 2014 and beyond. Changes in design and manufacturing require certification and new tooling, and this takes time. A number of our new factories are not yet running at full capacity. But we know that fixed cost absorption will improve as production ramps up.

Let me give you an example. In our Singapore facility last year, we produced 41 engines. In the next few years, production capacity will be over 200, so fixed cost absorption will improve.

We're also working hard with our suppliers to drive down costs. We've had some successes in 2013, and there will be more this year. So there's a lot going on, and cost remains an area of intense focus that we are actively addressing on a number of fronts.

Looking ahead to 2014 in Civil, we expect modest growth in revenue and good growth in profit. Revenue growth will be tempered by fewer business jet engine deliveries, having come off a record year. We also expect launch pricing and RB211 retirements to further dampen growth. Revenue will return to higher growth levels in 2015, driven by significant increases in Trent engine deliveries, including the XWB. The profit growth will reflect the cost reductions I've just talked about and volume growth after taking account of lower R&D capitalization and lower entry fees.

The TotalCare net debt has increased by around GBP 270 million, reflecting a combination of linked sales and engine overhauls. You can expect a similar increase in 2014. Many of you have asked about TotalCare accounting, and we'll be doing a briefing session this year at Farnborough.

So to summarize in Civil, a good year, especially on new orders. On cost, progress has been slower than we had hoped, but there has been a lot of activity which will begin to flow through this year.

Now let's take a look at Defence, which had a good year. Revenue was up 7%, and profit increased 11%, driven by strong exports of EJ200 and Adour engines and lower R&D spend.

Services revenue grew just 2%, reflecting lower flying hours and some retirements of older C-130Js. Our 2013 performance in a tight budgetary environment sets a high bar for a 2014 comparison. Against the background of a declining order book and the completion of the delivery phase of a number of our major export programs, we expect a 15% to 20% decline in revenue and profit in 2014. This reflects lower deliveries of engines to power the C-130Js, V-22 Ospreys and the Typhoon, as well as fewer Adour kits.

As always, it is important to put this into perspective. We've had 2 good years of revenue and profit growth that outperformed the market trend. For 2014, our guidance essentially brings us back to around 2010 revenue levels before revenue grows again in 2015, and demonstrates the scale and the opportunities that still exist. Even with the revenue reduction, we still expect to maintain broadly similar margins in 2014, as cost reductions kick in.

So moving on to our Marine business. Marine had mixed results in a tough environment, with good revenue growth of 12%, offset on the profit side by price pressure.

The order book grew 1%, reflecting lower order intake, particularly in Offshore and submarines. Competition remains tough in both Offshore and in Merchant. There is considerable bid activity, but the pace is slow on some projects because of project financing and capital expenditure phasing by some of our customers.

Our Marine business did a good job of reducing product cost by around 2% during the year, but the benefits of volume and cost reduction have been eroded by price pressure and adverse mix, particularly in the aftermarket, and infrastructure costs, as the Marine business -- rationalizes its footprint.

Looking ahead to 2014, we expect a modest reduction in revenue and modest growth in profit. Profit rises against a declining volume because of the cost reduction actions we've taken in 2013 and continued actions in 2014. We expect 2014 revenue to reduce, driven by the lower order intake in 2013, particularly in Offshore, due to deferred customer investments.

Next, let's take a look at our Energy business. We've seen good growth in the order book, with GBP 1.1 billion order intake for the year, predominantly in Oil & Gas, which provides good visibility for 2014. We have a well-established Oil & Gas business that makes up around 2/3 of the revenue, and more than all of the profit in our Energy business.

Revenue increased 9%, driven by higher OE volumes in our Oil & Gas business. Profit increased GBP 7 million, reflecting higher volumes, partially offset by pricing pressure and continued investments in our Civil Nuclear business. In 2014, we expect further good growth in revenue and profit. But as you can see, the margins remained poor in this business, and this is an area we continue to work on.

Turning to our Power Systems business. We are pleased with the contribution Tognum has made, and we are pleased with our investments. We continue to build on 2 strong technology platforms, and Tognum has added significantly to the breadth of our reciprocating engine portfolio. The chart shows the trading comparisons for Tognum. We saw good growth in the order book, with an intake of GBP 2.7 billion. Tognum had a tough first half and a good second half, exactly as we said. That strong performance in the second half was driven by sales in marine and agricultural markets, but included the effect of customers buying ahead of new emissions legislation that came into effect this year.

Revenue was broadly flat. We saw good growth in our marine and industrial markets, offset by lower revenue in oil and gas, mining and lower aftermarket sales. Profit was also broadly flat after a strong second half recovery, which is helped by unit cost reductions, too. In 2014, we expect modest growth in revenue and good growth in profit, driven by marine engines and land power systems.

Turning now to our financial strength. We are in good shape, we have good liquidity and a strong investment-grade credit rating. Our financial strength gives us flexibility and assures us our customers will be there for the long-term. As we said before, we are committed to maintaining a strong investment-grade credit rating.

So now before talking about our guidance for 2014, it's worth highlighting that we created 2 new reporting segments: Aerospace and Marine & Industrial Power Systems, which we call MIPS. This reflects our 2 strong technology platforms of gas turbines and reciprocating engines. Aerospace will comprise our Civil and Defence businesses, while Marine, Power Systems and our Energy business will now sit in MIPS. Our Energy business will now be called Energy & Nuclear and will include our nuclear submarines business, which transfers from Marine.

Now turning to our guidance for 2014, which will include Tognum. 2014 will be a pausing growth, not a change in direction. And in 2015, growth will resume. At a group level, we expect flat revenue and profit. On cash, we are guiding on a free cash flow basis, which is more consistent with market practice. For 2014, we expect free cash flow to be similar to 2013, which is around GBP 780 million.

Now looking at our guidance for each of the different businesses. Civil Aerospace, modest growth in revenue and good growth in profit. In Defence Aerospace, a 15% to 20% decline in revenue and profit. In Marine, a modest reduction in revenue and a modest increase in profit. In Energy & Nuclear, further good growth in revenue and profit. And in Power Systems, modest growth in revenue and good growth in profit.

And some additional guidance for you in 2014. We expect our cash and profit phasing to be H2-weighted, reflecting cost and restructuring initiatives underway, phasing of CapEx spend and our MIPS business, which is traditionally more H2-weighted. CapEx for the year will be broadly flat. And on R&D, expect a modest increase in spending, but a higher P&L charge as we stop capitalizing the XWB. And lastly, we expect an underlying tax rate of around 24%.

So let me close by being clear about our focus. The 4Cs: Customer, Concentration, Cost and Cash. We have GBP 71.6 billion order book. This is a concrete measure of the confidence our customers have in our products and technology. Delivering on the promises we have made is crucial, and I am pleased with the progress.

On Concentration, we have a long-term strategy that's been applied consistently over many years. We will continue to invest in our 2 strong technology platforms to deliver long-term profitable growth. As the CFO, you would expect me to be focused on cost and cash, and I am. Progress has been slower than I would've liked, and I get this. We understand that improving financial performance is key to our long-term success, and we are engaged in many cost-reduction programs. These will drive down costs as they are sustained across the business and as volume, in particular in our Civil business, ramp up.

Rolls-Royce is an exciting place to be right now. There's a great deal going on, including the entry into service of our biggest-ever program and good momentum established towards improving our financial performance.

Thank you very much for listening. And now, we'll take your questions. Thank you.

Question and Answer

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Mark. Okay. As usual, I will point, as people will go around, everyone will get a chance with the questions. If you could say your name and your affiliation before you start, and then we will take your questions. So we'll start right in front, maybe with Ben.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes, Ben from Deutsche here. Maybe kick us off with a couple of questions. First one, just on part of your slide, Mark, I guess on capital allocation, but also build again maybe with your comment, John, about your desire to grow in medium-speed engines. What should we think about capital allocation, about M&A, about leverage? And about your comment about continuing to want to grow in medium-speed engines, does that mean M&A or is there organic opportunity to do that? That's the first question. I can come out with the second one, or do you want me to ask it now? I'll ask the second one now?

John F. Rishton

Former Chief Executive Officer and Executive Director

Ask it or otherwise you'll lose the microphone.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Oh, wow, shocking.

John F. Rishton

Former Chief Executive Officer and Executive Director

This may be a good idea.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

The second one is just -- and I recognize this is probably a slight delicate topic, but just on this FRC issue. Is the FRC looking into any other accounting issues? Or does this draw a line under absolutely everything, there's no other issues we should be concerned about? Just if you can update us on what's actually going on there in discussions with the FRC?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Why don't I make a couple of comments, and then ask Mark to speak on both of those topics. In terms of capital allocation, a couple of fundamentals that you're all familiar with. First of all, we think it's essential that we have a strong credit rating. We're a very long-term business and we need to maintain that. In terms of M&A, it won't surprise me even the slightest, and I'm not going to get sucked into any discussions or speculation about what we are or not doing there. We've never talked about in the past, I'm not going to talk about it today, and I don't want to talk about it in the future. So what I would say is, as we look at the business and again, it shouldn't be a great surprise, we look at it in terms of the gas turbines and the reciprocating engine businesses. We've got those 2 platforms, and they have some similar characteristics in terms of the fact that they are complex integrated power systems in the sense of an OE and an aftermarket. And they also, I think, in terms -- importantly, in terms of the balance that they bring to the group, in terms of the different nature of the financials and the industries that they're in, with shorter-cycle, longer-cycle, earlier cash generation, longer-cash generation, more capital intensive, less capital intensive. So there's a mix there that I think is important to get that balance right. In terms of the medium speed, as we look at our portfolio in Marine, which is a strong portfolio in terms of what we

can offer to Marine, an area that I think we need to strengthen is our medium-speed diesel portfolio where we are relatively small. So if you look at the medium-speed diesel, the big players, Wartsila is a big player there. And if we look at our Marine business, an attractive part of that portfolio that we need to strengthen is medium speed, and it's important in terms of pull-through of other products. How do we strengthen that? Well, as I said, there are various options there. Clearly, you're well aware that we considered an M&A approach. And as I said, those talks have stopped. In terms of other approaches, we can certainly, and we are working, Colin can comment on this, on developing engines, more engines in the medium-speed in-house, so dual-fuel engines, different medium-speed engines. So we're working on that as well. Mark, if you want to make some more comments on the capital allocation or whether you'd like to talk about the FRC?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, I can -- I'll do both. On capital allocation, I think one of the main drivers will be sensitivity and desire to retain a strong investment-grade rating. I think from that, you can infer some leverage levels. I mean, there is always, a quantitative element that put on these things, but there's a qualitative element that goes in the rating agencies as well. And of course, it's important to understand that like all these things, whilst we desire to maintain a certain rating, it's not openly our gift to give. But obviously, that sits in the context of them understanding our business and what we're doing. So that's the important driver, having a strong grade -- rating for us, as you know, just because we're a long-term business and want to ensure that governments and customers know that we're going to be around to continue servicing them in sort of 5, 10, 15, 20 years time. And as John said, there are a number of factors we have to think about in capital allocation in terms of how we look across our businesses, where are we going to invest it, where we haven't, whether it's long versus short versus medium-term and all around the areas of how the capital is deployed, and it's also return on capital employed, and so forth. So that gives you some idea, I think, on that. Just turning now to the FRC, you sort of made a reference in this thought. I think the question was, are there any other ongoing inquiries or do you want us to explain a little bit first about the FRC, the accounting change that we've done?

Benjamin Charles Bourne

Liberum Capital Limited, Research Division

[indiscernible] it's more around looking at further issues [indiscernible].

Mark Morris

Former Chief Financial Officer and Executive Director

Well, look, a couple of things. I don't think it's unusual for companies from time to time to get inquiries from the FRC, and we are no exception. I mean, clearly, we're not going to comment on any private discussions that we have with the FRC until such time as -- like in all these things, there is something to say. So on the FRC, that's what I would say. I mean, if there was some specific question around the change in policy, which I think is explained quite a lot of detail in Note 1, I'm happy to talk about that as well.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. The next -- in the front again. So from this side, we kind of wind our way a little bit up and come back, unless Sandy likes to be at the end.

Christian A. Laughlin

Sanford C. Bernstein & Co., LLC., Research Division

Christian Laughlin from Bernstein. Just one question regarding around -- or the profit strength phasing next year, if you will. I was just wondering if you could provide some commentary on where you expect to see some tailwinds, some margin tailwinds in H2, just given that we should expect to see XWB ramping up and then, of course, C1000 running at higher production rates this year?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, we don't normally get into sort of detailed breakdown of half year phasing. But I mean, what I would say is this, and as I alluded to in the presentation, a number of restructuring and cost-reduction initiatives, how we're spending CapEx, some movements in R&D, but also just when you look at our MIPS business, generally, the volume load is generally a bit more second-half weighted and that's what will drive some of the profit phasing as well.

John F. Rishton

Former Chief Executive Officer and Executive Director

Could I just pick up on that? You kind of threw in there the XWB ramp up, just to be clear, the XWB engine volumes in 2014 are very small. Entering into services this year, our XWB really starts ramping up '15 and particularly, in '16. So this is a small volume of engines next year in terms of XWB. So that's still coming, just to be clear on that point.

And the next, so we just go back -- yes, gentleman just behind Christian.

Steven Lee Cahall

RBC Capital Markets, LLC, Research Division

Steven Cahall from Royal Bank of Canada. Maybe just a couple of questions on what we're expecting next year in Civil versus some of the trends this year. So maybe first on IAE, I mean, do we expect any uplift next year? It looks like we didn't have any uplift versus 2012 in H2 of 2013, so maybe just what your assumption is there. And then similarly, on the RB211, if you can give us maybe any color about what retirement rates were in 2013, and what's the expectation for that trend in 2014? Because it does look like it accelerated in terms of retirements in '13.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay, on IAE, let's try and put this one to bed. For the full year, as I said, there's GBP 112 million uplift and again, if you recall, if you go back to 2012, we had a half year of what I'll call the old world and then half-year of the new world. And your observation is right, there was no uptick in the second half. Going forward, we're not going to breakout IAE anymore. It just gets too difficult. We're working off assumptions of the old model back from 2012 and we don't know what they really were. What I will say is that generally, as we move forward, the uplift will reduce and I think we've given you that guidance before. On RB211 retirements, for this year -- sorry for 2013, we said the impact was a reduction of RB211 revenues of about 20%. And that's sort of what continues as we go forward. And again, this isn't a surprise to us. We factored in -- I mean, there's always some movements a little bit backwards and forwards, but we are anticipating that as it goes out we will start to see some retirements because one of the things that we're keen to do is to ensure that by lowering the cost of overhauls and so forth we can extend the life of those. But it's in our planning.

John F. Rishton

Former Chief Executive Officer and Executive Director

From this side.

Nick Cunningham

Nick Cunningham from Agency Partners. I hope it doesn't seem too aggressive, that sort of.

John F. Rishton

Former Chief Executive Officer and Executive Director

Very aggressive.

Nick Cunningham

But the Defence has been sort of enormously strong for several years. We kept on asking about that. Can this go on? And you haven't been specific in this one. But I think takeaway has been that it's sort of sustainable. But now we're looking at 15% to 20% decline, hence sort of when you notice. And which is unusual for a large company to do that. So I'm just wondering what happened? And why was it not flagged earlier? And I have another couple shall I ask them?

John F. Rishton

Former Chief Executive Officer and Executive Director

Please ask them all.

Unknown Analyst

And on the change in RSP treatment, I was just wondering why the FRC recommendation was only sort of half-adopted? What's the thinking behind your decision to adopt a different treatment from them? And finally, and this probably just displays my own ignorance, but why is the minority so small? One would have thought that half of Tognum would generate much bigger P&L minority, or it's probably just me.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. I'm going to ask Jim on Defence. I think in part, the answer to Defence question, though, is we have given in year guidance, and you kind of run into that, which is well do we -- how do you handle that? Well, we give in year guidance now, clearly this time we start talking a little bit about the future and I think that's made us think a little bit more carefully about how we manage that. So what I would say is what we are trying and we're heading in the direction of and I know it again will be slower than many of you would like, is trying to get more transparent about the whole variety of issues, including length of time potentially and details around it. As Mark said we will have a session on TCA accounting of Farnborough. But, in a nutshell, that's sort of answer that, but Jim, maybe if you could make a few comments on Defence, that may be helpful?

James M. Guyette

Former Chief Executive Officer of Rolls-Royce North America Inc and President of Rolls-Royce North

Thank you. What I'd like to do is why I may is take your narrow question and maybe provide a little more color to the Defence story, because I think it would be helpful to all of you and I suspect it's one of the primary issues of concern. Let's start with a couple of points of background. Let's go back 5 years and let's look at our revenue and profits. Our revenue improved 54% over the last 5 years; profits, 96%. Now this is against a backdrop of a very, very difficult defense budget situation, U.S., U.K. and a couple of other jurisdictions as well. So in this outsized performance, given the backdrop of a tough, turbulent environment. And the reason that we were able to do so well is product portfolio mix, and also some contracts that served us through that difficult period. What we're now finding is that the defense reductions are beginning to bite and they didn't begin to bite just this year. If we go back and look, our order book has been decreasing over the last 3 years. So I think quite a signal that things were going to catch up with us. And they have. Last year, it was the aftermarket business that did not do as well as one would've hoped or as we have done in the past. And if you look, it only increased 2%. So that's where we took the first hit. And it was in reduced flying, and it was also with respect to some airplanes that have been retired. So this year, it's now manifesting itself in an OE, and I'll cover that in just a second. But I'd like to provide a couple of other points that might be helpful to you.

If you look at the U.S. for a moment, last year, I provided a tutorial on sequestration. My colleagues have asked that I don't do that again this year, but we can do it later if you would like. We do have a defense budget for the first time in several years in the U.S. And that's good news. The other good news is it, for this 1 year, it put aside the effects of sequestration, only for 1 year. The other good news is that it is a GBP 12 billion improvement over where sequestration would've been. The bad news is the defense budget is \$40 billion less than the President requested. So again, a little bit of gain here, but not as much as the Defense Department thought it needed to run its business. The other thing that I would point out to you, again, for background, is if you look at the political situation in the U.S., yesterday, House of Representatives passed legislation on debt ceiling, another signal of stability. And that will carry us

through March of next year. So I think that's helpful. The other point that I would raise is this is a year of midterm elections. So every member of the House is up for reelection, 1/3 of the Senate. And I think it means that there is probably less room for political mischief. People are going to be on their better behavior. Now what is that mean for sequestration next year? Don't know, but I suspect, again, better behavior. If I could then move to another aspect of this. We have, in my view, good clarity on 2014, and we're having increased clarity on 2015. The next bit of information that we will have will come on March 4, when the President releases his budget to the Congress. We'll have a much better sense of what's in, what's out. Usually, we know about this in February. It's been delayed a month. So we're a month behind in all of that. But still, I think we understand pretty well what 2015 will look like. There are puts and takes. But a better understanding. If I were to, again, walk you through now the OE side of what is happening to us. Again, we're going to concentrate on the U.S. because that's where the volatility is today. The C-130J, it is our bread-and-butter airplane. We have been at a high watermark on deliveries of C-130s. This year, it will drop approximately 30%. You heard the announcement of the new order, a 5-year order, that will bring us up above this year, but not back up to the high watermark. V-22 Osprey has been an award winner for us over the last couple of years, and that drops by more than half this year. And we would anticipate that, that levels off. Now there is going to be some prospect for perhaps some sales to Israel and some other countries that would be nice upside. But for us, we think we know where we are. And, of course, A400M is delivering. We have now JSF starting to deliver. There are some opportunities in the tanker world that we're also having a look at.

The other side of this equation is cost. And a very, very important element of what is happening in Defence. Simply said, we are resizing the business. We're attacking every single element of cost. Overheads over the last 3 years, we pulled overhead down 20%. This year, we are bringing our production costs, our manpower on the shop floor, down 15%. That's almost 500 people. Most of that is in the U.S., and almost all of those people will be off the payroll within 2 weeks. So it's not a plan, it is a reality. We're now moving on product costs, what can we do to reduce product costs? Aggressive actions there as well, those take time to implement but they're under way. We're looking at production footprint. How do we consolidate, how do we reduce? Again, actions underway. So there is a cost element to this, we have got to resize, reshape the business to today's Defence reality. And lastly, John, I would also mention this for the group that we're up in the international marketplace, looking to see what we can do too, to sell equipment and we're working with our platforms suppliers. And then there's the aftermarket and one of the things that we're focused on in this kind of environment is how do we help our customers do more with less? An example of that, we have a new product upgrade for the T56 engine that serves the legacy C-130s. It is now a program of record in the U.S. Very, very helpful. And what we do is upgrade the engine and what it provides to the customer is somewhere between a 10% and 15% reduction in fuel. And so with the small investment, there's a big gain. So we're looking for every opportunity again to help those customers that we have do more with less in a budget-constrained environment. So I apologize for a long answer, but I do think that since Defence was kind of a headline item that perhaps it might be helpful to handle it in a comprehensive way, to answer your direct question, yes, we saw it coming, reflected in order book declining.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Jim. Mark?

Mark Morris

Former Chief Financial Officer and Executive Director

Right. FRC, look I think the key thing here is that risk and revenue sharing partnerships, which you're familiar with, Nick, are not directly covered by any particular standard under IFRS. So it requires judgment in arriving at what we believe is the right treatment and ultimately, it's like all these things, there is level of interpretation. And as we've alluded to, we've been in discussions with the FRC. We have a view on how we think it should be interpreted, they have another. There are both good arguments for both. But when we looked at it and looked at the difference in terms of where we ended up, we concluded that it was relatively immaterial. But for us, it's important that we stand behind what we believe is the right

accounting treatment. And that's the position that we take, and for us, it's consistent with what the rest of the industry does.

John F. Rishton

Former Chief Executive Officer and Executive Director

I think what we found was in discussions we have seem extremely constructive and helpful, and they made us really reflect on what we saw and how it works. I think it was really helpful in terms of getting us to think clearly about something that we haven't perhaps thought as clearly about in the past, so they were good discussions, I think very constructive and useful.

Mark Morris

Former Chief Financial Officer and Executive Director

Absolutely.

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, you had a question on minorities as well.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. I'm not quite sure I fully understood the question. But obviously Tognum has been from being JV accounted to fully accounted, and I think if there's a technical question we'll sort of take it off-line.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, we'll do that. Next, let's just go back to this side.

Unknown Executive

Those of you who are sitting at the back will learn have to sit in the front in the future.

David Howard Perry

JP Morgan Chase & Co, Research Division

It's David Perry from JPMorgan. 2 questions, please. The first one John, just this issue of medium speed diesel engines where you think Rolls needs to become stronger. When we were given the presentation on Tognum, that was the major raise on debtor [ph] if I understood correctly? So can you just explain why Tognum isn't meeting the need and why you felt the need to have talks with Wartsila please? And the second 1 goes back to Ben's question, right at the beginning about the FRC talks because I think you can't really ignore it and you might have private discussions. I mean, are you absolutely rock-solid sure that there will be no forced changes to TotalCare accounting going forward?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, let me take the first one. What has become clear and maybe it's been clear all along, is that we need to do a much better job explaining our non-civil business to many people, which is an issue for us rather than issue for you, if that makes sense. So one of the things that we'll be doing later this year is we will have an investor meeting on our Marine and reciprocating engine business and it isn't just about Marine. There's a land power part to it as well. So we need to make sure that you understand that business I think much more clearly than you do. We recognize that, that's something that we haven't been particularly good at doing. And to clarify that point, Tognum is sort of the high-speed diesel engine company rather than a medium speed. So if you look at reciprocating engines. In simple terms, you've got 3 speeds: Low, medium and high. Low is something you put in huge vessels and you build them into the vessel in place with a vessel is in simple sense of making it all simple. Medium speed is what we make at Bergen, and what Wartsila was good and has a very large market share. Tognum is a high-speed

diesel engine, and if you look at the different engines it makes there, I think Mark in total it goes about 28,000 engines, 20,000 of which are what we would call low-power high-speed engines, which primarily for Daimler and there's 8,000 which goes to a variety of different sources of different sizes whether that's agriculture equipment, construction equipment, the Oil & Gas industry, et cetera, et cetera, though a very diversified customer base. But the fundamental difference is high speed, medium speed, low speed, Tognum high speed, medium speed is an area that we need to build that portfolio.

David Howard Perry

JP Morgan Chase & Co, Research Division

I'm sorry, because clearly I phrased the question wrongly. I mean I think back of the Tognum meeting, back of the Tognum meeting, the point was you were not interested in that medium speed area. I know it was your predecessor, but the point was all about the niche folks not in the commodity market and you wanted the Tognum high-speed to clarify the gas turbine capability that Rolls had already in Marine. So I ask the question correctly, why the need to move into the medium speed market that previously, maybe by previous management wasn't perceived as important?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. So I'll answer that slightly differently. I think that, one, Tognum is a good acquisition, as I said in my presentation. The management team are doing a terrific, they did a terrific job last year, I'm sure they will this year. And were getting the benefits that we foresaw when we made that acquisition. As I said, I was there last week, one of the things that I go through when I go there is to look at where are we getting the revenue synergies that we spoke about, and how well they're progressing, and we do well, we got a detailed plan on that, lots of detailed examples where that's working. So as an acquisition, I am comfortable that was a good acquisition and a good plan. In terms of medium speed, though, it doesn't address some of the issues that I think we have, we think we have in terms of Marine and the growing land power business. So irrespective of what was understood or said in the past, to be clear, we believe that we need to strengthen our medium speed diesel engine businesses. FRC, Mark?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay, look, we have a huge number of accounting policies that we apply. We are confident with all the ones that we apply. They are viewed and vetted by our auditors. And in relation to TCA accounting, we are confident with that one. And like I said, to Ben, I mean, in terms of conversations or inquiries with the FRC, it's not unusual for companies to have them. But like I said, in any respect, conversations that go on between companies and the FRC are private.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, let's go back one more, this side.

Edward John Stacey

Haitong Bank S.A., Research Division

It's Ed Stacey from Espírito Santo. Just one question, which is cost savings in 2014. When I look at both Civil and Marine, you're talking about some kind of margin negative effects. So in Civil you're saying you've got the RB211s coming out of service and you've got lower pricing, so both pricing and mix problems. And Marine, you're saying the Offshore is a bit weaker than you thought so that's, I guess, mix-negative and you're saying there is fierce competition. So I guess, we're worried about pricing there as well. So I could imagine if you were doing nothing on cost savings, then your margins would actually be down for both of those businesses. And then when I look at you're saying actually both of them had decent profit growth, there must be a lot of cost savings. Can you tell me, am I right that it's a really pretty big number? And if so, what is it that is nailed down and I could be confident that it comes through the cost savings?

Mark Morris*Former Chief Financial Officer and Executive Director*

Okay, yes, I mean, look, obviously, our guidance for Civil, we've guided modest growth in revenue and good growth in profits. And I think what you're seeing there, as I alluded to in my presentation, is that obviously, you're going to start seeing cost benefits coming through. Interestingly, in Civil, that's against the headwind of lower RSP entry fees and lower capitalization. So there are number of things going. As usual, there's a number of moving parts and this usually include mix and various other things as well. On the Marine side, yes, absolutely they took 2% out in 2013, we expect continued cost reduction on that front, along with some restructuring and rationalization, again, those will start to flow through as well. But that doesn't mean that the price pressure is coming off, that's obviously something that is still with us in the Marine side in particular, in particular commercial Marine.

John F. Rishton*Former Chief Executive Officer and Executive Director*

Yes?

Rupinder S. Vig*Morgan Stanley, Research Division*

It's Rupinder Vig from Morgan Stanley. Just 2 questions perhaps. One for John, first. Just when I think about Defence, and perhaps Jim can kind of weigh in on this as well, what is the right long-term margin your Defence business? I mean you have this reset in '14. Are we going to go back to a period over time where we get towards a low kind of teens margin, or can we maintain the margins where they are? Then perhaps one for Mark around cash. When I look at the 2014 guidance, obviously, you're saying roughly the same sort of level. But if we have a good or some improvement, should I say, in working capital, is there a chance that cash will come to look little bit better, specially got flat CapEx as well?

John F. Rishton*Former Chief Executive Officer and Executive Director*

Well, I'm very impressed that you managed to find a topic that Jim didn't cover in his explanation of Defence. So congratulations on that. I'm not sure that I can answer you what the right long-term margin is in our defense business. Clearly, depends on whole variety of things. What we are clear about, what Jim did cover is that we need to manage the things that we can manage, which in the specific instance would be cost, or we need to be make sure that we are as efficient as we possibly can be and that's where our focus is.

Mark Morris*Former Chief Financial Officer and Executive Director*

Yes, look, I think in terms of cash, I think the key thing to recognize obviously is the improvements, and certainly flat CapEx, and our working capital what we could recognize there is, and I've signaled that is, when we look at the TCA net debt arising by similar levels, again. So that's really what's bringing down some of the effect. We've got a cost reduction out of [indiscernible] cash is being countered by obviously a rise in net TCA data. So that's why we are signaling around at similar levels.

John F. Rishton*Former Chief Executive Officer and Executive Director*

Let's just keep going back, and then we'll come back down to the front here. We'll get there. First one?

Zafar Khan*Societe Generale Cross Asset Research*

It's Zafar Khan from Soc Gen. Just on the headcount reduction, the 11% you mentioned. Could you give a little bit more detail on that, please? Where that actually happened and what the numbers are in the different divisions now? And how they compare with 2012 year-end?

John F. Rishton

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Former Chief Executive Officer and Executive Director

Yes, Mark, I think...

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, I can't break it down by division. I don't think it's -- as we've indicated this is all around sort of what we call indirect -- a large chunk of it would've been in the U.K. but it's everywhere we -- our indirect 11% is the number we get from where we started back in October in 2012 as our benchmark. And it will continue. So that's -- but we don't break it down by division.

Zafar Khan

Societe Generale Cross Asset Research

How many in total, roughly, how many people in total Mark?

Mark Morris

Former Chief Financial Officer and Executive Director

About 1,100. Yes.

John F. Rishton

Former Chief Executive Officer and Executive Director

About 1,100 people. And as Mark said, if it is the overhead area and as I think I've explained to you, my view is that we've carried too much overhead. Many mature businesses we've grown and we've had too much overhead. We need to improve our efficiency a lot in this area, so we're driving process improvements in the whole variety of ways and we'll continue to do that. So if I look at simple things like transaction processing, where do we do that, how do we do it, how many people have got doing it, how efficient are we doing it? Those are the areas that we're getting -- like in terms of the cost you can see huge change in the costs in the year because, of course, we had the cost of restructuring offsetting the savings and we should start to see the benefits of that coming through this year, but we're putting more restructuring in this year to drive more cost savings in the future. And we will drive a similar numbers again this year. Okay, next? Okay, come right down to the front again in the change with policy.

Unknown Analyst

Morning, it's Chris Alami [ph] from Goldman Sachs. Just 1 very quick question about your 2014 profit guidance. How confident you are in that guidance? Because if Defence is down 15% to 20%, and you're guiding for flat, it implies you're non-Defence segment is growing low single digits, but 85% of that non-Defence segment you said is good profit growth. So it seems you must be very confident on flat for the group, for this year?

John F. Rishton

Former Chief Executive Officer and Executive Director

Well, I said, we give guidance every year and I think the track record at a group level has been pretty good, which is a dangerous thing to say, obviously. And it's our best view as we look out into the future. As with all these things it's a projection into what's going to happen in the future, but it's certainly our best view, which we've been reasonably good at doing at the total level, I think as you look into the various divisions you get some ups and downs, which you inevitably do as you breakdown into the detail. But you wouldn't expect me to say anything other than we're pretty confident, otherwise we wouldn't have given it. We've got Sandy, who's just twitched.

Sandy Morris

Jefferies LLC, Research Division

As you welling [ph] some boots on just in terms of our cost base in Civil, the simple average number of employees in 2012 was 21,500 and in 2013, it was 23,400. I know you've taken overhead out. We are clearly sitting on a massive chunk of production capacity that we aren't using. And I mean, if we sort of

assuming that engine deliveries aren't going -- trends aren't going up markedly in '14 versus '13, despite 787, is that right?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, let me -- may kind of consider Mark refers to this and your point is well-made, Sandy. So if we take the most obvious example, in Singapore last year, we made 41 engines, and it has the capacity to make an engine a day. So clearly, that is a cost burden for us in the way that you're talking about. Next year, there will be a small ramp-up in Singapore. But in total, Trent engines do start to pick up next year, although there's a mix issue there, in terms of Trents, large ones going up and the smaller ones going down a little bit, which is the way that we're forecasting it. The issue for us is in terms of balancing that is preparing Singapore to take over the build of the Trent 1000, the Trent 900 at the moment, last year just build 900, we'll start building 1000s this year, and then the buildup of the XWB, which is our [indiscernible] is very small this year, starting in '15 and then really ramping up '15, '16 in particular. And that's when we start to see that change in mix. So if your question is, am I carrying too much fixed cost and fixed overhead at the moment for the level of production? The answer is yes. And that's what Mark was saying, which is as production ramps up, particularly in Civil, that will bring us benefits. If that's your question.

Sandy Morris

Jefferies LLC, Research Division

Well, it is sort of almost, precisely. Because we can muck about with unit cost in the Civil, I mean god sakes, give us a break. We're carrying a massive amount. So if you then confirm...

John F. Rishton

Former Chief Executive Officer and Executive Director

You're doing a good job for me.

Sandy Morris

Jefferies LLC, Research Division

Oh God. What's the share price if that happened? And therefore, if you tell me that actually notwithstanding that change is difficult, we are content with the progress we're making so that when we hit the button the business in the shape you want it to be, then I would regard that as a very encouraging comment, are you going to make it?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, I would. So for us, it's about shaping the business for the future and in the future we're going to get extra benefits of volume, and when we start getting the capacity and the demand in balance, we get that as a windfall. But if we right-costed the business before we get there, then we're in great shape, which I think is the point that we're making. And that's what we're striving to do.

Sandy Morris

Jefferies LLC, Research Division

And you're happy?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. Happy is not a word I ever use, by the way.

Sandy Morris

Jefferies LLC, Research Division

Less miserable.

John F. Rishton

Former Chief Executive Officer and Executive Director

Happy was 1974, about 1.5 hours and that was it. It's over. I'm confident. That's a much better word.

Sandy Morris

Jefferies LLC, Research Division

Gosh, you've got a charmed life. And then look, I mean, just blundering into TotalCare. Where actually the disclosure has gone up a lot. The liabilities are a bit smaller than I had imagined. And it's just part of this accruals and spend. Just in broad terms, how much does engine overhauls go up last year? And what's the trend in engine overhauls, just so we can capture the cash spend, please?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, I think there's so many moving parts here and you've alluded last year GBP 270 million and interestingly, about GBP 240 million of which is in the first half, and only GBP 30 million of which was in the second half, and that really reflects to various moving parts we have in, and what contributes to the net TCA debtor. And again, we get into live it more this when we get into Farnborough. But yes, we had more shop visits and overhauls in H1 than we did in H2. And that's the sort of main drivers, because that drives the creditor down, which in turn creates the net debtor being high. That's the main reason behind it, Sandy. But you had a pretty good go at answering yourself, so...

Sandy Morris

Jefferies LLC, Research Division

Yes, I do that and I move on.

Mark Morris

Former Chief Financial Officer and Executive Director

Well, you're right.

Sandy Morris

Jefferies LLC, Research Division

Are we adjusted to go up again, or have we like hit a maturity average level because my sense is the spend has gone up a lot for the last 2 or 3 years as the fleet matured.

Mark Morris

Former Chief Financial Officer and Executive Director

The levels of H1 -- it will continue -- I mean, obviously, that they will ebb and flow from 1 H to another just depending on how they are scheduled and where the aircraft delivered, and more importantly, how the aircraft are used. Because you can't say that every aircraft has 1 coming in every 5 years. If aircraft has been worked hard it'll be 4 years, so there's lots of moving parts that drive that. And of course, as you know, shop visits and overall costs are just 1 part of what makes up the net TCA debtor. But they will ebb and flow. But of course, as you got more volume under management, they're going to grow over time. That's the reality.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Just one more here.

Andrew Paul Gollan

Investec Bank plc, Research Division

Andrew Gollan from Berenberg. 2 questions, 1 on aftermarket and 1 on revenue drivers. Civil aftermarket, could you possibly tell us the split or broad split now between TotalCare and time and materials? And within the time and materials, a broad indication of how important the RB211 program is?

Secondly, on revenue drivers, sort of a couple of sub questions here. The launch pricing issue on T1000. Presumably, we knew about that because these are agreements that were made some time back. Or is it a factor that's becoming more of a headwind than we thought? Or do we know where we're going with this issue for '14 and '15? And I guess, the same applies to when we get into Trent XWB down the line. And secondly, on T2500, I believe that was down year-on-year, and I understand that to be part of the services supplied into the platform. Why was that lower given that industry volumes were up, please?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Three questions there. I mean, on aftermarket, the split is about 70-30. On the issue about launch costs, yes, of course, we know about them. They're contracted a number of years in advance. Lead times are typically sort of 18 months, 2 years, right out to sort of 5, 6, 7 as a set of delivery for what will go through. But again, when we guide on profit, that is just one element, along with where are we on if you just look at the OE element, what are the other deliveries are doing, and in particular within Civil, you've not just got Civil large, you've also got the business jet engines, which traditionally have higher-margin, and because they fly less hours in the aftermarket. So a logical business analysis says you get more on the OE. V2500, again, let's just remind ourselves of what we continue to manufacture and supply parts, and it's a transitioning process that's going on. And over time, some of the parts that's where we are sourced and supply will eventually transfer through to Pratt & Whitney. We will continue manufacturing a number of parts and again, even over time, some of those will start to drift as well, which is why we usually guided it will start come down over time. So that's the driver behind it. It's just as time's gone on, there's been some parts transfers of what was coming in through us and now what's been transferred and goes straight to Pratt & Whitney. So that's the driver. On the -- previously, I mean, obviously, some of the parts where we have volume is it's just a function of what part sales are being driven. You can forecast them, but what actually turns out may be different. And last year, for instance, we had a number of cases where more expensive parts are being ordered, and more of them which drove part of that revenue.

Unknown Analyst

And obviously that's within [indiscernible]

Mark Morris

Former Chief Financial Officer and Executive Director

I said it's about -- sorry, RB211, off the top of my head I haven't got that, but we'll get that for you.

John F. Rishton

Former Chief Executive Officer and Executive Director

It's obviously, quite significant.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes it is. Within time and materials of RB211 is going to be...

John F. Rishton

Former Chief Executive Officer and Executive Director

Almost all of it.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, 70%, 80%, I think. Yes.

John F. Rishton

Former Chief Executive Officer and Executive Director

And the 70-30, Mike just to be clear is the total as opposed to the split of sales that we've got at the moment where we got higher TotalCare and less time and materials.

Mark Morris

Former Chief Financial Officer and Executive Director

That's correct. So it's just on the existing and still...

John F. Rishton

Former Chief Executive Officer and Executive Director

That's the total, now it's different. Anything else? Just one more from -- last one from Ben, last of the last.

Unknown Analyst

Sorry to come back with a few more, and then I'll lay a point maybe. But just a couple of follow-ups. Firstly, you mentioned there was some deposit inflows that helped -- or deposit inflows, an item in the cash flow in 2013. Maybe you do just disclose it and I just can't find it but I wondered if you could share with us what that scale of deposit inflows was in the free cash flow number in 2013? The second question and I guess it builds partly on this launch pricing point, but just you clearly have good visibility about the launch pricing effects. But on XWB as those volumes rise on '15 and '16, just how that plays out and how we should think about the headwinds that may or may not create? And maybe the final one is just your comfort level on Trent 500 TotalCare net debtors. Your Trent 500 is 12% of your installed base, we've got 10% of the aircraft on the ground. Your offering understandably an improved package for the airlines of overhaul all the other 3, I was just wondering how that plays out in terms of your view on whatever the TCP net debtors is on Trent 500?

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark is delighted to have 1 last question.

Mark Morris

Former Chief Financial Officer and Executive Director

On deposit flows, I mean, we're surprised the bulk of that has really come from Civil and the massive growth in the order inflow, order intake and order book. At the same time, of course, Defence has been running down as the production delivery phase has been coming through. But one has more than offset the other. I don't think we sort of revealed the sort of net difference between the 2, but that's what's been driving it, Ben. On launch pricing of XWB, look, we are not going to sort of get staked out by some program-by-program in giving you the guidance from '14, and what I'll call it be a figure painting for 2015. We factor that in, into our corporate. And again, ditto on Trent 500 net debtor, it's a small contribution to the overall net debtors. As you know, Trent 500, as a 4 engine aircraft is not doing as well given the high fuel price environment. Again, that's factored into our calculations. But I'm not going to break it out specifically. But again, it's reflected in the total rise in net TotalCare debtor that I gave you for 2014.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thank you. As you see, if we have one extra question. The answer's tend to get a bit less answers I think is the way I would describe it. Less specific, maybe. Thank you very much for joining us this morning. It's very good to see you all again today. If I leave you with just a couple of thoughts. First of all, cost, cash, concentration and customer. Really, really important for us in the business. That's where our focus is, where my focus is, where the board's focus is, to make sure that we can do as Sandy was suggesting. Really important that we get the customer elements right, we're making good progress on that. We've still got a ways to go. 2014, pause for growth, not a change of direction. Growth comes back in 2015. Thanks very much for your time this morning.

Presentation

Operator

Good morning, and welcome to the Rolls-Royce Holdings plc 2013 Half-Year Results Conference Call. [Operator Instructions] And just to remind you, this conference call is being recorded. Today, I'm very happy to present Jilinda Crowley, Assistant Director of Investor Relations. Please begin, ma'am.

Jilinda Crowley

Good morning, everyone, and a warm welcome to everybody to our half-year 2013 results webcast. Regarding the material for today, we issued the results via stock exchange announcement earlier this morning. The presentation slides for this call are available both via the WebEx and also via our website.

As always, elements of this presentation contain forward-looking statements and are based on our view of the world and our businesses as we see them today. Clearly, these elements can change as the world changes, so please consider them in that context.

For today's webcast, I'm pleased to be joined by our Chief Executive, John Rishton; and our CFO, Mark Morris. John?

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Jilinda. Good morning. Thanks very much for joining us on the call. I'll make a few comments about our performance in the first half of the year and then Mark will take you through the detail.

At first glance, I think that these appear impressive results, but I suspect many of you have already stripped the numbers apart, and you'll realize that there are some significant one-off benefits. Well the true picture is rather more complicated. So while there are some strong elements of the group performance, our profit continues to be held back, in my view -- our view, by a lack of progress on unit cost, and our cash flow is unacceptable.

Fortunately, we have significant opportunities to improve both. As you will have seen, we've consolidated Tognum for the first time and you can see that the contribution has made quite an impact on the results. The order book is up 15% or 12%, excluding Tognum. Underlying revenue is up 27% or 9%, excluding Tognum. The underlying profit is up 34% or 32%, without Tognum. We've increased our payment to shareholders by 13% and maintained our full year group guidance.

If I measure this first half performance against our priorities, I would say the following. In terms of delivering on our promises, we've made progress. We were all very pleased to see the first flight of the Airbus A350 powered by our XWB engines, the A400M military transport aircraft has achieved certification, is about to enter service, powered by our TP400 engines. And we have delivered our first Environship that's now in service off the coast of Norway.

The second priority, deciding where to grow and where not to, we've continued to invest in capacity around the world, for example, in the U.K. close to completing a turbine blade facility in Rotherham and advanced disc factory in Washington, Tyne & Wear. In the U.S.A., we're building a new turbine machining facility at Crosspointe in Virginia. In terms of where not to grow, I'm sure you know that we've decided to sell our 50% stake in the RTM322 military helicopter program to Turbomeca.

On improving financial performance, as I have said, there is plenty of scope for improvement. Our profit increased by 34% in the first half. But as you have seen, this includes a contribution of GBP 112 million from the IAE restructuring, as well as benefits from volume growth. Whilst progress has been made in some areas on cost, we need to do much more. So the cash and outflow of GBP 460 million is not acceptable, and we must do better, particularly on inventory performance. This will take time and a firm resolve to deliver.

I look forward to take your questions later. For now, Mark will take you through the details.

Mark Morris

Former Chief Financial Officer and Executive Director

Thank you, John, and good morning. As usual, I will draw up the main highlights of the group's financial performance for the period. Tognum has been consolidated for the first time. I've shown our main trading figures, including and excluding Tognum in this chart. You will recall from the prelims, I said we would provide guidance for Tognum separately from the rest of the group this year, because at the start of the year, we could not provide for Tognum whilst they were listed. We'll continue this way for the remainder of 2013.

So the group, excluding Tognum first. I will come back to Tognum later. Overall, the figures show good progression at group level on orders, revenues and profits. But as John said, we have more work to do around cost and cash. The order book is up 12% after booking GBP 14.1 billion of new orders, predominantly in civil, and the order intake in the first half was up 54% compared to 2012. Revenue, up 9%, reflects good growth in OE and services. Both segments displaying overall growth, ranging from 6% to 16%. Overall, growth includes the 1.5 percentage point benefit from favorable exchange rates. Profits increased by 32%, which I will cover on the next slide.

Turning to cash. We started the year with GBP 1.3 billion and ended with GBP 921 million of net cash, a reduction of GBP 396 million. It predominantly reflects the growth in working capital, continued investment, which I will cover in more detail shortly. We've increased the half-year payment to shareholders by 13% to 8.6p, reflecting our continued confidence in the business.

So turning to profit, one of the key components of growth. Increased volume is worth around GBP 103 million, the IAE revised trading arrangements contributing GBP 112 million. Within the GBP 24 million other movements, there are a number of positive and negative items, around trading mix, R&D, restructuring, foreign exchange and entry fees. Entry fees increased by GBP 76 million relating to where we are on the development of the Trent 1000-TEN, the Trent XWB 97K programs. We expect a similar benefit over the full year.

Restructuring costs are up GBP 25 million in the first half, which includes severance payments relating to the indirect cost reduction and site restructuring activity. Group profit before Tognum was GBP 787 million, up 32%. Our profits in Tognum of GBP 53 million reflects full consolidation compared to our share last year, which was equity accounted.

Group cash flow. As usual, I'll just pick out major things in this chart that you're all familiar with. Firstly, net working capital increased by GBP 803 million reflects a number of moving parts. The main items are inventory, which increased by GBP 261 million, which are volume with no improvement in our turns, is disappointing and is receiving intense focus. And Civil Care -- sorry, and Civil TotalCare assets, which increased by GBP 240 million, representing a combination of new deliveries and shop visits. CapEx and intangibles were up GBP 402 million and includes GBP 261 million of capital expenditure and GBP 141 million of intangibles. Remember, intangibles are capitalized development costs, diversification costs, recoverable engine costs and software.

Trading outflow of GBP 208 million is before payments of GBP 250 million to our main stakeholder groups, pensioners, taxes and our shareholders. Tognum's trading cash flow was GBP 62 million after paying a GBP 60 million dividend to Daimler. Looking through the full year, we continue to expect cash flow, excluding Tognum, to be around breakeven.

Turning to the business segments, Civil has seen strong order flow during the period. Order book increased 14%, with intake of GBP 10.9 billion that included orders for Trent engines for over 200 wide-body aircraft. Trent engines now make up over 90% of Civil's order book as our market share continues to grow. OE revenue increased by 8%, which reflects an 11% increase in engine deliveries, partly offset by adverse mix. Services revenue was up 3%, broadly in line with the growth of the installed trust base. Profits increased by 59%, reflecting the benefit of increased volume. GBP 112 million from the IAE

restructuring, GBP 76 million higher entry fees, partially offset by higher restructuring and product launch costs.

Remember that the IAE benefit is a first half effect compared to 2012, because the deal was completed in the first half of last year. Profit performance in the second half will be lower than the first half, which is facing an entry fee receipt to R&D. Consequently, for the full year, we continue to expect modest growth in Civil's revenue and strong growth in profit.

Defense has performed slightly better than we anticipated, but there remains a lot of uncertainty regarding sequestration and broader austerity measures, which governments have to contend with. It is evident in the order book, which contracted by 4%, and the low growth in services revenues as a consequence of reduced flying hours. Full year revenue increased, while engine deliveries were unchanged, benefiting from a favorable mix and increased export sales. Profit increased by 10%, reflecting OE volume growth, favorable revenue mix and a lower R&D charge. Good first half performance now gives us the confidence to improve guidance for the full year from a modest reduction in profit broadly flat.

Our Marine business is a mixed story in terms of performance in the first half. Order intake was strong at GBP 1.7 billion, included a GBP 0.8 billion enabling contract for the MoD, which contributes to the order book increase of 10%. Excluding submarines, order intake was up 4%. Top line growth was also good. Revenue increased by 16%, reflecting OE volumes in the Offshore sector and services growth in Offshore and Naval. Foreign exchange benefits made up 3% of growth. Profit performance was disappointing and decreased by 8% due to adverse revenue mix, pricing pressures, foreign sea costs, partially offset by cost-reduction and foreign exchange benefit. [indiscernible] remains encouraging and good order cover for the second half gives us confidence to [indiscernible] the full year guidance with modest growth to Marine's revenue and profit.

In Energy, there are some large percentage changes. Remember, numbers are small in the context of the group. We are clear that the performance of this segment is unacceptable. We continue to explore avenues to improve the returns in the segment. OE growth of 6% was driven by increased demand in Oil & Gas, and the 12% services growth was driven by higher spare part sales and better capture of market share. Profit was reduced by GBP 3 million, and we expect some improvement in Energy's profit for the full year.

Finally, turning to Power Systems, our new segment. Let's just remind ourselves that Power Systems was formally known as Engine Holding, comprises of our Bergen business and Tognum. This chart illustrates the relative size of the 2 businesses and the impact of Tognum moving from being equity accounted in 2012 before consolidation in 2013. As you can see, Tognum has no impact on revenues in 2012, and its profit contribution represents our share of profits after tax.

This chart shows the performance of Power Systems as if Tognum had been fully consolidated in both years, so to provide a trading comparison. Power Systems' order book increased by 14%, and new orders were up 8%. OE revenue was down 9% due to weak sales in onshore Oil & Gas, the U.S. frac-ing market is reducing gas prices resulting in lower investment in new projects.

Similarly, in the aftermarket, weak commodity prices are resulting in reduced activity in mining. The lower use of equipment is depressing spare parts sales. Profit reduced by 45% as a consequence of the revenue fall, prior [ph] R&D and some warranty adjustments. We expect the second half performance to improve. Based on strong order cover, we continue to guide Tognum's revenue and profit performance as broadly flat for the full year.

Turning to financial strength, we continue to place considerable importance on maintaining investment-grade rating, given the long-term nature of our business, and having strong liquidity. During the period, we took advantage of favorable market conditions to raise GBP 1 billion of new funds, which provides a combination of refinancing and capital for general corporate purposes.

So to wrap up, we continue to see good order flow and top line growth across the company. Profit growth reflects the benefit of volume in the IAE restructuring, with other largely one-off impact broadly offsetting each other. While some progress has been made on costs, there is still much to do, as there is around

cash generation, particularly working capital, while maintaining our full year group guidance of modest revenue growth and good profit growth, and cash flow of around breakeven.

With that, I'll hand back to John.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks so much, Mark. We're now very happy to take any questions that you have. Over to you.

Question and Answer

Operator

[Operator Instructions] Our first question is from the line of Rupinder Vig of Morgan Stanley.

Rupinder S. Vig

Morgan Stanley, Research Division

I've just got 2 questions, perhaps 1 for John and 1 for Mark. John, first, just a question around the Four Cs. You've talked about the progress that needs to be made on cost and cash. Can you just give us a bit more color around what's happened in terms of the concentration, if you like, you're not happy with the portfolio post the disposals in Energy? And in terms of customers, what progress is being made there? And second question perhaps for Mark, on the IAE, what should we be now thinking for the full year in terms of the IAE payment? And are there any expectations at this stage of any RFP from the second half of the year?

John F. Rishton

Former Chief Executive Officer and Executive Director

I'm very pleased that you've asked me about the other Cs rather than cost and cash. That's always a good start to any discussion. I think we've made good progress on customer. The organization is really starting to get that. We're starting to measure things well and the feedback that I'm hearing from our customers has improved, which is always welcome and reassuring. In terms of our performance, I just highlight several large engines. We've been up purchase order, 100%, all of this year on all the products. Marine, which was a drag as I think you're all well aware, the performance of those [ph] orders improved significantly. We're now well over 70% on time. You may remember that I've said in the past that if you look back 2 years, we're about 10%. Last year, we were running at 55% and we're now running at close to 75%. So good progress in terms of customer, in terms of delivery. Good performance, I think, in terms of quality. I think we've still got much more work to do in what I would call responsiveness to issues. So the nature of our business is such that there are always going to be issues. We need to respond much more rapidly and effectively to those issues and we're turning our attention to those. But overall, I'm very pleased with the progress we've made in terms of customer and the attention it's getting within the organization. In terms of concentration, I think that, for me, there were 2 parts of that. The first part is the one that you referred to, which is, if you like, around the portfolio. And I've been long clear, I think that the Energy portfolio didn't make much sense to me. It's quite clear from the results again this half that we've still got more work to do on that. Good news, within Energy is, we've made lots of progress in terms of the product, in terms of the customer. They're starting to really get the groups [ph] of the cost base. We've got much more work to do there. So we haven't finished our thinking on that yet, more thinking to do. And as in all businesses, we'll continue to address portfolio issues as we see them and as opportunities arise. And I think the sale of our 50% holding in the RTM322 helicopter is just evidence of opportunistic in some ways and a view that, that wasn't something we wanted to invest in at this point in time. So there will always going to be those kind of activities going on. Energy will be the area that I'm still most concerned about from the overall financial performance within the group. Again, nothing new for you there. And, in fact, you're probably bored of me saying that, but I can assure you lots of work going on behind the scenes. The other thing that concentration means within the group is, I want people to concentrate on doing their job to the best of their ability and not be distracted by other things. So there's 2 elements to it, and I think we're seeing some progress there. Mark, do you want to talk about IAE and revenue sharing partners?

Mark Morris

Former Chief Financial Officer and Executive Director

If I have to. Rupinder, I think I've got your question, which really was just looking, I guess, it's H1 and then the full year and trying to sort of gather to the guidance when we look at it. Profits at the group level of 32% and obviously, Civil, even higher. The IAE question really is a fading issue and of course, an impact

of comparing H1 with H1. So if we go back to 2012, we were under the -- as I refer to them, the old trading arrangements. And of course, if you recall, back then, we originally guided, I guess the estimation has gone up from then about GBP 140 million for the full year and obviously when it would have been updated, it became GBP 92 million for the half year. And of course, this year I'll give you some numbers of GBP 112 million for the first half. So I think as I said in my presentation, except a similar benefit for the full year and what -- in terms of just looking at phasing of how we bring those profit numbers back to where our guidance was, really, what you've got are some phasing issues, we've got the IAE impact that only happens in the first half and impact much less in the second half, and then phasing issues of entry fee receipts, which are front-end loaded and R&D charge, which rises in the second half. So those will bring those profit numbers more in line with the guidance that we've given. So hopefully, that answers your question, Rupinder.

Operator

The next question is from the line of Ben Fidler at Deutsche Bank.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

A few questions, if I could, please. Firstly, just to understand within Civil Aerospace some of the moving pieces driving the profit performance there. And I guess, specifically, if you're able to just give us a bit more detail of what the level of product launch costs were in Civil Aerospace and the restructuring costs there? Just trying to get a view of the true underlying progress that you're making, John, on the unit cost base.

John F. Rishton

Former Chief Executive Officer and Executive Director

Do you want to -- we'll look at your questions and then we'll [indiscernible].

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes, I'm afraid there's some more. The second one is, just to understand with your confidence level as to why Tognum's profit performance will be so second half-loaded this year and why there's such a second half improvement, just to understand your confidence around that. And the third question that I had is just around how -- your opening statements clearly talk about the progress you're making on cost and cash, but as you say in the press release, this will take time and firm resolve to deliver. What sort of timescale are we looking at to deliver those benefits in your mind?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, let me maybe hand over the Civil question to Mark. Or maybe, Mark, if you talk about Tognum as well, then I'll talk a little bit about the cost and cash? That's okay?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Yes. Look, in civil, we -- like I sort of highlighted, again, we had volume growth, you've got the IAE restructuring and we've got a number of things that we sort of put in Other. Product launch costs are sort of in the 10s of millions -- low 10s of millions. And on unit cost, I mean, we've had some progression on what I'll call indirect CNA, which will be around the sort of GBP 10 million mark, but not sort of getting into sort of breaking out all the other components that we've got in here. I mean, we'll just go down a rabbit hole, frankly. But I think the key point to say is we're seeing progression.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes, I mean, where I guess -- and thank you for some of those numbers you shared. Again, I'm not expecting you to give full disclosure of that. My question is really coming from, you had 6% revenue growth in Civil. If we strip out the increase in the IAE effect and increase in partnership receipts, arguably neither of which are trading items, you could argue. We have 6% revenue growth and the underlying profitability fell even before we start looking at what you put on the balance sheet on TotalCare, et cetera. Now just to understand what's going on in driving some of these unit costs, hence, my question about was it a big one, was it a big product launch cost? Was it a big restructuring cost? Because it looks like unit cost have clearly gone up quite significantly in Civil Aerospace?

John F. Rishton

Former Chief Executive Officer and Executive Director

What I would say, Ben, is that there's a lot of one-offs in the negative GBP 24 million. We've broken out of the IAE, you can clearly see the RRSPs. But my perspective is, it's pretty simple. We've got volume growth. We have the IAE benefit that we've broken out. Then there were a whole raft of broadly one-offs that broadly offset each other, which, if you conclude, you take on what I've just said, what it says is that we didn't make much progress on unit cost or costs within Aerospace. We've made some progress in other areas. The biggest issue that I have, if I sort of pick up your last question in terms of cost of cash, really centers around the Aerospace area, and it particularly centers around Civil. Defense actually did make some progress on cost and is working hard on it. So if I narrow down where we -- where I am least pleased with the progress, it is Civil Aerospace in terms of costs. There are other areas in Civil Aerospace where I'm very pleased with the progress and I gave you some examples in the response to customers. So in broad terms, cost progression in Aerospace is virtually nothing, and we have to address that because it is our biggest cost base and our biggest issue. And as I think I've said to a number of you at various times, when you get into sort of why is that, in part, it's just human nature, I'm afraid. So if you just talk a little bit about what's been going on, my simplistic story is that when you announce record profits, which we've just done again; when you announce record order book, which we've just done again; when you announced record everything, then people have a difficulty understanding why it is that I'm talking about costs. They really do have a difficulty. Now you guys kind of get it immediately. You look at things from a slightly different perspective to most people. If I break our company down, the defense guys kind of get the cost issue because there's something called sequestration in the U.S. and they've been through the spending review in the U.K. and they kind of get it and their world has changed. The Energy guys get it because of the environment that they're operating in. The Marine guys have started to get it and are making progress in terms of their cost reduction, as we have to, because we've got a very high cost base largely been based in Scandinavia, which is uncompetitive. So they get it. The area, understandably, that is struggling the most is the area where the growth and the benefits are -- a big growth, they're all flying through, which is Civil Aerospace, because Civil Aerospace is in a boom period. So what we did is, as again as you're well aware, is I've got a group of 6 senior managers to go away and look at this and come up with a whole lot of ideas. They finished their report. We've had a great discussion with those guys. We had a great discussion with Civil -- Civil management. Civil management are quite clear on the opportunities that exist within their business and there are significant opportunities. We are now grappling with the hardest part. So I've got people's heads of the management team in the right place. We've done a lot of work in terms of identifying opportunities. We're now moving to delivering the opportunities. Now in some businesses, and I've worked in some, it's pretty easy. I would suggest in the banking industry, it's usually pretty easy to reduce costs. You've got to know where your costs are, you just get rid of them. In our industry, particularly in Civil Aerospace, when you're dealing with gas turbine engines, and the biggest part of those costs are the engines, it isn't quite as easy. It takes engineering resource, it takes time, energy, effort, you've got to go through simulator reviews. Some of the cost benefits are associated with how can you get longer on-wing service to reduce servicing costs. Some of the benefits are around how do we drive repairs into our services business rather than replacement, which is something we are comparatively weaker relative to our competition. Now there's lots of opportunity there, but it takes time. Other areas, and Mark mentioned one, our indirect cost-reduction program, we're making progress on that. But frankly, you don't see any benefit of that because we've got a restructuring cost, which offsets the financial benefits at this point, but they'll flow through at some point in the future. So in simple terms, if you're looking for cost benefit, your cost performance in Aerospace, you're not going to find much. So that's the short answer to -- or a long answer, I should say, to your simple question.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

That's a very interesting answer. And I guess, I think, just drilling down a bit further with that question. So in terms of timescale, and how long does that take to push through that scale of cultural change and the inevitable scale of restructuring change in what is a very complex business and supply chain in Civil Aerospace? I mean, is that a 2-year -- is it 2 years? Is it 5 years? When do you think you'll start to really see benefits come through?

John F. Rishton

Former Chief Executive Officer and Executive Director

You're sitting in my board meeting yesterday?

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

I was actually, yes. But I'm small, so I'm easily missed.

John F. Rishton

Former Chief Executive Officer and Executive Director

Because as you would expect the civil questions are getting asked there. And rather conversely, the guy who sort of has a reputation for cost and cash management sort of [indiscernible] him away, that happened overnight. I think the answer, Ben, is back in what I was saying about the complexity of the changes that we need to make here that will determine the start. As you might well expect, I'm not going to get hung up on a timescale on this. What I can do is absolutely assure you that it has a lot of attention at the moment and we are determined, I am determined, Mark is determined, the management team in Aerospace is determined, to make progress, because it is affecting what we can do and where we can invest, as is the cash performance. But people are starting to understand that, they're starting to understand, that if we don't improve our cost of cash performance, we can't invest as much as we want in new products and do the things we want to do in terms of people, trading, infrastructure, products, all those kinds of things. So I'm not going to get on a hook in terms of a week on Friday, but it's going to take us some time. It's hard.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. You had one other question, Ben, we rambled around. Probably one [indiscernible], so you had a question around...

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Just Tognum, the confidence level around, obviously, there's a very big improvement that needs to be delivered in H2. You mentioned R&D phasing. Is that -- I was just understanding why you're so confident on what has got to be a big step-up in the second half that it will be delivered?

Mark Morris

Former Chief Financial Officer and Executive Director

This is a much shorter cycle business. They have got good order coverage that go into the second half. And again, this is very much a higher-volume business, obviously it helps on the overhead recovery. We've got some phasing on R&D, and obviously, we had some warrant adjustments in the first half, which won't repeat in the second half. So those are the sort of things as to why we're confident that Tognum will end up consistent with guidance we originally gave.

John F. Rishton

Former Chief Executive Officer and Executive Director

Ben, what we've seen in that business is, the first part of the year was dreadful and it's been improving ever since. So the trend is -- gives us confidence as well. And that's what you've sort of seen. If you look at the direct competitors with Tognum, you look at their kind of results, you saw the same kind of thing in their first quarter and second quarter results. So the trend is positive. Order book -- their order coverage is high. The management team at Tognum, I think, understood the realities to the pricing at the start of the year, which means we don't have to change guidance, but I think they got it right the first time around.

Operator

Our next question is from the line of Robert Stallard at RBC.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

I just got a couple of questions on the aftermarket, if that's okay. In Civil, I was wondering if you could give us some idea of what Trent was up in the quarter and how that contrasted with the RB211 aftermarket?

Mark Morris

Former Chief Financial Officer and Executive Director

Look, we don't sort of break out individual engine programs. I mean, as you'll take from the numbers, the aftermarket was up 3%, broadly in line with our thrust base. I mean, within that, obviously in aftermarket revenues, we've got a combination of T&M and long-term service agreements. And within that, of course, we've got our product range, some of which are new and young coming on and building up in terms of LTSAs and so forth, and some of which, that are coming now to the end of their lifecycle and you've referenced to some of them in the RB211. What I would say on RB211 is that the 535 continues to perform well. And of course, as you'd expect, we try and manage the lifecycle to extend life. And whilst as aircraft get parked and engines come off, we also have a part of our business, which we call parts trading, which we'll tie-up parts to help reduce overhauls and extend their lives. On the RB211, so the 767 fleet and the old 747 fleet, of course, they are older and much smaller fleet, so the impacts are much smaller. But by and large, and as we've guided, when you look at H1 versus H2, Civil, as well as every other division, will see growth in revenues in H2, both at the OE level and at the aftermarket level.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

And do you expect that aftermarket growth to accelerate in the second half or be similar to what we've seen in the first half?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, I think we've given our view of revenue guidance for the year, I'm not going to start breaking out. All I've said is it's higher than the first half in terms of absolute revenues.

Carter Copeland

Barclays Bank PLC, Research Division

Okay. And then on the defense side, you mentioned that there's a lot of uncertainty here. But the defense aftermarket here, how do you expect this to progress given this lack of visibility? Is it possible to say, we expect this to be similar in the second half or could it possibly be down?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, I mean, like I said -- I mean all of our divisions, we are expecting for H2, have higher revenues than H1, both at the OE and aftermarket level. And again, I don't want to assume they're massive swings, but I mean, again, we generally tend to have a bit of a bias in general between in H1 and H2. And in certain

cases, and particularly when we're dealing with government bodies and quasi-government bodies, in terms of buying, that there tends to be some behavioral activity that they with their budgets at beginning of the year and they're very cautious, then they sort of try and make sure they spend them by the end of the year. So you've got a little bit of that behavior in some areas and defense, I guess, is no exception. Of course, with the continuing uncertainty around sequestration and just generally austerity measures in defense, I think, as I alluded to in our results, maybe there's some [ph] suppressed flying hours in the first half, that may change slightly in the second.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Okay. And then just finally on Energy, you mentioned that there's still work to be done. Are you contemplating some -- gross level mechanical action here like potentially selling or spinning off or joint venturing some of the businesses here?

John F. Rishton

Former Chief Executive Officer and Executive Director

We're not going to get towards any specifics. But what I've said and what you've all told me and whatever everybody knows, is that the financial performance of that segment is totally unacceptable, and we need to address that. There are a whole raft of things, as I said, that we've already done in terms of improving the product, improving our customer position, reducing our costs, improving deliveries, all these kind of things that are going on, we have to address those issues. You could break the Energy down into it's 2 main parts, but those are the issues. Fuel -- Oil & Gas is a good business, as I've said, on a number of times, but it's small. We had a good market share. It's basically us and GE. If there's [indiscernible], Power Generation is much troublesome for us in terms of financials, where we are a tiny, tiny, tiny flare. We're looking at what we should or shouldn't do, how we could or couldn't do it, and when we've got our minds around that, we'll let you know.

Operator

Our next question is from the line of Nick Cunningham at Agency Partners.

Nick Cunningham

I think it falls to me to ask some of the nerdy rather than the philosophical questions. An elephant issue as far as the margin outcome in Civil is concerned, is the mix between the linked and unlinked engine sales. And judging from the big rise in the TotalCare in Civil and the very small rise in capitalized engine cost, it was mostly linked in the first half. Is that going to continue to be the case for the rest of the year? And is there any indication as to how that's going to look next year? And also just to clarify on IAE and the entry fee receipts, I think what you're saying is that you've had most of them for the year, there will only be a little in the second half, I just want to make sure I got that right. And then final detailed question, just I've sort of lost track of what the basis is for Tognum in saying that you're going to do something similar this year compared to last year. So would you just be able to clarify what last year's basis was?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, let me just answer in reverse order for a second. So the Tognum stuff that's actually on the charts we showed you -- the second to last chart, which shows how Power Systems, what I'll call Tognum -- with Tognum at 100% trading. And what we've said is that we were guiding revenues and profits broadly flat. And if you want, I can give you the breakout for those, which revenues -- I mean, broadly around about GBP 1.3 billion -- sorry, for the full year. Are you looking at the full year?

Nick Cunningham

Yes, yes.

Mark Morris

Former Chief Financial Officer and Executive Director

Give me one second here. Let me get that for you in a moment, I'll just answer the other questions. So your second question. So what was your second question?

Nick Cunningham

It was -- I was looking at just clarifying the IAE and entry fee receipts, the --

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, your assumption was right on question 2, yes. Most of it is particularly in the first half.

Nick Cunningham

And then the linked and the unlinked ratio?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. Okay, so in terms of the net TCA debt, yes, it's risen. And again, you remember, there are 2 components to that. We've got the combination of more engine deliveries. And again, with the linked, we get the benefit of -- or we get the impact of, clearly, revenue ahead of cash, which builds up a deficit [ph]. But on the flip side of that, shop visits will obviously drive down the trade credits and it's really a combination of those. And I think your question was relating to is, has there been a bias towards linked versus REC? And the answer in the first half is, yes. And I don't want to sort of get into specifics of next what happens in H2 and then what happens in next year. And I think you're aware, Nick, that obviously it relates to XWB. As the volumes grow there, that will -- tend to be REC accounted rather than accounted just because of the nature of the contract we have with Airbus there. And obviously, as those grow, then you can expect some increases in RECs versus linked. For the full year, so just to give you some broad picture on Tognum's revenues, last year, they're about GBP 3 billion and profit of around about GBP 300 million. And again, we've guided flat for the year, so the same again, effectively for Tognum 100% level.

Operator

Our next question is from the line of Andrew Gollan at Investec.

Andrew Paul Gollan

Investec Bank plc, Research Division

Just to extend -- or 2 questions really. First on Civil aftermarket and to extend I think what Rob was asking earlier on. The growth year-on-year was 3% in the aftermarket, could you perhaps give us a split between -- or rough split between Tognum materials and LTSA? That will be quite helpful. That's the first one. Second one, again, a clarification on the IAE guidance for the full year. Are we talking about roughly GBP 200 million versus the GBP 140 million that you've talked about a year or so ago? And the other sort of sub-question to the IAE number, can you explain what's exactly going on relative to your expectations, I guess, in terms of supplying parts into the V2500 build program or some parts into the spares system? Just explain why it is outperforming by so much.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. So a couple of questions. The issue around IAE, I mean, again, I've given you sort of guidance or indicators for the full year, so similar effect for the full year. So I guess, around about GBP 200 million will give you the flavor. Your last question was?

Andrew Paul Gollan

Investec Bank plc, Research Division

The last question relates to IAE was why that is so outperforming where we thought we were 1.5 years ago in the context of what's going on within the sort of build program and the spares environment?

John F. Rishton

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Former Chief Executive Officer and Executive Director

Okay. In terms of -- I mean, it always reflected the amount of part sales and the type of part sales and therefore the type of margins that we make. We make estimates, but obviously spare parts sales are relatively short term, they're sort of typically on sort of 30 days, sometimes lead time even less. It's just a question of what's happening both in T&M and the LTSA market as to what can drive that. And in effect, we've sort of under-called in the past what those are. And of course, the other part of this is there is some transfers that are ongoing between us and UTC. And we've assumed the timeline for that. Some of those timelines have sort of moved a little bit to the right, so there is some stuff we're doing more that eventually we won't be doing. But again, all of those is factored in. So it's really a combination of -- the volumes are a little bit higher. The types of parts you sold make slightly better margins. Some of the work transfer that was destined to go on a certain schedule is delayed a little bit. Your first question --

Andrew Paul Gollan

Investec Bank plc, Research Division

I'm sorry, can I just ask then, do we expect a sort of similar rates of fade from the sort of 200 or so annual number we were talking about?

John F. Rishton

Former Chief Executive Officer and Executive Director

Look, when we reach the -- I'm not going to give multiyear guidance. But when we originally raised the IAE effect, what we said is, we're going to get an uplift in profit, reflecting the revised trading arrangements. And again, just to clarify what they are, in effect, we've gone from being an equity partner to a supplier. We continue to make parts. We've made -- we continue to assemble engines, and we've achieved a number of -- a value of dollars per engine flying hour on the installed fleet at the point-of-sale. So those are the sort of revenue sources. And what we've said is, yes, eventually it will start to drift down. But for the first few years, it will sort of remain relatively flat. Your first question, just to come back to it because I didn't write it down, was the split between T&M and LTSA. I mean, I'm not going to get down into sort of individual breakdowns. What I will say is that our T&M and LTSA between them, if I look at H1 to H1, was slightly up on T&M in the first half. I expect it to be slightly less in the second half, but it will -- could be more than compensated by LTSA revenue in H2. And that's why we continue to see revenue growth and higher revenues in H2 on aftermarket for Civil.

Operator

[Operator Instructions] And we go over to the line of Olivier Brochet of Exane BNP Paribas.

Olivier Brochet

Exane BNP Paribas, Research Division

I would like to focus on 3 questions, if I may. The first one is on warranties. You mentioned that a couple of times in the prepared remarks, could you put some more flesh on that for Marine and Tognum? Is there any lumps that we should be aware of there? Second question is on Tognum. Can you update us on the -- your view on the synergies and business opportunities that you found now that you're in complete control of the company, any good or bad surprises there? And third, on inventory and working capital, you clearly look displeased or even upset about the performance in H1. What has exactly been slipping, what has been missed, what will you be doing different now?

John F. Rishton

Former Chief Executive Officer and Executive Director

Let me take a couple of those, maybe ask Mark to comment as well. In terms of inventory, you're correct. Here's what I would say, there are a number of elements to it. First, I think in some ways, most important, we've been driving to improve our customer performance. And our customer performance has been 4 in the past. And I gave 2 examples to an earlier question where Civil at 100% -- large engines at 100% and Marine increasing from 10% to 55% to over 75%. One of the ways that we've achieved that is inevitably, the obvious way, which is we've put more inventory into the system to make sure that we

don't let our customers down. So that's part of it. What we were unable to do is to drive the performance better, so that we have more confidence for the moment in the supply chain. So we're getting there. Supply chain performance has improved significantly, but it hasn't reached the tipping point whereby the inventories are starting to flow through the system more efficiently and effectively. So in simple terms, I'll put more inventory in to protect the customers; supply chain performance has improved, but it isn't yet at the point where we can reduce the inventory offering and still protect our customers, but we're getting closer to it. The second point is, the overall management of inventory within the company, if I could take that as a big bucket. So we've -- we've set up an aerospace organization and we're still working through that. So whilst we announced that some time ago, the beginning of the year, anybody who's been involved in large organization changes know that it takes some time. But we're getting down to some of the really important elements in terms of inventory control and the actual individuals responsible for ordering, managing stocks within each individual plant. And we've got to centralize that because at the moment, that's still done at a plant level. And in my experience, if that's the case, you never got control over inventory, you need to get control over it at a central level because what the plants really are still interested in is making sure they don't get beaten up for nonproduction, so they buffer on the buffer on the buffer. So in simple terms, those are some of the main issues that are going on. And that's why it takes time to get to, and why it requires more patience. In terms of Tognum, on the synergies side, yes, we are -- we've been through the synergies side. I think what I would say, I'm not sure I said this before, it is clear there are more benefits in terms of Marine than there are on the Energy side. We're comfortable -- there are synergy. We're comfortable that the acquisition is a sensible one. We are pleased with the program and the progress they're making. Clearly, they have a lot to do with the integration of Bergen into their business. We're already getting benefits from their expertise associated with our Bergen Engines in terms of R&D, in terms of knowledge of the missions, in terms of that technical expertise, and we're starting to see some benefits in terms of sales. We've still got a lot more work to do on that area. And whilst Tognum has been around for 2 years, management control has only been for 6 months, but we're working hard on that now, and that's going, I think, as well as I would expect. Warranties, Mark, I don't know if you want to make any comments on warranties?

Mark Morris

Former Chief Financial Officer and Executive Director

No, not really. We don't break out individual components of warranty. I mean, what I did allude to, obviously, in the presentation were the 2 areas where we increased warranty loss were really around Tognum and B.

Olivier Brochet

Exane BNP Paribas, Research Division

But there's no big lumps that we should be aware of?

Mark Morris

Former Chief Financial Officer and Executive Director

No, I mean, look, it contributed to the movements in profits in terms of affecting adversely though. But -- I don't think there was some sort of material sort of overly stated -- overly sized adjustments, but there was an increase.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, quite my normally, warranty costs rise and sink, and that's just part of the business cycle.

Olivier Brochet

Exane BNP Paribas, Research Division

What I was aiming at is, is it something that we should be thinking of continuing in the future or?

Mark Morris

Former Chief Financial Officer and Executive Director

I hope not.

John F. Rishton

Former Chief Executive Officer and Executive Director

If you [indiscernible] -- it's how do I improve my performance to customers? And one of the ways I do that is by making sure the products have the right quality, and it works right the first time. So hopefully, we should get some benefits. But again, they take a long time to flow through.

Operator

Our next question is from the line of Celine Fornaro of Bank of America.

Celine Fornaro

BofA Merrill Lynch, Research Division

My question will be on the Marine weak performance on this first half of the year, because even if we compare it historically, I mean, you used to have the Bergen business, which was slightly below the division margin and now it's been carved out. So how should we think about the margin progress in the H2? And also, when I look at the big increase in the order book in this division, how is the pricing? Is there a risk study of being trading sales for pricing and shall we see that coming through quicker because these orders or this order book is not as lengthy as it used to be 2, 3 years ago?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. The first thing to say and as I sort of said in the presentation, we're disappointed with profit performance in Marine in H1. There are a number of reasons for that, that I alluded to. I mean a combination of adverse mix, warranty charges, we've just talked about and against, interestingly, some foreign exchange benefit and unit costs. Again, better mix in the second half, good order cover, some non-repeats, some of the one-offs gives us the confidence that's where we'll be. And like I think John alluded to when he gave a sort of broader overview of Marine, I mean there's sort of 3 basic segments in there: Offshore, Merchant and Naval. Offshore, we're seeing some encouraging signs in terms of bid activity and it's certainly as we look into H2. Services revenue growth has got good opportunity. Build up more networks there and that gives us more access. The Merchant business still remains pretty much in the doldrums. But it's only about 20% of the total size of Marine. And Naval, I mean, interesting to watch is sort of you'd argue or sit in terms of defense behavioral patterns. It performed slightly better, certainly in terms of what we've seen this year and for the rest of the year that we're looking for. So I think that's a sort of quick summary of Marine both in terms of what we see profit progression and revenues.

Celine Fornaro

BofA Merrill Lynch, Research Division

But in Offshore, can I just -- I mean do you continue to see a pricing pressure in the Offshore environment?

Mark Morris

Former Chief Financial Officer and Executive Director

Absolutely. I mean, look, it's a tough market. We're seeing, interestingly, a move certainly on things like OSVs to slightly larger ones, which gives us the opportunity to quote for more types of equipment on those vessels. But, yes, it's a tough environment. And I would say that active price pressure more than offsets unit cost even though they've made good progress on unit costs.

Celine Fornaro

BofA Merrill Lynch, Research Division

And my second question would be if you could split -- looking out, you've done that in the past on the service growth in the Civil Aerospace division. If you could give us an idea on how much was Time & Material, and how much was TotalCare on the 3% growth number?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, again, we don't normally break that out. I've actually got it to hand. I'm sure we can give you that number if you need it.

Operator

Our next question is from the line of Sandy Morris at Jefferies.

Sandy Morris

Jefferies LLC, Research Division

A slightly simplistic question, but if I look at Civil Aerospace and I look at engine deliveries in this first half, what we appear to have is nice volume growth on BizJets, and so [indiscernible] in Germany. When you say there was a sort of a GBP 103 million, whatever it was, volume benefit, I'm assuming that it rises. In the meantime, in terms of large engines, we're sort of marking time. And is that the right way to sort of look at it? A big chunk of the business is doing just fine and enjoying strong volumes growth, and the rest of it is still kind of sitting there poised to go at some point, or is that just too simplistic?

Mark Morris

Former Chief Financial Officer and Executive Director

No, I think, as you say, Sandy, I mean, there's an element of truth in that. We've talked about XWB in terms of when you look at our investments, we're looking to double capacity for Trent. The XWBs haven't come online yet, and of course you know there's a huge order book. So this year has been one where, yes, of course, in some divisions, we've got more growth in units. But Trent totally for the year, will be similar numbers to last year. And of course, we're just getting ready for the growth that we'll see -- that starts in 2014.

John F. Rishton

Former Chief Executive Officer and Executive Director

I think you surmised it very well, Sandy, I think -- and Mark's point is right. So you break it down to the engine types, is you kind of see Trent 700 continuing to do well. You're seeing slow and good growth coming in Trent 1000; XWB, yet to come; and a slowdown in Trent 900s, which is exactly what you'd expect based on the aircraft sales. And the growth that we're going to get in Trent, which is evident from the order book, but as Mark says, 90% of the order book related to Trent is yet to come. They will come as the volume of Trent 1000s for 787 grows as the aircraft sells more. I'm sure it will. And it will come even more when the A350 comes online and starts to sell, as it will. So that's what really drives the volume growth. So one of the issues that we as the company grapple with terms of costs is managing the preparation of significant growth in large Civil engines, which hasn't happened yet, but will happen. While we're trying to manage our costs against that future -- the future what we've got to do in the current environment. So you're -- if the summary described as simplistic is exactly right.

Roger Peter Johnston

Edison Investment Research Limited

I mean, I'm not trying to be sort of glass half-full or empty here. It's just, I mean, your comments about driving cash and costs, I think, are generally welcome and I think we appreciate it takes time. How happy are you, though, that when the volumes go up, they won't just absorb cash to keep the comfort zone? And do you think costs are getting to the right place? I mean, I understand that you want to keep the pressure on, but is it a worry or is it just...

John F. Rishton

Former Chief Executive Officer and Executive Director

I don't like worrying about it, if that's what you mean. I think we'll make progress. I think if you work in a company that's shrinking, getting costs out is one thing because people see a clear and present danger. Getting you out in a growing company is about how do you manage the cost expansion relative

to the growth. And as I said, to someone earlier today, what we have been doing which was not smart was allowing our costs to grow ahead of the volume increases. In some areas, that's inevitably the case. Building Singapore, we don't need much of Singapore at the moment, going to build 50 engines there this year. But at some point in the foreseeable future, we've going to have one a day. So I have to let those costs increase ahead of the volume because otherwise I haven't got capacity. Some of the fixed cost apparently weren't fixed in this company, we've got to make sure that we nail those down. We've got to get ourselves into this cost mentality is what I would say, Sandy, which is, we're grappling with, particularly in the Civil businesses, I was explaining earlier, so that we are well placed to be much more efficient, much more cost competitive, and therefore, much more profitable, so we can invest in people, products, infrastructure, price, whatever it happens to be. That's what we're trying to do.

Operator

As there are no further questions, gentlemen, may I please return the conference for you to close.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks very much for joining us this morning. I hope you found the call useful. It's always a pleasure to talk to you every half-year or so on the results. We look forward to speaking to you early in the next year about the full year results. Thanks very much.

Operator

This now concludes the call. Thank you all very much for attending. You may now disconnect your lines.

Good day, and welcome to the Rolls-Royce Holdings plc 2012 Full Year Results Fixed Income Conference Call. Today's conference is being recorded.

At this time, I would like to turn the conference over to Mr. Mark Morris. Please go ahead, sir.

Mark Morris

Former Chief Financial Officer and Executive Director

Well, good afternoon, good evening, good morning wherever you are. I thought what I'll do is just maybe give a quick summary. I suspect most of you by now have seen the press release and maybe some of the presentations, maybe listened into the prelims analyst session we had this morning. So I'll just sort of pick out really a few things.

I think the first thing to say is that I believe it's been a good year for us. We certainly delivered on our guidance. The order book is up at GBP 60.1 billion against the backdrop of relatively uncertain macroeconomic climate, and of course, the order book is what gives us the visibility and confidence to continue investing to meet the rising load. Revenues were up 8% to GBP 12.2 billion, and core profit before tax was up 12% to GBP 1.26 billion, excluding Tognum and IAE, and I'll talk a little about those in a minute. Underlying profit before tax was up 24% to GBP 1.43 billion, including Tognum and IAE. So again, the effects there is sort of, in that total 24%, 12% from the core business and 12% from the recent transaction activity we've had with Tognum and IAE.

The key point really here is we've seen some margin progression, better margins, up to 12.2%, so that's a 1.5 percentage point progression. And you'll recall certainly that John and I are very focused on looking at cost and bottom line margin progression. Of course, we're a long-cycle business, so these things sort of don't happen overnight, but it was pleasing to see some movement in that area. Of that 1.5 percentage point progression, about 0.4% is from the underlying business and 1.1% is from the effects of -- trading effects from now Tognum and IAE. They do distort a little bit in the sense that because Tognum is equity accounted, it has no contribution to revenue, so therefore, sort of exacerbates part of that. But nonetheless, good performance, good progression.

You'll be aware that last year, we concluded the IAE transaction at the half-year, resulted in about a \$1.5 billion of proceeds or GBP 940 million or so, which we took back in June and profits -- the one-off profits at the time of about GBP 700 million. With the revised trading arrangements, the guidance we gave back in 2012 was that we would expect to see about GBP 140 million for the full year or GBP 70 million for the half-year, which is, of course, when the transaction concluded, and we ended up with about GBP 92 million, so slightly better than we thought, really reflecting higher part sales and more profitable part sales, so slightly higher than the estimates that we had.

Tognum, you're aware, is a joint venture acquisition we've made with Daimler. That progresses, and it contributed last year GBP 77 million in terms of equity contribution to us, maybe profits. And as of this year, starting in January 1, we will look to consolidate Tognum fully into our accounts.

So I think that's the sort of background. Maybe I should just sort of summarize by saying that when I look across each of our segments, that sort of Civil and Defense had a good year and sort of more subdued performances from our Marine and Energy businesses, just reflecting shorter order cycles and more volatility around original equipment and the rates and pace at which customers are making those decisions and when they have made them, the pace at which they're then taking and paying for them.

But nonetheless, I think the trends look promising. For 2013, we've guided the market with modest revenue growth, good profit growth and cash flow around breakeven. And I guess, looking to -- most of the analyst commentary that we had this morning tended to focus around cash flow and certainly their perception, the lack of cash generation. I think it's sort of, first, important to say that we are where we are

and where we've expected to be in the investment cycle. This is a long-term business. We've got a \$60 billion order book, and we're developing -- delivering 2,000 Trent engines over the next 5 years. And just to put that into perspective, it's taken us 15 years to deliver the last 2,000.

So we're ramping up facilities to ensure we can meet the volume rise and deliver on our commitments to customers because that damages our reputation and gives us financial penalties if we don't, and of course, we need to be ahead of the curve. It's not just about building a few facilities that we've got in Singapore, in the U.S., the ones that normally get flagged out. There's continual refresh of our facilities as we implement modern working practices and look to restructure operations to be more efficient and help drive bottom line margin progression, so that's ongoing. As I've said, we've guided, back in 2012, breakeven. We've ended up with GBP 137 million inflows, so slightly better than where we thought we would be. But we continue to invest to meet the rising load.

I think, just turning quickly to Defense, a lot of surprise the Defense business had performed as well as it did. And again, we did guide the market last year that Defense would have quite a good year in 2012, driven by engine flying hours, predominantly from our transport sector and export sales opportunities. What I mean export sales, this sort of beyond our normal markets of the U.S. and the U.K. and some of the other NATO countries. We're generally taking product that was developed for our core countries and it's being now exported to other countries as well, and we generally make better margins on those.

Nonetheless, I think the defense landscape looks pretty uncertain as we look forward into 2013, lots of budgetary constraints and sequestration and so forth. And of course, accordingly, we're not immune from that. We expect to see lower opportunities, and we expect to see lower flying hours. And of course, on the back of that, we've guided that profits will reduce slightly, although from a higher base than which most of the market was starting from.

Energy, I think just briefly. I mean, this is a business where we have really a very good Oil & Gas business, and it generates about 2/3 of the turnover or almost all of the profits. But its performance is then dragged down by the investment we have in less mature and immature technologies that we've had in the power generation, Civil Nuclear as we seek to build that up and our tidal and fuel cells business, both of which now -- the tidal business has been sold, and we sold a 51% stake in our fuel cell business as we seek to focus on the key areas that we do want to grow. So as we look into 2013, we expect the Energy business to perform better, obviously less drags from having the 2 business effectively having been removed, lower R&D also from those parts as well. But of course, we'll continue to invest in Civil Nuclear. So I think that's a quick sort of go round the houses of the segments. And not to try and take up too much of your time with stuff that you've already read, maybe I'll stop there and open up for questions.

Question and Answer

Operator

[Operator Instructions] We will now take our first question from Stephen Smith [ph] of Thomson Financial.

We will now move on to our next questioner, Michie Yana of ECM.

Michie Yana

Wells Fargo Asset Management (International) Limited

My apologies because I didn't have a chance to listen to the earlier equity call, but 2 questions, if I may. Is it possible to give us a color on what implications you might have from the 787 being grounded? And my second question is -- again, my apologies if there were some slides on the appendix or in the reports, but can you just comment about any P&L and balance sheet implication from the change in the pension accounting?

Mark Morris

Former Chief Financial Officer and Executive Director

Right. So 2 questions. Let's start with the 787 first. The 787 grounding certainly, as it currently sits, will have minimal impact on us. If we just rewind ourselves for a second, this is obviously a relatively young program. There are only 22 of our powered aircraft currently in service. And just to put that in context, we've got about 12,000 civil aircraft engines in service, so 24 [ph] engines over 12,000 is a fairly small amount and of course, they're early into their days in terms of requiring overhauls and so forth. So the short answer is a sort of 1-month, 3-month, 6-month grounding has very limited impact to us in terms of loss of revenue and inventory buildup. And in fact, we continue to deliver engines to Boeing, and Boeing continues to produce 787 aircraft at the moment. I mean, obviously, to the extent that 6 months becomes a year or whatever, and we have no idea how long it will be, then, of course, it will start to have a small impact. I think related to -- I didn't quite catch all of it. Was it around pensions and implications?

Michie Yana

Wells Fargo Asset Management (International) Limited

Yes. That's correct, yes.

Mark Morris

Former Chief Financial Officer and Executive Director

Sorry, what was the particular question? If you could just say it again a bit more slowly, I didn't quite catch it.

Michie Yana

Wells Fargo Asset Management (International) Limited

I'm sorry. If there was any implication from pension accounting changes.

Mark Morris

Former Chief Financial Officer and Executive Director

Short answer, for us, is there have been some, but we strip them out of our underlying numbers because there's sort of revaluation effects. So when we think about pension is we think about sort of about 2 things. One is what is the cash contribution that the companies are making, and that's purely driven by the actuarial valuations that we have 3 every years. And then, of course, we have the accounting noise from IFRS. And there's been a number of changes that have happened over the last few years. So one of them was the move in the U.K. from RPI to CPI, which had some effects in terms of what we were recording. And secondly, there's been a change just recently on IAS 19. I can't remember the exact name of the part of it now, but it talks about using a AA discounted bond rate to effectively value both assets and liabilities, so the net deficit or the net surplus. Whereas, pre this change, most companies would value

their assets on expected returns, while using the AA curve just for liabilities. And that was done for very good reasons. It was that it is quite easy for companies to artificially inflate their profits by whatever their estimations on what their return on assets. In our case, we have a pretty much matched asset and liability profile. We've moved progressively from equities, which were about 75% of the portfolio 10 years ago, to around about 12% now. And the rest is in what we call LDI, liabilities-driven investments, which pretty much correlate and match the underlying liabilities. So in effect, applying this accounting treatment has relatively smaller effect on us than it does on many others. But as I say, we strip any of those effects between our reported and underlying numbers out because, again, it's just sort of accounting noises, I'll call it.

Operator

[Operator Instructions] We have no questions at this time. [Operator Instructions] We have no further questions at this time.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Well, maybe I'll just wrap up by saying thank you for attending the call. Like I said, we feel it's been a good year for 2012, and I think we sort of set the scene and tempo for 2013. So with that, I'll say thank you, and goodbye.

Operator

That will conclude today's conference call. Thank you for your participation, ladies and gentlemen. You may now disconnect.

Presentation

John F. Rishton

Former Chief Executive Officer and Executive Director

Good morning. Thank you for joining us today. Let me start by introducing my colleagues from the board. Mark Morris, our Chief Financial Officer; Colin Smith, Director of Engineering and Technology; and Jim Guyette, President of Rolls-Royce North America. I'm going to give you a brief overview, then Mark will take you through the numbers, and then we'll have Q&A.

I would like to start by saying a few words about our Chairman, Simon Robertson, who I know is in the audience today. Many of you will have seen that he's going to retire from Rolls-Royce at our Annual General Meeting in May. Simon has made an exceptional contribution over the past 8 years. He's worked tirelessly on behalf of the company and his energy and enthusiasm have been an example to us all. I wish him every success in the future. I'm delighted to welcome Ian Davis as our new Chairman and look forward to working closely with him.

Now turning to the results. The order book is up 4% to GBP 60.1 billion, adjusted for the sale of IAE. Underlying revenue is up 8% to GBP 12.2 billion, underlying profit up 24% to GBP 1.4 billion with margins improving by 150 basis points to 12.2%. Payment to shareholders, up 11% to 19.5p. These results are a tribute to the hard work and dedication of everyone at Rolls-Royce, to the support of our partners and suppliers, and most important of all, to our customers, who continue to place their trust in our technology.

You'll have heard me say before, but it is worth repeating that this is a long-term business. And while a year may seem a long time, I think you get a far better view if you look at the performance over a longer period, both back and forward. I'm pleased to say that today's results add to a record of consistent delivery that has been established over the past decade.

Revenue, order book and profit have all increased steadily for the last 10 years. Over that period, revenue has doubled, the order book has tripled, and the profits have more than quadrupled. In the same time, the share price has risen just over GBP 1 in January 2003 to GBP 9.84 at last night's close, and we've more than doubled our payment to shareholders.

The strategy that has produced that decade of growth has been consistent and has proved itself in battle. During the last year, we've reflected on how we express our strategy. And as you can see, we've made some changes. In particular, we make it crystal clear that the customer is at the heart of our business. We have sophisticated customers with a deep understanding of our technology. Our success depends on shaping and meeting their requirements on time, at the right price and at the right quality. Innovation is critical in creating future opportunities. For example, the Trent 1000-TEN will offer up to 3% fuel improvement when it enters service in 2016, while the Trent XWB is proving itself to be the most efficient large jet engine in the world. To put it simply, we need to be world-class in terms of understanding and satisfying our customers' needs, and we need to be world-class at innovation and execution. And of course, we need to grow profitably, not just grow.

I said at last year's results presentation that the business has 3 priorities: deliver on the promises we've made, decide where to grow and where not to, and improve financial performance. I categorize these into the 4 Cs of customer, concentration or focus, cost and cash. So let me say a few words about each of these priorities.

Delivering promises is principally about our customers, although it can clearly be applied to all of our stakeholders. During the year, we have worked hard to improve quality and delivery. We've made particularly good progress within civil large engines and Marine, but there's still a lot to do. In terms of products, I'm delighted with the progress of the Trent XWB engine for the Airbus A350. The XWB was certified last week, and the engines for the first A350 have been delivered. Our Trent 1000 engine has had the best entry into service we have had, and we continue to work on improving it.

Growth. You can see where we have chosen to grow from the investments we have made. Just a few examples are our acquisition of AEC, the XWB and the BR725 programs, the expansion of our Civil Nuclear business, the growth of our global network of marine service centers, along with 19 new facilities we have opened around the world in the past 3 years. Where we have chosen not to grow, as you know, we have sold our Tidal business and the majority stake in our fuel cells business. While these businesses may both prove to be successful, they did not play to our strengths.

Financial performance. We've increased profits and improved margins in 2012. And the good news is we have plenty of opportunities for further progress. We need to increase sales and continue to drive cost performance to make sure that we are not just growing, but improving our margins as well. In terms of cash, clearly reducing our costs will help, but there is also significant scope to improve inventory turns.

So while I'm pleased with the overall progress in 2012, we can deliver much more. But this will take time and will need to be carefully managed. Therefore, it should not surprise you to learn that our priorities for 2013 are unchanged from 2012: deliver on the promises we have made, decide where to grow and where not to, and improve financial performance.

Mark will now take us through the numbers.

Mark Morris

Former Chief Financial Officer and Executive Director

Thanks, John, and good morning to you, all. I'm going to draw out the main highlights of the group and segmented performance for 2012. I'll then provide 2013 guidance for the group. This will exclude the impact of Tognum while it continues to remain listed. Finally, I'll update you on where we are with Tognum. As usual, I will restrict my comments to the underlying performance.

It's been a good year for the group with the order book, revenue and profit all growing. At a segmental level, I would summarize 2012 performance like this: Civil and defense both had a good year with more subdued performances for Marine and Energy.

Turning to the group, the order book grew 4% with a GBP 16 billion order intake, which is marginally lower than 2011. The GBP 60 billion order book represents good top line visibility and underpins our confidence to invest. Order cover for 2013 is around 75%.

Revenue, which is up 8%, includes OE revenue growth of 12%, driven primarily by higher engine deliveries in civil, defense and aftermarket revenue growth of 5%, reflecting contributions from all businesses with around half coming from civil.

Profit, which is up 24%, is well ahead of turnover and includes a GBP 77 million contribution from Tognum, as well as an incremental GBP 92 million benefit from the revised IAE trading arrangements. Excluding these effects, profit grew 12%, so a pleasing result.

Let's break down the 1.5 percentage point margin progression, 1.1 of which came from Tognum and IAE and the remaining 0.4 from other trading in the group. I'm pleased with the cash performance this year given where we are in the investment cycle. We started the year with GBP 223 million and ended with GBP 1.3 billion of net cash. This was after generating GBP 137 million inflow from the business and receiving just under GBP 1 billion from acquisition and disposal activities, including the IAE proceeds. Liquidity remains strong at GBP 3.5 billion. Finally, reflecting our confidence in the business, we've increased the full year payment to shareholders by 11% to 19.5p.

So what are the key components of profit growth? Trading is up GBP 296 million. This reflects an 8% volume increase, and that's about GBP 200 million of the uplift and another GBP 50 million from unit cost reduction. The remaining balance is a combination of better mix in margins in civil and defense, offset by the one-off benefit of the SDSR settlement in 2011, which you're all familiar with.

The R&D charge was higher for 3 reasons. One, higher spend of GBP 57 million, an increase of about 11%; two, lower capitalization of GBP 55 million, reflecting the Trent 1000 entry into service at the end

of 2011; and three, higher amortization of GBP 14 million, again, mainly due to the Trent 1000 entry into service.

In 2013, our R&D spend will be slightly higher, but the charge will be slightly lower as we start to capitalize the Trent XWB following its certification. Our entry fees, which are primarily related to the XWB, were lower as the program moves towards entry into service. So the core profit was GBP 1.26 billion.

So let's have a look at the effect of Tognum and IAE on the underlying profit of GBP 1.4 billion. The revised IAE trading contributed profit of GBP 92 million for the second half, higher than our original estimate of GBP 70 million. This was mainly due to a higher volume and more favorable mix of parts than originally envisaged. Tognum GBP 77 million contribution reflects full year compared with only 4 months for 2011. So in arriving at the 24% increase in full year profit of GBP 1.4 billion, approximately half of the increase is from IAE and Tognum, and the rest is from the group. Of course, IAE and Tognum have a bigger effect on margin progression because they mostly add to profit, not revenue.

So turning to cash flow, I'm just going to pick out the major themes from this chart, which you're all familiar with. Firstly, net working capital, which increased by GBP 175 million, reflects a number of moving parts. Inventory was up GBP 156 million as we prepare to ramp up production, and net debt has increased by GBP 116 million. These increases were partially offset by a high level of deposits at GBP 99 million, mainly in civil and Marine.

Second, CapEx and intangibles reflect continued investment to meet the rising load of delivering 2,000 Trent engines over the next 5 years. CapEx accounted for about GBP 550 million of the spend and included major projects, such as Seletar, the new disc facilities in the U.K. and a new facility in Brazil for our Energy business. The remaining balance of about GBP 130 million relates to higher development and certification costs. We expect CapEx to be about GBP 100 million higher in 2013. Our trading cash flow of GBP 914 million represents 64% cash conversion, slightly down on last year, as we continue to invest for the rise in load. Our return on capital of about 18% would indicate this is a good return on investment and the right thing to do. Going forward, my focus will be on improving working capital.

Finally, we spent just under GBP 800 million in 2012 in payments to our main stakeholder groups of shareholders, pensioners and taxation. This leads us with an underlying cash flow of GBP 137 million. The underlying cash flow performance is slightly better than where we expect it to be at this point in the cycle. So in summary, a pleasing result.

So turning to the business segments. Our civil business has seen strong top and bottom line growth. The order book increased by 5% to GBP 50 billion with an intake of over GBP 10 billion. This was slightly down on 2011, but we continue to grow our wide-body market share with Trent engines now making up 75% of the civil order book.

Revenue rose by 16% in the year, driven by 31% increase in OE revenue off 23% more deliveries of higher thrust engines. And remember, you know the correlation between thrust and revenues. Services grew by 5%. This was in line with the growth in the installed thrust base.

Now turning to profit, the 46% increase includes the impact of the new IAE trading arrangements, which contributed GBP 92 million and 1.4 percentage points of the margin improvement. Excluding IAE, profit increased by 27% and the underlying margin by 0.9 percentage points. This was due to improvements in volume, mix and unit costs that more than offset a higher R&D charge and lower entry fees.

So let's take a look at defense. The 15% reduction in the order book reflects a slightly lower intake than in 2011, as budgetary constraints played out together with some cancellations, mainly related to the C27J contract. As you're aware, defense budgets remain under pressure, so we're pleased with our revenue performance this year, which is up 8%. This reflects good OE performance, especially from our combat and trainer exports and incremental deliveries from civil helicopter engines.

Services revenue grew 5% with a good contribution from our transport business that makes up well over half of the revenue. Profit, which is up 7%, reflects volume increase, higher-margin exports, lower R&D spend and cost reduction. We expect a modest reduction in profits for 2013 as budget constraints continue

to put pressure on pricing, engine flying hours and new opportunities, along with some adverse mix issues.

Our Marine business has 3 sectors, as you know: Offshore, which makes up around 1/2 of the business; Naval, which is around 1/3, with the balance in Merchant. I'd characterize Marine's performance this way: Offshore had a good year in terms of OE and aftermarket growth, offset by more subdued performances in Naval and Merchant. OE revenue was down overall reflecting lower activity, some delays by customers and a 3% adverse foreign exchange impact. Revenue wise, this was partially offset by some improvement in services as our expanded network starts to capture more business.

In Offshore, there continues to be encouraging signs of recovery, driven by higher oil prices. You can see this in the rising order intake, and we expect this to continue in 2013.

In Naval, our customers face budgetary pressures similar to our Defence Aerospace business, but we're pleased to have secured some important wins during the year. Firstly, the GBP 1 billion contract to power the U.K. nuclear submarines, then the ship-to-shore connector contract for the U.S. Navy and also a new customer with the South Korean Navy. All of these leave us well placed for the future.

In Merchant, demand remained subdued, and there isn't much sign of any pickup yet. The modest uplift in profit is mainly due to cost-reduction improvements that have offset the lower OE volume and the pricing pressure we continue to see in the market.

Finally, to our Energy business. There are some big percentage movements here, but remember the absolute numbers are small in the context of the group. Similar to Marine, Energy revenue performance has been subdued by lower OE deliveries due to less volume and customer delays, partially compensated by good growth in services revenues. Importantly, the level of bid activity has risen both in our Oil & Gas and Power Generation businesses. We have a well-established Oil & Gas business that makes up around 2/3 of the revenue and nearly all the profit in our Energy segments. The 4 less mature businesses of Power Generation, Civil Nuclear, fuel cells and Tidal have suppressed financial performance with continued investment.

As you are aware, we have now sold our Tidal business and the 51% stake in our fuel cells business as we focus on the areas we want to grow. We'll carry on investing in the Civil Nuclear business where we see significant opportunities ahead.

So returning to the group, we continue to place considerable importance on retaining a strong investment-grade credit rating. And we're pleased to have received an upgrade from Standard & Poor's during the year. A strong credit rating provides assurance to our customers that we are here for the long term and ensures continued access to funding. Our liquidity is strong at GBP 3.5 billion, representing GBP 1.3 billion in net cash and GBP 2.2 billion of committed facilities. And there are no material maturities over the next few years.

So looking ahead to 2013 and turning to our guidance. As I said earlier and as usual, we provide our guidance on an underlying basis. And for 2013, this will exclude Tognum, while it remains listed. For the full year, we expect the group to see modest growth in revenue and good growth in profit, with cash flow around breakeven as we continue to invest for future growth.

For the businesses, Civil Aerospace, modest growth in revenue and a strong growth in profits; in Defence Aerospace, modest growth in revenue and a modest reduction in profit; in Marine, modest growth in revenue and profit; and in Energy, some improvement in revenue and profit. To help you with your modeling, we provided some additional areas of guidance, which are shown up here on the slide here. It's what you'd expect from where we are in the cycle.

Before we move on to Q&A, let's just remind ourselves where we are with Tognum. As of the 1st of January this year, we now have management control through our Engine Holding joint venture with Daimler, and we'll consolidate Tognum for the full year. So what does this mean? It will enable us to work more closely with the Tognum management and to realize the planned synergies. The legal process to squeeze out the remaining minority interest continues, and we expect this process to continue during the year.

So in summary, I'd say it's been a good year, and I'm pleased with our performance. However, there is more work to do in order to deliver the margin progression and the cash performance that I expect. And with that, we'll move on to Q&A. Thank you.

Question and Answer

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, why don't we start at the beginning, start at the front on this side, and we'll move around. If you could maybe just introduce yourself and the institution that you represent and then ask your question, that would be great. Thank you.

Christian A. Laughlin

Barclays Bank PLC, Research Division

Christian Laughlin from Barclays. Just a kind of couple of general questions around patterns and trends that you see emerging. As old TCAs come up for renewal or roll-off, do you find some customers increase or decrease their level of service contract on subsequent renewals? Is there a certain subset of customer who are more likely to let their TCAs roll off and revert to a T&M construct, or is it kind of, it heavily depends on the individual situation?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, look, I think every situation is unique. I mean the first thing to recognize is that once an airline looks to outsource its servicing and capabilities, at the end of it, if it doesn't want to carry on, it's got some decisions about whether it does it itself or whether it puts it to other third-party markets. We have experience of sort of all outcomes, those that continue with TCA, those that switch to T&M, and that tends to be driven by how short they plan to keep their service in fleet. So we certainly look and seek to extend TCA contracts. And generally, the way we do that is by using our scale of economy to help make it cost effective and share some of that benefit with the customer. So we see all outcomes, but generally, we've been quite successful at continuing to extend TCA contracts.

Christian A. Laughlin

Barclays Bank PLC, Research Division

Great. And just a quick question on margin progression, particularly in Civil Aerospace. So I've noticed in 2012, about 40 basis points, I think, of the overall margin improvement were attributed to cost-cutting measures and initial gains realized. Do you see an acceleration -- did you see an acceleration from the first half to the second half? And is this expected to continue or accelerate in 2013? Said another way, are you in the phase where you're picking low-hanging fruit, so to speak, and we can expect some jumps here and there over the next several halves?

Mark Morris

Former Chief Financial Officer and Executive Director

Sure. Firstly, we don't measure things in halves. I just don't think we have the granularity to pick up trends over from one half to the other. I mean I think as both John and I have alluded to, when we talk about our 4 Cs, cost and cash are big drivers of those. And clearly, unit cost reduction is a key part of that. And of course, now as we are larger and we have far more larger share, our ability to leverage our supply chain and deploy far higher levels of TCA contracts in terms of the amount of capture we take, which enables us to schedule how we do overhauls and the work scope, all of that helps us with efficiency, and therefore, cost improvements as well. So it's an ongoing journey. I wouldn't sort of take -- draw any conclusions from any blips you see between one half to the other, other than a strong desire and determination from us to continue to take unit cost out.

John F. Rishton

Former Chief Executive Officer and Executive Director

If I could add just maybe in sort of more general terms. As you see, one of the 4 Cs that we have is around cost. And one of the things we are all aware of is we need to improve our margin performance,

and specifically, I think, in civil. Couple of observations. One, as Mark says, these things take time. It isn't sort of a quick journey. It takes time, and it takes time for a number of reasons. First of all, we're trying to grow and expand our civil business significantly at the moment, so we have a lot of new facilities coming into play. We've got new engines being launched. All of those are very important issues for us. So balancing the determination to reduce cost, improve margin alongside execution and satisfying our customers is something that we're playing with all the time. So how we balance those is a challenge for the business, and we spend a lot of time and energy on those. The direction of travel for civil, in particular, is driving margins and improving the profitability, whilst bearing in mind the point that I'm making, which is one of our other 4 Cs is about making sure we satisfy our customers and deliver to our customers at a time when we have new engines being launched and developed, new facilities being launched and developed. So this will take -- this takes some time. As I said in my little set piece, it has to be carefully managed and will take time. Okay, why don't we stick with the front, maybe Ben on the front?

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Ben Fidler from Deutsche. A couple of questions. Firstly, on the TCP net debtor, which about GBP 360 million increase looked quite a sizable increase, I guess that was driven by the strong growth in OE deliveries, was it? And also how should we think of that increase going forward and where you see that TCP debtor number, the GBP 1.3 billion, maybe settling out at? That's the first one. I'll come back with the others if you want to answer that.

John F. Rishton

Former Chief Executive Officer and Executive Director

[indiscernible] Go for all three. [indiscernible] Then we'll test our memory to see whether we've got it -- memorized the questions.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Yes, the other one was the earn-out expectation. That, clearly, did a little bit better than you were anticipating and we were all anticipating in 2012 H2, wondered where that leaves you with your sort of prior commentary about GBP 140 million as a sort of full year type of number. Has that also gone up? And the final one was just looking at the Marine services side. 1% growth in the Marine services revenues, where you think that could well get to this year, particularly with further rollout in your Marine service centers, which presumably, are now coming onstream in a big way?

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, I'm going to ask you as [indiscernible]. I said to Mark before we started this morning that one of the joys of not being the CFO anymore is that any difficult questions I can give to him, and I can take the easy ones. So they're all yours, Mark.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay, well, let me start with the TCA net debtor, the increase of GBP 360 million. I mean I think you've alluded to, to part of the right answer. Obviously, we've got rising OE deliveries that you saw particular in civil of 23%. Higher thrust engines, Germany, we're sort of getting about 85% to 90% penetration on TotalCare and sort of linked contracts. And again, this phase where you tend to have gaining market share at the front, sort of deeper discounting, it can accentuate a little bit of the TCA debt. But that's 1/2 of the equation. The other 1/2 of the equation is, of course, the number of overhauls that you do. And of course, as the overhauls come in and they can be quite lumpy sometimes, they reduce the size of the creditor and of course that results in the net debtor growing. So there's 2 parts of that element. I think the second sub-point of that first question was, is there a sort of end in sight? I think the short answer is, it will move up and down and grow in line with engines in service, I think would be a sort of natural -- and of course, the combination also between where we are in the cycle and which engines are

on TotalCare and which ones are not, so there's lots of moving parts. But I would expect it to grow broadly in line with our installed base. Your next question, I think, was on the IAE uplift. So if we just sort of re-datum ourselves for a second, the guidance I gave back in 2012 was that we'd see a full year impact of about GBP 140 million for IAE. Of course, we sold our equity share at the half year, so you've got half of that, that GBP 70 million which you had plugged into your models, and we've ended up with GBP 92 million. That was higher than our own original estimates, and it reflects a number of things. It reflects the change of the trading arrangements, but in particular, what we're seeing as a supplier sales of more volumes of certain parts at -- had higher margins. And again, when we think about us as a supplier now, selling parts and spare parts, the order lead cycle is much shorter. It's typically sort of 30 to 60 days, so our ability to forecast that accuracy is a little bit more difficult. So we saw an uplift. Whether it repeats itself this year, we don't know. But in short, we don't plan to sort of, to break out IAE in the civil reporting going forward for 2013. It's now part and parcel of our new trading arrangements. And question 3, this was Marine services progression. I think the short answer is, yes, we're expecting services margin -- the services -- so was it services or services margin, just to be clear?

Unknown Executive

The revenue.

Mark Morris

Former Chief Financial Officer and Executive Director

Services volume. Yes, we expect services to increase this year for 2013. I think was the question you were asking.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Okay. Is that sort of in line with, I guess, what's going on in the market? My question was more around where I'm finding a bit tricky to keep track of is where you're at with the growth of the services network, because once you have increased that network [indiscernible].

Mark Morris

Former Chief Financial Officer and Executive Director

Well, yes, careful. So if we just dial back for a little bit. We've increased the number of service centers to about 37 now, and it's quite important strategically where you place them. But the Marine market tends to be far more reliant on time and materials because ships just turn in to the nearest relevant port and overhaul center where they can go to. So whilst there is some penetration, and we're obviously, that's an area that we're keen to develop, you've got to have the logistics and the supporting network to deliver that. So the investment has been going there. Certainly, the more centers we have, the more ability that we have to capture revenue. And of course, we saw that in after the second half of Marine in 2012. And we expect that to continue in 2013. I don't think you can draw a straight correlations just between adding a servicing center. I mean, intuitively, to a first order, you'd expect to be able to capture more revenue, but whether it sort of goes up at the same sort of rate, I think remains to be seen.

John F. Rishton

Former Chief Executive Officer and Executive Director

You remember the half year, one of the comments that we made about the Marine services was what we were seeing, to a certain extent, was owners and operators being more specific about what they wanted repaired rather than fix everything, fix this, this and this, but don't look at it or don't worry about anything else. So we saw some of that. So there are other dynamics that go on in this business. But certainly, overall, having more service centers will result in us getting more service business.

Okay, yes, stick on the front row, and then we're going to move backwards and then come forwards.

Nick Cunningham

Nick Cunningham from Agency Partners. I thought I'd follow the 3 question trend. Just back to the -- and I'll ask them all together. Just back to the TCA issue, just to clarify, Mark said that 85% to 90% of OE sales were linked. And I think linked hasn't been that big a percentage in the past. Is that now what you expect to achieve going forward and is that sort of an underlying assumption? That's one question. Secondly, on cash, cash has flowed into inventory to some degree over the last few years. I think part of that has been to do with Singapore and other new facilities. Should we expect a lump of cash to flow back out of inventory at some point in the next few years? Are you going to surprise us at some point or will wide-body engine growth absorb that? And finally, in Defense, on the service side, clearly, the services in the U.S. are talking about a full year's continuing resolution impacting on their overhauls in the second half of their fiscal. What's your assumption about CR for the rest of the year?

John F. Rishton

Former Chief Executive Officer and Executive Director

I'm going to spread things out a bit. I'm going to ask Mark to take the first one. I'll maybe take the second, and then I'll ask Jim Guyette at the end to take the third one on the state of the American economy.

Mark Morris

Former Chief Financial Officer and Executive Director

So your first question, TCA capture rather than just TCA linked, so we can have contracts that will have a long-term contract that's not linked to the OE. So we haven't broken out and don't break out what is linked. But aftermarket capture in terms of where we have got some type of contract to ensure that we can either divert overhauls to our bases and ensure that we capture the spares, on new product typically seems to be up at those sorts of levels, but they're not all linked. That's question one.

John F. Rishton

Former Chief Executive Officer and Executive Director

And I don't think you should assume 85% is a trend or something for the future.

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, absolutely.

John F. Rishton

Former Chief Executive Officer and Executive Director

You need to be careful with that thought process. But as Mark says, you've got linked and unlinked, and the difference in the 2. On cash, surprises are frequently good. So I'm not going to try to disappoint you with the potential for surprises. What I would say is that the inventory that we have is not simply where [indiscernible] and that is, once you've sorted that out, it will be okay. The scale of the changes that we've got coming at us in terms of the growth potential, or the growth of the business that we've got built in and the potential growth, means that we have to be thoughtful about inventory. If I look at our turn rate across the group, for the sake of argument, it's around 3%. That is too low. We need to work at driving that inventory turn rate up, but it will be, as I've said about cost, take us some time and will have to be carefully managed because again, what we're trying to balance there is delivery to customer and execution, where I do not want to fail and we will not fail, against the benefits of -- the financial benefits of releasing cash. So in my simple world, we have lots of parts that are out to build an engine, and we're missing a couple of parts. That means we can't build the engine, therefore, I got all these part hanging around. So how do I get focused on the couple of parts that are missing to make sure that we can build the engine at the right time, so I can plan more efficiently and effectively, so that I can drive the inventory performance, whilst still meeting the customer, which is unrelated in some ways to -- when you've got more facilities, therefore, you've got more inventory. So the focus is how do I drive inventory turns, how do I get more specific and detailed in that inventory planning to make sure that I've got the right bits at the right time to deliver the plan, to deliver the customer so that I can drive the inventory turn rate. So

that will take us some time. Jim, do you want to talk about continuing resolutions and U.S. budgetary constraints?

James M. Guyette

Former Chief Executive Officer of Rolls-Royce North America Inc and President of Rolls-Royce North

Yes, thank you. The simple answer to your question is, yes. However, it's much more complex. Perhaps 3 points of context: First, as a business, we have worked our way through the cuts on this side of the Atlantic, SDSR. We have worked our way through the first series of cuts in the U.S. that were brought about by the Budget Control Act introduced in August of 2011. What we now have to face is this much more difficult circumstance. The other point that I would mention is, with the background of a very challenging defense environment, I think our defense team posted some fairly positive results in light of all of that. So I mention that for purposes of perspective. Now to 2 things. One is the sequester; and two is a continuing resolution. Whether or not there is a sequester or not, a continuing resolution or not, I think we all know that budgets in the developed world for defense are going down. So we have that kind of challenging environment. What makes this much more difficult for us is a sequester. Because a sequester -- by the way, our opinion, not necessarily it's going to be fact. But our opinion is it will kick in on March 1. That will bring with it a lot of chaos. Chaos, because the Department of Defense and the various service chiefs have no ability to move money. They can't change the priority. All they can do is simply take a cut. What makes it even worse is because of the way the law works, they're going to have to take a year's worth of cut in 7 months, and they can't do this with a running start. So again, significant chaos. It's been described as a shave with a chainsaw, and I suspect that, that's probably an accurate representation. Now you asked the specific question of continuing resolution and that the current continuing resolution expires on March 27. In light of everything that's going on, I just don't see how the Congress is going to be able to enact a budget to take us from that point until the end of the fiscal year, the end of September. So again, a continuing resolution.

That just adds to the drama because here again, the service chiefs in the Department of Defense do not have the ability to move money around. It is less money because all they can do is last year's budget, less inflation, again, applied to the same programs. So it is quite difficult. Now having said that, I just don't see how a sequester survives. I just -- I may be wrong here. A great quote by the #2 person in the Pentagon in front of the Senate Armed Services Committee this week. And his quote was, "Sequester is a self-inflicted wound." So we have the ability to stop this and right it because if it continues on, forget defense for a moment, the impact on the U.S. economy is staggering. It probably means over 2 million jobs, and it probably means a couple of points off of GDP. That can't stand, in my view. I may be wrong. So to sum, to sum it up, yes, I think sequester will take effect. It's unfortunate. We'll go through the chaos. It will be painful, but I think we're all going to have to come to our senses after the fistfight is over and resolve it. Now the question you didn't ask me is have we baked some of this into our assumptions? Yes, we have as best as we know how. But again, I want to reflect back to my comments on perspective. I think we have managed through this environment fairly well given circumstances. And we're preparing ourselves for this challenging environment, which means we're going to be looking for other areas of growth, and of course, we're going to be looking to where we can reduce our costs. So I hope that is responsive to what was a rather simple question.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, let's progress a little bit down.

Steven Lee Cahall

RBC Capital Markets, LLC, Research Division

Steven Cahall from Royal Bank of Canada. Just 2 questions on Civil Aerospace. The first, in terms of margin trends, I was wondering if you could talk a little bit about the margin trend in OE versus services? We get the impression with the cost unit reduction in OE, I think we have a good idea what's going on there with leverage. So I guess the question is more focused on what the margin trend has been at services? Are we seeing more contingency release on TotalCare because of better cost accounting and forecasting? Is there anything that's going on in the RB211 fleet that affects that trend? And then

relatedly, if you could talk maybe a little bit about what the installed thrust looked like in the second half? It looks like the services revenues took a sequential change, so if you could speak a little bit to that, and again, maybe contrast what's going on in Trent versus RB211?

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, you're up again.

Mark Morris

Former Chief Financial Officer and Executive Director

I will try and answer those multiple questions. I mean, margin on OE and aftermarkets, I mean, at one element, they're both linked because at the end of the day, whether it's a spare part or a part that goes into an installed engine, the cost of the part is the cost of the part. I think we've talked about margin progression. John gave you some color, and I did too, so I won't sort of cover that on the OE stuff again, other than that unit cost remains a key focus for us. Aftermarket, of course, one of the things that we try and seek to do to improve margins is that if you have a T&M model where at short notice, engines are coming in and a work scope may be declared by somebody else that's going into your shop or even someone else's shop. The ability to sweat the assets that you have in terms of your shop utilization, the loading goes through it, designing the work scope is not yours. In the aftermarket world and TCA capture, we would typically set the work scope. And we can decide when and where we're going to pull engines off. So it allows us to optimize the loading into the shops, so that should help, and of course that's a focus we remain on in addressing. And of course, in driving those costs down to ensure that we incentivize customers to come back, some of that is shared. But net-net, it should help drive margins. I think you then sort of dipped into having described that what's happened in H2, and you're comparing H2 of 2012 to H2 of 2011 and sort of said, why is that flat? I think -- is that the comment you were driving at?

Steven Lee Cahall

RBC Capital Markets, LLC, Research Division

Well, that was the sequential change of services sales [indiscernible]

Mark Morris

Former Chief Financial Officer and Executive Director

And I would just say a couple of things. Just step back a little bit, there's a lot of moving parts that go on in aftermarket revenues. And you can't draw any conclusions just by looking at one half. Remember, what drives these are where new engines go in and whether they are -- they have a TCA contract attached to them. So a TCA contract that starts in December will get 1 month's worth of revenue, whereas one that starts in January will get 12 months. So if you started in June, you get 6 months. So you got the movement of where engines are coming in and engine deliveries aren't always just constant. You'll have customers who switch from time and material to TCA. And of course, that will drive. So in the half you can get some sort of movements that will make it drive up and down. And then of course, you talked -- you raised the issue about RB211. And again, some of the older fleets, as it starts to come out, 2 things to remember in our total aftermarket, which includes time and materials and spare sales, is that our older engines, we typically have a far lower level of TCA penetration, sort of 40% to 50%. And although engines may sort of grow in a sort of much more predictable pattern, when we look at retirements of engines, they don't typically just go at a straight line. It depends on where the fleets are and what people are doing with them. So 2 things are happening. If you don't have the level of TCA capture on all product, which we don't, and you start to get some lumpy retirements, which we're starting to see in 524, which is totally expected, by the way. You will get those engines being torn down and the service used material going back into the system and stopping some new spare sales. And that's one of the reasons as I wind the clock forward to another question I'm sure someone's going to ask in a minute, which is civil revenue progression in terms of being modest for 2013 looks low, and part of that is being driven by some of those retirements. I think I've captured all of your questions now.

John F. Rishton

Former Chief Executive Officer and Executive Director

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Okay, let's take one on this side just to be difficult.

David Howard Perry

JP Morgan Chase & Co, Research Division

It is David Perry.

John F. Rishton

Former Chief Executive Officer and Executive Director

Colin Smith, by the way, needs to answer a question at some point in time. [indiscernible] On the basis that we're a technology company, and he's responsible for it.

David Howard Perry

JP Morgan Chase & Co, Research Division

Okay. I've got a bunch of questions. The first one, Mark, sorry, so just following up on what you just said. Are you able or willing to give us a guidance on Civil Aero aftermarket assumption overall for 2013? Second question is I'm just a little bit confused on the guidance for the full year. Does the tax rate, which looks nicely down to 22% to 23%, is that including Tognum, or is that excluding Tognum? So just to clarify that, and I'll try and think of a question for Colin when you answer.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay, well, the short answer to your first question is, no, we don't break out aftermarket guidance on civil. The guidance we've given is excluding Tognum. When we add Tognum to the results, it will drive the effective tax rate higher.

David Howard Perry

JP Morgan Chase & Co, Research Division

I was hoping you'd talk longer so I could think of a question...

John F. Rishton

Former Chief Executive Officer and Executive Director

Somebody else, I'm confident will get Colin. I will ask Colin a question, if necessary. So it will be fun.

Celine Fornaro

BofA Merrill Lynch, Research Division

;

Celine Fornaro, Bank of America Merrill Lynch. I actually have one question for Colin. And it's my first one, related to CapEx as well. And it's just if you could explain...

John F. Rishton

Former Chief Executive Officer and Executive Director

[indiscernible] anything to do with finance as well, he really does.

Celine Fornaro

BofA Merrill Lynch, Research Division

If you could explain looking at the cash R&D and also the CapEx, what is driving the increase on '13 against '12, so where is that going again, I would say? My second question is on the Energy division. I thought we had a GBP 26 million charge in 2011 related to industrial trends. So actually, the improvement in margin in '12 is actually probably slightly lower than anticipated, is that a fair point. And thirdly is related to the 787 grounding situation. There a lot of ANAs engines out there that are grounded, how should we think about that in terms of the impact for the group if that was to continue another couple of months?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, I'm going to ask Mark to start on the R&D and Colin to make a few comments about what we're actually doing in terms of research and development. Mark, you may want to comment on Energy, and then I'll maybe pick up the 787 and Jim can add a few comments on that as well.

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. So on R&D, as I sort of guided during my presentation, so spend will be up this year, sort of modestly up is what we've said. But the charge is going to be down, and that really reflects as the Trent XWB has been certified now, we start to capitalize, if you remember, between certification entry into service. And in effect, what we create is a sort of a headwind and tailwind depending on when you start and stop capitalizing and expensing. And that creates the volatility. But the R&D is still being driven predominantly -- remember, XWB 97k, Trent 1000-TEN, continued R&D still on XWB as you bring it into service. And some still some more work on Trent 900. So with that, I'll hand over for Colin to give you the details.

Colin Peter Smith

Former Group President and Executive Director

Well, that's the R&D. As Mark said, it's broadly what we actually do. The amount of work is broadly, consistent a little bit up this year. And underneath that, a part of that is the research and technology, which is the very long-term technology sometimes up to 25 years out. We try and be broadly consistent because we've got technology centers and universities working on this stuff, and you can't keep turning it on and off. And as new programs come in, you pull it off the shelf and implement it. So I think that's pretty covered the R&D component of discussion. On the 787, maybe a little bit of [indiscernible]. Boeing are working very hard to try and get the aircraft back up in the air. As far as we're aware, they're making good progress. We've got 22 aircraft out there powered by Rolls-Royce engines. And we would expect, like aerospace always does to fix the problem relatively soon. We're not going to speculate quite on the timing of that, but they are making progress.

John F. Rishton

Former Chief Executive Officer and Executive Director

And the impact on for us is negligible, frankly.

James M. Guyette

Former Chief Executive Officer of Rolls-Royce North America Inc and President of Rolls-Royce North

John, I might comment that -- I'll admit this, I have spent 46 years in this industry and have a view on how this industry deals with safety. You'll note that last year was the safest year ever in air travel. And it is in the interest of the manufacturers, be they airframe manufacturers, engine manufacturers, the operators or the regulators, to dial in the highest level of safety that we can. It's in our interest, and we have always done that. And I think this is an example of the industry working together to determine the cause and to get these airplanes back up in the air with safety and confidence. And in our view, Boeing and Airbus and the other manufacturers are very, very highly skilled companies. This will get fixed. It will be fixed properly, and we support the Boeing company.

Mark Morris

Former Chief Financial Officer and Executive Director

Right, Energy. So as I said in the presentation, we look at Energy and profit and margin progression. The Oil & Gas business really drives this business, and the other businesses continue to sort of take an investment, and therefore, drag its financial performance. As we said, we've removed 2 of those, so the R&D associated those would expect to go down and the associated investment with that will start to go down. We continue to see price pressure in the Oil & Gas business. But a lot of good inroads are being made on cost reduction. So we do expect some progression in profit and margin for next year. But again,

it's just worth remembering that these are off small numbers. And the Energy business has low volumes of relatively expensive packaging. And so if something slips over the year, the ability to sort of move the numbers can be a bit more accentuated than it can in our other businesses. But certainly, we are expecting both revenue and profit growth during 2013.

John F. Rishton

Former Chief Executive Officer and Executive Director

Let me just add what I said last year. The finance performance of the Energy division is not acceptable. We know that. We're taking steps to address it. You've seen some of the steps we've taken during the course of 2012. We'll continue to work on that.

Celine Fornaro

BofA Merrill Lynch, Research Division

And is the cash, the CapEx spend in '13, that's going up in '12. We start to see them maybe coming down, so where is it going?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, I think -- again, there's this sort of belief in some places that well you've done 3 big engines so R&D should come down. You sort of got this new place in Singapore, so CapEx should come down. And that is simply not the case. As Colin and Mark have said, we'll continue to spend money on research and development, and as I've said in the past, if you see us spending less then I think you should be concerned. The nature of this business is very long term and very long cycle. We need to continue to invest for the future success of the business. And it's the same with CapEx. We've got huge growth. So the spend that we've got -- just to pick out a couple of things here. We've got a new facility, turbine facility in the U.K. We've got a new disc facility in the U.K. We've got new test facilities. We're expanding Crosspointe, and we continue to invest in the expansion of our Singapore facility as well. Just to pluck a few items out of the air. So the CapEx spend and the CapEx requirements of the business are significant. And they won't be going down rapidly anytime soon because we continue to invest for that growth. We continue to invest for the fact that we're going to double our revenue over the next decade. We have significant increases in deliveries. So I want to sort of dispel this belief that sort of R&D is suddenly going to go down and CapEx is suddenly going to stop, and everything's going to be fine. We will drive our cash performance, if I can bring you back to that, by cost, getting the cost down over time and by driving working capital, in particular, inventory turns. That's what we need to do.

Okay, let's go a little bit further back on this side, then we'll come back down this side, and we'll get to you. Don't worry.

Rupinder S. Vig

Morgan Stanley, Research Division

Rupinder Vig for Morgan Stanley. Just 2 questions. I have one for Mark first. John just mentioned cash. Outside of inventory, obviously, that's the focus area. Can you just tell us where do you see potential for improvement there, be it the other line items in working capital? Where is the area that you think you can perhaps do most in, if you like, outside of inventory? And then for John perhaps, when we think about the 4 Cs, how is the pace of the 4 Cs progressing versus what you thought it would be when you first took over as CEO? Just an idea of is it progressing in line? Is it going slightly better, et cetera, et cetera?

John F. Rishton

Former Chief Executive Officer and Executive Director

Just your first question, was it where else in working capital can we get improvement?

Rupinder S. Vig

Morgan Stanley, Research Division

Yes, absolutely, yes.

Mark Morris*Former Chief Financial Officer and Executive Director*

As John said, we focus inventory, first and foremost. But when we look at the other part, the other elements that make up working capital, clearly, we focus continually on overdue debtors [indiscernible]. But in looking at usual trade debtors and creditors, I mean that will just tend to rise and flow with the sink of where we are. And deposits are clearly a key driver. So beating the drum to ensure we get orders with good deposits. Deposits will be another part that we'll be focusing on. I think that the various components you would expect. It's not that we're just focusing one. We're looking at all of them. And of course, as we start to drive out unit cost and improve ability to make more margin on OE, then of course, that will also help as well.

John F. Rishton*Former Chief Executive Officer and Executive Director*

In terms of the 4C's, the pace -- I think -- if I just run through them. Customer. I think we've made good progress through the course of this year. We've still got a long way to go. We made good progress, as I referred to in terms of focus on quality. During the course of year, we introduced something called stop and fix in the facilities. We actually stop production if we think of any issue, so we stop it, fix it and move on. And it's an important mindset change to the business. In terms of delivery, a lot of focus on delivery. And Jim has been leading a particular focus on customers, so I would say good progress on that, still more to do. In terms of concentration, I think if I take it to the kind of things that I've been concerned about, I think the evidence around getting sharper on that is, what do we do and what don't we do, and Tidal and fuel cells would be examples of what we decided that we're not going to do those. But that never really goes away. I think the nature of the business that we have and the kinds of people we employ who are naturally curious, inquisitive are looking to do -- trying to make their focus on what we really want to focus on. It's always going to be a challenge, so it will probably remain one. But I would say some progress there with evidence I've given you. Cash and cost, I would say, less progress and much, much more to do. And I would say to somebody before we came in this morning that one of the differences, as far as I'm concerned with this company as some of the others that I've worked for, is what's the burning platform to be able to get people motivated to work on cost and cash? Because most people don't come to work and say, "Yippee, I've got to reduce costs today and wouldn't it be great if we drove the inventory turns a bit fast -- faster?" And the companies I've worked for, previously, there's been a burning platform of some kind or another. And within our organization, we're in the fullest of position where we've got great growth prospects, we've got a strong share price, very high levels compared to history. We've got profits that are at record levels. It's difficult to get people's attention, so I think we've made a slower start on cost and cash than I would have hoped for. But we're starting to get there, we're starting to get some traction, and we're starting to get the folks' understanding within the business. The ability to get our cost down isn't simply what John Rishton thinks it's important to reduce cost to make him happy. It actually goes to our competitors have an advantage if they have better cost, that means they can price more aggressively than we can. That means they can invest in more product than we can. That means they can invest in more training for people than we can, better facilities, better infrastructure. And getting people to understand that, that's why we need to do it is very important. So that's my sort of, if you like, my performance card would say, I think, good on customer, OK on concentration, room for improvement on cost and cash. Okay. Yes.

Andrew Paul Gollan*Investec Bank plc, Research Division*

Andrew Gollan from Investec. Two questions. First one on Engine Holding, I understand why you can't talk about the future perhaps until that situation is resolved. But the number that came through for the current year was slightly below my number. And I know we're all adjusting to a new world. But within that, can you say what's happened maybe between Tognum and Bergen in terms of financial performance? Is that relative to the association of Rolls-Royce starting to benefit from that relationship because we all have no idea. It's some fairly big numbers that go into make that number that kind of falls into the P&L. Just a better understanding of Tognum and Bergen within the Engine Holding venture?

John F. Rishton

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

Former Chief Executive Officer and Executive Director

Okay, let me make a couple of general observations about Tognum, and then maybe I'll pass over to Mark. The process of getting control of the company has been quite long, but we've lived through it. I think if we fast-forward 5 or 10 years, it will be irrelevant. So the good news is, we've got to a place, January 1, as Mark said, we've got control of the company. We'll finish to hope to squeeze out during the course of this year. That means that we can exert far more influence on the company. That means we can get what -- in some of the details, we can start trying to drive those revenue benefits. But as we've always said around the benefits, they are mostly revenue and with revenue as opposed to cost, they take longer to get at because you have to get at them by country by customer by product rather than cost, which tends to be, "Well, let's close the head office, or let's close this factory." And once you've done it, you've got them. So these benefits take longer to get at. As we reflect on it, what I would say is we still think there's significant benefit as we've got to understand their business more as is always the case in these things. Some of the assumptions we made at the start, we said, well actually that wasn't quite right, negatively. Some of the assumptions we made at the start weren't quite right, positively. So overall, we still think this is absolutely fine, some less, some more. And we need to get driving those benefits during the course of this year and into the future. So overall, I would say we're satisfied with where we are on Tognum. Tognum's business is subject, as all businesses are, to the ups and downs of the market and they've had a, I would say, a tougher time during the course of the last year in some areas of their business than we would have anticipated about a year ago. Mark, maybe you want to talk to specifics?

Mark Morris

Former Chief Financial Officer and Executive Director

Right. I think you asked some questions really about what's in Engine Holdings and the financial performance, presumably looking and comparing '11 with '12, is that right? Just to be clear. So let's just remind ourselves. So Engine Holdings is the vehicle, the joint venture through which Rolls-Royce and Daimler have sought to acquire Tognum. We have also put in our Bergen diesels business that went in from effectively our Marine and Energy businesses into Engine Holdings. Now there is some funny movements in Engine Holdings, which surely our IR people can take you through in detail at some stage. But in essence, the only thing that is in there for 2012 on the revenue side is Bergen revenue. So Bergen was put into Engine Holdings at the beginning of January in 2012. And although Engine Holdings now has Bergen in it and the 99% share that we have of Tognum. Because Tognum is still equity accounted, we only have the profit effects. So if I just go between '11 and '12 just to try and help you quickly, so Bergen profit was GBP 44 million in 2011 and a GBP 32 million contribution in 2012. And that predominantly reflects lower OE deliveries at Bergen diesels, again reflecting the sort of market that we've seen in Energy and Marine, suppressed sales of original equipment. And the contribution from JV -- sorry, from Tognum in both years was GBP 36 million for '11. And again, that's only 4 months, remember, because that's the point at which we started to acquire Tognum. And of course, you got a full year's contribution of GBP 77 million for 2012. Now we're just going to sort of wind the clock a little bit forward now because of course as we go into 2013, we're going to fully consolidate Engine Holdings -- or Tognum in Engine Holdings, and of course, that will move from being equity accounted to being above the line. So but if you want sort of check for reverse, I'm sure Simon and the team can take you on detail on that.

Andrew Paul Gollan

Investec Bank plc, Research Division

One other question, please. On civil aftermarket, you've already given some answers on that. But at the half year, you gave a split in terms of growth rates on TCAs and time and materials. Can you do the same for the second half given the question that came earlier and I can't remember who from.

Mark Morris

Former Chief Financial Officer and Executive Director

Off the top of my head, I can't actually. I'm sure if we're prepared to give it to you, we'll provide that to you. But I haven't got that off the top of my head.

Andrew Paul Gollan

Investec Bank plc, Research Division

I would assume that TCA is going to continue to grow steadily and Tognum materials was negative?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes. I mean the key thing to recognize is that the T&M model will tend to be far more volatile market whereas the stability of getting sort of annuity of flow means that you don't see the necessarily the step-ups or the step-downs that you see with T&M. But of course, we do have both, but are heavier weighting towards...

John F. Rishton

Former Chief Executive Officer and Executive Director

[indiscernible] I'm saying, I think at the half year, we talked a little bit about that because it distorted the picture H1, H2. But in the second half that wasn't the case. But Mark's already commented a little bit about next year in terms of some of the Tognum materials as the 524s and 535s come down. So we're trying to give you the significant changes.

Okay, please on this side?

Jeremy David Bragg

Citigroup Inc, Research Division

Jeremy Bragg from Citi. Predictably, another one on cash, I'm afraid. Now I appreciate there's lots of moving parts, and it's a long-term business. But I guess my question is, when is the first year when we're going to start to see these improvements? Because if it's going to be a matter of cash breakeven until 2017 or '18, then the investment case is very different from one where we see steady improvements from 2014 onwards?

John F. Rishton

Former Chief Executive Officer and Executive Director

You're not going to be surprised when I tell you that I'm not going to tell you when we would anticipate the kind of clarity that you would like. What I would say is, as I try to say is, one, we're well aware of the views on cash from numbers of people. Two, we were working hard to reduce our costs, which will drive our margins and help our cash position. Three, we'll work very hard in terms of driving inventory turn rates, which will improve our cash position. We will continue to invest in R&D and CapEx to support the execution and growth of the business. Exactly when you start to see the benefits of that when you take into account the actual model that we have and you're fully, very familiar with the model we would have, especially in terms of civil, which is where a large part of this sits. You've got -- the OE element of civil, which is growing rapidly and the TotalCare that grows behind that, the margins that we make on the OE equipment, the margins that we make on the aftercare, the way that the accounting works for that in terms of the profit versus the cash, these are things that you're familiar with. So you'll be able to model how you expect that to play out. But I'm not going to give you this year, this year or that year. We're well aware of the views on cash. We did what we said we would do in 2012. We're clear where we think we'll be in 2013. And as we get to the next year, we'll give you clarity about where we will be in the future. Let's go to the -- that's perfect.

Gordon Hunting

Gordon Hunting of Fiske. Question mainly for Colin. At the moment, all your big engines are 3 shaft. On the premise that 2-shaft engine is less likely to have dangerous oil leaks, are you going to switch over to carbon blades and also to 2 shafts for your 777 replacement engines? And are you already doing R&D for the 777 replacement? The second thing is a question mainly for the Chief Executive. Have SFO given you a timetable and also is it affecting your order flow in the Far East?

Colin Peter Smith

Former Group President and Executive Director

The simple answer, Gordon, to the first question is, no, we're really comfortable with the 3-shaft concept, for a whole host of technical reasons that I could bore the ears off you, but I won't in the interest of time. We have put an offer into Boeing with an engine that's based on the technology we've been developing, which does include carbon fiber fan blades as I think we've discussed in the press. And all engines have oil in the middle of them, and all engines have a propensity to leak. And each person resolves that in their own way, but I know what you're alluding to.

John F. Rishton

Former Chief Executive Officer and Executive Director

In terms of the SFO, I think you had 2 parts. The second part I remember was sort of the order flow and the first part was?

Gordon Hunting

The timetable [indiscernible]

John F. Rishton

Former Chief Executive Officer and Executive Director

No. The -- in broad terms, I have nothing really to add to what we said in our announcement on December 6. So we provided information to the SFO. We've told you what the potential consequences could be, and that now sits with the SFO. And they will decide what and when they want to do it, and that's clearly nothing that I can comment on. I wouldn't want to comment on what they should or could do. But we haven't heard anything explicitly from them about their plans. In terms of the order inflow, I think that the answer really is, no, we've not seen any change.

Okay? Let's go back, that's the one. Yes, and then we'll come back to the front again.

Charles J Armitage

UBS Investment Bank, Research Division

Charles Armitage, UBS. First of all, can you talk through the average cash, which seemed to, having been improving for the last few years, to go backwards, particularly when you got a slug of cash in at the mid-year for IAE?

John F. Rishton

Former Chief Executive Officer and Executive Director

I think it was a problem with paying for Tognum. That was the, that was the main...

Mark Morris

Former Chief Financial Officer and Executive Director

So it's purely the effect of how averaging works. So in Tognum, sort of quarter 4, we made a payment of about GBP 1.5 billion. So in the previous year, you'd only got 1/4 worth of that in the averaging effect where you got the full year. And then we've only had half of year's benefit at the IAE proceeds. So it's mass.

Charles J Armitage

UBS Investment Bank, Research Division

Okay. And just on the 777X, how big a change does it need to be for it not to be exclusive to GE?

John F. Rishton

Former Chief Executive Officer and Executive Director

So when you say how big a change?

Charles J Armitage

UBS Investment Bank, Research Division

From the current 777, which is exclusive for the [indiscernible]

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, clearly...

Charles J Armitage

UBS Investment Bank, Research Division

To Colin?

John F. Rishton

Former Chief Executive Officer and Executive Director

Boeing decide what they do or don't want to do. Because this is a big engine on a large aircraft, which sort of plays to our strengths, we're obviously very interested, and we're putting in what we believe to be a very competitive bid to get on that aircraft. We don't decide what the outcome's going to be, but Boeing decide that. So irrespective of whether we've made a change of this much, this much or this much, it's still Boeing's decision as to what they want to do. We think we've got a compelling offer, but they'll decide on -- add anything, Colin?

Colin Peter Smith

Former Group President and Executive Director

The only thing I'd add is, as John said, the XWB engine that we've just certified is the most efficient engine in the world, so the external validation of the capabilities that we've got, and we've built on that with technology. So we've got the best engine currently flying. GE you've got to chase to catch up with us will be the way I decide -- I'd describe it. And we'll see if Boeing feel the same way.

Charles J Armitage

UBS Investment Bank, Research Division

Any ideas on when they might make a decision [indiscernible]

John F. Rishton

Former Chief Executive Officer and Executive Director

No, no. Again, that's with them. And as you would expect, I think -- well, it's with them. Yes, back at the front, and we're getting towards the conclusion as we get to second questions. Now you've worked out all the details. Now you've got more difficult questions [indiscernible].

David Howard Perry

JP Morgan Chase & Co, Research Division

No, hopefully, this isn't. I think you said at the last meeting, you'd give us an update on your plans for fixing power gen. Can you just give us some detail on that, please?

John F. Rishton

Former Chief Executive Officer and Executive Director

What I would say is the Energy business in total, we've sort of talked about. You break it down as Mark has done. It had the 5 parts. Fuel cells, we've dealt with. Tidal, we've dealt with. Civil Nuclear is a business we're investing in. Oil & Gas is doing well. Power gen is a challenge for us in a number of ways. What I would say in that area is, one, we have addressed a number of customer satisfaction issues; two, we've addressed a number of product issues, so we're at a better place than we were a year ago, but we're still a small, niche player in that market. And we're trying to get our heads around what are the best -- what's the best approach to address that issue. I don't have any more to say on that today, but it's certainly something that I and others are spending time on.

David Howard Perry

JP Morgan Chase & Co, Research Division

Why is it taking longer? Because I think you were fairly clear in the last meeting, you'd come back to us, I think you said by year end with your plan...

John F. Rishton

Former Chief Executive Officer and Executive Director

I'm absolutely sure I didn't give any date. If I said I was going to give you -- if I said I was going to fix something, I wouldn't have given you a date. If I gave you a date, I wouldn't have promised to fix it. I wouldn't have put the 2 things together, so...

David Howard Perry

JP Morgan Chase & Co, Research Division

I'll have a look at the transcript, maybe I'm wrong.

John F. Rishton

Former Chief Executive Officer and Executive Director

I've learned a few lessons, but that's certainly one of them. No, I'm absolutely sure I never said that we would come back by year end. The progress we made in Energy in total is the ones that we've talked about. And we have made some progress on some issues in power gen. I'm not going to get hung up on a timetable for this because that undermines some of the things that we may or may not want to do. But we're well aware of the issue. And as I said, we're well aware that the financial performance of the Energy division, in total, is not where it needs to be, and we need to address it.

Unknown Analyst

But it's -- one thing I'm struggling with, and I look back at your second slide in your presentation, you've doubled the scale of the business in the last decade. Through the early 2000s and mid-2000s, you generated a lot of cash flow, about 70%, 80% EBIT free cash conversion. We're doubling the business again, and we're not generating very much cash flow, because we're having to invest. I remember when I first visited Derby in '97, the amount of facility renewal that's gone on there has been huge. So the question is a fairly basic one, apologies. But basically, why is this second phase of doubling the business proving so much more cash and capital intensive than the first phase of doubling the business?

John F. Rishton

Former Chief Executive Officer and Executive Director

My superficial answer would be, let's wait for 10 years' time and look back and see what our perspective is, which is the point that I was trying to make in terms of the time frame, which is if you fast-forward 10 years and look back, you may be surprised at where we are. And you may be asking exactly the same question about why you want to double the business, why is it going to cost so much cash again? But you have a different perspective on what the journey that we've been on. Had we told you 10 years ago that we would quadruple our profits, the share price would go from GBP 1 to GBP 9.84, that we would double our revenues and triple our order book, I suspect there would have been some skepticism about that. So my superficial answer is, when we look back in 10 years' time, we'd be able to see the cash generation of the business, where the investment was made and what happens. In all businesses when you look at the fixed structure, things happen in steps. So you have a factory, you've got nothing in it. You fill it. You need a new factory, you spend a lot more money. You go along, you fill it again, you need another factory, you fill it again. So as you go through those bottlenecks or those big steps, that's when you have to spend more money. So if I take a specific example, for us at the moment, which isn't to do directly with production, IT. We spent a huge amount of money on IT in the last 12, 18 months, and we'll spend quite a lot more because we hadn't spent much on it for the previous 10 years. We had got through the previous 10 years substantially under-investing in that. We got to a point where we have to make a big step change, bang, you've got to spend a lot of money. So it's a slightly superficial answer, which is, "Let's look back and reflect on it in 10 years' time." Secondly is how do you go through the bottlenecks? Mark, I don't know if you want to add anything.

Mark Morris

Former Chief Financial Officer and Executive Director

I think you've summarized enough.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, good. Well, thank you very much for joining us this morning. It's been great to have a chance to talk to you again. We look forward to seeing you in 6 months' time. Thank you.

Presentation

Operator

Good morning, and welcome to the Rolls-Royce Holdings plc 2012 Half-Year Results Conference Call. [Operator Instructions] And just to remind you, this conference call is being recorded. Today I'm pleased to present Simon Goodson, Director of Investor Relations. Please begin your meeting, sir.

Simon Goodson

Thank you, Hugh. Good morning, and a warm welcome to everybody to our half-year 2012 results webcast.

Just regarding the materials for today. We issued the results stock exchange announcement earlier this morning. The presentation slides for the webcast are available both via this webcast and also via our website, www.rolls-royce.com.

As always, elements of this presentation contain forward-looking statements that are based on our view of the world and our businesses as we see them today. Clearly, these elements can change as the world changes, so please consider them in this context.

So for today's webcast, I'm pleased to be joined by our Chief Executive, John Rishton; our Finance Director, Mark Morris; and also our Chief Operations Officer, Mike Terrett.

It's a busy morning for everyone, so I'll pass straight over to John.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Simon. Good morning. Thanks for joining us on this call. As you will have seen from the press release, we've delivered a solid set of results with the order book up 4%; underlying revenue, up 5%; underlying profit, up 7%; and our half-year payment to shareholders, up 10%. We also confirmed our full year group guidance.

Mark will take you through the details after I finished my brief comments.

As you've heard me say before, we are focused on 3 main areas: delivering the promises we've made; deciding where to grow, and just as importantly, where not to; and improving our financial performance.

Let me give you a few examples of progress in these areas. In terms of delivering promises to our customers, one of our Cs, gas turbine original equipment delivery performance improved in the first half compared with the same period last year. Where are we going to grow? You can see an extensive list of investments in the press release, providing clear evidence of our growth ambitions. Where will we not be growing? Fuel cells. You are, I hope, all aware that LG are now majority shareholders in that business. And for financial performance, our revenue and profit and margins are up in the first half. But we have lots more opportunity, including, of course, fixing the Energy segment performance. I look forward to taking your questions a little later. Mark will now take you through the numbers.

Mark Morris

Former Chief Financial Officer and Executive Director

Thanks, John, and good morning. I'll draw out the main highlights of the group's financial performance for the period, and then I'll update you on Tognum and IAE. As usual, I'll concentrate on the underlying performance.

You'll see from this slide, the order book revenues and profits are all heading in the right direction. And as John just described, we are investing for future growth. The order book of GBP 60.1 billion is up 4%, adjusted for the sale of IAE and reflects GBP 9.1 billion of order intake. Group revenue was up 5% with growth pretty evenly split between original equipment and services supported by good performances

in Civil and Defence as you'll see in a minute. Profit increased by 7%, reflecting increased volume and productivity improvements and a GBP 32 million net contribution from Tognum. We ended the year with GBP 869 million of net cash. This includes the GBP 953 million we have received from the sale of our shareholding in IAE and another GBP 167 million from the transfer of Bergen into Engine Holding, our joint venture with Daimler. Excluding these, there was a cash outflow of GBP 447 million. This reflects where we are in the investment cycle and is in line with our expectations. We're increasing the payments to shareholders by 10% to 7.6p, reflecting our continued confidence in the business.

So let's look at the key components of profit growth. Trading, up GBP 120 million, reflects the benefits from higher volume, favorable mix of business and lower unit costs, offset by the nonrecurrence of last year's GBP 60 million SDRS benefit. The net R&D charge is higher, reflecting our major development programs. As I guided at the prelims, the R&D charge would be higher this year, reflecting increased spend, higher amortization and lower capitalization reflecting where we are. You can expect the increase in the R&D charge for the full year to be roughly double what it is at the half year. Entry fees are lower as the Trent XWB program approaches certification later in the year. And finally, we have the net profit contribution from Tognum.

Turning to cash flow. I'm just going to pick out the major themes in this chart that you're all familiar with. Firstly, networking capital, which increased because of higher inventory associated with the new factories we are opening and the new products we are delivering, together with an increase in debtors. Second, CapEx and intangibles. As you know, we have good visibility of future growth, and we continue to invest in both capacity and product. Finally, we have spent around GBP 350 million in the first half servicing our main stakeholder groups, shareholders, taxes and pensioners. So we're pretty much where we expected to be.

Looking at the full year, I expect cash flow to be around break-even. The second half of the year will benefit from reductions in inventories as volume of deliveries picks up; further order intake, which will yield increased deposits; and improved cash flow phasing an aftermarket activities.

Turning to the business segments. Our Civil Aerospace business has seen strong top and bottom line growth. The order book increased 4%, adjusted for IAE, and now contains around 3,300 engines of which our Trent engines make up over 70%. Our share of the wide-body market continues to grow and we are on course to double our production of large civil engines by the middle of the decade. OE revenue was up 26%, driven by a 14% increase in Trent deliveries and a 22% increase in deliveries of corporate engines. Services revenue was up 10%, driven by our TotalCare aftermarket model and higher engine flying hours. You can expect this growth to continue as our fleet of younger and more fuel-efficient engines expands and new aircraft, likely Airbus A350, and to service over the next couple of years. Profit increased 24%, primarily reflecting the benefit of the increased volume, better mix and unit cost improvements offset by higher R&D and lower entry fees.

Moving to Defence. We are pleased with the performance in Defence, particularly when we adjust for the SDRS settlement in 2011. Revenue showed 4% growth. OE was up 11% due to a 19% increase in engine deliveries. Services were down 2% but if we adjust for the SDRS settlement, the figure was up 10% highlighting that opportunity still exists as you will have read from our recent contract wins. Profit was down 11% due to the one-off SDRS benefit. Adjusted for this, profit was up 23% due to increased volumes, mix and unit cost improvements. Our Defence order book was down 8%, which reflects the budgetary pressures of our major customers. We have a well-diversified portfolio and a large installed base with around 50% of our revenues coming from transport, which tends to be more resilient.

The Marine business now excludes Bergen, which you remember was transferred to Engine Holding at the start the year. It's worth remembering that Marine has 3 segments: Offshore, which makes up 1/2 of the revenue; Naval which is about 30%; and Merchant, which makes up the rest.

In Offshore, there are encouraging signs of recovery, driven by higher oil prices as you can see in our rising order intake. We expect that recovery to continue in the second half of the year. In Naval, we secured some important strategic wins: the U.K. -- sorry, the U.K. nuclear subs contract, 2 more LCS vessels; and our first ever contract with the South Korean navy. Demand in the Merchant business

remains subdued and there's not much sign of a pickup yet. So overall, we expect revenue improvement in the second half of the year, driven principally by demand in the Offshore sector.

It's encouraging to see the 44% increase in our order book with order intake outpacing revenues for the first time in 2 years. Although profit was down 6% due to lower volumes and pricing pressures, looking ahead, we expect profits to be broadly flat for the full year due to increased volume and an improved revenue mix.

In Energy, the numbers also exclude Bergen and there are some big movements here; but remember, these numbers are small in the context of the group. Energy continues to underperform. We have a well-established Oil & Gas business and 4 less mature businesses in power generation, Civil Nuclear, fuel cells and Tidal, which suppressed financial performance. As John had said before, we are reviewing these areas. In the first half, we sold a 51% stake in our fuel cells business to LG, and we continue to invest in the Civil Nuclear business where we see significant opportunities ahead. In Oil & Gas, there is continued bid activity and strong competition for OE, while in Power Gen demand remains weak. However, services in both Oil & Gas and Power Gen have performed well.

Base on our first-half performance and what we see for the rest of the year, we have amended our full year guidance for Energy from an expectation of growth to broadly flat for revenues. We continue to expect some improvements to Energy's profits and group level guidance remains the same.

So turning to our financial strength. We continue to place considerable importance on obtaining a strong investment grade credit rating, and we're pleased to have received an upgrade from Standard & Poor's. A strong credit rating provides assurance to our customers that we are there for the long term and ensures continued access to funding. Our liquidity is strong at GBP 3.15 billion, representing the GBP 869 million of net cash and GBP 2.1 billion of committed facilities with no material maturities over the next few years.

So let's just remind ourselves where we've got to with IAE and Tognum. So IAE first. We completed the sale of our shareholding in June and received a consideration of GBP 1.5 billion of cash. We originally guided for a full year contribution of GBP 140 million of profit, so I expect around 1/2 of that for remainder of 2012. The new joint venture for the next generation of mid-sized aircraft with Pratt & Whitney and the other IAE partners remains subject to regulatory approval.

Our joint venture acquisition with Tognum is following due legal process. We now expect that process to complete in the first half of 2013, and therefore, we will continue to equity account for our share in 2012. We're already working closely with Tognum to coordinate sale opportunities, but we cannot give any financial guidance while Tognum is still listed. Remember that Tognum reports its H1 2012 results on August 7.

So to wrap up, I'm pleased with the progress we have made in the first half of the year. The group delivered solid growth in underlying revenues and profits and cash flow where we expect it. We continue to invest for future growth. And we are confirming our full-year guidance of the group. And I think with that, we'll move to Q&A.

Question and Answer

Operator

[Operator Instructions] Our first question is from the line of Celine Fornaro of Bank of America Merrill Lynch.

Celine Fornaro

BofA Merrill Lynch, Research Division

Now a few questions, if I may, regarding the service performance within the divisions. So in Aerospace, could you just say what was the FX or stripping out the FX contribution on your service growth of 10% there? And the other thing is on the Marine division. What was the service growth achieved, and how should we think about that in terms of the full year contribution?

Mark Morris

Former Chief Financial Officer and Executive Director

I'm not quite sure I fully understood your question. Maybe something I missed when you -- do you refer to FX or do you refer to service contribution?

Celine Fornaro

BofA Merrill Lynch, Research Division

Basically, in the service growth was 10% in Aerospace and those includes or how much is it without an FX, what is the organic number?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Well, FX we said this year is going to be broadly neutral. No FX effect. In relation to the aftermarket, as you've said, we've seen a 10% growth and in Defence aftermarket...

Celine Fornaro

BofA Merrill Lynch, Research Division

And that 10% doesn't include an FX?

Mark Morris

Former Chief Financial Officer and Executive Director

No, it doesn't include FX. So what was your other question?

Celine Fornaro

BofA Merrill Lynch, Research Division

The question was in Marine where the services seem to have been affected in H1. So if you could tell us what was the service growth in H1 for Marine and what is the full year outlook for that?

John F. Rishton

Former Chief Executive Officer and Executive Director

Well, services growth was negative as you can see in the press release. It was down about 6%, the services of Marine. And I think what I would say is there are couple of factors there. First of all, there is some evidence that -- of some deferrals of servicing in the Marine sector and secondly, when servicing is coming in, there's some evidence that instead of a more general servicing, they're being very specific about service requirements so there is slightly less spend on each service element. I think, again, not entirely surprising when you look at the economic environment. But those are, I would suggest, are the main reasons for the decline.

Mark Morris

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Former Chief Financial Officer and Executive Director

Again, looking forward in terms of -- for the rest of the year, we're expecting revenues in Marine, including services revenues, to tick up. If you look at the performance in the first half relative to guidance, we've obviously got -- there's an increase in the second half. I think there's 2 elements to that: the OE, and again, given the orderly tons, most of that order intake is already booked, written and contracted, and we're expecting more growth in aftermarket, particularly in Offshore in H2, which is why we're confirming the guidance for Marine.

Celine Fornaro

BofA Merrill Lynch, Research Division

Okay. And just as a follow-up on the Aerospace services, last year, at the H1, you gave a bit of a flavor on the service growth of 10% in Aerospace. If you could just tell us what was the TotalCare growth and what was the time and material growth compared to that 10% number. Was one stronger than the other one?

Mark Morris

Former Chief Financial Officer and Executive Director

Okay. Yes. Of course, it wasn't me who gave that update back in H1 in 2011, but I can probably remember what was said. But in relation to H1 this year, and again, as you know, broadly about 2/3 of our aftermarket revenues are on some form of long-term services agreement with the remaining 1/3 on T&M. And if I look to the growth that we see in civil aftermarket at 10% this year, about 3/4 of it has come from aftermarket and about 1/4 of it has come from time and materials. And again, I think this sort of reflects our model, which is the sort of pay-as-you-go on engine flying out and it's all thrust-related whereas, of course, in T&M, the ability for the operator to either defer or reduce the work scope means that you can see a bit more volatility. And again, we're aware that when you look at some of our other peer groups are reporting, you'll see a mixed bag of results there.

Operator

Our next question comes from the line of Ben Fidler at Deutsche Bank.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

A few questions please. Firstly, just if you can comment on the pricing environment that you've seen in OE in Marine on some of these new orders. It's good that you see the order intake up. But just, yes, wonder what the pricing has done there on a year-over-year basis. The second question was just around the TCP net data [ph]; I noticed up GBP 168 million in the first half. If you can help me just figure out where that full year increase in the TotalCare Package net data [ph] might be headed for 2012. And the final one -- sorry, another one, on commercial aero engine services, was there a significant element, at least, from conversion from ton material into TotalCare in this half or is the 10% growth that we saw sort of true underlying number? It will be helpful just if you're able to comment on that.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Why don't I just talk a little bit about pricing and then I'll ask Mark to deal with the numbers questions. In terms of pricing, the pricing has been under some pressure in Offshore and in Marine in particular. Again, that's something you would expect in the environment in which we're operating. So we've seen certainly some pricing pressure there, which is why we are working hard. You would expect to reduce our cost and improve our efficiency. Mark, do you want to make some comments about TotalCare and services?

Mark Morris

Former Chief Financial Officer and Executive Director

Yes, certainly. I think in terms of the TotalCare, you're right, Ben. Obviously, the data [ph] has risen and I think that's primarily reflecting the higher uplift in engine deliveries of 15% weighted towards Trent

deliveries. And of course, as you all know, a significant higher proportion of new business tends to be on some form of LTSA, and of course, we get the usual effects, the TCA accounting providing services, the timing differences between recognition of income and costs and payments of -- cash payments and receipts. And that's what you're seeing in the front and in terms of it growing there. Again, I think, as we've given full year guidance, it's pretty much in line with that. In relation to services, H1 did not have any significant transfers from time and material to aftermarket -- sorry, to TotalCare-type contracts. So it's the usual phraseology, more underlying, more normal.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Okay, that's great. I just need to clarify on that TotalCare. Your comment that the first half is in line with the full year implies presumably we should see a broadly similar level of increase in the second half. Should I read it that way, or have I misunderstood reading between the lines?

Mark Morris

Former Chief Financial Officer and Executive Director

No. I mean, I think we can get -- I mean, we don't sort of divide things, from 1H to the next. I mean, I think just in terms of the full year guidance, I'm not suggesting necessarily the H2 will be the same growth as you'll see in H1. But in terms of the full year, the guidance obviously falls in line.

Operator

Our next question is from the line of Nick Cunningham of Agency Partners.

Nick Cunningham

Two questions, if I may. First on percent, which, as you've guided, produced a very good margin, over 17%. And perhaps considering an excess of the traditional margin that you get out of that division, which has been in the 10% to 13% range, which is normal for the industry, so I was wondering if you could give us a little bit more color on how that's arising so that we can perhaps judge as to the sustainability? Second question, cash flow. You've continued to guide to neutral free cash flow for the year because you're in an investment phase. Question really there is, when you get out of that investment phase, what would normal free cash flow be? In other words, how much of the cash out this year is attributable to the fact that you're in a sort of extraordinary investment phase?

John F. Rishton

Former Chief Executive Officer and Executive Director

Nick, thanks for your questions. Let me make a couple of comments and ask Mark if he wants to add anything. In terms of Defence, as you rightly say, we had, I would describe, a very strong margin in the first half -- I'm sort of hesitating at using the words exceptionally strong, but certainly a very strong margin in the first half. If you look at the guidance that we have given you, I think that that will lead you to believe that 17% is not a margin that we would anticipate, not would continue in the future of this year. We would expect to see it returning to more normal levels. So if you just do the math in terms of the guidance, I think that's the conclusion you get. So 17%, which was a terrific performance from the guys in Defence is very strong and reflects the mix of business, the cost reductions that we've put in place, et cetera, et cetera. In terms of cash flow, we've been investing for some time and we continue to invest to support the future growth. And you'll see in the press release a number of examples of capital expenditure. And again, you're familiar with that list, whether it's new facilities, new machinery, et cetera. You're also familiar because you know as well that when we open new facilities and expanding growth, we inevitably end up with more inventory than we would do if we were in a steady state. So the fact that we opened Seletar, our facilities in Singapore earlier this year. But we're not producing anything from those at the moment, doesn't mean to say that there is no inventory, and there clearly is. We are going through tests. We've got engines out there, Trent 900 engines in the assembly plant, we've got fan blades in the fan blade plants. So we have been increasing inventory as a consequence of that. We've also continued to spend significant amounts of money in terms of research and development as we continue to invest for the future. You know all of those elements. In terms of what a normalized situation would

be, I mean as frequently the case, it's difficult for me to sort of create a picture for you of --I'm trying to picture myself about what I would want normal to be because I quite like having all these growth opportunities and I hope that they continue into the future. So let me answer from a slightly different perspective. We are clear that we need to improve our cash performance, and certainly, the areas that we will be concentrating on really are around working capital, and within that is primarily inventory and inventory term performance. And Mike Terrett is here with us today and Mark Morris and myself and many others in the rest of the business spending a significant amount of time on that, trying to manage the balance between what we need in new facilities to test those out, how do we manage out inventory and complex supply chains to make sure that we deliver to our customers. As I've said, we've improved our performance. You've seen -- just taking Civil, we've increased the number of deliveries by 15% in the first half. So significant changes going on in within the business; how we can continue to meet our customers' requirements while at the same time improving our efficiencies. So it's a complex equation, but one that we are fully focused on. So I haven't answered your question as you would expect. That is, you would expect me not to answer your question. But what I am saying is that we clearly recognize the significant opportunities in terms of improving our cash performance, particularly from working capital, and within that, particularly from inventory. But these things take time and we need to manage it carefully because of the items that I've spoken about. Mark, do you want to add anything to that?

Mark Morris

Former Chief Financial Officer and Executive Director

No. I mean, only on Defence margins. And I think as we've guided to modest growth, both in revenues and profits, you can see that we're not wanting you to get run away on return on sales, that full year is going to be more towards the mid-teen range rather than where we are at the moment. So I guess -- I mean, on cash, I think sort of John has really covered it, I mean it's not as if it's going to change overnight and next year all of a sudden we're just going to be looking at CapEx that's sort of in line with depreciation or something. We continue to invest in a growth cycle. You can see the order book. We've got production and we've got a doubling of our Trent production over the next 5 years or so. And of course, we continue to open up new factories and so these will give us those operational benefits and ensure that we can deliver the capacity. So it's -- along with a number of opportunities that I think John just described.

Nick Cunningham

Can I just follow up briefly? If you were to benchmark your peers in terms of inventory turn, where do you think you ought to be, because we might be able to use that to try and perhaps model where, if you like, a normal level of working capital would be.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, I'm happy to help you with your model, as you're all aware. Clearly, you're aware of this. Our inventory turn performance compared to GE as an example is far worse, and are a number is I think I've seen before. There are a number of what I would describe as structural reasons for that and a number of reasons that are bad out performance. Structural reasons may be the fact that GE has huge volumes of the CFM engines, which certainly always help inventory turns. But they have managed their inventory, I would say, more effectively than us in a number of ways and we're trying to learn from that, and we will improve it. So we think we've got considerable scope to improve our inventory turn rate. But it will take some time because I want to make sure that we don't get the balance wrong between satisfying our customers, managing the launch of new facilities while trying to drive inventory turn rate up.

Operator

Our next question is from Rupinder Vig of Morgan Stanley.

Rupinder S. Vig

Morgan Stanley, Research Division

Just got 2 questions, please. One, perhaps just about unit cost reduction. And Mark, you mentioned a few times during the presentation, there had been a benefit coming through. Can you just give us an

idea, given Mike is also there, in terms of what's being done, what the scale of the improvement might have been, perhaps in Civil plus also the other bits and pieces of the business. And then just a question on Energy, perhaps for John. You mentioned right at the very beginning that obviously you're improving performance in Energy is a key focus. You've obviously done the fuel cell agreement, which you talked about. But what else might we expect over the next few months? What's the time line for further progress in this division?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Let me start with Energy and then I know Mike is keen to talk about unit costs; he is anyway when I talk to him. In terms of Energy, I've said a couple of times, it's quite clear if you look at the segment results and you look at them over a number of years that the financial performance there is unacceptable, so we need to address that. As with all these things, whilst it is clear that we need to address it, the time it takes to address it and the complexity of doing that is always going to take a little longer than most people expect. I'm delighted that we've formed this joint venture with LG. I think LG bring with them some terrific skills, capabilities and knowledge. And we look forward to working with them and the progress of that in the short term has been up and running has been pretty good. So I think that, that is a fairly clear answer to the future as far as Rolls is concerned as to fuel cells. You're also aware that I've made comments about time that we need to address that and we're making some progress on that, but I'm not going to discuss that in detail today. But I'm hopeful that we'll have something to say about that by the end of this year. In terms of Power Generation and the other elements of Energy, the Oil & Gas section, the comments that I've made about there in the past is that we need to address a number of issues there regarding some of our product performance cost rose to market. Those, again, take a little longer than some people would like. We are working on those, but I'm not going to get into any commitments in terms of time frames on that. I can assure you that it has our full attention. It is something that we have been looking at, are looking at and will continue to look at to make sure that we have a solution, to make sure that the financial results in that segment are consistent with the rest of the group. The other area that we have -- yes, that we're committing to is Civil Nuclear. And as I've described in the past, Civil Nuclear is a fledgling business. Its performance in the first half in terms of IMC wasn't where we would have liked it for a variety of very specific timing reasons and it will improve in the second half. But it's small business where we're investing for the future. We're making good progress there in terms of the agreements that we have with the prime contractors, Areva, Westinghouse and Rosenergoatom, for example. So I'm comfortable that we're in a good place in terms of Civil Nuclear and that there are good growth opportunities there that are profitable. We've made clear decision on fuel cells. We will be addressing the other elements of Energy to make sure that, overall, we get a satisfactory financial performance. But it will take a while. Mike, do you want to talk a little bit about unit cost?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Yes, first thing, I'll talk generally about unit cost and productivity and investments. As with John's comments on inventory, these are very long-term things that we ship and I've been saying this to you for a number of years now, that it's a long-term process in operations. Our aim has always been and continues to be to drive productivity to at least eat inflation or beat it. The reason we don't speak in specifics on unit cost numbers is that we have such a complex mix now across different sectors and different product mixes inside gas turbines. So we'll only talk generically and say that we're pleased with the progress we're making on that long-term battle. And the things that we're doing are working. But to give you a sense of why it's complex picture. This year we're going into full production from essentially a flight test program into full production on the Trent 1000. So that's obviously from a learning curve. The same is happening on the BR725, which has, again, gone from flight testing to full production. With that, we have obviously the learning curve that we're working our way through. But on the other hand, new products have the full benefit of all of the productivity and investments we've made on manufacturing techniques. So you've got 2 trends. We're in the middle of a flight test program. We started with the flying test bed, we're building the flight test engines, A350. So those had also gone through our facilities; very large, 9-ton engines in amongst of volume engines. Facilities that we've invested, and you know about these, in America, in the U.K. and Singapore. They are going from empty sheds into full production. And

those are in our cost base, but not yet in our revenue. So in that complex mix, we don't give an average number. But we are seeing the benefits in those facilities of putting in modern manufacturing techniques, modern control processes. And over time, they will allow us to capitalize on the volume, which also, obviously, offsets all our fixed costs. So it's an encouraging trend, but I think we will not be giving a 1-point guidance on those numbers.

Operator

Our next question comes from the line of Robert Stallard at RBC.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

First of all, a question on the aerospace aftermarket again. I was wondering if you could tell us how discussions with your customers over the last 6 months have been going on the time and materials side and whether you've seen any sign that they could even be deferring or destocking spare parts?

Mark Morris

Former Chief Financial Officer and Executive Director

Well, I think in the previous couple of [indiscernible]. I mean, when we look at the growth in all our aftermarket, the fact that 3/4 came from TCA and 1/4 came from time and material, certainly in this half, relative to 2/3-1/3 split would suggest that -- I mean, there can be a number of factors in terms of how many particular overhauls we scheduled. But there is no doubt that out in the market, there is a mixed response from different airlines in terms of what they're doing. In terms of either deferrals or lower spec overhauls. But I think it comes as no surprise that airlines are looking to preserve cash where they can.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Has this materially changed over the last 3 months?

Mark Morris

Former Chief Financial Officer and Executive Director

Off the top of my head, I couldn't tell you. I mean, I don't think, just looking it -- and again, you can't draw any conclusions just from 3 months worth of data on T&M.

John F. Rishton

Former Chief Executive Officer and Executive Director

What I would say is I continue to be particularly pleased that we have focused on and continued to focus on our a TotalCare packages rather than time and materials. And I think that if you were to line up the services, for example, on Civil, in terms of the performance that we've had versus what you're seeing with some people who are primarily on time and materials, I think you'll see the answer to your question.

Robert Alan Stallard

RBC Capital Markets, LLC, Research Division

Yes, yes. And then secondly, on the Trent 1000, I was wondering if you could comment on the issue over ANA with the gearbox whether it has any impact on your delivery schedule or R&D costs?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, clearly, disappointing that we caused the ANA an issue, but we and they are primarily focused on safety, which is exactly where it should be and we found a component in the gearbox was wearing a little more quickly than we thought it should. So I think the summary is they put 5 aircraft on the ground, 4 of those aircraft are now back in the air and I believe the fifth one will be up again soon. Clearly, that causes some changes in our production. But in terms of financial consequences, they're not material.

Operator

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

spglobal.com/marketintelligence

Our next question is from the line of David Perry of Goldman Sachs.

David Howard Perry

Goldman Sachs Group Inc., Research Division

Maybe it's one more for Mike. I was just wondering, Mike, can you help me scale the size of the facilities in Singapore and Brazil? How many employees are in each and just whether you've got any medium-term plans to have more such sites in, should we said, developing markets, please?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Okay. Well, first of all, just to take that last point. Well, clearly, where the customers is important in both those locations, but also we need a [indiscernible] as well. So that -- those factors drive where and when we decide to have facilities. So we need both. So future decision will be based on capacity needs and also a whole range of strategic choices as to whether that influence our location of the facilities. Broadly speaking, there'll be 1,000 employees in the Seletar site when up and running fully. And we're in the recruitment process, as I speak, and we're building up quite nicely there. I don't have a precise number to hand in Brazil, but it's substantially smaller than that. It's in the sort of 100, I think, that sort of territory. And we're clearly nowhere near having that number of employees yet because we're building the plant. It's -- hopefully, that market will be good and strong for us in Brazil. And there's certainly a lot of opportunity in there in the Offshore, and we'll see how the market develops.

Operator

Our next question is from the line of Finbar Sheehy at Sanford Bernstein.

Finbar Thomas Sheehy

Sanford C. Bernstein & Co., LLC., Research Division

Back to Marine for a minute. You've been working to expand your waterfront presence around the world. Can you give us an update on where that is and whether it's a significant contributor at this stage of the order, is that you're seeing?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, as we already said, we've been expanding the number of service centers that we have around the world. If I remember correctly in the first half, it was not much significant change in that. There wasn't any change in that. We will continue to grow our service network. Just going off at a slight tangent on that, one of the things that we're looking at as part of that is the relationship now that we have with Tognum, which has, again, as you would expect, a significant number of services albeit with -- in terms of different arrangements in terms of ownership, but how do we look at the total network in the future. In terms of importance, again, as we've touched on the reason that we're opening these service centers is that the Marine is different to Civil Aerospace. It generally needs physical presence if you're going to do the overhaul and the physical presence where the ships are because no one is going to take them halfway around the world to get them -- to get to repair and overhaul. So it's important that we have service centers where the ships are, and as the centers of gravity of where the ships are shipped, then we need to make sure that we reflect that in our network. So we will continue to expand. It is a very important element of our offering and it will become an increasingly important element of our offering in the future.

Mark Morris

Former Chief Financial Officer and Executive Director

And as I indicated, I think you can expect some improved performance in aftermarket in the second half in order for us to get to our guidance that we've given.

Operator

Does that answer your question?

Finbar Thomas Sheehy*Sanford C. Bernstein & Co., LLC., Research Division*

Just to come back to the order flow. Is it the network of service centers a significant contributor? Do you expect it to be to the order flow or is that more OE focused when you report backlog?

Mark Morris*Former Chief Financial Officer and Executive Director*

Yes, in terms of lead times, let's just recalibrate ourselves. I mean, generally on OE, you're looking around 9 to 18 months in the Marine business. And on spares, I mean, it can be anything from sort of 24 hours to normally 3 months to something longer if it's a major item. So it will cycle its way through the order book and it will be whatever it is at that point in the cycle when we strike the balance sheet date. But -- so the answer is, yes. It does contribute whether it's a significant contributor. I mean clearly, it generally is driven more by OE just because of the short lead times of aftermarket. And again, Marine, just remember that -- and again, I think you've got this in the back of your data pack. The amount of business that is actually on some -- of LTSA is actually quite low [in general related to Naval business, so its predominantly T&M. And again I think, as John alluded to, that T&M is subject to people deferring and lowering [indiscernible] if they're looking to preserve cash.

Operator

Our next question is from the line of Sandy Morris at Jefferies.

Sandy Morris*Jefferies LLC, Research Division*

Trying to phrase this as a question rather than a statement, but Civil Aerospace clearly had a very strong first half despite headwinds from R&D and/or contributions. I mean, Mike sort of rounded it off, but I guess my take is we probably did very well on A330, so a long-established program. And we were quite punchy, much punchier than I expected on BizJet. I mean, as we go on into the second half, go off in the newer programs [indiscernible], does the mix slightly weaken for us? Sorry, I'm in my glass half empty-sort of mood at the moment

John F. Rishton*Former Chief Executive Officer and Executive Director*

Well, if you need to get another kind of glass, Sandy, I'd tell you. I can't believe you'd be so pessimistic. We saw a good increase in deliveries in the first half as you can see from the numbers at 15%, significant increase in wide-body deliveries and an increase in corporate jets as well. If you look at the volume for the large Trent, the volume is clearly -- the Trent 700 or the A330 and that really doesn't change significantly in the second half, certainly as far as I'm concerned, because the Trent 900 is relatively low volumes anyway and the Trent 1000 is still in early stages of ramp-up with relative low volumes.

In terms of corporate jets, as you say, that was significant volume. But as Mike started speaking about the -- getting into the production of the 725 engine, we would expect that to ramp up and continue to ramp up in the second half and into next year as well. So that should be -- it's important for us in the future. So if I look at the total mix in terms of engines, large and small, I wouldn't expect a significant change from Half 1 to Half 2.

Simon Goodson

Okay. Thanks very much, everyone. We're going to finish there. I'm sure that we've got more questions, but we'll have to take those up via the IR. So thanks to John, Mark and Mike. And thanks to everybody else for listening.

John F. Rishton*Former Chief Executive Officer and Executive Director*

Thanks very much.

Mark Morris

Former Chief Financial Officer and Executive Director

Thank you.

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Thank you.

Operator

This now concludes our call. Thank you, all, very much for attending. You may now disconnect your lines.

Presentation

Operator

Ladies and gentlemen, thank you for standing by, and welcome to the Rolls-Royce 2011 Fixed Income Call. [Operator Instructions] I must advise you that this conference is being recorded today, on Thursday, the 9th of February, 2012. And I would now like to hand the conference over to your speaker today, Mark Morris. Please go ahead, sir.

Mark Morris

Thank you. Well, good afternoon or good morning or wherever you are. My name is Mark Morris, I am the Finance Director for Rolls-Royce and this fixed income call really is to go over our preliminary results for 2011. I'm not sure if any of you have managed to either read our press release or see our WebEx. So what I'll do is just give a quick summary in highlights of our results and then I'll open up the floor to questions.

So I guess the first thing to say is it's been a good year for Rolls-Royce 2011. We had a record order book, record underlying revenues and record underlying profits and the first time profits of over GBP 1 billion. I think this demonstrates an increasingly resilient business. We've had 10 years of consistent progress. And over those years, we have consistently grown the order book, our revenues and profits.

We doubled revenues in the last decade. And we're confident of doubling them again in the next decade, when we look to our order book which provides us good visibility and confidence about the growth of our business.

Order book was GBP 62.2 billion, which is up 5%. Underlying revenues at GBP 11.3 billion were up 4%. Underlying profit was up 21% and again, that included a number of but one offs, including some foreign exchange benefits, and obviously, the movement that we generally have in things like volume and mix between original equipment and aftermarket deliveries.

It's a strong financial position, we ended the year with net cash of GBP 223 million after an acquisition -- a number of acquisitions that we made to the tune of about GBP 1.5 billion. Reflecting our confidence in the business and our order book, our final payment to shareholders of 10.6p bringing the total to 17.5p providing a rise of 9%.

I guess where we are in the cycle at the moment is very much investing for the future against the large order book that we have. We had someone -- over the last 18 years, we delivered around 2,000 Trents, and we're looking to deliver 2,000 Trents over the next 5 years. So you can see it's quite a significant ramp up in load for us.

During the year, we made 3 strategically important decisions, one was our joint acquisition with Daimler of Tognum, the largest made by Rolls-Royce to date, provides highly complementary portfolios with our existing business and will create new opportunities for growth.

We also entered into an agreement with Airbus for the A350-1000, exclusive position on that aircraft, which strengthens our position on the wide-body market. And finally, in the second half of the year, we announced the restructuring of IAE, where we look to sell our equity shareholding of 32.5%, realizing the value of our investment. And we will continue to be a subcontractor in the existing arrangement. And at the same time, announcing a new JV with Pratt & Whitney for the future midsize market.

We made good progress this year on a number of programs, the Trent XWB has now over 1,500 hours tested and the number of -- sorry, hours completed. The BR725 will enter service on the new Gulfstream 650 in 2012. The LiftFan for the new JSF will be a various variant to the F-35, has performed a number of demonstrations on various carriers and on airfields and so forth. And finally, the TP400, which goes on the new aircraft, military transport aircraft, the A400M. That is of 8,000 flight test hours now and the aircraft is due to enter service in 2013.

We're becoming increasingly international. We're well-diversified by geography, markets, products and sources of revenues. Our order book, at GBP 62.2 billion, of which around 1/2 of it is from Asia, the Middle East and South America, and is larger than the entire order book in 2006. Nearly 1/2 of new orders this year are from faster growing economies, GBP 5 billion from Asia alone. We continue to keep a focus on costs and operational efficiency. Significant investments in technology facilities, tolling capability continue, reflecting the larger order book and the load rises that we're seeing at the moment.

Cross-points, opened in the U.S., now producing discs, our new facility in Singapore, Seletar, will be opening next week and production begins in the second half of this year. On top of that, we've expanded our Marine services network capability, opening up 4 new facilities and expanding one. And similarly, in our Energy business, we're opening up a new assembly and test facility in Brazil, which will open up in 2013. Again, to capitalize on both activity that's running in the Marine and Energy sectors there in the offshore markets.

Productivity, steadily improving. Revenue per person, up every year for a decade and now at GBP 274,000 per employee.

Just dipping a little bit into the results for the sectors. Civil Aerospace, the order book was up GBP 51.9 billion and that's up 7%. Revenues at GBP 5.6 billion were up 13%, and underlying profits at GBP 499 million, up 27%. The outlook for our Civil business is good and we've guided underlying -- good underlying revenue growth and strong underlying profit growth. Defence Aerospace, while the order book was down, underlying revenues were up 5% and underlying profits are up 22%, but benefiting from a one-off GBP 60 million settlement -- termination settlement from the Strategic Defense Security Review. In terms of guidance we've given this year for Defence, we've guided both a modest increase in revenues and profits.

Marine sector, again, the order book, GBP 2.7 billion, was down about 8%. But more importantly, order intake was up 15% at GBP 2.1 billion. It's important to remember that the Marine business is a much shorter cycle business, typically running the sort of 9- to 12-month period. Again, the Marine business was affected by predominantly, the downturn in the offshore market, which saw our OE deliveries fall some 23%. But again, we're expecting on the back of order intake in the lead order cycle for that to improve in 2012. Underlying profits were broadly as guided and broadly similar to 2010.

And for 2012, we are guiding a modest increase in revenues and profits broadly flat, reflecting continued price pressure in the offshore market. Finally, Energy. The order book was up 25%. Underlying revenues were down about 1.2 -- sorry, GBP 1.2 billion, down 3% and underlying profits of GBP 24 million, down about 11%.

I would characterize with you the Energy business as a mature business in the oil and gas side, which represents about 55% of turnover. And that generally generates good profits. And then less mature businesses in power generation, civil nuclear and low carbon technologies, where we continue to invest and, clearly, this suppresses our financial performance.

The main drag on underlying performance -- on underlying profits for Energy in 2011 were primarily due to higher bid costs associating starting costs of our Nuclear business. And again, in terms of guidance, we've guided both revenue and profit growth in the energy sector. And I think with that, I will stop and allow an open forum up to questions.

Question and Answer

Operator

[Operator Instructions] We seem to have no questions from the phone lines, sir. Please continue.

Mark Morris

Well, it's nice to receive no questions sometimes. I guess one thing I didn't highlight was to give you a group level guidance although it's in our press release. And that was to say that we expect to see continued good growth in both revenues and profits at a group level and I think that just underpins the resilience of our business and the confidence we have in the size of our order book. And in relation to cash flow, we've guided around breakeven. And that's really reflecting the fact that we continue to invest and we're seeing slightly higher R&D, slightly higher CapEx and slightly higher inventory as we get ready for the rising load. However, we think these are both the right things to do when we look at our return on capital employed around 18% and shows it's a good return on our investment. We continue to invest in technology and we continue to invest in growth. And I guess with that, I will end the conference. So thank you. And no doubt, we will catch up with you later. Thanks.

Operator

Ladies and gentlemen, that does conclude our conference for today. Thank you for participating. You may now all disconnect.

John F. Rishton

Former Chief Executive Officer and Executive Director

Good morning. Thank you for joining us today. Let me start by introducing my colleagues from the board. On my right, first here is Mark Morris, our Finance Director, taking over, of course, from Andrew Shilston; Mike Terrett, our Chief Operating Officer; Colin Smith, who is Director of Engineering and Technology; and to my farthest right, Jim Guyette, who's President of Rolls-Royce North America.

And I worked out -- my colleagues on the platform have 109 years of experience with Rolls-Royce. And the good news is, that when I sit down, it'll be 110 years of experience with Rolls-Royce. So I'm confident that we will be able to address any of your questions, if not, answer them. I'm going to give you an overview of the business and then Mark will take you through the numbers and then, of course, we'll have Q&A.

So as I hope you will have read this morning, we ended 2011 with a record order book of GBP 62.2 billion, up 5% from 2010. Record underlying revenue of GBP 11.3 billion, up 4%. And a record underlying profit of GBP 1.16 billion, up 21% on the previous year. And this, against a backdrop of a difficult economic environment, especially in Europe. This performance is a real tribute to the people of Rolls-Royce who've worked so hard. To our suppliers, who support us. And of course, to our customers, who continue to trust us. These results are not down to luck, but are the consequence of a consistently applied strategy. A strategy that many are familiar with, that is summarized on this slide.

We address 4 global markets: Civil, Defense, Marine and Energy. We have invested, we are investing and we will continue to invest in technology, capability and infrastructure. These are the sources of our competitive advantage. We benefit from our competitive portfolio, not only in original equipment, but in services as well. We continue to grow our installed base, a hugely valuable asset for the company, but based on the surprise in the value of our IAE holding, is not fully appreciated by everyone. And the provision of product-related services is essential for us and our customers. This strategy has produced significant growth in the last decade. Let me remind you of the scale of that change.

In the last 10 years, the business has been transformed. If I had said in 2002 where we would be at the end of 2011, I doubt that many would have believed me. And if I remind you of some of the headwinds, it is even more remarkable. The SARS epidemic, a soaring oil price, commodity inflation, global financial crisis, recession and more recently, the Eurozone challenges, have all buffeted the markets in which we operate. So our strategy has been very well shop-tested and has still delivered substantial growth. And as we have grown geographically, grown our product offering, grown OE and services, we have become an increasingly resilient business.

As you can see, since 2002, revenue has doubled, the order book has trebled and profit has more than quadrupled. While the share price has risen from just over GBP 1 to GBP 7.85 at yesterday's close. And in addition to being a growth stock, we have more than doubled our payments to shareholders. The transformation of our business and the expansion of our portfolio have given us an even more powerful platform for future growth. While the size of our order book underpins our confidence that we will double our revenues, again, in the decade ahead, before taking acquisitions into account.

In 2011, we took 3 major strategic decisions about the future shape and size of the business: Firstly, we acquired Tognum with our partners Daimler. You will, I hope, have seen Tognum's preliminary numbers for 2011. Revenue of nearly EUR 3 billion, up 16% from 2010. EBIT of EUR 345 million, up 43%. And a margin of 11.6%, up from 9.4%. This is a strong, successful and growing business, a world leader in high-speed diesels. Our product ranges are highly complementary. And with 3 world-class brands, Tognum, Rolls-Royce and Daimler, working together, I am confident that this will be an outstanding acquisition and partnership.

At the Paris Airshow, we announced with Airbus that Rolls-Royce will be the exclusive provider for the long-range A350-1000. As you know, we are the sole provider for the A350 family, and have taken orders

of more than 1,100 XWB engines, which makes it our fastest selling Trent engine yet. The engine program is on-time and the A350 flying testbed will take off for the first time this month.

The third major decision was a sale of our financial holding in IAE, surprising many with the embedded value. At the same time, we announced plans to form a new joint venture with Pratt & Whitney to build engines for the next generation of mid-sized aircraft. Three very important actions, but there were many others.

In Civil Aerospace, we celebrated the first commercial flight of the Boeing 787 Dreamliner, powered by the Trent 1000 engine. The Trent XWB engine is performing well and already has more than 1,500 hours of testing. It is the most efficient jet engine in the world. We also delivered BR725 engines to Gulfstream for their new flagship G650 jet that will enter service in 2012.

In Defence Aerospace, the TP400 engine for the Airbus A400M was certified and is on course to enter service in 2013. It has already flown over 8,000 hours. Our LiftFan system for the F-35B Joint Strike Fighter continued to make good progress during intensive flight tests. And last month, we were delighted the probationary status was lifted, and the first STOVL aircraft have been delivered to the U.S. Marines. Set against this, we were, of course, disappointed that the alternate engine for the F-35 was terminated. Elsewhere, the EJ200 engine for the Typhoon received praise for its outstanding operational performance over Libya.

In Marine, we received an order to power a further 10 U.S. Navy Littoral combat ships, our largest ever surface fleet order. In Submarines, the U.K. government announced that its next generation of nuclear submarines will be powered by our latest Pressurised Water Reactor technology. We also secured the first 2 orders for our award-winning Envision, a cargo vessel powered by liquid natural gas. We continued to invest in our network of service centers, opening or expanding another 5 during the year, to bring us closer to our customers.

In Energy, we won our biggest ever single contract to supply Petrobras, Brazil's leading oil company, with 32 turbine power generators for its offshore operations. Investment continues in our Civil Nuclear business. We signed a number of MOUs with major prime nuclear contractors as we look to leverage our capability in this sector. And signed a EUR 250 million contract to supply instrument and control technology to the world's biggest reactor upgrade program in France.

So we delivered a lot in 2011. Where will our focus be in coming years? First, delivering on our promises. We have made substantial commitments to our customers, and quite rightly, they expect a lot of us. Our job is, therefore, to deliver our record order book on time and specification. Second, we need to decide where we want to invest for future growth and just as importantly, where we don't. Thirdly, improving financial performance. While our financial performance has been good, we can do a lot better. We are growing and volume is a financial friend. We have invested and will continue to invest in new efficient plant and equipment. And we are constantly looking at how we can become more productive. We will improve margins over time. And as our supply chain gradually settles into shape, we will improve substantially cash generation, in particular, from working capital.

I've been working for Rolls-Royce for one year and have learned a lot. I have visited many countries and many of our facilities. I have met customers and suppliers and, of course, investors. I have said it before, but it's worth repeating. This is an outstanding company with outstanding people, professional, committed, enthusiastic and hardworking. As I have described, the business has been transformed in the last decade, showing increasing resilience as its products, OE and services, and its markets, have grown hugely. The foundations are strong, the prospects are exceptional and this is a very exciting place to work. The work we do is essential. It is mission-critical. We are trusted to deliver excellence and we strive to achieve that everywhere, every day. When we remember what we look like at the turn of the century, and we think about what has been achieved since then, it gives us, and I hope it will give you, enormous confidence about what we can achieve in the future. Thank you.

Mark Morris

Good morning, everyone. I'm delighted to be presenting my first set of results as Finance Director. I represent 25 of the 110 years that John just spoke about. I've been group Treasurer for the last 10 years, and I hope you take from that, that I'm well immersed in the business and have a good understanding of the business.

As usual, I'm going to restrict my comments to the underlying performance. You all have the published data and the headline figures, as well as the underlying. But it is the underlying figures that we look at as a business, in terms of how we look and manage the business. So what I'm going to do this morning, I'm going to talk a little bit about the trading performance at the group level, and then I'm going to drill down a little bit into each of the segments and point out some highlights. And then I'm going to provide guidance for 2012. And just to be clear, the guidance that I'm going to give will be excluding the impacts of IAE and Tognum. And then finally, I'm going to give you an update on Tognum and IAE, 2 of the key strategic decisions we took in 2011.

So to the group highlights. As John stated, it's been a good year. Order book is up 5%, reflecting good order flow. Order intake of GBP 16 billion is up 33% year-on-year, approximately 1/2 of the order book from emerging markets. This underpins our confidence in the future and provides great visibility of growth over the next decade. As we said before, we doubled revenues in the last decade and we're confident in doubling the revenues again in the next decade organically.

Revenues, up 4%, underpin strong performance in aftermarket, which is up 9%. While OE revenues were down 1%, despite a good performance from Civil, but countered by lower OE revenues in Marine, which I will come onto later. We should not forget these are big businesses with a number of moving parts. Profit, up 21%, is well ahead of turnover, which represent a combination of a better mix, productivity, FX and a number of one-offs, including the GBP 30 million net contribution from Tognum. And I will cover this in the slide in a minute. Next slide.

Cash. We are pleased with the cash performance. We started the year with GBP 1.5 billion of cash. We've invested GBP 1.5 billion of cash. The business has generated over GBP 200 million to end up with a net cash balance of GBP 223 million. On top of that, liquidity remains strong at GBP 2.5 billion. Finally, shareholder payments, the increase of 9% to 17.5% for the full year, reflects our confidence in the business and the size of the growing order book.

So let's look at some key components of growth on the profit chart. So we're going to start off with the GBP 955 million for 2010. Trading of GBP 52 million represents increases in volume, predominantly Civil and Defense, unit cost improvements, higher contribution from profits from JVs, lower restructuring charges, offset by higher manpower, slightly higher Civil Nuclear bid costs and IT costs, all reflecting where we are in the investment cycle.

The GBP 52 million that represents 3.8% growth on base trading, which is broadly comparable with group revenue rises of around 4%. Net one-offs. Now you know about these, there's 3 particular items. There's SDSR, which is the termination settlement, which was a GBP 60 million benefit in 2011. The Trent 900 incident, which you're all familiar with, which is a charge of GBP 56 million in 2010 and GBP 18 million in 2011. And finally, the Trent DLE, GBP 26 million charge, which we took in 2010, which makes up that GBP 1.24 billion bar. Net foreign exchange comprises of GBP 64 million of transactional benefit, offset by GBP 10 million of translational negative.

Now net R&D is higher as we guided. And again, this reflects where we are in the investment cycle due to the phasing of new development programs, where we are spending more. It's important to recognize there are really 3 components here: there's what we spend, what we capitalize or expense and what we amortize. And for those of you who came to the Investor Conference we held in November last year, you'll recall we did a bit of the deep dive on R&D. And just to remind you a little bit, we spend about GBP 1 billion on average on R&D growth. About 1/2 of that is what we fund privately. It's somewhere in the order of 4% to 5% of turnover.

The components of, in terms of where we are, also reflect where we are in various points in the program. So we only capitalize between engine certification and entering into service. And you will recall, the T1000 went into service in September last year. So we've stopped capitalizing the Trent 1000. The next main

program that will be capitalized will be the Trent XWB, which will not start until Q4 2011. So the higher R&D charge reflects slightly higher spend, higher amortization and lower capitalization. And [ph] I'm going to guide for next year, you can expect the R&D charge to rise significantly as we have lower levels of capitalization, higher amortization and higher expensing.

Entry fees are lower, and this again purely reflects where we are in the program. Trent XWB and where it is, where the majority is, so we're 17 lower there. Then finally, to underlying profit pre-acquisitions of GBP 1.127 billion. I want you to remember this number because this is your base number for guidance pre-acquisition. We add in the net effect of GBP 30 million Tognum contribution, and that brings us to our reported underlying figure of GBP 1.157 billion.

Okay. Moving on to the group cash flow. So if we take our GBP 1.157 billion, it's how we're turning our profit into cash, we add back noncash items, depreciation and amortization of GBP 410 million, up slightly over GBP 367 million for 2010. And again, reflecting where we are in the investment cycle. Networking capital reflects a number of moving parts. Inventory was up GBP 140 million. Really reflecting buffering as we build new factories and get ready for the increase in load. Deposits were down GBP 126 million, reflecting where we were in the OE order cycle. But both more than offset by the improvement in net debtors and creditors. I expect this position to reverse for 2012.

CapEx and intangibles of GBP 775 million reflects continued investment as we tool up to meet the rising load. It's worth remembering that we delivered 2,000 Trents over the last 18 years. And we're due to deliver 2,000 Trents over the next 5 years. So a significant ramp-up in orders and deliveries.

Of course, investment is not just about building the factories. You're aware of Seletar and Crosspointe. In addition to that, of course, we do factory refreshes. We have to put the expensive kit that goes in them and we do regular refreshes and updates of existing factories for productivity improvements, and of course, IT modernization as we globalize. This is a continuum. We're investing heavily because it's the right thing to do and reflects the confidence we have in our order book. And a return on capital employed of 18% is also a good return on our investment. CapEx goes hand-in-hand with R&D, and expect this to rise in 2012.

Other relates to financial RSP [ph] payments, provision utilization, and the difference between JV profits and dividends, cash dividends. We focus on trading cash flow as items to the right tend to be largely fixed and escalating or specific in the case of acquisitions. 80% cash conversion in 2011 demonstrates good cash conversion in the underlying business. But again, I expect this to be lower as we move into 2012, as we invest for the rising load.

Pensions and tax representing GBP 410 million. You'll see rising taxes as we're generating more profits and in jurisdictions, where tax rates are slightly higher. And then finally, servicing our shareholders and investors, GBP 315 million increase. Brings us to our base cash flow of GBP 210 million. Obviously, the acquisitions we add in to our reported figure of GBP 1,310,000,000.

So let's have a look at the business segments and see how they fared in 2011. Firstly, Civil. There's a lot going on here, but just pick out a few things. In a tough of environment, a strong portfolio is allowing us to continue to grow the order book extending visibility. Up 7%, including an order intake of GBP 11 billion, which is up 40% -- 47% year-on-year. It's worth noting that the order book contains GBP 250 million of thrust, compared to our installed base of GBP 400 million of thrust. So a significant stored value in the order book.

Just turning to OE revenues and service revenues. OE revenues growth is ahead of aftermarket, which is primarily due to the leveraging effect of large engine deliveries. You can see that engine deliveries were up 14%. And again, the leverage effect of larger thrust and higher value engines has contributed to that. Aftermarket revenues, up at 10%, slightly higher than where we guided at the half year and this is predominantly to a number of time and material contracts switching to TCA.

So profit and revenues. Profit growth of 27%, let's remember, includes the effect of the Trent 900 incidents. So adjusting for this one-offs, profit growth is around 15% and broadly in line with revenues.

The remaining difference is due to a combination of mix, volume, unit cost, FX, partially dampened by a higher R&D and lower entry fee receipts.

So turning now to Defense. The Defense business performed well despite pressures on defense spending in Europe and the U.S.A. We continue to benefit from diversity of our portfolio, having 24 engine programs across 103 countries, with 160 customers, and with platforms that range from transport through to heavy combat. This provides a natural shock absorber, as well as export opportunities to the emerging markets. Remember, transport represents around 50% of our Defense business. And troop mobility, humanitarian aid and movement of materials is always going on in and out of conflict times. The 7% decrease in the order book is partially down to the SDSR termination settlement, which represents about half of the decrease. And the rest is due to a decrease in the order intake during the year, which at GBP 1.7 billion, was 16% down on 2010.

The strong profit growth has benefited from the SDSR termination settlement of GBP 60 million. When we adjust for this, profit growth is around 2%. This lower growth reflects the volume mix in unit cost movements and R&D, on the basis of where we've had lower capitalization in some of the defense programs.

So to Marine. Now let's just put some context around Marine. There are 3 segments in our Marine business: offshore, which normally represents around 50% of turnover. A little lower last year due to lower OE deliveries at around 40%. Merchant, which is normally around 20%. And naval, which includes our Submarines business which is around 30%. The order book declined 8% primarily reflecting the phasing of investment decisions in offshore. You need to understand that Marine is a much shorter cycle business with lead times typically around 9 to 12 months. However, we are encouraged by the order intake, which is a good lead indicator, which rose 15% in 2011 to GBP 2.1 billion. And we are confident the order book will grow again in 2012, although we continue to expect to see price pressure going forward.

Overall, OE revenues -- sorry, overall revenues in Marine were down 12% due to a 23% decline in OE revenues, which was partially offset by a 9% improvement in aftermarket revenues. We said at the half year that OE revenues would come back strongly in the second half. That didn't happen, which is disappointing. Despite encouraging bid activity, some customers just chose to defer deliveries. However, what is encouraging about the Marine business is that we were able to continue to leverage of our expanding network of service centers, adding 4 more and expanding 1 during the year, to see strong growth in service revenues. As guided, profit was broadly similar to 2010. The 3% decline relative to a drop in revenues of 12% reflects improved revenue mix and increased focus on cost, quality and operational performance.

So finally, on to Energy. Again, let's just provide some context as how I view this GBP 1.2 billion business. I would characterize it as having a mature, well established and profitable oil and gas business, which represents about 55% of turnover. And then a number of less mature businesses in power generation, Civil Nuclear and low carbon technologies, which we continue to invest in, which suppresses financial performance in this segment. We need to be careful with the significance we attach to percentages, as these are off smaller numbers too.

So to the order book, which increased 28%, driven by significant demand in the O&G sector and included our largest ever order in O&G to Petrobras in Brazil. Order intake was up 57% at GBP 1.5 billion. Revenue declined by 3%, largely due to phasing of OE deliveries in power gen, while demand for aftermarket products and services continue to grow with an increase of 10%. Profits fell 11% as a result of lower revenue and primarily from our investment in Civil Nuclear.

Okay. Now on to financial strength. You have 3 items up here, really, but I think it's important that in a long-term business like ours, the importance of having a strong balance sheet is key to us. A credit rating, a good investment credit rating is key where we have long contracts with governments and customers that are spending 20 years. People want to know that we're going to be around over that sort of period. We have strong liquidity at GBP 2.5 billion at the end of the year. We have access to all the global debt markets. And debt maturities are well spread to 2019 with no material refinancing until 2013. This underpins our long-term commitments and gives us confidence, flexibility and options.

So on to group underlying guidance. Now just remember, this is excluding the impact of Tognum and IAE, and the base core underlying PBT [ph] number is GBP 1,127,000,000. So what we have said, for the group, we expect to see good growth in revenues and profits. We expect cash flow to be around breakeven and this really reflects the continued investment of where we are in the cycle, higher R&D, higher CapEx, and obviously, growing working capital. In the segments, for Civil, we're guiding good growth in revenues and strong growth in profits. In Defense, modest growth in revenues and profits. In Marine, modest increase in revenues and profits broadly flat, reflecting increasing price pressures. Energy, we expect growth in revenues and some improvements in profits.

So some housekeeping for your models. Some other relevant data for you. Foreign exchange for 2012 will be neutral. There'll be a significant increase in R&D charge. And again, this reflects the lower levels of capitalization and therefore, high levels of amortization and expensing. Cash, as I've already guided, we expect to be a modest increase in capital expenditure and similar for R&D, too.

Overall, I'm pleased with where we are heading. And when we consider that we are guiding at the group level, good growth in revenues and profits against the current economic backdrop, when we take into account higher CapEx and R&D, no FX benefits and no tailwinds such as that from SDSR for 2011. And when I overlay Tognum and IAE, it is only going to get better.

So let's just remind ourselves where we are with Tognum and IAE. So the status on Tognum. It's a JV, a joint bid we did with the Daimler. Between us, we now own over 99% of the shares. We've invested GBP 1.5 billion as our share. And our next steps, we're currently in the due legal process, which is referred to as a squeeze-out, which is to extract the remaining shareholders. Tognum will announce its results on March 8 and if, obviously, we're successful with the legal process, eventually, the group will delist. Our assumptions are, for the first half, is we will equity account for Tognum. And for the second half, full consolidation. We will continue to report Tognum for 2012 as a single segment.

Finally, on to IAE. And again, you're aware we announced some restructuring with IAE, where we're looking to sell our equity stake and still remain as a subcontractor. But at the same time, we also announced a new JV with Pratt & Whitney for the middle of the market. Both are awaiting regulatory approval and we are just in due process at the moment. Upon completion, and assuming we gain approval, the order book will reduce by about GBP 4 billion. We will receive GBP 1.5 billion as our share at closing. There will be a small reduction in 2012 revenues, and profits for the full year would rise by GBP 140 million. Obviously, you'll need to do some pro rata-ing to the extent that happens later during the year.

So I think with that, it concludes my part and I'll hand over to John for Q&A. Thank you.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, very much, Mark. I suspect as this is a clear presentation, there'll be relatively few questions. We'll go to our normal format, if you could wait for the microphone before you ask your question, if you could raise your hand, wait for the microphone, state your name and the company that you're representing, that'll be very helpful. And then we will attempt to answer those questions. So over to you.

Question and Answer

Nick Cunningham

It's Nick Cunningham from Agency Partners. Two questions coming out of those last 2 slides, if I may. First of all, looking at the GBP 140 million pro rata full year uplift that comes from the IAE transaction, does that imply that you're assuming that the payment, and I referred to as the earn out payment that you're getting from Pratt, is greater than GBP 140 million then? Because presumably, if reported sales are going down, reports of profits must go down accordingly, particularly if you're booking a subcontractor margin. And then that's being sort of more than made up for by the payment from Pratt. First of all, is that a reasonable assumption? And secondly, a different question, but on Tognum. Do you have the intention of buying out the Daimler half of Tognum? If you do, how will you finance it? Would you have to issue paper in order to continue to finish the year with net cash, as you said that you want to in the past?

John F. Rishton

Former Chief Executive Officer and Executive Director

Thank you. Let me take the second question first. Daimler are long-term partners -- and that's the position. It's as simple as that. So we -- I'm not going to get into speculation about buying it, not buying it, how we'd finance it, there's not a discussion. Daimler have been, and are, and I'm sure will be terrific long-term partners, and that's how we regard that joint venture. In terms of IAE, I'm going to suggest Mark, if he wants to add any comments to it. But what I would say is, just stand back a little bit, which is there's some technicalities going and then there's the bigger picture. The bigger picture is clearly, we're getting a significant payment reflecting the installed value of the base and the pull-ahead of the earnings of some of that, which is the GBP 140 million and the GBP 1.5 billion. And I think the GBP 1.5 billion was significantly more than most people would have estimated the value of that installed base. So the point that I've made, and I'll continue to make, is people should reflect on what that means for the total installed base of Rolls-Royce. Then there are technicalities about what we're actually doing. This is a financial transaction. We continue, obviously, to still make parts and products for the V2500 engine and we continue to assemble it as well. So there's a technicality in terms of who has the orders, which goes down, a little bit of jiggling around with the revenue and then the income streams. And I think where you're going is, you're kind of getting down and getting sort of into some really detailed granular information. And we just stood back and given you -- painted a broad picture. But Mark, I don't know if you want to add anything to that?

Mark Morris

Yes. I mean, I think all I would say is, look, there's a number of moving parts. Like in IAE, like we have within Rolls, we have OE sales, we have spare sales and we have total contracted accounting. And of course, when you unpick these numbers, they will change how we take profit. And I think that's one of the things you need to recognize. But recognize we used to have 1/3 of all the revenue that came from IAE. We've monetized some of that by selling our equity stake. We continue to be a supplier and we'll make a return on the work we do in terms of both what we manufacture and what we assemble. And of course, we continue to get a share of the aftermarket, which is effectively a royalty stream, which is obviously based on engine flying hours. So I think this sort of gives you a sort of good picture of where we're going. And the number, I think, just reflects our assessment in the first year of how that will look.

Nick Cunningham

Can I just follow-up, is that possible? Just on the earn out stream or the royalty stream, you said possibly about \$2 billion in total. It declined each year. It's front-end weighted, it's mostly the first 5 years. So whether we want to back it out or leave it in, we still need a sort of point of departure. I mean, an idea of the gradient in order to be able to come up with some sort of realistic forecast looking forward, because it's clearly going to be very material to your outcome over that period of time.

Mark Morris

Well, I think the only answer I could give to that is we don't give guidance beyond the year we're in. So I mean, we're not going to do that for you.

John F. Rishton

Former Chief Executive Officer and Executive Director

So we get the regulatory approval. We hope to get that this year and then we'll provide updates to you. But this is, again, a backup. Think about the value of the installed base and the impact that means for the rest of the business. The first thing. The second thing is, the new joint venture that we've established or will establish we hope with Pratt & Whitney, which gives us access back into this very large and important market in the future. So there's those 2 elements that I would focus on and encourage you to focus on. We'll go to the next question.

David Howard Perry

Goldman Sachs Group Inc., Research Division

David Perry from Goldman Sachs. Apologies, 3 questions, please. Easiest one, can you just tell us on the Civil aftermarket in 2011, just for the full year, just what it was pre- and post-FX, since I'm not sure there? The second one is, can you just clarify your Defense EBITA guidance for 2012? You talk about modest growth and profit. Do we strip out the SDSR for the starting point or do we leave that in, in this modest growth off what you reported? And then perhaps the more detailed question that I'm most interested in is the supply chain. You alluded to improvement you're going to make there. Could you just give us more color in terms of the how and the timing and the potential upside, please?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Well, if I take the last question first and give you an overview of that one, I'm going to ask Mike Terrett to make a few comments, and then ask Mark to address your other 2 questions. As the company is growing, as we have invested in significant new plants and equipment, the obvious examples would be the investments that we've made in Singapore, the investments that we've made in Crosspointe, as well as the [indiscernible] investments we've made in the U.K. refreshing much of our plant and equipment. The expansion that we're seeing takes time to one, fill up the system and then get production up to a certain level. So if I take Seletar as an example, we will officially open Seletar next week. There will be a very gradual ramp-up in production in Seletar during the course of the year. So in that ramp-up, what we will see in the supply chain is a buildup of inventory. And then once we reach production, you will see that inventory level coming down as we reach a level of efficiency and productivity that you don't get to in the initial buildup. And then you multiply that around the system. Clearly, we're sitting on quite a lot of inventory. So over time, and I would emphasize this is a gradual process, there are significant opportunities for us to improve that working capital position as we grow and as we become more efficient, and as we get through the launch phases of many of these new facilities. Mike, I think you're in a far better place to comment on inventory than me.

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Yes. Thanks, John. Yes, the volume is our friend and new programs are our friend. The investments that we make in technology, not just in the R&D, that's the technical side, the manufacturing technology, all of those are benefits to us over a long period of time. And that's really the core of what we're driving in the supply chain. And as John said, getting to volume actually has some cost and some investment requirements. And you can go and physically see these in Singapore, in Virginia, in the U.K. Not just the externals, which are relatively cheap, but the internals where the advancement manufacturing machines are. And they give us both a near-term challenge in terms of investment, which is very exciting. But also, give us the longer-term opportunity to put in late machine tools standards, later processes, newer processes, for us to drive productivity in the long term. Because these are long-term programs. The XWB, we're building the first engines. Flight test is this year. Development engines are clearly running. And that gives us an opportunity to build a platform for 25 years of production, and a further 25 years of aftermarket. That's a much better place to be than sitting on legacy products, which are nearing the end

of their life. So it is a whole series of phased opportunities that we're taking in the supply chain. That's both our internal supply chain and the 75% or so of the engines that are produced in the external supply chain. And I would like to stress how pleased we are with our partners and our suppliers, who are actually also investing in new facilities, factories and processes alongside us. Again, largely off the back of the new products that we develop in pretty much in every segment, albeit the ones that you hear most about are the ones in the big trends in the Civil segment.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Mike. Mark, would you like to...

Mark Morris

David, I think you asked 2 questions. The first was on FX and the impact on aftermarket for 2011 on Civil. The short answer to that is, it's around about 4%.

David Howard Perry

Goldman Sachs Group Inc., Research Division

So organic aftermarket?

Mark Morris

So you're looking for understanding pre- and post-FX impact?

David Howard Perry

Goldman Sachs Group Inc., Research Division

Yes. So the organic aftermarket is 4%?

Mark Morris

10% for the year was aftermarket for us for Civil. And the impact of FX was about 4%.

David Howard Perry

Goldman Sachs Group Inc., Research Division

So 6% organic. And then in the Defense?

Mark Morris

Your second question which was, what is my guidance based off? And the answer is it's our reported figure of GBP 376 million.

David Howard Perry

Goldman Sachs Group Inc., Research Division

So why such an improvement in Defense EBITA in 2012? Because the underlying would be much, much better?

Mark Morris

Yes. I understand what you're doing, you're stripping out SDSR. You're getting the number back down to whatever it is -- GBP 316 million. Look, the combination again it's where we are in the cycle, a number of moving parts. And you've got, first of all, higher top line growth, you've got some unit cost improvements, the benefits of some R&D. I mean, there's various moving parts that we're not going to sort of break out. But having done our guidance, that's where we come out.

David Howard Perry

Goldman Sachs Group Inc., Research Division

Let me try on a cheeky one because we're getting to know you. As Mark Morris, new CFO, what's your definition of good? We've got GBP 1.127 billion as a base.

John F. Rishton

Former Chief Executive Officer and Executive Director

I think if I just come back to Defense and your question there. I think, clearly, the guidance we have given to 2012 will be a little surprising maybe against the backdrop of the defense budget positions that many of you have in your heads. But if you reflect on our position, if you reflect on the markets that we operate in as Mark has said, we have 160 customers, 103 countries, although the U.S. and the U.K. are clearly the biggest. Where are markets are, we're actually in a slightly different position to many of other defense companies. So we get a slightly different result, which is why when I've been speaking to people whilst my optimism and enthusiasm about the defense would have been higher a year ago than it was today, based on the budget cuts and the budget positions that we have. Actually, we're okay in terms of our Defense business, which I think is probably a slight surprise to some of you. We'll go to the next question.

Zafar Khan

Societe Generale Cross Asset Research

It's Zafar Khan from Soc Gen. Just wanted to get back to Nick's question on the GBP 140 million that you're talking about for this year from the IAE transaction, the benefit to your EBIT line. Is that an ongoing benefit? Or is there an element of one-off in that GBP 140 million?

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. Let me get Mark to answer the question. But the GBP 140 million is not this year. The GBP 140 million is in the 12 months once we've got regulatory approval. Just to make sure that's crystal clear. Mark, do you want to...

Mark Morris

Well, again, you're asking me to give you guidance beyond the...

Zafar Khan

Societe Generale Cross Asset Research

I'm not asking for guidance. All I'm asking you is the GBP 140 million that you get in the first full year, is there an element of one-off in that or is that an ongoing thing?

Mark Morris

No. I think, as Nick alluded to, some pull forward as part of the deal of what we've done in terms of how we structured over the 15-year period effectively. But we're not going to get into the details of exactly what the rate of change is year-on-year. It's just a one part of a much bigger business.

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. We've been crystal clear. GBP 140 million in the first 12 month and then declining over a period of time, but we're not going to go...

Carter Copeland

Barclays Bank PLC, Research Division

Carter Copeland, Barclays Capital. Just wondered if you might elaborate a little bit more on the Civil aftermarket. You said that the like-for-like organic growth was 6%, but you also called out the TCA conversions providing some uplift to that number. I wondered if you might comment on what extent that would further reduce that organic number. And if there's any phasing that, that number would imply, I think a little bit of a weakening second half versus first half in that growth profile. And I wondered if you

might comment about TCA conversions and how that weighed first half, second half or what we should think about the underlying growth?

John F. Rishton

Former Chief Executive Officer and Executive Director

One of the great dangers of providing information is that you all you want is more information, which is understandable. What I would say is, let me go back to the guidance that we've given for Civil for 2012. So to cut to that, which is good revenue growth and strong profit growth. I'm not going to give any further breakdowns of that. I'm not get sucked into the detail of exactly where this is, because I'm not personally convinced that it's entirely helpful. We saw good performance in Civil, good growth in Civil in 2011, and we expect that to continue. But unless, Mark, you have anything more that you wish to add? I don't want to get sucked into more granularity about who did what, why and when.

Mark Morris

I think the danger is you just get sucked into looking piece by piece by piece, and there's lots of moving parts. Remember, we're a long-term business. I think just to measure something from one half to another half is not really representative of a natural underlying trend. So no, I really don't want to get staked out in the sun and saying everything else is here, here and here. Because I think the premise of our philosophy and strategy is having a broad portfolio and a split between OE and aftermarket. Recognizes that when we produce our group results, there are pluses and minuses in each of the little subsectors. And trying to be sort of held accountable for every various subsector, it's quite difficult. It's guidance at the end of the day.

John F. Rishton

Former Chief Executive Officer and Executive Director

Next, how about around the front, Jemma [ph]. Just see if we can edge our way backwards.

Andrew Paul Gollan

Investec Bank plc, Research Division

Andrew Gollan from Investec. A couple of questions. Firstly, on some of the divisional guidance you've given, Marine and Energy. Firstly in Marine, you talked and mentioned quite a lot of pricing pressure. You've got a few dynamics going on there in terms of growing aftermarket and the OE story that's happened over the last year or so. How do we think about it going forward? Because the margin has improved significantly. We've got some -- clearly, some new dynamics coming in. What should we think in terms of forecasting forward? Secondly, on Energy, similarly -- actually, you said the investment in Civil Nuclear is one of the factors holding back the margin. But still the margins are very suboptimal there. What is the longer-term trend? I mean it should be up, but it's a long way down. So how far should we be thinking?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. I think we spoke a little bit about Energy at the half year. And if I look at the various elements of that as Mark has said, there's 5 elements in the Energy sector. The oil and gas, which is a good profitable business. Power generation, which needs to improve. And it's important in terms of proving equipment that is subsequently provided to the oil and gas, so there's a linkage there. Civil Nuclear is a fledgling business, I think I've described an opportunity for us to grow. It's an area that we spend a lot of time on and we're investing money in, in a variety of ways. And I'm confident that, that will be a successful business in the future. But as I've said to a number of you, it's one of the few businesses around that makes our Civil Aviation business look short cycle. So that will take some time to develop and mature. But I think we're in a very good position, based on the capabilities and skills that we have, the relationships that we've built up over time with the prime contractors in that industry. And I'm sure that will be a profitable and successful business out into the future. I think the other 2 businesses, tidal and fuel cells, are the ones where we're giving some serious thought to. Again, I'll refer to a little bit to this at the half year. In terms of what is the business case, what are we doing and what are we really good at? And

what I would say is, if I take the tidal business, we're really good at parts of that. It's propeller with a turbine. Okay, we do that in Marines, so we're good at that. But what are we not so good at? Well, putting things on the seabed, it isn't one of our core skills. Getting power off the seabed onto the land and then getting it to the grid, isn't something that Rolls does. So how do we go about this for the future, and we're wrestling that to the ground as we're speaking here. There are people giving thought to that. So to come back to your question, Energy is going to improve over time, but we've got to wrestle some of those things to the ground in terms of what we want to be and where we're going with some elements of it. And then there's the Civil business that is growing and developing, and what period of time does that take? Energy's performance is going to improve. But it won't be, as I said at the half year, something that we wave a magic wand at and it transforms over time. And whilst we may be frustrated by that financial performance, I've got to say in the last 3 years, it has been a profitable contributor. Whereas, in the previous 4 years, it was a loss-making area. So it's already notched up a step. It needs, obviously, to improve in the future because it is a drag on the overall business. In terms of Marine guidance, I'm not to get drawn into any more than we've said clearly. You're all aware of the Marine environment, the various pressures there are on that, particularly on the very large merchant elements of that business, which we're not in, and the pricing pressure that has been exerted there. We see some of that in a variety of parts of the business. If you went back 2 or 3 years ago, people were concerned about getting equipment, not what price they paid. Now they're concerned about what price they pay, as well as getting equipment. So the dynamics have changed a little bit in that industry. And that's the pressure that we and everybody else are seeing. And that's why we are, like most other people, focusing very hard on our cost and how productive we are and how efficient we can be, which is one of the contributory factors as to how to manage to compensate for the OE demand in the second half of 2011. But the guidance is clear and laid out in the press release. Anything else?

Andrew Paul Gollan*Investec Bank plc, Research Division*

And just one more quick question, please. On dividends, once you get the profit uplift from IAE, I mean, you've had a progressive policy for many years now. Do we expect that to be progressive still in line with earnings? Do we see a step-up as a result of that because of the new level of profitability that's occurring?

John F. Rishton*Former Chief Executive Officer and Executive Director*

It will undoubtedly be a topic of important conversation at the board when we get to that stage.

Gordon Hunting

Gordon Hunting of Fiske. A particular question for Colin Smith, because he hasn't had any, poor chap. Now much more to the point of various airlines not wanting to use 3-shaft engines, they much prefer 2 as being safer. Does that mean you're expecting competition on the A350 XWB from either of the 2-shaft manufacturers?

John F. Rishton*Former Chief Executive Officer and Executive Director*

As you rightly say, that is a question that's going to head towards Colin in terms of 3 shaft and 2 shaft. What I would say before I pass to Colin is, is having gone an exclusive position on the A350-1000 and having sold 1,100 engines on the other derivatives. We're in a particularly good position on that aircraft. And whilst the other engine manufacturers have the opportunity to come and compete with us, we're confident that we have a strong competitive position. Colin, maybe you'd like to talk a little bit about 3s and 2s.

Colin Peter Smith*Former Group President and Executive Director*

Perhaps a misunderstanding. I don't see it as any fundamental difference in safety between 3 shaft and 2 shaft. They're both incredibly reliable machines from a fundamental concept point of view. And the safety across all of Civil Aerospace, all the manufacturers is increasing -- is improving year-on-year. It's

phenomenal how good -- for instance, the in-flight shutdown rate is now on any of the big engines. It's something between 20 and 40x better than any certification requirement at all. So from a safety point of view, Gordon, there's absolutely nothing to call on.

John F. Rishton

Former Chief Executive Officer and Executive Director

Just the next one. Just will go on the side of the room.

Edward John Stacey

Haitong Bank S.A., Research Division

It's Ed Stacey from Espirito Santo. Just one question on the Civil division and the margin uplift in 2012. In 2011, if we strip out the effect of the one-offs getting better and the FX improvement, then the operational leverage sort of boost to margins was very little, which is as per your guidance for the year. But then in 2012, you do have a sort of like-for-like margin improvement it seems. So what -- is there sort of more favorable mix coming through or something?

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, do you want to answer?

Mark Morris

Yes. I think it's, first of all, higher volumes and a particular mix of units that we're selling in terms of the margins that we expect from them, and obviously continuing growth in aftermarket revenues. So again, even with those additional R&D headwinds, that's factored into our guidance.

John F. Rishton

Former Chief Executive Officer and Executive Director

Colin's delighted -- and thank you, Gordon, for asking the question. But I know that Jim is getting concerned about not having a question. So may we have this --- I know it's going to go towards Jim.

Unknown Analyst

Yes, 2 questions. Actually, one is for Jim. Perhaps a question for Jim first, so he doesn't feel left out as well. Just around IAE, we've heard from John quite a lot about the logic behind selling the stake. I mean from your perspective given your role there, I mean what's your view on Rolls versus logic there? And what do you see as the future of IAE? And then a question perhaps more for Mark on the kind of R&D side. Is the increase in R&D in CapEx, although there's obviously, manpower. But is it primarily coming through in Civil or will it be across the business?

John F. Rishton

Former Chief Executive Officer and Executive Director

Jim, would you like to have a run of that?

James M. Guyette

Former Chief Executive Officer of Rolls-Royce North America Inc and President of Rolls-Royce North

With respect to IAE, I have been on the IAE Board for probably 10 or 11 years. So I have lived with this collaboration, which is probably one of the most successful collaborations that the industry has seen in the engine arena. And I think, one in which shareholders on both sides have benefited greatly, a great product, a great reputation in the marketplace. So I think we start from a very, very good base. The difficulty came about when the Airbus company decided that it wanted to launch its new airplane, the NEO, and we could not make a business case to launch a new engine for the NEO. Pratt & Whitney was in a different phase of development with respect to their new engine, and they felt they could. So it put the partnership out of alignment and it became increasingly difficult because your customer base had the previous style of engine, the V2500, and on a go-forward basis, with new airplanes coming aboard, they

wanted to take advantage of the new Pratt & Whitney engine. So it became very, very difficult, very hard to go in and renegotiate contracts with airlines that you had contracts going out into the future. And it simply didn't work the way it had in the past. So we've all felt that the best way forward was for us to move out of the partnership at this time. Take in the \$1.5 billion. Have the revenue stream, going forward on power by the hour. And also, maintain our industrial position. But then, even more importantly, to make sure that the partnership could reform for the next narrow-body airplane. So I think that there's great logic to it. And I will tell you that the partners, I think, feel very comfortable with this position.

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, would you like to...

Mark Morris

Yes. Your question in relation to R&D for 2012. So again, let's just recap what I said earlier on. So we expect to see a modest increase in R&D spend, but quite a significant increase in the R&D P&L charge. Again, this just reflects the various components, and I'll come onto sort of a broad split of where we spend the activities. So let's just look at where we are in the cycle. John just reminded me that I inadvertently referred to 2011 versus 2012 with respect to Trent XWB, but the next large engine which will be capitalized will be the Trent XWB, when we look to engine certification in quarter 4 2012. So there's a lot lower levels of capitalization going on during 2012, which is one of the reasons the R&D P&L charge is rising as we expense more and we amortize what we've already capitalized. In relation to where are we spending it, I mean, the short answer is we spend it in all our businesses. But Civil takes the lion's share. But there are growing activity in areas like Civil and Marine. And of course, again, when we talk about R&D, at the sort of broad level, you've got to remember there are 3 subcomponents to that. There's research and technology, which sort of I normally refer to as the sort of science projects. There's R&D, which is the productionization of our engines and development of them. And then there's sustaining engineering, which is continued improvement throughout the life of them. So all of those are being worked on. And at any point in time, the spend reflects where we are in the cycle. And the P&L really reflects what we're capitalizing and what we're not capitalizing. Ben?

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Ben Fidler from Deutsche. A couple of questions. The first one, just on FX. You talk about no transaction benefit in 2012. You have reasonable visibility presumably on the hedge rates based on the scale of the hedge book. As we look beyond '12, should we expect to see, at the current spot rate, would we expect to see any further transaction benefits or should we think of those as now having pretty much played out to the business?

Colin Peter Smith

Former Group President and Executive Director

Well, as you know, from the press release you've got a pretty good idea of the size of our hedge book. At the year end, it was roundabout GBP 22 billion, with an average rate of GBP 160 million. We have guided for 2012 a neutral impact from FX, and that's transactional FX we're really talking about. Obviously, we don't give guidance beyond that, but I don't think it takes a brain surgeon to realize when the average rate in our book is around GBP 160 million. We think there's a lot of potential uplift at the moment.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Right. The second question is, sorry to come back to this point, R&D, but whether you are able to give us any steer in any way as to -- I mean, the 4% to 5% range you give that's effectively up GBP 120 million delta between the top and the bottom of the range, which is about a 20% impact on Civil profits based on the number you reported last year. Should we think top end, bottom end of the range looks more -- I mean, it sounds like you're steering more towards in the short term of the top end of the range, would that be a correct...

Mark Morris

Yes. I look at it, I think, I've given you guidance, which is a modest increase in spend. And I think, as David referred to, I think the Rolls-Royce lexicon is sort of relatively well established out there, and a significant increase in the R&D charge. But I'm not sort of, I think, get into any more detail than that at the moment.

John F. Rishton

Former Chief Executive Officer and Executive Director

The real answer to your question is that Mark and Colin wrestled each other to the ground on this, and the outcome will be exactly who's wrestled who to the ground.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

One final question, just coming back to an answer to one you had earlier on Defense. What you seem to be implying is, we should think of Defense as a broadly 17% margin division as being sustainable. And my question is, just scratching my head slightly, in the current defense environment, why we're now looking at the business that is structurally 300, 400 basis points higher margin than it's ever been and how sustainable that is?

John F. Rishton

Former Chief Executive Officer and Executive Director

Again, if I refer back to what we said, we've given guidance for 2012. We have not said anything about the future of the nation, leading [ph] to that the world comes to an end after 2012. And if you think back around the dynamics of what is it that we sell and how that works in practice, again, I made a couple of comments in terms of the budget position. I'm going to ask Jim just to comment a little bit in terms of the U.S., where we are in the U.S. budget, just to make sure that you're clear. When people talk about defense budget cuts, people shouldn't think that the defense budget is going from 100 to nothing overnight. In many cases, it's a reduction in the rate of increase rather than even a reduction in the rate of absolute amount. But Jim, maybe I could ask you to make a few comments about it as the U.S. is such an important area and I think that, that's...

James M. Guyette

Former Chief Executive Officer of Rolls-Royce North America Inc and President of Rolls-Royce North

For 2012, we have great visibility with respect to defense budget. And I think, also, it's important to recognize the area in which we play a significant role, which is transport. These are very, very important, solid programs where there are some long-term commitments, multiyear contracts. This C-130J, the V-22 Osprey, in particular are major, major components to this. The LiftFan system for the Joint Strike Fighter, again, a very important technology that only Rolls-Royce has. No other company has that technology. So I would ask you to just think about that. Moving back now to the defense budget process. We have to recognize that this is a very complicated year, politically, in the U.S. I think I have said that politely. Being impolite, we have a dysfunctional Congress and we have an election year. And this means that the clarity that we would like to have on a go-forward basis is not quite as good because nothing is going to happen until after the election. But what I would say is that there has been, I think, a great deal of work done by the new Secretary of Defense. And I will tell you we are very impressed with the strategic thinking that has gone on, because this is not simply a haircut. It is looking at what are the capabilities that the U.S. requires and the budget is being tailored accordingly. Recognizing, again, the political issues, I think a quite good process of a slow reveal of what budget is going to look like for 2013 is underway. The President will be sending his budget officially to the Congress next week. But in advance of that, there have been some press conferences that have outlined the current thinking. If we take that in and look at it for Rolls-Royce, I would describe it as a couple of bruises, nothing major, some bruises. And I don't think that anyone in this environment is immune from reductions. But again, we don't see a major hit. Now I say we don't see that based on what we know today. You have to recognize that the process in the U.S. takes the President's requests, moves them to the Congress. The Congress will deal with them. And a couple of the bruises that I mentioned may not come about because the Congress may reverse them.

But I think the important point is, our bread-and-butter programs, the big programs, are intact. That's also true -- and I think you're probably thinking more on the aviation side, but you'll have to remember, we also have a naval business that is important in the U.S. The big programs there, the DDG 1000, the newest Destroyer, those 3 ships are still in the budget as we know it today. The Littoral combat ship, which is an important part of the go-forward U.S. Navy, those ships, on our judgment, are going to be built. The Navy needs that capability. The other business that we have in the U.S. that's part of the naval, it's kind of something you don't see a lot of, but that's an important part. And that is, in the U.S., we build all of the propellers for the surface combatants in the U.S. Navy, and we also have other products on ships as well. So again, our Defense business is well balanced and I think it is well placed. And I would also say to you that other companies would like to be positioned as we're positioned. This is not dropping off a cliff.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

My question was, as much as anything, trying to get to the margin aspect, we've been a sort of 12% to 13% division for the last 3, 4 years. We're suddenly now becoming a 16.5%, 17% division, if my math is broadly correct.

John F. Rishton

Former Chief Executive Officer and Executive Director

And my answer, I'm going to go back to my answer, which is we've given you the guidance for 2012 and that's what we're going [ph].

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

But the question really is, what's driving that in 2012, the fact that...

John F. Rishton

Former Chief Executive Officer and Executive Director

We've given you the answer in terms of -- Jim's talked a little bit about it. Mark talked about it and I've talked about it. And we're going to stop there because of what it has been. We're going to start to circle around again but we have one new question, just in the middle of the back and then we'll come back to the front.

Celine Fornaro

BofA Merrill Lynch, Research Division

Celine Fornaro, Bank of America Merrill Lynch. One question, if I may, on the working capital for next year, I mean, for 2012, sorry, on the guidance. So basically, as far as I understand, you've got an inventory buildup, somewhat related to the new plants. How much of this inventory is under your control? Or how much risk should we add on to that if Boeing fails to deliver more 787 DC [ph] than what their currently planning? So how much of this inventory is really under your control?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes, I think Mark's right. I think Mike, he would like to have a run at that.

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Well, strictly speaking, all of our inventory's under our control in the sense that we schedule it in a controlled manner. Just to talk about the process we follow, that may help. In all of our sectors, we run what we call a sales and operation review board where we take in our contractual position, our long-term views, which we talk deeply with the air framers about in civil and other primes about their production schedules, their progress, which customers we're going to win. And we put that into a sale schedule, which we then flow down into our supply chain at a piece part level using an ERP system. So we actually know, really, every time we look at forward planning, we know in real detail down to part

Copyright © 2019 S&P Global Market Intelligence, a division of S&P Global Inc. All Rights reserved.

number and to that contract over a period of more than 12 months, significantly more than 12 months, what inventory we have and where it is in our system. And while we have that inventory, whether it be for schedule variation for smoothing or for buffering against risks, and we understand that in really great detail. Now clearly, when we have a macro problem of the nature of past slippages on the 787 and the A380, that clearly can have a macro effect that's quite significant. But we've proven quite agile in recent years at being able to respond to those signals by staying close to the air framer and also making timely and appropriate decisions. You're quite right in what you said earlier, that a significant amount of that inventory is to do with new programs and new capability. If I just bring out 2, we are actually bringing on board the Seletar facility in Singapore this year, which will double our output of final assembly and double our output of wide-chord fan blades. The other half being what we currently have in the U.K. But clearly, we have to go through a product proving process to make sure those facilities are the same in terms of capability as the U.K., and that has some inventory. Similarly, as I mentioned earlier, we were building flight test engines for the A350 XWB flight test this year. Again, that's an inventory requirement, both of which are fantastically good for the business but are near-term absorbers of cash, to later become tremendous generators of cash. So we have great visibility. Strictly speaking, we're in control. Any macro issue that happens, we will be very -- as agile as anybody in responding to it. But as we see the programs today, we see good progress, good control in our major air framers and we work quite closely with them.

Celine Fornaro

BofA Merrill Lynch, Research Division

I'm sorry, what about the U.S. plants, you didn't really talk about these?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Our U.S. plants, as you know, we've built a new plant in Crosspointe. It's ahead of our Singaporean plant, in the sense that we started producing first parts about a year ago, and that's now ramping up into volumes. So it's ahead -- we've recently got into production in the LiftFan factory in Indianapolis, which is small, but spectacular modern facility that really excites everybody who goes to see it. I've also put a lot of investment into our older plants in the U.S. to -- whilst the outside shell looks older, what we've actually put into it for example, in Mount Vernon, our energy plant we've improved flow lines and we've actually improved the machinery inside the older plants. It's less visible. It is a CapEx investment and it is, therefore, longer-term development. And then we've got plants elsewhere in the world, including the U.K.

James M. Guyette

Former Chief Executive Officer of Rolls-Royce North America Inc and President of Rolls-Royce North

Mike, if I could just add on to that. We are investing for the future. We're investing for growth, we're investing in technology, we're investing in people. And that's true throughout our company, but also true in the U.S. We've just announced an investment in the U.S. in Mississippi for another outdoor test facility. We're ready to make an announcement in Indianapolis about a new bit of work that's coming in that will require a small new facility. And we are also looking at another project for our new Crosspointe facility in Virginia. So those investments are being made and they're being made not just for product that is being made in America, but for product that is being made globally. So I think that this is really an important point when you look at our 2012 year. It's an important year for investment. But again, it's not just plant, it's about technology, people.

Celine Fornaro

BofA Merrill Lynch, Research Division

Follow on from that, it's about the unit costs. I know in the past, Rolls used to guide about unit costs and how we should think about that from one year to another. Is there any comment, any color that we could have on '12?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Yes. Let me deal with that. Again, stepping back to use John's phrase, my life and my team's life is surrounded by one purpose, really, which is to make sure that not only do we deal with growth, but actually do it with improving productivity. So our aim is always to meet or beat escalation pressures with our productivity improvements and do that on a continuous basis. So everything we've talked about in terms of investment, our attitudes, people, plant, processes, all about making sure we drive productivity and everything we do faster than pressures that come on us from an escalation perspective. And we've been successful in doing that. And it comes out in the financial numbers, which have been mentioned today. We've -- basically not in a position to give one simple number because by range of our products, are really very diverse. From Marine products to Civil to Defense to Energy, they're quite diverse products. We have a lot of new products being introduced going through learner processes, the ones I've just talked about. So to actually give a number would actually be meaningless. The numbers best come out in the overall numbers, which we've given you in some detail. And the general improvements that we're making, which are on the productivity things we share with you at different times during the year and whenever we give an update.

John F. Rishton

Former Chief Executive Officer and Executive Director

Ladies and gentlemen, we're almost out of time, so we'll have to go for 2 more questions, please.

Unknown Analyst

Just coming back to Civil aftermarket, 2 subquestions. Time and materials at a half year, I think you talked about some of the trends in terms of slightly improving forward bookings and the risings. How is that panning out now? We've had 6 months down the line and looking ahead? And then secondly, back to the TCA conversion issue. I mean, for us, that's a new phenomenon. It's the first time we've heard that. How did that come about? Is it strategic...

John F. Rishton

Former Chief Executive Officer and Executive Director

It comes from the finance [ph] directors.

Unknown Analyst

Is it a strategic change in what you're trying to do with your time and material business in terms of locking into long-term contracts? Just a bit of an explanation around what this means given that -- notwithstanding the fact that you don't want to give any financial [indiscernible].

John F. Rishton

Former Chief Executive Officer and Executive Director

Mark, maybe you can talk to those and I'll come back at the end?

Mark Morris

Your 2 sub questions, so first 1, which really related to TNM activity during the year, I think it's fair to say that we're always pursuing time and material opportunities like many of the other players are out there. It's driven largely by the airlines themselves wanting to bring their aircraft and their engines in for overhaul. And of course, as we've seen growth in ASMs and more aircraft coming out of those in the part [ph], people looking to bring aircraft back into service will naturally start to drive up time and material activity. So the answer is yes, some of that 10% growth in the aftermarket revenues also reflects more activity in time and materials from where we thought we were at the beginning of the year. In relation to your next question, I don't think it's a change in strategy at all. I mean, we have always been keen to sell the virtues of TotalCare and long-term service agreements. We think there is sound logic, not just for ourselves, but also for our airlines. I mean, at the end of the day, it removes the lumpiness in terms of scheduling. It removes the issues around having to schedule because we take care of all that. And arguably, we sit at the top of the knowledge curve because at the end of the day we have more days than anybody else. We know which shops are available and we can utilize that to our advantage in scales of economy to help drive down the costs and, therefore, share those benefits with our airline customers.

And so that's part and parcel. So what you see when we talk about 70% of our aftermarket now sort of captured in some form of long-term service agreements. You will see that on the newer programs, that's probably closer to around 90%. But on the older programs it may be around sort of 50% or even lower in some of them. And of course, what airlines are doing, along with us trying to convince them of the sound economic logic for it, is trying to move them from time and materials onto TotalCare. And of course, what you saw in part of last year is a number of airlines recognizing that outsourcing had those benefits, and that's what you're seeing. So it will happen -- I mean it's still difficult to sort of forecast at what point we flatten things. We will continue to market the virtues and benefits of TotalCare and success will depend on where the airline is in its thinking effectively.

David Howard Perry

Goldman Sachs Group Inc., Research Division

David Perry, again. Two real quick ones, I hope. Just the tax rate was very low in '11. Can you give us some color on '12? And also, can you just -- your cash flow guidance, just to double check, presumably that was before any dividend payment, you say flat cash flow over the year or broadly flat cash?

Mark Morris

Yes. Let me take the first question first. And so tax -- underlying, I think, it came at about 22.7% versus 24.7% for 2010, I think. The 2 main components there, really, are some prior year adjustments. So release of provisions and then the effect of joint venture profits, which is an accounting effect on the underlying effectively. I think if you strip out the joint venture effects, it gets to about 23.6% or 23.7%. Simon can give you the exact numbers, but it's around there. In terms of our guidance, I mean, obviously we always guide around our base cash flow. So that will have included our views on where we see post-tax, pension and payments and so on.

David Howard Perry

Goldman Sachs Group Inc., Research Division

Sorry, just your tax rate that are underlying in 2012, does it go through...

Mark Morris

We're, I think, in the press release, we're guiding around 24%.

David Howard Perry

Goldman Sachs Group Inc., Research Division

I'm sorry, I didn't see that. Okay. And in cash flow, you said broadly flat cash in 2012? Is that after paying the dividend?

Mark Morris

Yes.

John F. Rishton

Former Chief Executive Officer and Executive Director

Thank you very much for joining us this morning. If I may just make a couple of comments. I think that the good number, the side numbers that you've seen from the company in 2011 really reflects the application of this consistent strategy that John Rose and Ralph was before him have applied over many, many years and we'll continue to apply in the future. I would say that as the management and the people who work for Rolls, we are confident about the future. But, and this is very important, not complacent. As Jim has said and I have said and a number of others have said, we are and we will continue to invest in future growth. Thanks very much for coming today. Thank you.

Thank you for standing by and welcome to the Rolls-Royce Preliminary Results Fixed Income Call. [Operator Instructions] I must advise you that this conference is being recorded today, Thursday, the 28th of July 2011.

I would now like to hand the conference over to your host today, Mr. Andrew Shilston. Please go ahead, sir.

Andrew B. Shilston *Former Director*

Thank you very much and good afternoon. Welcome to everybody on the call. I'll just give a brief summary of some of the highlights of our results presentation this morning and throw us open for questions.

For the overall company, there's no doubt, we had a good strong performance for the half year, with good growth in underlying revenues and profit. I think importantly, as a good leading indicator, the order book reached another record level and all of the businesses took in significant levels of orders. We had underlying revenues were up 4%, underlying profits, up 28%, and a strong financial position.

And overall, we didn't change the financial guidance, although there were some small detail changes to composition. And I think as a key indicator of our confidence, we increased the dividend by 8%, which is an increase in the rate -- the rate of increase, if you like, compared to last year.

Now if you just go -- I can go quickly through the various businesses. Civil business I think is characterized by an incredibly strong wide-bodied story where it's gets better and better and it was obviously helped by securing the exclusive agreement with Airbus to buy engines for the Airbus A350-1000 a longer range, larger version of the A350. So that's a very good piece of news.

And if you look at the amount of thrust that we've got in the market today versus what we expect to deliver in the next 20 years, over the next 20 years, we'll probably deliver about 5x as much thrust as we've delivered to date on Trent engines. So I think that Trent gives you a sense of continually having started the Trent journey and it's all to come in the future. And it's not all in the very distant future, either, we'll double Trent deliveries over the next 5 years. We didn't really change the guidance on Civil business. That profit will grow quite nicely this year. The detailed guidance points, which I won't go into, but essentially, profits will growth 20%, 25%, much as we guided back in February.

Turning to Defense. We took in some good orders in the half-year. I mean, obviously, there's a lot of concern about U.K. MoD and the U.S. DOD, but they were nicely positioned on military transport aircraft which, as you know, with all of the activities in the Middle East, North Africa and some, there's a lot of demand for military transport assets and all the maintenance cost that the utilization is causing. And that's all helping us very well.

There have been some contract cancellations with the U.K. government on the Harrier fleet and some of the Tornado fleet. The in-year effect year-to-year is not that great, but there's a one-off settlement, for GBP 60 million that we've put in the first half-year results. But absent that, Defense business has performed much as we thought it would back in February and excluding that settlement, would be shown overall with much the same as last year.

Putting Marine and Energy together, I think the leading indicators there are all turning up largely because of the pickup in oil and gas activity and deepwater exploration and production. So order books are starting to fill. We're getting more inquiries. And that's too -- sorry, it's not soon enough probably to make much difference to OE and Energy this year, which will be fairly flat. But I think the OE recovery, we're already starting to see it and we'll see some OE pickup in Marine in the second half year as we deliver more of the specialized equipment and specialized vessels to support the oil and gas industry.

And just going back to Marine. Good news on the naval side, with the first order for the Littoral Combat Ship, the U.S. Navy 10-ship order, and that's a really important beachhead, I think, into the U.S. Navy, which has previously been dominated by GE. And there's also been an agreement by the U.K. MoD that they will -- they have selected the new advanced PWR3 reactor for the next generation of nuclear submarines. So that's ultimately good on the long term on the naval side.

And elsewhere, in Energy. I think power generation is still fairly quiet in the developed markets. It is quite active in onshore power generation in some of the developed markets, which is really a diesel play around the gas turbine play. As I say, oil and gas, order interest has definitely picked up. The profits in the Energy business will be a little less than was previously thought. Probably GBP 10 million to GBP 20 million, a variety of reasons to do with a bit more R&D and some softness in OE, but in the overall scheme of things at the company level, that's not that great.

We pointed out that this one-off settlement that we received in Defense is unlikely to be as visible at the full year because we've had 1 or 2 negatives to deal with. For example, the consequence of the earthquake in Japan has disrupted our supply chains, caused some delayed in maintenance activity. It will cost us some profits. There's some slightly high R&D costs, and not just in the Civil business, but elsewhere. And there's a small translation difference as well. If you take all those things together, we won't see much, if any, of that one-off settlement benefit coming through, in Defense, coming through at corporate level. And that's why we've maintained guidance really for the whole company, haven't really changed it at all.

Turning now to some other activity, Tognum balance sheet and cash, just an update on Tognum. This is the joint acquisition that we are undertaking with Daimler. We have got about 94 --just over 94% of the shares secured on the joint offer, and that's proceeding nicely. We're getting through the regulatory clearances, and that is likely to complete sometime in the second half of this year. We've got good conversations with both Daimler and Tognum about way forward. Obviously, those can't be too detailed at this stage before completion takes place, but I think there's complete agreement about we need to do next.

Now obviously, with that level of equity interest, this year, there are going to be much financial effect on us because completion relates on in a year, and we will only have a half or 50% interest in the Tognum results. But from the beginning of next year, we should get the benefit of half of Tognum's earnings into our financials, whether that's through a variety of different ways of accounting for it. That will be a benefit to us next year. But I think the most important thing is that I think Tognum is doing well. It's well-positioned. It's a good product. I think we can work well together and work well with Daimler. That's a good story, and I think there will be lot more to say about that as we go into next year.

In terms of balance sheet. A strong balance sheet, no change to that. We've got plenty of liquidity to enable us to complete our share of the acquisition of Tognum. We've got sufficient liquidity and funding around us to keep our credit rating in the right place. And we feel very relaxed about the balance sheet. There's no real change to our pension and other healthcare liabilities. There's a slight change to the basis of calculation, which will be beneficial to the company, it's not in the underlying results. It's a sort of one-off benefit put through the headline results that will see some benefit from in cash terms over many, many years to come.

We guided on cash flow for the full year that if we put aside the effect of Tognum for one minute, we will have a small cash inflow. We're obviously still investing a lot of money. And that's to industrialize head of the need double Trent production over the next 4 to 5 years. This involves factories in Singapore and the United States and there are other businesses where we're investing as well, obviously, amounts of money somewhat less but investing in service centers in the Marine business and so forth. So we're still on the growth trajectory, which implies a level of investment and -- but clearly, this level of investment will capitalize the business to be able to deliver a much higher number of Trent engines. So I think we're looking at sort of 2 to 3-year increase in CapEx that should tail off somewhat after that.

So I think that's about it. Just as we are going back to corporate level, we've maintained guidance for the full year on profit. There are lots of small puts and takes one way or the other across the businesses and

maintain guidance on cash flow with a small cash inflow expected for full year, ignoring the money we'll spend on completing Tognum.
I think that's all I'd say by way of introduction, and I'll hand you back to the call moderator to take any questions.

Question and Answer

Operator

[Operator Instructions] There are no questions, Mr. Shilston. Please continue.

Andrew B. Shilston

Former Director

Well, thank you very much, indeed, for joining the call. There are a number of contact points you're all familiar with here, Rolls-Royce, if you have any further questions. So thank you very much, indeed, for joining the call.

Presentation

John F. Rishton

Former Chief Executive Officer and Executive Director

Good morning. Thank you for coming. Welcome to Rolls-Royce First Half Results. Given the very busy reporting day across our sector and the fact that this is our half-year results, we intend to keep this short and focused. I will give an overview. Andrew Shilston will then take you through the financials, and then in a break with tradition, we're going to go home, or alternatively, we could take questions.

I want to cover 3 topics before I hand over to Andrew. Firstly, share my views on our business, give you a flavor of what I've been doing since I arrived and make a few comments about the future. Secondly, highlight significant first half achievements. Then thirdly, review the key financial indicators that demonstrate the strong health of the business and the strong start that we've made to 2011.

I joined the board of Rolls-Royce as a nonexecutive in 2007. I took on the role of CEO in April of this year. My time as nonexecutive gave me a good understanding of the breadth of the business. And since taking on an executive position, I've concentrated on improving the depth of my knowledge by visiting many of our facilities and meeting with many of Rolls-Royce employees and our customers. My overview would be that this is an extraordinary company with extraordinary products and extraordinary people.

Everywhere I have been, I've met with people at all levels. And without exception, they've been proud of the company, passionate and professional with an enthusiasm I have not seen in other businesses. The customers I have met have generally been complementary about what we do and how we do it. But it is clear that on a number of occasions, we could have done better. So we need to sharpen our focus on the customer.

Rolls-Royce has a number of striking characteristics, a very long cycle business, a huge order book that provides good long-term visibility in a number of our sectors, an exceptional brand, and a strategy that has been in place for many years and has been followed consistently and proved its resilience. I supported that strategy as a nonexecutive, and I support it now as Chief Executive.

So John Rose and his team have done an amazing job over the last decade or more, transforming the business and creating choices about where we grow in the future. So I see my role, as firstly, ensuring that we deliver the promises we have already made. And as you know, we believe that revenues will double over the next decade from organic growth alone.

This is a complex and long-term task. We are investing in new facilities, new technology and recruiting new people. It is also clear that we must focus on execution, cost, cash conversion and efficiency. We must ensure that we are competitive on all fronts everywhere.

The second main element of my role is to examine the options for future growth so that we can make the right choices. So in summary, my take away from my first few months is shown on this slide: Great people, great products; right strategy; a strong balance sheet. We need to sharpen our focus on customer, cash and costs; deliver the promises that we've already made; and choices about how and where we grow in the future.

Turning to the first half of 2011. I think that there have been 2 really important decisions taken so far this year that will shape the agenda for many years to come. Firstly, the selection of the enhanced Trent XWB to be the exclusive engine to power the Airbus A350-1000. This builds our strong position in widebody aircraft and sets the stage for significant growth of those engines are delivered and operated over the next few decades. This aircraft will be a powerful long-term growth driver for our civil business and the group.

Secondly, our joint offer with Daimler for Tognum that is progressing well. This will add breadth and depth to our Marine and Energy businesses. We will bring significant systems integration and aftermarket capabilities to an already successful business. Tognum possesses a particularly strong diesel portfolio that

will complement our own diesel and gas engine technologies allowing us to double the revenues of the business in much less than the decade.

In addition, we have continued to invest in refreshing and growing our facilities and strengthening our supply chain. You will assume that we've invested more than GBP 600 million on CapEx, on research and product development in the first half. These investments include the continued development of new facilities in the U.S. and Singapore, both of which have started initial production and preproduction, and the extension of our services network as we grow our global capabilities to support customers. For example, we have outnumbering[ph] centers in Holland, Poland and Namibia and further extended our civil overhaul facility in Hong Kong.

As you would have read, we are confirming the full year guidance that we gave in February for 2011 in terms of revenue and profit growth. And excluding the Tognum acquisition, the core business will generate a modest cash inflow.

As you can see from this slide, overall, a strong performance in the first half. The headlines are our record order book up 4% to GBP 61.4 billion. We won new orders of GBP 8.7 billion in the first half with around 75% coming from Civil Aerospace where we continue to take around half of the lucrative widebody market, with new orders of 4 different Trent engine types for customers in Europe, the Middle East and Asia. Orders in Marine and Energy were similar to last year. But some sectors, notably oil and gas, will be second half biased. We remain encouraged by what is going on, on both offshore exploration and production and land-based pipeline and transportation activities.

For example, investment announcements from Petrobras and BG Group make it clear that there would be good opportunities to support the development and extraction of new reserves around the world.

The order book once again serves to highlight the global nature and the rapid growth in our market position over the last few years. Today, 47% relates to Asia and the Middle East, with that element alone, now largely the entire order book just 5 years ago.

Underlying revenues grew by 4%, with services up 10% and the slight reduction in original equipment sales, mainly a function of the Marine slowdown that we had signaled earlier this year. Underlying profits grew by 28% but benefited from a well-off settlement of some U.K. defense contracts. Excluding this benefit, underlying profits were up 15%.

The balance sheet remains strong. We finished the period with nearly GBP 1.5 billion of cash after GBP 82 million outflow from the start of the year. Average net cash fell to GBP 780 million.

Reflecting our confidence and the strength and resilience of the business, the outlook for growth over the next few years and the opportunities we have to drive performance by focusing relentlessly on execution, we have increased the first half payment to shareholders by 8%.

So in summary, a strong first half. We are well positioned and confident about the future. I believe that we must sharpen our focus on customers, cost and cash, deliver the promises that have been made that will double the revenues over the next decade and we have choices to make about future growth. Thank you.

Andrew B. Shilston
Former Director

Right. Good morning. The flavor of this section is very much a case, I think, of -- this is largely all in line with guidance. So I'm going to be fairly brief, and I know there's a lot on stage. You've got a lot of other companies to look at. As usual, I'll focus on the underlying results. The headline result is somewhat more eye-catching with the usual revaluation movements in this half-year have been quite heavily positive. But all that details in the handout just to reconcile between the headline numbers and what I'm going to talk about here.

First of all, this familiar chart is looking at how profits have moved from one half year to the next, taking foreign exchange, first of all. Back in February, we said we would have the benefit of that 6p to 9p

improvement in the achieve rate for use our hedge book over the full year and there's no change to that guidance.

In the first half of the year, we had benefit from the hedge book of about GBP 36 million, and that was offset by a small translation negative of about GBP 13 million. I mentioned that simply because we don't forecast translation differences, and that is a change to what would affect previous guidance. That's small GBP 13 million number.

With regard to R&D, compared to previous guidance, we expect the full year to be up around GBP 20 million, something like that. About 3 quarters of that is spent in some of it is accounting effects. We knew obviously that R&D this year, there'd be a heavier charge than last year, that guidance we gave back in February. And that's mostly to do with the mix of activity moving away from the Trent 1000 to the engine for the Airbus A350.

With regard to operating income, there's no change to full year guidance, so that negative there is exactly as we expected. And then we'd move to the one-off items on the right-hand side, the industrial Trent provision that we've made last year was a one-off. I think John's already alluded to that. And we have been in conversation with the MOD on contract terminations, and there are some benefit arising from that as well, and I'll touch on that in the defense sector in a moment.

So turning to the civil business. First of all, a continuing, very strong widebody aircraft story. There's a lot of really good data in the back of the appendices about market share by aircraft type, which I won't go into detail now. I think you're familiar with that. But if you add it all up, we have a very strong market share story to tell of at least 50% in aggregate across the whole market, with much greater market share in some other product types, for example, the Airbus A350.

Now we talked about installed thrust as a proxy for value. We've done that, I think, for quite some time now. Just to give you a sense of the strength of this trend story that's emerging or will emerge over the next few years, we have about GBP 140 million of installed thrust in a Trent fleet today. And if you look at the next 20 years and assume we get about 50% of the market, then we should deliver about another GBP 700 million of thrust over the next 20 years. And that isn't all in the distant future, we would double Trent deliveries in the next 5 years. So a very powerful story there coming through.

Services revenues, we guided that the full year would be up around 6% or 7%. We're not changing that because remember that in 2010, we had that Aviall logistics deal which has meant that's the year-on-year growth figure looks a little lower than it would if you had excluded that. And if you un-pick that services growth, we've had good double-digit growth in our large engine TotalCare business, and a slightly slower growth in the smaller engines and time material business. Yes, there is some recovery in time material activity, but to an extent this is going to happen later in the year as the arisings go through the overhaul shops.

Worth just pointing out, I think, that because of the nature of our aftermarket business, because it is so long-term contract based, it tends to be more stable than some other companies who I think have been reporting quite significant quarter-on-quarter gains in their time material business. The beauty of our long-term contract model is that we're much more stable and we get paid on an hourly basis, not on shop visits. And that's a great benefit, I think, both to the customer and to us because it produces predictability.

Profits-to-date are more or less as we expected. And compared to previous guidance, we will see a small effect from the nuclear disaster in Japan that has caused some disruption to our supply chains and delayed deliveries into the factories and also delayed some overhaul activity. And that's going to cost us about GBP 10 million of whereabouts over the full year, and there are some slightly higher R&D costs as well. And finally, there's no change to our guidance from the effects of the Trent 900 event last year. So that's in line with what we said before.

Turning to Defense. On the 2 new development programs, we're getting through the key milestones that some of the TP400 for the European A400M military transport aircraft and the stable engine likewise, the JSF development is proceeding satisfactorily. Work has largely stopped on the alternative engine for the Joint Strike Fighter. While GE and ourselves consider our options, this is the program that isn't completely

stopped in the language that's used in the United States. Because if that happens, all the tooling and everything else is destroyed if that has not happened. So I think there's still further conversations to be had between GE and ourselves and the U.S. government about where this program goes. But for the time being, funding has been stopped.

Transport sector continues to be very strong. The theme, I think, we've talked about for quite a number of half-year periods over the last 2 or 3 years. And we're also pursuing export opportunities and service ideas to offset U.K. and U.S. slowdown in some procurement programs. Obviously, the first half is dominated by the profit effect of settling these contracts that were canceled by the U.K. MOD, and I think BAE was in similar position. They talked about that earlier on today. So other than this one-off, the full year will be largely as we expected in profit terms.

Now turning to Marine. Some good news in the Naval sector. We had talked a lot about that, usually that we've won, as you can see here, the first order on the Littoral Combat Ship program for 10 ships which is a major foothold for us now in the U.S. Navy. And in the U.K., we've had confirmation that the U.K. government will support the next generation nuclear reactor, the PWR3 reactor, for the next generation of nuclear subs, and that is a very, very long-term business as well.

Turning to other areas of Marine. We're definitely past the inflection point on orders in the oil and gas sector, that's the -- or what we call the offshore market. Well, it's taking a little bit longer than normal to get customers to sign on the dotted line, but there's no point. Sorry, there's -- it's clearly -- it's quite clear that the inflection point has been passed. And so we'll see some turnaround, some significant turnaround in original equipment deliveries in Marine. They were down about 25% for the half-year. They'll recover quite strongly over the second half of the year. So overall, we will be down about 10% in Marine, which is plus or minus what we've guided back in February.

And services are growing at a good double-digit rate, about 11%. And that's based on all the work we've been putting into dock side presence around the world which has been very successful. We're just pointing out here, I think, that we're not involved in the big bulk carrier market container ship market. I think 1 or 2 other companies in this sector have had some issues in that piece of the market place. We're not in that. Our gain is in specialized vessels, particularly involved with the oil and gas industry, which, as you've heard already, it's pretty busy deep water, offshore exploration and production.

The margins are benefiting from a greater percentage proportion of services and the revenue mix. But overall, there's no real change to guidance for the full year.

Turning to the last of 4 divisions. Energy, we continued to invest to improve products and in new businesses of some nuclear fuel cells entitled [ph] power. We still believe civil nuclear is worth pursuing despite the Fukushima disaster in Japan. And the reason for that is our capability is unique, and we're developing plans with the key reactor vendors and all the other participants in the market. And I think that the quality of our brand, together with our capability is meaning that we've got access to all the key players in that marketplace.

Now as in oil and gas in Marine, order inquiry is picking up, but current revenue growth is mostly from services. So half-year profit compared to last year clearly benefited from non-recurrence of the refit costs on the industrial Trents that didn't recur. And for the full year, we expect slightly lower profits than we've previously guided, mostly due to slightly softer OE, some new civil nuclear spend and some other people rated costs, bid costs and the like.

A brief update on Tognum. We're very pleased with the take-up of the joint bid for Tognum. We've achieved very nearly 95% in aggregate acceptances year-to-date which is good. The regulatory process, especially with regard to the antitrust clearances, is going very well, and we would expect completion sometime in the autumn. And after that, we will follow on with the process to squeeze out the minorities.

And all that timeline is laid out in the appendix so that you can see how that's all going to work. And in terms of the financials this year, there'll be no significant effect on our numbers because completion happens later on in the year. We've only got half of the business and that's the bid costs, so there wouldn't be much effect. But clearly, from the 1st of January next year, we will get the full benefit of

half of Tognum's earnings incorporated into our numbers. Now the precise accounting cosmetics of that will change as we go through, and I won't go into that detail now. But economically, we will have an entitlement to half of the earnings of that company in terms of the way the accounts are presented.

The other thing that I think is worth mentioning is, that although we can't formally have detailed conversations with the Tognum management until this transaction completes, together with Daimler, there's no doubt that there is unanimity between Daimler, ourselves and Tognum about what needs to be done to move this whole business forward. And we're starting this conversations in the most detailed way that we're permitted, subject to not having completed the transaction.

In terms of our balance sheet, as ever, a strong balance sheet is a key part of Rolls-Royce story. You can see here, we've got sufficient resources to pay for our share of the Tognum acquisition from our own internal resources. We don't need to raise any more money, and the credit rating is secure. The rating agencies know about the Tognum acquisition. They've had a look at it, and our credit rating is unchanged. The average cash figure is down about a little bit on the first half last year. And that's largely because of the effect of the ODIM acquisition which was about GBP 150 million. There's a much greater effect on the first half of this year than it did in the first half of last year in terms of how the averages are calculated. Customer financing and supplier financing positions are largely unchanged. And finally, there are some changes to the methods of calculating pension liabilities and U.S. healthcare liabilities that appear in the notes in the headline to underlying reconciliation. Now these are economic benefits that will be beneficial to the company over many, many years, but we've not included them in the underlying results.

Looking at cash flow, we're still investing heavily, as you can see here. There's no doubt that industrializing the growth in Trent deliveries over the next 5 years is going to require some physical investment that is reflected here in the financials. The breakdown is all in the press release. The breakdown between intangibles, and fixed assets and so forth. It's all in the handout. But for the full year, we expect to spend something like GBP 800 million. That's currently our expectation. Working capital is a big subject. As I've said before, and I think the gross working capital balance in aggregate add up to something like GBP 14 billion. So you can see that relatively small movements in these numbers can have an effect on the business. What's been happening in the first half is that we've had some modest inventory build. As we anticipate the entry into service with the Gulfstream G650 and Boeing 787, and then you add to that the disruptive effect from the nuclear disaster in Japan and the knock-on effects in our supply chain, inventories in aggregate have gone up to something like GBP 200 million at the half-year. Now some of that will unwind by the full year, but you can see that's one of the reasons why we've got a small negative on working capital. The M&A line relates to the purchase of a small number of Tognum shares. Clearly, that number is going to be a lot bigger at the full year, but if you ignore that, we expect a modest cash inflow for the full year.

So to summarize, full year guidance, we expect mid-single-digit overall increase in revenues where we're only held back a little bit by small to slight decline in Marine. The Civil business, we expect to recover strongly, as I've said earlier. The tone is definitely getting better in Marine and Energy from oil and gas demand and the order flow rising from that. Although profits are likely to be flat for the full year.

The one-off item in Defense is largely offset by the small translation difference that I've alluded to, some R&D costs and the impact from Japan, all of those effects occurring in other businesses. So net-net, there's no overall change to guidance and profits. And we expect a small cash inflow if we put Tognum investment to one side.

So that's the end of the formal comments, and I think we'll now take questions.

Question and Answer

John F. Rishton

Former Chief Executive Officer and Executive Director

We'd be happy to take questions. If you could say your name, who you work for, and wait for the microphones that will be coming around. And I will try to manage your questions, taking as best I can. So who would like to answer the first question? Right at the very front.

David Howard Perry

Goldman Sachs Group Inc., Research Division

I'm David Perry from Goldman Sachs. I've got 2 questions. You mentioned customer cash and cost reduction several times in your intro. Could you elaborate a little bit on the cost reduction piece? I mean, Rolls has been doing this for a long time, and normally, you might give us an update about where you think -- what you think still can be done, please? And the second question is, Rolls has this fantastic story on the widebodies coming, but that also gives you a bit of a profit headwind for the next few years. Do you think there's anything you can do to try and help overcome that profit headwind? Or it just has to work its course and we just have to be patient?

John F. Rishton

Former Chief Executive Officer and Executive Director

A couple of comments, and maybe I'll ask Mike and Andrew to add to the comments that I make. Having traveled around the business and certainly talked with Mike, Andrew and the rest of the management team, I think that there is opportunity for us to sharpen our focus a little in the areas that you talked about. So customer, cash and costs being those 3 Cs. What that means is, can we turn the dial on the attention on those a little further? And certainly, on the cash and the cost side, they have received significant attention over many years. And Mike and the team had done a terrific job. We need to keep going down that journey. And I think my observation, coming in new is that while we're making good progress on that, we need to continue to make good progress on it. And I certainly want to make sure that within the organization, those things are considered to be important to our future. But you should be under no misunderstanding that Mike and the team had done terrific job improving cost performance over many years. And this was about sharpening the focus, about turning that dial up a little bit, about making sure that everyone knows just how important it is as we start to reach a significant ramp up. Mike, would you like to add anything on that?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

John. Yes, I do give an update. And because the supply chain and operational stuff has a continuity about it, it doesn't change a lot from half-to-half. There's probably what's reflected several years where inflation pressures have outstripped our efforts on productivity. But as we guided this year, productivity efforts will be offsetting inflationary pressures, which is still there, which we know about in Energy and materials. We're investing very heavily, as Andrew has just said. A lot of these facilities, both new facilities that we've invested in, new facilities that our supply chain have invested in and also new machine tools and processes going to our existing facilities. These strands of activity on the product side are coming to fruition. But clearly, in fact, as you build a new facility and put in new machine tools, there's a lag before you actually start to get the volume coming through, and the benefits and those will take some time. We're also heavily invested in IT, processes, and we've been doing this a number of years, and we're starting to accelerate that. And as John has said, our focus in the organization on delivering what we've promised and delivering that not just for the customer, but also to our business clients is something that we're really focusing on in all lines of the business. And John's encouraging us on that, and that's great.

John F. Rishton

Former Chief Executive Officer and Executive Director

In terms of your second question about the widebody, I'm going to ask Andrew to make a few comments on that. Clearly, the investments that we're making to support the ramp-up, particularly in the widebodies area, clearly the investments we're making in new products, the fact that we've had 3 new wide-bodied engines in very close succession, and the results in the cost increases as you said. But I think the beauty of this strategy that's being put in place. And the portfolio approach really shows its strength in that kind of environment where despite the economic turbulence that we've experienced over the last 4 or 5 years, despite the fact that we've had these investments, and we are set for growth, the overall group profitability and group revenues have progressed well through that period, which is why I said during the course of my presentation, that I supported the strategy when I was a nonexecutive and I continue to support it now. I think it's an extremely well thought through, well implemented and well-led strategy. So it gives a significant benefits and helps to address the kind of issues that you're talking about, which are inevitable when you are launching a significant new product. Andrew, I don't know if you'd like to?

Andrew B. Shilston

Former Director

Well, I think my colleagues have covered most of the issues. Now what I would say on the portfolio point is that probably 4 or 5 years ago, if we were projecting forward to 2011, we wouldn't have envisaged anything like the quantity of Trent 700 engines going into production on the Airbus A330. So I think part of the answer to the new product question is the aftermarket that's growing from the installed base and the portfolio effect that's allowed us to enjoy the continuing life of what 5 years ago was considered to be an aircraft with a fairly limited life. But that's -- I think we've always said that, that we were in the market for lift, in those demands for lift in aggregate and if some programs are delayed or some capacity has delayed then older programs turned to benefits. And I think that's what will happen over the next few years.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay, the next question. We got another one right in the front.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Ben Fidler from Deutsche Bank. Three questions, please. Firstly, one for you John, which is I just want to understand your aspirations and goals about where you think the margins might be capable of getting in the Civil Aerospace business? And today around 10% somewhere below most of your peers in that area. What are your sort of own aspirations might be for that? The second question was, just to understand, one for Andrew really, your guidance for Marine being unchanged for the full year which based on my scribbled notes from February seems to imply flat sales, flat EBIT, implication flat margin. You did a brilliant margin in the first half, 15% in the marine. I'm just wondering why that unwinds so much at the margin level in H2 or whether it's just conservatism? And the third question was, just to understand the R&D implications of the extra development work you're going to have to do for the 350-1000 engine, and where that leaves R&D and how we should think about that for the next couple of years?

John F. Rishton

Former Chief Executive Officer and Executive Director

Let me take the first one, and maybe ask Andrew to answer on 2 and 3. I think, in terms of margins, if I look at our margins, look at all our competitors margins, if I look at the future potential revenue growth that we've talked about, it would be disappointing if we didn't improve them over time. In terms of aspirations, I'm certainly not going to get into where I would hope, like or want them to be in this meeting. But as you would expect internally, that's something that we talk about quite a bit. But certainly, with the doubling of revenues, we would hope that they would improve. Andrew?

Andrew B. Shilston

Former Director

And I think on the Marine margin, probably the answer is that the margin expansion in the first half is because of the greater proportion of aftermarket, which gives us a higher margin rate. And what I said was that OE would recover quite significantly in the second half, so that mix is going to work slightly to our disfavor in the second half. In terms of R&D, if you've inferred from my comment about R&D this year that, that's associated with the A350, that's not case. It's more bits and pieces across the whole business. And what we've always said, looking at the R&D in total, is that it's the portfolio points that for example, as the engine for the Boeing 787 goes into service, you've got more engineering time to address the engine for the Airbus A350. So when you look at it in aggregate, as the old programs mature you have more resource available for new. So I don't think you should assume that what we've said in the past on R&D is really going to change in terms of overall numbers.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

So just confirming, it came from that resource is R&D stays flat as opposed to?

Andrew B. Shilston

Former Director

Well, as you know, we don't give multiyear guidance, but what I'm telling you, there's not going to be a significant change to resource levels, no.

John F. Rishton

Former Chief Executive Officer and Executive Director

If I could just raise up on the A350 exclusive, I think that's a really, really important win for Rolls-Royce. Lastly, we look at that as a very positive thing that really enhances our position on the widebody market and in the total A350 fleet as well. So perhaps I think it's exceptionally positive, positive position to be in. Let's go to the next question.

Zafar Khan

Societe Generale Cross Asset Research

It's Zafar Khan from Societe Generale. One for you John, just trying to understand really your strategy on the engines for the narrow body. It clearly, very well defined strategy on the widebody, very good position, but I'm really struggling to understand really where you're going to go in the narrow body. So if you could help us with that, I'd be very grateful.

John F. Rishton

Former Chief Executive Officer and Executive Director

Okay. On the narrowbody, a couple of comments. First of all, I think that our decision not to go on the reengined Airbus was a sensible decision from a business case perspective. If we're way up to where we want to invest our money on the returns that we can make, our view was from a simple financial basis, that there was areas that we could do better on. So I think that was a sensible and rational decision. In terms of what Boeing now seemed to be saying about reengining rather than a new aircraft, as you're all aware, CFM is certainly exclusive on the 737. And my understanding, but it is only my understanding, would be that, that wouldn't change with the reengining. So that doesn't alter the position going forward. So that's where we are, are comfortable with the position that we're on, on the neo. If you look further ahead for new aircraft, I think we would take naturally, as you would expect, take a serious look at that, and would envisage that, that would be something we would be interested in. So the fact that we're not on the neo [ph] and nothing's changed on the 737, you shouldn't read into that, that, that's not part of the market that we wouldn't be interested in. But I'm comfortable personally with the position that we're currently in, in that market. When I look at the other things that we invested our money in and our position on the widebody, for example, also across a broader spectrum. So if you take into account the Marine business and the Tognum acquisition, those kind of things, for me, it's a rational and sensible business decision.

Zafar Khan

Societe Generale Cross Asset Research

So should I assume that you are still interested in the smaller engine, and narrowbody is still very much part of the longer-term plan?

John F. Rishton

Former Chief Executive Officer and Executive Director

Yes. You should take into account the fact that that's a part of the market that is an important part of the market and is certainly one that we would look very seriously at as in when new aircraft are considered. You shouldn't take into account -- you should not draw the conclusion that because we're not on the reengining that we have exited that market. That would be completely the wrong conclusion to draw from that.

Celine Fornaro

BofA Merrill Lynch, Research Division

Celine Fornaro, Bank of America Merrill Lynch. Two questions, if I may, on services. The first one is on the aftermarket for Civil Aerospace, the guidance for the full year. So on H1, you grew probably slightly better than your average full year guidance. Why should we expect a slowdown in H2? Is there a specific reason for that? And also if you could just give a bit more color on the performance between the large engines on time and material, and maybe the business jet if that's coming back. Or we're seeing the first [indiscernible]? And the second question, still on services, in the Marine business, is given the strong growth by the OE recovering, how should we think about the split, services versus OE, where it is today and where is it going? And also, when you open these new centers in services, how quickly after that do you generate service business or you gain market share?

John F. Rishton

Former Chief Executive Officer and Executive Director

Thank you for that series of questions. Andrew, if you could help me out with those that would be excellent.

Andrew B. Shilston

Former Director

Okay, well, let's pick up on the Civil Aerospace aftermarket, first of all. I did point out that we had the Aviall deal in the second half of last year, which when you're looking at the year-on-year growth, it will tend to depress that percentage for the second half of the year. So I think that's probably the answer to that point. In terms of small engines, I don't think there's anything more to the guidance I've already given. I mean, we expect good double-digit growth in our large engine TotalCare business. In smaller engines, it's fairly flat and we're seeing some of the older V2500 engines or the older aircraft gradually going out of service, maintenance events perhaps are stretching out. I think, Safran was seeing some of that. And in other respects on business jets, it's pretty much steady as she goes. So I think that's why despite the fact that the large engine story is very strong, when you add it all up and produce the overall civil business result, it's down around 6% to 7%. And looking at Marine, well, I think the story on services is pretty clear, that it's growing at a nice double-digit rate. There's every reason to assume we can continue to make that grow just by virtue of the greater dockside presence and the growth in the installed base. And so we don't really target any split of OE and aftermarket. It is what it is. It's just a result. And I think I suggested that the tone in OE is getting better. So OE in Marine in the second half will be better than the first half,, and obviously we'll update that guidance in the New Year as we look into 2012. In terms of the new centers that we put into our service network, the benefit is pretty rapid because mostly it derives from putting service engineers on the dockside and the service engineers get into the vessels pretty quickly. And so they are earning money almost from the date that you commission the factory. So that's quite a nice position to be in. It's not a heavy investment, heavy long-term payback story, it's all quite short cycle.

Edward Stacey

It's Ed Stacey from Espirito Santo. Just one question, and it's for John. On the 3 Cs, the customer, one, and the need to sharpen the focus on the customer, I guess, in the last sort of 12, 18 months, we had the event on the A380, and maybe that sort of raises some issues. But we probably think of that as being kind of an extraordinary event. In more general terms, is there something you're doing wrong currently in the way that you support your customers, something you need to change? Could you maybe give an example of what you mean by the need to sharpen the focus on the customer?

John F. Rishton

Former Chief Executive Officer and Executive Director

I don't think there's anything we're doing wrong in terms of our customer. And again, if I go back to the success the business has had in terms of winning business in all sectors, it's quite clear that we have good relationships with our customers. And as I said when I've met -- most of the customers that I've met have all been very complimentary. So what do I mean? I mean, that I think as with all things, there are some things that we can sharpen up on and there are some things that we need to improve around. And some of it is in quite some detail. I think, coming from a different business background, I come from a business-to-consumer background rather than a business-to-business background, and in those businesses, the organizations tend to be more customer in their mind in everything they do. So I think there's a little bit of -- it isn't quite the same in a business-to-business, which I understand, but I think that there's some areas that we can tweak, some areas that we can improve our attention on our customers. And in discussing that with my colleagues, I think there's a general view that, that is the case. But this doesn't mean that anything was necessarily wrong. I think this is an area that we can improve and get better out rather than it's wrong so we must change it. I think we do it, generally, very, very well. So in many ways, I go back to the answer that I gave on costs, which is an area why I just like to turn up the dial a little bit and turn up a little bit of attention and put a little bit more focus on that area than maybe there has been. That doesn't mean it was bad or wrong in the past.

Rami Yehuda Myerson

UBS Investment Bank, Research Division

Rami Myerson from UBS. Just 2 quick questions. You talked about inflection point in Marine. And on the order intake in Marine activity and order interest, can you just tell us what you're seeing so far year-to-date and potentially the interest going forward to the end of the year? And if I understood correctly, there's an Advance2, Advance3 -- or Advantage2 [ph], Advantage3 [ph] engines that are currently under development for the narrowbody, after Boeing's decision to reengine with the CFM LEAP-X engine, does that mean that, that has been pushed to the right and development of that will be deferred until you see the potential for new narrowbody aircraft?

John F. Rishton

Former Chief Executive Officer and Executive Director

Let's start with the second one first. Mike, I don't know if you want to make some comments about that.

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Yes. Basically, Advantage [ph], we have technology programs and the technologies that we develop are applicable at different thrusts. So clearly, in our compressors to the buy-ins and so on. And so the programs that we have feed all of our programs for Civil and Defense, but certainly, across all the Civil portfolio. So we don't see change in our technology programs at all as a result of this. And the other thing to remind everybody is the Trent XWB is demonstrating now the world's most efficient performance from the data that we have. So in terms of technology, we're actually living the cutting edge of that on a daily basis. And the technology that lies behind future developments has applications in current programs, as well as in future programs.

Andrew B. Shilston

Former Director

Just on the Marine order point. I think actually if you look at the press release, there's probably all that we need to say on that subject. But just to pick out a few highlights. We took GBP 1 billion worth of orders in the first half. And the point about the Marine business is that it's quite fragmented. It's not like the Civil Aerospace business where individual orders can be worth very large amounts of money. They were financed individually. Marine orders tend to be small and they aggregate after quite big numbers. But just some examples here, about the UT design and system integration packages, the oil and gas sector, we won more than GBP 100 million of orders in 4 or 5 different countries all over the world. And this is another example here, an order for 6 UT offshore supply vessels by the Blue Sea Group. So there's a lot going on, and it's all over the world and what's driving this is the same thing, it's activity in the deepwater oil and gas sector, which is driven partly by the oil price and partly by the fact that there are very few places that oil companies can invest to own oil reserves other than offshore.

Rupinder S. Vig

Morgan Stanley, Research Division

Rupinder Vig from Morgan Stanley. Two questions, perhaps one for John, first. Going back to the 3 Cs, when we think about cash, how quickly should we see get to see improvements in cash, given we've got ongoing headwinds such as new program investment, we've got the inventory build that we talked about? So how near-term an objective can that be to sharpen on cash if you like? And then a question for Mike, perhaps on the operational side. We've talked today about doubling Trent production in 5 years. Are the resources in place to be able to do that? What else needs to happen? So what are the big challenges from that perspective to be able to get to a stage where you can double the production 5 years on Trent?

John F. Rishton

Former Chief Executive Officer and Executive Director

One of the danger of being the new guys, as soon as you mention something, it becomes sort of the flavor of the month internally and externally. So let me reemphasize, this isn't about sharpening our focus, just pushing a little harder on it. I mean, one of the things that, if I read any of your reports over a long period of time that you would talk about, I think, is cash and cash conversion. So I don't think I'm sort of breaking new boundaries by suggesting that we could maybe increase our focus on cash. I know clearly a number of areas that we can look to, and there's clearly a number of headwinds that we have faced, some that we will continue to face. So the question is: How do you get the organization more interested in cash? And again, this is about sharpening the focus rather than turning a switch that was off. Andrew and the team have been very focused on cash, but nevertheless, bring a scenario that we could usefully get some more people within the organization more interested in, and that would be beneficial. So again, sort of [indiscernible] in terms sort of you've already termed it the 3 Cs. I can already read tomorrow's reports. Thank you very much, indeed. Again, this is about sort of my views and just increasing the emphasis in a few places on a few topics. None of which, in my view, would surprise you in the slightest if I read your reports in total. Mike?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Thank you. Well, it's a big subject to talk about, preparation for the growth in Trent. But just 2 things to put into context. First of all, the significant ramp-up of new product is clearly the Trent 1000 and the Trent XWB, although that is not a substantial ramp-up still on the Trent 700, as was mentioned earlier. So as you know from the airframer's requirements, that ramp-up is starting now on and we really start in a couple of years time on the XWB. So it's not sort of a totally immediate thing to ramp up to the full rates. I'll talk about the factories that we are building around what we call our make components because I can paint that picture more simply. But also our suppliers, our partners are putting in similar investments. So let's just talk about 3 major make components first. The fan blade and the assembly of the engine is clearly make. We clearly make the turbine blades and we clearly make their rotating disks. And in those 3 areas, we've announced investments, and some are now complete to affectively duplicate capacity, but also duplicate it with modern methods and modern processes, which we'll also read across into our older facilities. So I'll just give you a quick update on those. In Crosspointe, Virginia, we are making disks and that factory opened this first half. We produce parts. These are production parts, and they're going through the production proving process. But there are production parts that will fly. So that's a brand-

new facility in Virginia, the U.S.A. and it looks great. In Singapore, we have 2 major facilities, as well as a hub complex, on what is actually a stunning aerospace parking suite in Singapore. That will be officially opened next year. But at the moment, we're stocking it with machine tools and a production proved in the processes to do 2 things. One is to make wide-chord fan blades for the Trent, which is clearly our iconic feature, and the thing you see as you get on an airplane. And secondly, to assemble a large Trent engines. And again, total effective doubling, doubling and more of existing capacity, which we'd also invest in, in the U.K. And both of those are coming along really well, and we'll ramp into production in line with the requirements for engines for the aeroplanes. We're also building a facility up in northeastern England to replace essentially an older facility in Sunderland, again, making disks. And we have announced that we will be investing in turbine blade machining capacity again in the U.K. So we are investing and when we go around the world, we can see our partners investing and we can see our supply chain. We've carefully selected on these new programs to be a smaller number of bigger more capable players, and it's a big task. You have to put the factories in place. You have to fill the machine tools, then you recruit, improve the processes and the hardware then follows. And we're pretty excited with the progress but it's a big task for us.

Andrew Paul Gollan

Investec Bank plc, Research Division

Andrew Gollan from Investec. Two questions, please. The first one, easy financial one for Andrew. The hedge book has gone off a little bit. Can you tell us what the average hedge rate is compared to the end of 2010? First question. And secondly, I think you mentioned with regard to Tognum, that you expect to double the revenues in a shorter period in 10 years. Does that -- are we talking about the combined businesses here? Or are we talking about what you're expecting for perhaps Rolls-Royce Marine and the other assets before you put them together with Tognum assets?

John F. Rishton

Former Chief Executive Officer and Executive Director

I'll take the second one first. We talked about the total business Tognum, doubling that in less than 10 years. Andrew, do you want to talk about the hedge book?

Andrew B. Shilston

Former Director

Yes, by all means. And there's some information actually in the press release under Note F. But just for the benefit of the audience, the hedge book is now just over \$20 billion. The average book rate is about \$1.60 in the hedge book. And for those of you with the [indiscernible], you'll see that's fairly close to the forward rates that are currently available in the market

Jason Adams

Nomura Securities Co. Ltd., Research Division

Jason Adams from Nomura. Just 2 questions, the first one for you, John, on the Energy business. When you look at this business, do you think it's at a scale now where you're confident of growing it organically and delivering margins that would be acceptable to your shareholders? Or do you think this one could be a focus for bolt-on acquisitions and you need to get the scale up to compete? I'm wondering how you feel about the size of that business. The second one for you, Andrew, on Civil Aerospace. You mentioned that the disruption caused by Japan is impacting profits by GBP 10 million, R&D is a little bit higher than expected, and then perhaps maybe there is even a negative translation impact that you didn't forecast, but yet you maintained guidance. So can we infer that perhaps the first half of the year delivered a little bit better trading than expected? And if so, where did that slight upside surprise come from within Civil Aero?

John F. Rishton

Former Chief Executive Officer and Executive Director

Thanks, Jason. Energy business, a couple of comments from me. First of all, clearly, the Energy business is smaller than the other areas. Secondly, the financial returns are, I think, the euphemism is

disappointing, and we need to address that. So I think that the first thing that I would say is that we need to address the financial returns that we're getting from our Energy business and we need to think carefully about how we can do that. As I said in my speech, the oil and gas part of that business looks pretty good, the power generation, less so. So we need to address that, the first thing. The second thing is that clearly the acquisition we're making in Tognum is significant for the Energy business in total and that will bring, to a certain extent, some scale. But of course, it's in a different part of the business, so it's the diesel engines part rather than the simple gas turbine. So what I would say is, one, for our existing Energy business, we need to fix the financials and that's sort of something that I take on and will look at very carefully. Exactly how we can do that, whether that is, a, we need to be bigger or a different answer, we'll see. Secondly, the acquisition of Tognum will bring some scale to the Energy business, but in a slightly different way.

Andrew?

Andrew B. Shilston
Former Director

Yes, I think looking at the Civil business, we're in danger of micro-analyzing a very large business. This is a business that can generate profits over a full year of close to GBP 0.5 billion. And we're talking about 10 or 15 million items here, which realistically a morass than a noise[ph]. So I don't think there's any sort of more detail in which to give you the about first half. What I would say is that, again, perhaps we're being trying to be too precise with guidance. We did say back in February that we would expect the Civil business to produce results about 25% up for the full year. I think you can see the chart, we've said 20% to 25%. Frankly, realistically, there isn't any change to guidance. I think we're trying to be too precise here in the outcome. The difference of a few percentage points in profitability in the Civil businesses is not capable of being forecasted, given the huge array of products we have, the huge array of transactions, it's all in the noise.

Sandy Morris
RBS Strategy

It's Sandy Morris from RBS. And I'm trying to avoid circling back and asking the same question about margins. But if we just were to look at Civil Aerospace, notwithstanding that we have rounding errors, the mix was pretty adverse in the first half. We had more R&D, we understand, in this business, but the margin is holding up pretty well in those circumstances. Mike, in the meantime, is busy starting up factories left, right and center. And in the meantime, he's got launch programs going through. I mean, without trying to ask the margin question again, there is a lot there that one could be encouraged by, for the future. If Mike or someone would help elaborate quite how challenging these startups may be, it would be helpful, please.

John F. Rishton
Former Chief Executive Officer and Executive Director

Well, I'll let Mike take it, but as I said earlier, I would agree with your synopsis, which is why it would be disappointing if we double our revenues and we don't improve the margins. Mike, do you want to make some comments?

Mike J. Terrett
Former Chief Operating Officer and Executive Director

But I think I started explaining what we do around the world. I mean, when you're introducing new products, if you -- everybody will understand if you increase the volumes through a factory. You're going to get some fixed overhead [ph] absorption benefits, as well as the opportunity to drive productivity out. Actually, as you introduce the new product, you also have to actually put it through an proving process, take it down the learning curve, makes sure that everything is set up on relatively smaller volumes. So there is a challenge in doing that. That is in the mix. We're also -- as I said, services revenues are growing, so that's helpful, but we're also launching products. And I mentioned the Trent, but we're also launching the BR725, which is going into volume production now, so that's again in the BR710 world, which is still strong volumes. We're suddenly adding a new product, which is in the family, but nevertheless, we have to learn it out. So in the Civil business, generally, there are learner challenges

through our factories. And those factories are shared factories, would also put in TP400 and the LiftFan through those factories as well. [Indiscernible] So it's a great challenge to have. It's one that we enjoy enormously. But in a supply chain, you've got to manage new product, you have to manage old product and legacy products, and that's all in the mix. I'm trying to disentangle it on a half-year, half-year basis. It's not easy to do it in a simple way because it's part of a general mix, which is, I think, a point Andrew has made a number of times. I don't know if that helps put a bit of color on the world that we live in, but it's a good challenge to have.

Harry William Freeman Breach

Barclays Bank PLC, Research Division

Harry Breach here from Barclays Capital. I'll just ask 2 questions without 3 subparts to each. Firstly, Andrew, you touched earlier on the Civil section about time materials being below the large engine TCA growth in the first half. So should we be thinking about that as being sort of flattish? And what's the sort of profile looking like? You said better in the second half. Does that mean up to the level of the large engine TCA revenue growth we've seen? And then turning over to Mike. Mike, there's been a lot of focus that, I suppose, this year really on the supply chain management and the ramp up. It's probably getting to be pretty top of the list of concerns. What can we take away to make us feel more comfortable that part shortages and the supply chain broadly, given how large and complex that is, can be better managed this time to mitigate shortage quality schedule issues compared with previous ramps? Is there anything tangible we can sort of think about to make us feel better about it?

Andrew B. Shilston

Former Director

Right. Well, let me take the first questions on the time material piece of our civil aftermarket. I think your characterization of the timing material performance in the first half as flattish is the one I'm happy with. In terms of the second half, there's no doubt that the number of arisings of bookings, if you like, in the overall base network is increasing. But I don't think that's going to cause the sort of double-digit increase that we've seen in the large engine long-term support contracts. And it's because there's a very large installed base of engines, about 30%, as you know, around time materials. And so there are some areas of the fleet that are looking better. For example, the 524 engines, I think, we've talked with 1 or 2 operators, we're seeing more demand for those overhauls. But then a quite a large number of engines where there may be little change in the second half. So I don't think you should expect a sort of double-digit necessarily upturn in the second half on time materials, but there will be some improvement.

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Okay. On the ramp-up. I think if you're referring back to the challenges everybody faced in the last big cycle turn of 2004, I think there needs to be a bit of context here in that prior to 2004, there was enormous dip in civil as a result of 9/11 and the Iraq War and SARS. And the ramp-up that occurred was just to a large extent, a ramp-up in existing products and existing supply chains that came on very quickly, most of you remember. We've been planning this ramp-up in civil for some time. And rather sadly, we've had to wait a little bit on the 787 and the A380 delays, but we've had plenty visibility. We've had a lot of planning tools in place. We've carefully selected our suppliers and have worked with more production readiness, and continue to do so. And so it's -- and we've also hedged our materials probably far more extensively than we did back in 2004. Now having said that, it is one of those things that -- and if you were in my job, you'll lie awake and worry about it, which is the right thing to be doing. And constant attention to detail with suppliers, planning, making sure we're close to them, particular attention to making sure the parts are production-ready and are learnt out and the processes are capable. So those sorts of things, we're heavily engaged in our production readiness programs, and we'll continue to do so.

David Howard Perry

Goldman Sachs Group Inc., Research Division

David Perry again. Can I just come back to Energy? Just trying to understand the lower guidance. Andrew, I think in your presentation, you said it was -- the guidance was lower because of softer OE nuclear costs,

and I think you said people costs, as I was scribbling away. Can you just elaborate on that? Have you started doing some restructuring already?

Andrew B. Shilston

Former Director

No, it's not restructuring. I mean, we're talking quite small numbers here in the overall scheme of things. It's largely to do with just having people to bid for new work. I mean, before you win orders, you need people to address the market, so I think that's really what I'm talking about. It's not restructuring.

David Howard Perry

Goldman Sachs Group Inc., Research Division

Sorry. I'm not sure I understood you. So you said before you bid, you need people?

Andrew B. Shilston

Former Director

Before you win orders, you have to have people to respond to requests for RFPs, request for proposals. You have to have people to address the market, so those are creating costs without revenue. And you have to incur that cost before you win new orders.

David Howard Perry

Goldman Sachs Group Inc., Research Division

And you're talking about power gen or oil and gas?

Andrew B. Shilston

Former Director

Well, it's principally, I mean, it's in both. I mean, perhaps oil and gas has been more buoyant. As I said, the order inquiry level has definitely picked up. We have been bidding for power gen work both from a diesel side and gas turbines. And it does require a certain amount of effort, so I think it's across both businesses, really.

Benjamin Philip Fidler

Deutsche Bank AG, Research Division

Just one final one for me, which was maybe I missed it in the press release somewhere. But I just wondered if you could update us, Andrew, on what the TCP net debt was at the end of the first half?

Andrew B. Shilston

Former Director

Well, I'm so pleased, Ben, that you've asked me that question. And I think you'll find the answer in the press release. And I will refer you to the note in a moment when I have found it. And it is on Note F, Page 11 of the press release. And the short answer is there's not much change.

John F. Rishton

Former Chief Executive Officer and Executive Director

So hopefully, that's discouraged any more questions. Are there any more? Okay, well, thanks very much for coming here again this morning. Just to summarize again. It was a strong first half. I think we're well positioned and confident about the future. And certainly, my first few months in this company has been a terrific experience. And I look forward to seeing you again at the full year. Thank you very much, indeed.

Presentation

John A. Rose

Former Chief Executive Officer and Director

Good morning, everybody. I'm President. We're starting on time. Thank you for coming. I know it's a busy morning you've got. We've already been upbraided by a number of people for not being competent enough to schedule a meeting on a different day from BAE, so apologies for that. We'll try and do better next time. I blame Mark Alflatt. First, just sort of housekeeping, do turn your phones off, just to avoid interference.

As usual, it's the same four matters as we always follow. I'll give you a brief introduction, and Andrew will step through the detail of the first half and the guidance. Mike will give you an update on where we are on all our operational activity, by which there's a huge amount at the moment, and then I'll summarize.

As you've heard me say before I was a noted pessimist on the economy and I'm likely to be late optimist, unless there are optimistic signs around. I think we're in a period of continuing uncertainty, where we are going to be subject to surprises of one sort or another. And in that context, it's very important that we have the sort of access to global markets that you can have as a high-technology company where in many of the potential customer countries, they don't have equivalent capabilities, so we don't have domestic competitors.

So in a world where we believe recovery is likely to be a, unpredictable and b, asymmetric, that's very important. And equally important in these circumstances, and I think demonstrated by the first half performance, is the resilience of the portfolio that we've developed. And that portfolio has a number of different components obviously. We're in a relatively wide group of markets from similar space through to energy. But also the portfolio is getting increasingly broad in terms of the product components. And that's true both in terms of the existing portfolio, but also as we showed you in the preliminaries. We are involved in an unprecedented number of new programs, which the underpinning of our growth over the next decade and where we're saying that we are confident that the business can double organically as it has over the last decade. And obviously, we've got a mix of original equipment and services. And that mix is likely to remain broadly the same as we grow. But obviously, in absolute terms, it's growing strongly.

In that circumstance and with these many new programs, and I like the fact that it requires considerable investment ahead of delivery in order to ensure that you have the capacity and capability to deliver the growth, execution is key. And we're making really for this company, unprecedented investments in new capacity but also in improved processes and in more flexibility because we found that flexibility is a important dimension of our ability to respond to the sorts of events we've seen over the last couple of years.

So the first half was encouraging, and if I could make this work, it will be better. Andrew will step through this in great deal of detail. But just to pick up a couple of points, we continue to take orders in the first half and the order book has grown. We've actually added about another billion pounds of orders since the half year. The revenue growth was strong in the first half of underlying profit, up by 4%, really influenced by a strong performance in Marine and really good cost management. As a result, we've increased our payments to shareholders by 6.7%. And as you can see in the press release and here, we've improved our guidance for the full year. That point, I'll hand over to Andrew to step through you in detail.

Andrew B. Shilston

Former Director

Good morning. Before I take you through the individual businesses, this is just a reminder that I'll be addressing the underlying not to see as reported numbers. And the main difference, I think, as you'll remember is the periodic re-evaluation of the hedge book. And this time, we had a \$0.07 strengthening in the dollar, and that causes the underlying profit of GBP 465 million to turn into a loss of GBP 475 million on a headline basis. And there are a lot more details in the notes of the press release, which reconcile the headline to the underlying performance. And there's also some information about the hedge book in the appendices presentation.

There were no significant translation benefits or cost to the underlying profit and the use of hedge book was largely as we've predicted.

Turning to the high-level differences between this year and the first half last year in terms of underlying profit. You can see that we have a column for foreign exchange, the light blue on the foreign exchange column is the transaction benefits and the dark blue is the translation benefit, which is more than said. We had about a \$0.07 improvement in our achieved rate in the first half of the year. That contributed to the GBP 28 million improvement in profit. And for the full year, we anticipate a \$0.06 to \$0.09 improvement in the achieved rate, which will contribute somewhere between GBP 15 million to GBP 75 of profit. That may be a little less percent movement in the exchange rate than you're used to. And the reason for that simply is the contract accounting, which plows some of the benefit forward in the calculation.

We're not assuming any further deterioration or benefit from translation movements. And the guidance that we give for full year is assuming that, that GBP 9 million benefit does not change. We've got slightly low restructuring cost this year, and that benefit should be preserved full year.

Turning to R&D. There's quite a little bit of analysis in the appendix in the usual form, and there's little change in the R&D cost half-year-to-half-year, but by year end, we should see quite a big turnaround in that. And we think there'll be a GBP 40 million to GBP 50 million negative effect year-on-year, partly for spend reasons and partly because of more R&D being expensed, particularly associated with the XWB engine Airbus A350.

And finally, the net effect of one-offs from half-year-to-half-year is that we have a GBP 20 million negative. And I'll make a few more comments about that in the business results. And we have a net GBP 20 million odd negative on trading and mix. Most of that is in the Civil business as you'll see on the next slide here.

So in the Civil business, we've had a pretty busy period, lot's going on, flight test programs on the Boeing 787. Gulfstream G650, the Embraer Legacy 650 and the first run on the XWB, so you get more evidence of when new product is coming from and how this is going to contribute to growth in the future.

The order book grew despite the uncertainty, we now have 5,100 engines in the order book, just on the half of which, not trends. So yet again, more indication of growth to come.

Overall results and the full cost of full year largely as we predicted, except some modest effects due to the volcanic ash disruption in Iceland and some waiting of original equipment delivers the first half. So we expect revenues up about 10% to 12% for full year. Service revenues will also be up about 10% to 12%. And that guidance is largely unchanged from February.

As we said back in February, the margins this year will be affected by early engines on new programs. We'll have more of those in the second half of the year. We've sold fewer lease engines this year, and I've already alluded to the turnaround in R&D, which will have an impact on the full year results. But overall, the guidance for Civil profitability has not changed from February, and we expect that business segment to be down about GBP 40 million year-on-year

Lots of activity again on Defense business. Flight test program on the A400M and JSF LiftFan continue. And we continue to work on the alternative engine for the Joint Strike Fighter, the 136, and that's making progress as well. The order book continues to be replenished. As you can see here with military transport and aftermarket is doing very well. And I think the fact that we powered 160 services in 103 countries is helpful in the face of some risk to govt expenditure in the more traditional markets in the U. K. and the U.S. And there are other markets overseas which are not under the same pressure.

As we've been saying now for at least two years, the Military Transport sector continues to be bouyant, and we're seeing some benefit from that in the results. The first half margin improvement reflects cumulative consequences. There are lots of small differences on R&D restructuring costs in the absence of one-offs. We expect full year profits to be up pretty strongly, up about 10% year-on-year with some weighting of costs overall to the second half.

Yet again, another busy segment in Marine. You can see a lot of activity on the naval side and particularly Littoral Combat Ship, Astute and Type 45, all going through sea trials. We took around GBP 1 billion worth of orders during the period. And with fewer cancellations, the reduction in the order book has definitely slowed down. And we are seeing more signs of activity in the market, more request for proposals and some signs that order intake is starting to pick up again. Just to remind you that we completed the ODIM acquisition during the period. And that contributed about GBP 100 million of revenue in the first half, and it'll contribute about double that for the full year.

Excluding the effect of the ODIM purchase, original equipment was down a little in the first half and it'll be down a bit more in the second half as we burn off some more of that backlog and before we get benefit of new orders coming through. Services on the other hand, are growing pretty strongly, up 14% through the half year and we'll grow strongly again in the second half. The strong first half margin improvement is largely due to about GBP 40 million of charges in the first half last year, which didn't occur. And we also had better realization from orders, another, backlog, fewer cancellations and better execution at some of those contracts.

As I said, original equipment will weaken further, in the second half, but after market were very strong again. And profit for second half, we think, will be GBP 10 million to GBP 15 million lower from the first half of this year, but that will tell you that the Marine business as a whole will perform strongly compared to last year.

The Energy business and activity, as much as we foresaw it back in February, good demand in power generation in particular. We did incur some retrofit costs on the fleet of the delevers and the industrial trends to improve combust of life, and that caused the first half loss. We can see a continuing strong OE and aftermarket growth in the second half, and that should leave revenues up, about 30% for the full year. In this together, with good cost control, should lead profits for that business segment, up about 30% over 2009.

Turning to financing cost. We continue to have net interest costs despite average net cash. And that's due to the low yield we have on cash balances compared to the funding costs on the debt. But we value the financial flexibility that, that gives us. And as we go into next year that the carrying cost will reduce quite significantly as we repay GBP 500 million bond issue. And we've already in fact refinanced that. The implied interest on financial RSPs is going down. And that's because one agreement is being concluded, and overall financing cost of full year will be roughly double what you can see for the first half.

Financial strength continues to be one of our keynotes. We've had a cash inflow during the period. The average net cash was up GBP 155 million compared to 2009. We've got two smaller pension schemes going through the triennial reviews in 2010, but we don't anticipate any changes to funding overall into the pension schemes.

There were no changes to gross and net contingent liabilities on existing customer finance. And in terms of new customer finance improvement, it remains pretty modest. And that's basically because the wholesale markets and the ECAs have provided most of the capacity that the market has needed. And so there's been much less recourse to the manufacturers.

As you can see here on this chart, we've had a cash inflow the half year that's a little better perhaps than we expected. On the left-hand side, the gray bars represent the cash we expect to generate. On the right-hand side, the red bars represent July recurring spend. The GBP 356 million now you on CapEx intangibles is roughly half, split half on CapEx and half on intangibles. And there's a lot of information in the press release breaking out the intangible additions over the various headings, which you can review through our ledger.

Overall, we expect capital and intangible spend to be GBP 600 million to GBP 700 million. At the full year, obviously, these are large amounts of money. But I think just to emphasize the point John made, we do invest heavily before we generate cash flows and in a way that's just another signal that organic growth, we're already investing in that for the long term.

So I think the message from that picture is that on a recurring basis, we can afford to spend what we need to spend to generate that growth. And we'll also be moderately cash positive on the way. Working capital benefits reflect good collections of over dues, some waiting of deposits the first half, which translates a little better than we expected. I think it's important to note that overall, working capital if you net it all out, it's not a very large number, but the individual components are quite big. We have about 4 billion of debtors, 5 billion in creditors and 2.5 billion of inventory. So fairly small movements in these large numbers can move the working capital around quite a lot.

And overall, we expect to have positive cash flow but the full year modest 100 million, 200 million, something like that. And it's worth just noting that over the three years 2008, 2009, and '10, we've spent about GBP 3 billion on investment capital R&D and the like, IT, as well as GBP 700 million on dividends and payments to shareholders. And along the way, we've also improved our average cash position by GBP 500 million. So that's not a bad performance through those, which have might pull recession years or soft years.

So just to wrap up, all the guidance points I've made so far. Revenues for the full year, we expect to grow by nearly 10%. And the guidance for the Civil business did not change. We expect profit slightly down about GBP 40 million year-on-year. Defense business will perform strongly. Profit should be up about 10%. Marine profits, I think, I've given some indications on what the second half will look like. And so year-on-year, the profit's going to be up significantly. And the Energy business will also grow strongly as the original equipment deliveries build up.

We will get the predicted benefit from the hedge book, no change there. And underlying profits which were up 4% the half year, that should be a good guide to what we expect for the full year. In other words, full year, we would expect to be up about 4% or 5% year-on-year. And we should see a modest cash increase alongside with average cash similar to the first half. I think that's me done. Mike?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Good. Thank you, Andrew. Good morning, everybody. In my world in operations, we work every day, the day job, delivering the engines and the services that end up with the financial results. And we work hard at it and it is the day job. But the other part of our day job is actually creating the future, and we do that every day. And it's tremendously exciting because we're actually leaving the future revenues as we create the opportunities by building the portfolio, extending the portfolio, making it real, facilities that will allow to deliver these products designing, developing, testing and producing that will that will allow us to deliver these products out through the next decade.

So in operations, in many ways, we get a much clearer and much more real deal with the future than anybody else because we live in it. Now what I'd like to do today in this presentation is to sort of bring you into that world and give you a glimpse of the progress we're making. On extending the portfolio, investing for growth and investing for productivity.

I showed you this chart back in February. And at that time I called it a year of firsts because I love these first flights and first sailings. It just happened, and we're pretty excited about that. We've made a lot of progress this year. Things are moving along at a significant pace.

So just a few highlights. The LCS, that's now deployed in service. The Joint Strike Fighter is actively completed and doing a lot of work on vertical lift. And the G650 has four aircraft now in the flight program, one fully kitted out. And that's going very well. You saw, some of you will have seen the A400M, which is now the three aircraft in the flight program flying at Farnborough and also at Riyadh. And that was a quite a spectacular daily display. I'm sure some of you would have enjoyed them.

Also at Farnborough, one of the four Rolls-Royce-powered 787s was on display. We're doing the bulk of flight testing that's being completed. And that's over 1,000 hours of tests so far. And the engines have been doing fantastically well. But to bring you up-to-date with just one of our other products, I've only been able to put some of our products on this chart because we're doing very large numbers across all

sectors. The one of our very exciting products is the Trent XWB, the latest trent engine, which Andrew has already mentioned.

Just to give you some sort of sense of the scale of this. I mean, the size of that engine is about the same as the size of the Sentry, same fuselage. Four years ago, it was an idea. We told Airbus it would run in June 2010. Thousands of possible design, manufactured both together. We assembled them, put them on test bed, pressed the button and the engine started. It's quite an amazing thing. But we won't get any revenue for that engine until 2013 because we'll go with the flight test program and perhaps to deliver the aircraft. And from 2013, that aircraft will start to live in with our engines. And by the middle of the decade, and the rates -- let's say the rate's 250, which it maybe, maybe more. We'll be delivering annually the equivalent trust of 80% of today's Civil deliveries for all of our boarders today in just one program.

So all of that has to be realized. It's the future. It's what we live in every day. And we clearly have to make a lot of new facilities and the supply chain has to invest a lot in new facilities to make the products that we're going to deliver.

I've got a world map here that just shows some of the 60 major property activities we've got running. Some of those are marine service centers. But I'm going to talk today about three locations: the U.K, which we've broken out because we have a number of facilities we worked on here; Singapore; and Crosspointe in Virginia in the U.S.

Back in February, I stood on this site to essentially start the construction. And we have just an artist impression on a flat piece of land, and that's showing up at the top. And this is the aerospace part that will have new wide court assembly facilities, assembly test for Trents and a hub which has in it a manufacturing lab, research lab, HR, purchase, quality personnel from our Asia region, so it's a big facility.

Just to show you, at the bottom page, you'll see a photograph of the local facility. Now this will be able to double our capability to do Trent assemblies, advanced technology in Singapore there. You can see that this facility has made enormous progress. I'm amused by the picture, it's going to -- the traffic sign that says slow. I can't think of anything less appropriate to the progress on this site. We have a thousand people put in our facilities at a phenomenal rate that ahead of program, that'll be finished as a facility at the end of LM [ph] and then the machine tools go in and we produced parts in 2012.

Moving along, as we all know what the assembly and test facilities look like, these are going to duplicate the modern facilities, 57 Bed on the assembly at test site. So we'll be able to double the Trent capacity, which is as I've said, we're living in the future, that's doubling our Trent capacity for the order book that we've got. And this is a photograph of the new test bed in construction, similar to the one we have in Derby 57 Bed, capable of taking very large engines.

Now moving across deals out of the world. In Virginia, we have 1,000 acres of land. It's a very large amount of land near Richmond in Virginia, a site called Crosspointe. Top left-hand corner is the artist's impression of the first facility that will be built on that site. And that facility will produce disks of the Trent family for engines and for aftermarket. And you could see, if you look at the artist's impression, you see it becoming a reality in the bottom photograph and the top photograph. That's a photograph of us as of a few weeks ago. We'll actually start producing parts there in 2011.

And into the U.K. We announced four new facilities in the U.K. last year. They're going through varying degrees of design and planning. One of the most advanced here is up in Derby. You could see it's near our submarines facility and the artist's impression on the left, the reality coming together the right. This is capable of making nuclear components for our submarines. But also, it has a capability to do civil nuclear in that facility.

Productivity is crucially important to us. We are partners in the Advanced Manufacturing Research Center network that's growing around the world. Six in different stages of completion. These are places where we actually pushed the manufacturing to an advanced level to make us more productive and make our supply chain more productive. The one on the bottom left is the one in Sheffield that's being built for a number of years, and we're actually seeing the fruits of that now in our facilities.

The one in the middle there is a forming center. It was just about to open in Glasgow. The building is complete, that's the real building. The one on the right is composites down in Bristol, we have one in Crosspointe in Virginia and one in Singapore, also under development. So we invested in capacity for growth, but we're also investing heavily for productivity at our manufacturing facilities and in all the other things that we do.

So in summary, we deliver everyday but we've invested for long-term growth. Those new programs you saw are some of the new programs, not all of them, we've got many others that underpin the organic growth that John and Andrew talked about. We're developing a more flexible supply chain who invested heavily in our suppliers internally, and they're investing in us by building new facilities all around the world. And the last two years have been quite volatile. This year has been more stable but we've seen that we can be flexible, and it's a key element in the way we think about the world. That we have choices and we have flexibility as we invest.

So pretty exciting time being in operations and pretty busy time. And with that, I'll hand it over to John to summarize.

John A. Rose

Former Chief Executive Officer and Director

Thanks, Mike. Just briefly, as I said at the beginning, I think we are in for a period of continued uncertainty generally across the world. But in that context, I think that the company is well positioned where we are on the technology ladder, the range of programs we're involved in. I mean, access that we have to global markets and the new programs we're investing in. And indeed, the success of the programs that we already have. As an example, we're seeing more activity now on the A330 than we've ever seen. And it's worth sort of remarking on the fact that Airbus have sold 600 A330s since the 787 was launched.

So it is becoming a workhorse of the industry, and that's partly driven by some of the distances and volumes that need to be traveled and volumes that need to be carried in the developing world, places like China and so on. But we're comfortable with the strategy we've been following. The investments we've been making in our portfolio in the markets that we're in supports our view that we can double business organically over the next decade.

Clearly, as Mike has made it obvious, good execution is key. And that involves a couple of things. One is we have to ensure that we have the capacity in place to deliver that growth. That has to be done ahead of the revenue. And you have to put in place the total capacity and then occupy it. And the productivity on the investment we are making in new manufacturing techniques, processes, facilities, working practices and footprint is key to that.

So in summary, for the full year, we're guiding to slightly stronger profit and cash flow and wherever is in that bet than we do the preliminaries. And at this point, happy to answer questions.

Question and Answer

Andrew Chambers

[MF Global UK Limited]

Just trying to drill down a bit more into some of the most detail on Civil aftermarket side, which I guess you're not surprised I'm asking question on that. If we assume that in the first half the total care side of the equation grew reasonably well, given the fleet growth and flying hours et cetera. In the light of what some of your competitors have said in terms of demand trends, can you give a bit more color on what's going on with the time and material side and spare parts, and whether the order trends are picking up or what your customers are indicating to you going into the second half?

Andrew B. Shilston

Former Director

Yes. I think we indicated back in February that we haven't seen much upturn in demand on the time and material side. And that continues to be the case. I mean, typically, we get two to three months of visibility of demand through the repair and overhaul network. And we're still not seeing much change to that fairly flat pattern. Obviously, in the end, I think as there is more flying activity, one would expect some recovery. But there's not much evidence of it yet.

Andrew Chambers

And on Civil margins, if we stick with that profile of recovery and what you said about production, do we see Civil margins trending back higher from where we are this year, given there's a few negative hitting the division?

Andrew B. Shilston

Former Director

Well, I think we'll have to wait until early next year before we start to give some guidance for 2011. But for this year, I think the comments I've made hold good that we'll see the number of engines on early programs having some negative effect. And obviously, over time, those will tend to work out the system.

Andrew Chambers

Switching to Marine, very strong performance. Is that on the aftermarket side or results of market share gains? Is your proportion of aftermarket going up as a result of your investments? And similarly on the margin side, going forward, you've had a very big jump in returns. Is that sustainable or will the mix continue to go up?

Andrew B. Shilston

Former Director

Well, I think on the aftermarket, it's a function of two things. Firstly, we've spent quite a lot of money improving our dock side presence around the world, which captures more of the aftermarket. And the fact that we've delivered so much original equipment has contributed to that growth. And so, we see that the strong performance in the first half continue into the second half of the year.

Andrew Chambers

And beyond?

Andrew B. Shilston

Former Director

Well, I think, we'll give you that guidance when we get there. But I mean I think the margins this year will clearly show the benefit from growth in aftermarket.

Antoine Boivin-Champeaux
CA Cheuvreux, Research Division

[CA Cheuvreux]

Antoine Boivin-Champeaux. Could you take any color on Civil? You showed us plus 7% in Civil Aero aftermarket in the first half. Could you give us the underlying figure in dollar terms and excluding the Aviall distribution agreement for the first half? And give us your expectation for the full year as well.

Andrew B. Shilston
Former Director

Well, I think we guided back in February that the full year aftermarket growth will be about 1/3 to do with foreign exchange, 1/3 to do with the Aviall agreement, 1/3 to do with the growth in the underlying aftermarket. And for the full year, we see that to be very much what's likely to happen. And I think what's happened in the first half, we've seen a bit less from perhaps time materials, and we expect to go low. We never had great hopes for recovery. But I think the full year composition of the aftermarket would be much as we expected back in February.

John A. Rose
Former Chief Executive Officer and Director

And indeed, the scale of the growth. So we reguiled to 12% in the prelims, and we're staying with that guidance. So mathematically, the second half will be a bit better.

Zafar Khan
Societe Generale Cross Asset Research

[Societe Generale]

I have two questions, please. First one is on the Marine. You mentioned the encouraging pick-up in the orders there. I was just wondering if you could give us a bit more detail of where that's going to be? Is it specific or across the board? The second us just on your balance sheet, which is almost 1 billion of net cash on an average basis. And I know, Andrew, you mentioned that gives you flexibility. I just wonder how you're hoping to deploy that going forward?

Andrew B. Shilston
Former Director

Well, I think on the balance sheet, we've always made a feature of financial strength. And that continues to be the case. We have appetite to grow, in particular, our Energy and Marine businesses. In time we'll see what opportunities we identify, whether those are inorganic or organic. And we have nothing particular in mind, I admit it. But we have a lot of capability and we'd like to find ways of capitalizing on that. Sorry, what was your question on Marine?

Zafar Khan
Societe Generale Cross Asset Research

Just in terms of the order activity [indiscernible].

Andrew B. Shilston
Former Director

Well, I wouldn't overstate how quickly it's coming back. But I think the nature of our products, all of it, we have a lot of capability we are increasing. The market is interested in high-efficiency products, lower-emission products. I think for the first time, perhaps the last year, people are talking about emissions in the merchant fleets around the world, which is not something that people have really talked much about before. So there's going to be more demand for these sorts of things that we do, which is not the way of concentrating in the heavy end of the merchant fleet world. But for example, coastal ferries which originally started in Norway using gas engines, we detected demand elsewhere in the world as people get worried about emissions close to coast lines. So I think it's not only going to be from our traditional

markets that in the future we'll see demand picking up. It's also going to be demand spawned by appetite for clean and more efficient equipment.

John A. Rose

Former Chief Executive Officer and Director

Addendum to that, our Marine business is slightly different from the other Marine businesses that you would typically compare with. And that most of them are diesels led, whereas we're systems led and diesels is just one of the prime drivers that we can use. And Andrew's point is that environmental agenda are always getting more important but also just the capability and what we generally do. Clever ships they go fast, they are very maneuverable, they can hold position on the seabed, they can tow or raise, et cetera, et cetera. So they have a lot of systems capabilities. So as you've seen pictures before of the sorts of vessels we provide systems for, we will be providing something like 60% of the content of a vessel and doing the integration task.

Harry F. Nourse

[HSBC]

I was just wondering, could you possibly give us some kind of geographical breakdown on your Defense revenues, let's say just the different parts of the world, and perhaps your thoughts on how potential cuts might affect you.

John A. Rose

Former Chief Executive Officer and Director

Well, I think, probably Mike can give you a detailed breakdown. But just simply, our biggest customer is the United States. And our second biggest is through the U.K. and Europe. And then it grades through the world as Andrew said, we have more than 100 countries which we sell to. I think the points that he made remain valid, where we have about 50% of our revenue coming from services. Then there's about 20% that comes from the development programs, which are typically in Europe and the U.S. And then the balance is original equipment, which is pretty broadly spread across a large number of programs. So no individual program is a disproportionate part of our revenue in that sector. And we're highly focused on areas such as transport sort of utility areas of demand, as opposed to the more exotic programs that we are involved in, the old exotic program. So I think it's important we have a very widespread of customers, a very widespread of programs. We have a split between services and OE. And no single program is disproportionately important to us.

Harry Breach

[Barclays Capital]

I'm following on my colleague, Harry's question on Defence. First, could I just resolve a small question. The F136 development expenditure to go to completion to move into production. At Farnborough, I think we had a number of \$1 billion, and your friends on that program have given number of \$1.8 billion, which is correct?

Andrew B. Shilston

Former Director

I have no idea. We'll come back to you and just correct the data point. But I think the point is that we're not incurring costs on our own dollar. I mean this is still a funded program. And it looks as if funding will be in place through the balance of this year.

Harry Breach

second part on Defence...

John A. Rose

Former Chief Executive Officer and Director

And the other thing that's just worth remembering on that program is that we're involved in two components of the F-35, one is LiftFan, which we own 100% of it. And then the other one of course, is I think the one you're asking about which is the engine, which is where we're 60-40 with GE.

Harry Breach

And the other question was we've seen a number of companies comment on delays in contract placements by various Ministries of Defence. Have you seen any of that at Defence Aerospace?

Andrew B. Shilston

Former Director

No, I don't think so, not discernibly. I mean there are some places in the world where contract negotiations take a long time, but that's always been the case.

Harry Breach

When we saw the slides earlier in Mike's presentation of Singapore, it reminded me of a nearby customer. And I'm wondering, have we seen a 787 engine selection by Singapore Airlines?

[indiscernible]

Avi Hoddes

UBS Investment Bank, Research Division

[UBS]

First, could you pass a comment on unit costs, pressures and the various pieces in that? Give us some color where that's going? Same question on working capital. If you could just again, kind of give some color as to where you think the three pieces of guidance, I guess in particular I'm interested on the inventory but also given the order flow that we've seen, what's going to happen on the tables and your balances line? Then finally on the volume ODM I don't feel like I've ever really heard from you the rationale behind ODM and publicly and really kind of how that fits with? I see you guys as a company that can deliver his power, that the energy, how the ODM fits into that strategy.

John A. Rose

Former Chief Executive Officer and Director

Why don't we start with ODM first. I mean we did explain the rationale and it is consistent with overall systems strategy in Marine business which has as you know is beyond just the power. We go from the bridge through propulsion, and we have some of the ancillary capabilities that are associated with the function that those ships deliver, but primarily power. But we have a broader systems offering as we do persons oil and gas where we have a broader systems offering with compression. So it is analogous to the sorts of activities that we already perform in the oil and gas industry particularly but we just broadened into a slightly wider area of activity. It's a business we know is extremely well. It's co-located more or less with businesses in Ulsteinvik. And we're very comfortable with the acquisition. We think it will add a lot of value to the company.

Andrew B. Shilston

Former Director

Well, I'll take working capital and then Mike unit costs And we're looking at working capital if we look at inventory, first of all, we know that those to bring inventory levels down. But I think this is not a simple process because we have about 2/3 and what they put into an engine comes from the exceeding supply chain. So were also having to manage risk in the external supply chain and then we have the over the last two years of program delays which is gigs for those of you to what Acopia is over time come I think there are opportunities in imagery but they may not be that significant in their short-term. With parts to deposit, I think that is always difficult to predict and we are forecasting some negative turnaround in deposits in the second half the order intake particularly demurring business will not be as levels that we've seen in previous years but we could be wrong. So I think the deposit areas and inventories it difficult

to forecast is one of the weak results were working capital is quite volatile. Mike? Objects generally, the guidance on when it comes February we guided that will distinguish and I don't see anything to change that guidance.

Avi Hoddes

UBS Investment Bank, Research Division

Zama materials and our contract on that was there is pieces there?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

I think the give you some data back in February and nothing's really changed. We hedged out well into the next decade on titanium, we hedged on the materials and so we have some volatility up and that's bouncing same as it goes down. It's a hedging process. So billings, operations doesn't really move around the rapidly day-to-day basis. So welcome.

Avi Hoddes

UBS Investment Bank, Research Division

Will your Marine business event affected by what's happened in deep-sea golf particularly since you don't Mr. And comes one if your directors?

John A. Rose

Former Chief Executive Officer and Director

Particularly I haven't quite got the connection here. But we're interestingly since then, David's particularly is reaffirm its capital programs for their activities and it's not only the quarter, but also some of the other areas in the world where expressions taking place since the colder waters that are driving the demand for vessels. And so that, plus the renewal cycle if you go I look at the major leagues, some of them have a lot of assets that are no longer really useful for some of these more complicated environments. So I think on the whole, we think that demand will remain consistent with our really the advantage to reporter has changed that. Just sort of a sideline, it is the government says where we are going to have 50% of our nobles, our editors a generated by renewables largely optional been by 2020, couple of required unprecedented operations. I don't personally think it's an easy target to meet. What of sure, what of course exactly the same sort of capabilities the scenery. And so you got the ships for that globally. And then you about a format. You saw our title generator sort of artistic impression of this on one of the slides. The time that it is for testing. That it's a sort of vessel what we're talking about. We get the would that sort missile.

Avi Hoddes

UBS Investment Bank, Research Division

You touch on materials hedging. To do just come back to foreign exchange hedging at the. And what the hedge book doesn't hedge book and what the average was?

Andrew B. Shilston

Former Director

There's a more detailed in the offenses to summarize the hedge about \$20 in size and the average rate and manages \$1.60.

Rupinder S. Vig

Morgan Stanley, Research Division

[Morgan Stanley]

To questions, we are results to provide with the Energy prices can you just give us a bit of an update as to what's happened since I was thinking about the area in the future than just back to the civil business, if we think about the items that, what's the picture for that is going to be in terms of new programs? And our own perspective, how big or small the impact we the future progress we I we.

John A. Rose

Former Chief Executive Officer and Director

Nuclear first. Smoking alone the trajectory that we thought everybody's writing., about it? Or. Frankly what was to the income of the companies learned something when Korea one immediately. So there are more number potential and actual competitors now in the market. We continue to pursue our strategy Richard Wiseman subsists of parts of the farm so we can do special is design and manufacturing., of large components to give us a minimum of asset a role in the aftermarkets. And secondly, the instrumentation and control opportunities that comes from our base that we provide insufficient control and I think in a positions have the rest of a bunch of others around the world. So there would be two strands to the third richest around services and advisory capability. It's going to be a subset right from the outset, let me so what were taking longer than people originally expected. But we're still comfortable with his a sensible expansion of our capabilities in your clear. And you've seen and it is around in a reason to references. Which possible ways of spending on manufacturing capability. And as Mike showed you, we're investing in absurd and it's largely or submarine capability, but it's nice that we can do with respect to the civil demand. I'm absolutely sure that for many countries the Energy mix is going to be clean coal, gas and nuclear. country severe because there is a registered environment and different resource strengths but clearly prices nuclear. is that the reader that can you sort your cost. And Energy strategy is going to be very important as we look forward and I'm convinced there's going to be up a big part of it. Than expected. It is cleaner we know how to do it. On IE, community is essentially one part of company at the moment and the next position will have some impact on what the future of IE but said I think two or three years ago when they started, we are always happy that we have the option to go out on Friday that we have a preference to use the bread rally in partnership relationships that we built up over to your use with IE and addressing that particular sector. But we have the option to address it on a stand-alone basis today and the weighted we did and to the 19 eighties.

Rupinder S. Vig

Morgan Stanley, Research Division

Coming to this exciting line this to me unlike some of these goals is right products, with the terms of your. We have a new opportunities that have settled down and make one thing. I know you want flexibility, but you might assert in terms of your operations that that was actually up some space going to make you like easier and might allow you to some of closely rival's are showing piece what are you talking a salary don't know what? Yamato assault facilities, think a lot of different files for different products with the division but where wanted me producer to view that as an opportunity?

Mike J. Terrett

Former Chief Operating Officer and Executive Director

An estimate as we talked about and there is about 70,000 big wave of hundreds or thousands seconds because the scale and size of it. So yes, it's clearly a goal to have a big stable run of his which is facilities. A lot of the tooling predicted the importance of the trend. Quite flexible but to attract families. So if you go more into see a huge months commonalities to be able to use the term on the purveyors different products, sometimes exact same one of the similar. But when you take some around toward facility, I do have the figure which made is producing still going to actually make a facilities domestic facilities work flexibly because they companies where do you differentiate the product that is a high degree of precision technology in the making as well as the design and that's where we make our components. In our supply chain, our supply chain is much more what is the biggest events products. But they tend to have facilities that are more the way described in and so when we said about, we've got less than 130 supplies in Q2 the more specialized, but at less than 100 supplies, some of them critically our programs in part to Texas on another trends. Some are dedicated to a pretty good program. So it's more complex answer to diversity.

Rupinder S. Vig

Morgan Stanley, Research Division

And go nowhere you look at what to say, yes, that takes operations it gets inside.

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Of our biggest volume is one or the IE program which is across several independents. MBA program us across the 22, C130-J, the Embraer, the assessment. It's, the order of that engine in Indianapolis very, very smart high volume. The subsandwiches to some of applications, the engine is my about the. The between 500 is high-volume but the. Those supply chains have high-volume repetitive product. The train 700 is another great as you at this will be another one. Our domestic facilities a Senate to get the best of the special products that we make ourselves. Our supply chains are then designed around the volumes we expect for different products.

John A. Rose

Former Chief Executive Officer and Director

Which is how important as I've in terms of overture and so on. And does is remembered, 77, segment seven that the market I interested that the market we have 35, we have the percent of that 25%. So it's a relatively small percentage of market.

Rupinder S. Vig

Morgan Stanley, Research Division

If so V.C. Summer and a good example.

Mike J. Terrett

Former Chief Operating Officer and Executive Director

Building Singapore and others in the U.K. but have the capability to do multiple trends in both facilities which is very helpful from a business that in perspective. But remain of those facilities to optimize the repetitive nature of certain products and this is true to that is similar to the December test we have the choice to do what you describe which is showpiece. What begin quite expensive.

John A. Rose

Former Chief Executive Officer and Director

There no more questions. Thank you very much. I know you've got a busy day, so thank you for joining us.
